

The more you KNOW about **SCOTCHTINT™** Window Film...
The more you WANT **SCOTCHTINT™** Window Film

INDOOR AIR QUALITY

Indoor Air Quality is becoming a big issue of the 90's. As commercial building owners become more aware of the issue, they will be asking manufacturers and suppliers to provide them with emission data on all products used inside the facility. Sun Control Window Films will be one of the products that building owners will begin to request emission data as outlined by the EPA.

A sample of 3M **Scotchint™** Window Film (RE20NEARL) was tested in accordance with the EPA for the "TVOC" (Total Volatile Organic Compounds) emission factor and the result was very positive. Total emissions from the laminated film were below minimum detection limits (< 1.0 micrograms/m per hour). We are confident that all of our 3M **Scotchint** Window Films will pass this critical test for indoor air quality since RE20NEARL represents many of the coatings used in the manufacturing process for our family of films.

While you may not need this data today, we assure you that the indoor air quality issue is intensifying and you may soon be asked from building owners about window film. It's good to know that our 3M **Scotchint** Window Films pass the test.
