

New 3M™ SelfCheck™ System V-Series:

Photos & Facts

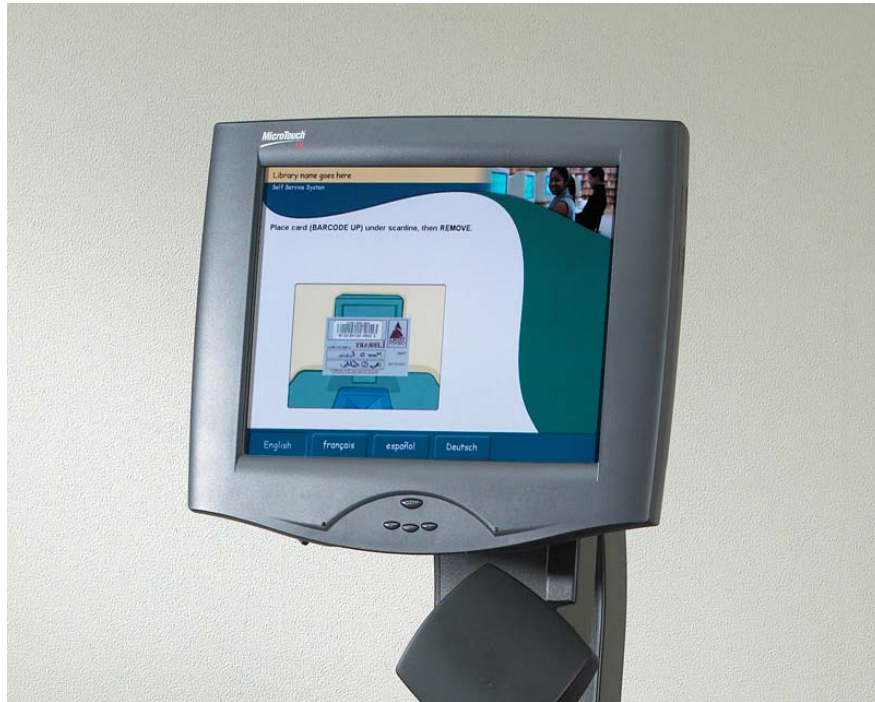

ST. PAUL, MN (January 31, 2005) – The new 3M™ SelfCheck™ System V-Series is an intuitive system with a sharp contemporary look and dynamically intelligent design. Available now, in a wide variety of cabinet finishes and countertops, Model V1 combines self-service with 3M™ Tattle-Tape™ Security Strip technology.

The new 3M™ SelfCheck™ System V-Series Model V1 features a distinctive V design, ensuring the proper placement of books, magazines and other items. An easy-to-use touchscreen-based user interface guides customers through the self-check process. The data is easily accessible by librarians from any Windows-based PC with Web access. An embedded printer uses standard size rolls of printer paper, making it easier to change and easy for customers to read return slips.

Virtually any library material is placed properly in the new 3M™ SelfCheck™ System V-Series. A visible scan line helps customers orient barcodes correctly. The barcode scanner configuration is designed to handle almost any barcode location and orientation. 3M's L-coil design provides reliable security. Customers are prevented from checking out more than one book under a single barcode, substituting items during checkout and more.

The new 3M™ SelfCheck™ System V-Series features an easy-to-use touch screen and step-by-step instructions that ensure first time success. Four languages can be displayed with 24 languages available in all. Continual software updates, provided by 3M, keep the system up-to-date with today's changing technology.
