   B1. Fill, Void or Cavity Material* — Sealant or Caulk — (Not Shown) — As an alternate to Item 4B, sealant to be forced between blocks and periphery of opening to the max extent possible. In addition, sealant shall be forced to the maximum extent possible within the interstices between all cables in the cable trays. Sealant to be applied into all voids within the annular space between blocks to the full depth of the blocks (Item 4A).

   3M COMPANY 3M FIRE PROTECTION PRODUCTS — CP 25WB+ Caulk or FB-3000 WT Sealant

The L Ratings of the firestop system apply only when Item 4B Foam is used.

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.
Insulated Pipes

CAJ
Concrete floors with a minimum thickness less than or equal to 5 inches (127 mm)
Concrete or masonry walls with a minimum thickness less than or equal to 8 inches (203 mm)

CBJ
Concrete floors with a minimum thickness greater than 5 inches (127 mm)
Concrete or masonry walls with a minimum thickness less than or equal to 8 inches (203 mm)

FA
Concrete floors/Steel decks
Concrete or masonry walls with a minimum thickness less than or equal to 8 inches (203 mm)

FC
Floor assemblies
Framed floors

FE
Truss floor assemblies

WJ
Floor assemblies
Concrete or masonry walls with a minimum thickness less than or equal to 8 inches (203 mm)

WL
Wall assemblies
Framed walls

**System No. C-AJ-5001**
March 05, 2007

**F Ratings – 1-1/2, 2 and 3 Hr (See Item 4)**
**T Ratings – 0, 1/2, 3/4 and 1 Hr (See Items 1A and 4)**

**L Rating At Ambient – 2 CFM per sq ft**
**L Rating At 400 F – less than 1 CFM per sq ft**

1. **Floor or Wall Assembly** – Min 2-1/2 in. (64 mm) thick reinforced lightweight or normal weight (100-150pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified **Concrete Blocks**. Max diam of opening is 18 in. (457 mm)

   See **Concrete Blocks** (CAZT) category in the Fire Resistance Directory for names of manufacturers.

   1A. **Steel Sleeve** – (Optional, not shown) – Nom 10 in. (254 mm) (or smaller) Schedule 10 (or heavier) steel sleeve cast or grouted into floor or wall assembly. Sleeve may extend a max of 2 in. (51 mm) above top of floor or beyond either surface of wall. As an alternate, nom 10 in. (254 mm) diam (or smaller) sleeve fabricated from nom 0.019 in. (0.48 mm) thick galv steel cast or grouted into floor or wall assembly flush with floor or wall surfaces. **T Rating is 0 Hr when sleeve is used.**

2. **Through Penetrant** – Nom 4 in. (102 mm) diam (or smaller) Type L (or heavier) copper pipe, nom 12 in. (305 mm) diam (or smaller) service weight (or heavier) cast iron soil pipe, nom 12 in. (305 mm) diam (or smaller) Class 50 (or heavier) ductile iron pressure pipe or nom 12 in. (305 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe centered in the opening and rigidly supported on both sides of the floor or wall assembly.

3. **Pipe Covering** – Nom 1/2 to 2 in. (13 to 51 mm) thick hollow cylindrical heavy density (min. 3.5 pcf or 56 kg/m³) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt strip tape supplied with the product.

   See **Pipe and Equipment Covering – Materials** (BRGU) category in Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Firestop System** – The details of the firestop system shall be as follows:

   A. **Packing Material** – Min 1 in. (25 mm) thickness of firmly packed mineral wool batt insulation used as a permanent form. Packing material to be recessed from top surface of floor or sleeve or from both surfaces of wall as required to accommodate the required thickness of caulk fill material (Item B).

   B. **Fill, Void or Cavity Material** – **Caulk or Sealant** – Applied to fill the annular space flush with the top surface of the floor or sleeve or flush with both surfaces of wall. When nom pipe covering thickness is 2 in. (51 mm), min thickness of caulk fill material is 2 in. (51 mm). When nom pipe covering thickness is 1-1/2 in. (38 mm) or less, min thickness of caulk fill material is 1 in. (25 mm). The hourly F and T Ratings of the firestop system are dependent upon the thickness of the floor or wall, the size of pipe, the thickness of pipe covering material and the size of the annular space (between the pipe covering material and the edge of the circular through opening), as shown in the following table:

<table>

L Rating At 400 F – less than 1 CFM/sq ft

1. **Floor or Wall Assembly** – Min 2-1/2 in. thick reinforced lightweight or normal weight (100-150 pcf) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max diam of opening is 36 in.

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

1A. **Steel Sleeve** (Optional, not shown) – Nom 36 in. diam (or smaller) Schedule 10 (or heavier) steel pipe sleeve cast into min 4-1/2 in. thick concrete floor or wall. Sleeve to be flush with or project max 2 in. from top surface of floor or from both surfaces of wall. When steel sleeve is used, F Rating is 2 hr and T Rating is 0 hr.

2. **Pipe** – Nom 4 in. diam (or smaller) Type L (or heavier) copper pipe, nom 15 in. diam (or smaller) service weight (or heavier) cast iron soil pipe, nom 30 in. diam (or smaller) Class 50 (or heavier) ductile iron pressure pipe or nom 30 in. diam (or smaller) Schedule 10 (or heavier) steel pipe centered in the opening and rigidly supported on both sides of the floor or wall assembly.

3. **Pipe Covering** – Nom 1, 2 or 3 in. thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt strip tape supplied with the product.

