

3M™ 360 Encompass™ Health Analytics Suite Patient Compare Module

- Improve performance in publicly measured readmissions
- Minimize the impact and penalties for excessive re-hospitalizations
- Identify barriers to patient care and improve care coordination efforts
- Highlight exceptional cases and improve public perception through better coding and documentation

Get ready for value-based care

Nearly 10 percent of all hospital expenditures come from avoidable readmissions and complications.*

Most measures look at all cause readmissions (ACR) and hospital-acquired complications (HACs) to help hospitals reduce costs in these areas. But these models don't factor in readmissions or complications that are unavoidable or expected.

As healthcare organizations improve their efficiency for value-based care, the next step is to focus where payers focus: patient comparisons.

An up-close look at patient data

Created as part of the 3M™ 360 Encompass™ Health Analytics Suite, Patient Compare gives organizations a patient-level review of where and how best to reduce length of stay and improve mortality, costs and charges. The application shows the impact of potentially preventable readmissions and complications (PPRs and PPCs) and compares peer-to-peer performance using 3M benchmarks.

Patient Compare drills into data provided monthly by organizations, all the way to the individual patient level for up-to-date reporting and immediate action items. Through the 3M™ Potentially Preventable Readmissions and the 3M™ Potentially Preventable Complications Grouping Software, organizations receive a more detailed look at their patients and quickly see where and how to improve quality and amend coding and documentation issues. Patient Compare focuses on those readmissions and complications, and tells you how your physician and physician groups are performing.

Analytics for your advantage

With Patient Compare, hospitals also receive exception reporting, which identifies cases that fall outside of the norm, such as:

- Mortality in low-risk cases
- High costs and long stays
- Low-acuity cases with long stays
- High-acuity cases with short stays
- Readmissions
- Cases flagged with a HAC, patient safety indicator (PSI), quality issue or complication

The report also analyzes admission and discharge status, as well as payer breakdown.

Interactive reporting and robust dashboards

Through Patient Compare's intuitive and consistent user interface and interactive dashboards, administrators can select their own metrics and views. Whether for internal reporting or public, organizations have the freedom to create reflective, up-to-date reviews of their hospital's data and performance.

When it all works together.

For hospitals to meet the rising demands of competition, compliance and patient care, they must have an efficient and accurate revenue cycle management system.

But what does that really look like?

It looks like coding and clinical documentation working from the same content, reducing duplication. It looks like facility and professional services coders using one application, putting an end to disjointed workflows and communication breakdowns. It's timely, complete query responses from physicians and full confidence all HCCs are captured. It's big-picture insights so hospitals can stay ahead of market changes.

It looks like every team, every workflow and every application working together. Ensure it all works together with 3M™ 360 Encompass™ System Platform.