   See Pipe and Equipment Covering – Materials* (BRGU) category in Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Firestop System** – The details of the firestop system shall be as follows:

   A. **Fill, Void or Cavity Materials** – **Wrap Strip** – Nom 1/4 in. thick intumescent elastomeric material faced on one side with aluminum foil, supplied in 2 in. wide by 24 in. long strips. Nom 2 in. wide strips tightly-wrapped around pipe covering (foil side exposed) to fill annular space. Each layer of wrap strip is to be installed with a butted seam, with the butted seams in successive layers staggered. Wrap strip layers securely bound with steel wire or aluminum foil tape and slide into annular space such that the top edges are recessed min 1/2 in. form top surface of floor. In wall assemblies, the wrap strip layers shall be installed in the same manner used for floor assemblies but shall be installed symmetrically on both sides of the wall. The min number of wrap strip layers required is dependent upon the max pipe size and the pipe covering thickness, as shown in the following table:

1. **Floor or Wall Assembly** – Min 2-1/2 in. (64 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max diam of opening is 27 in. (686 mm). 

See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Pipe** – Nom 4 in. (102 mm) diam (or smaller) Type L (or heavier) copper pipe, nom 15 in. (381 mm) diam (or smaller) service weight (or heavier) cast iron soil pipe, nom 20 in. (508 mm) diam (or smaller) Class 50 (or heavier) ductile iron pressure pipe or nom 20 in. (508 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe centered in the opening and rigidly supported on both sides of the floor or wall assembly.

3. **Pipe Covering*** – Nom 1, 2 or 3 in. (25, 51 or 76 mm) thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt strip tape supplied with the product.

See Pipe and Equipment Covering – Materials* (BRGU) category in Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Firestop System** – The details of the firestop system shall be as follows:

A. **Fill, Void or Cavity Materials** – **Wrap Strip** – Nom 1/4 in. (6 mm) thick intumescent elastomeric material faced on one side with aluminum foil, supplied in 2 in. (51 mm) wide by 24 in. (610 mm) long strips. Nom 2 in. (51 mm) wide strips tightly-wrapped around pipe covering material (foil side exposed) with the top edges butted against the underside of the concrete floor. Sufficient layers of wrap strip shall be installed to lap a min of 3/16 in. (5 mm) on the concrete around the entire perimeter of the through opening. Each layer of wrap strip to be installed with a butted seam, with the butted seams in successive layers staggered. Wrap strip layers temporarily held in position using aluminum foil tape, steel wire, or equivalent. In wall assemblies, the wrap strip is to be installed in the same manner used for floor assemblies but shall be installed symmetrically on both sides of the wall. The min number of wrap strip layers required is dependent upon the max pipe size and the pipe covering thickness, as shown in the following table:

3M COMPANY – FS-195+

B. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Generous bead of caulk to be applied to outer perimeter of wrap strip at interface with floor or wall surface(s). In floor assemblies, a min 1/2 in. (13 mm) depth of caulk shall be installed in annular space (if present) flush with top surface of floor. Packing material in annular space, if needed, to be polyethylene backer rod, mineral wool batt or glass fiber insulation.

3M COMPANY – CP 25WB+, IC 15WB+ caulk or FB-3000 WT sealant.

C. **Steel Collar** – Nom 2 in. (51 mm) deep collar with 1-1/4 in. (32 mm) wide by 2 in. (51 mm) long anchor tabs and 1/4 in. to 3/8 in. (6 to 10 mm) long tabs to retain wrap strip layers. Coils of precut 0.016 in. (0.41 mm) thick (No. 30 gauge) galv sheet steel available from wrap strip manufacturer. Steel collar, with anchor tabs bent outward 90 degrees, wrapped tightly around wrap strip layers with min 1 in. (25 mm) overlap at seam. With steel anchor tabs pressed tightly against floor or wall surface, compress collar around wrap strip layers using a min 1/2 in. (13 mm) wide by 0.028 in. (0.71 mm) thick stainless steel band clamp with worm drive tightening mechanism at the collar midheight. Secure collar to floor or wall surface(s) with min 3/16 in. diam by 1-1/4 in. (5 mm by 32 mm) long steel anchor bolts, or equivalent, in conjunction with min 1-1/4 in. (32 mm) diam steel washers. One anchor bolt required in each anchor tab. As a final step, bend retainer tabs 90 deg toward pipe covering to lock wrap strip layers in position.

*Bearing the UL Classification Marking
System No. C-AJ-5005

November 11, 1994
(Formerly System No. 203)
F Rating – 2 Hr
T Rating – 3/4 Hr

1. **Floor or Wall Assembly** – Min 4-1/2 in. thick lightweight or normal weight (100-150 pcf) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max diam of opening is 6-1/4 in. See Concrete Blocks (CAZT) category in Fire Resistance Directory for names of manufacturers.

2. **Copper Pipe** – Nom 3 in. diam (or smaller) Type L (or heavier) copper tubing or Regular (or heavier) copper pipe centered in the opening.

3. **Pipe Covering** – Nom 1 in. thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt strip tape supplied with the product. Min clearance between pipe covering and sides of through opening is 1/2 in. See Pipe and Equipment Covering – Materials* (BRGU) category in Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Packing Material** – Min 1 in. thickness of ceramic (alumina silica) fiber blanket or mineral wool batt insulation firmly packed into opening as a permanent form. In floors, packing material to be recessed min 1 in. from the top surface of the floor. In walls, packing material to be recessed min 1 in. from both surfaces of the wall.

5. **Fill, Void or Cavity Material** – Putty – Moldable putty material kneaded by hand and packed tightly into annular space, flush with top surface of floor, to a min depth of 1 in. In wall assemblies, min 1 in. thickness of putty to be installed symmetrically on both sides of wall.

*Bearing the UL Classification Marking

Reprinted from the Online Certifications Directory with permission from Underwriters Laboratories Inc. Copyright © 2010 Underwriters Laboratories Inc.®
1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete or min 5-1/2 in. (140 mm) thick reinforced lightweight or normal weight concrete wall. Wall may also be constructed of any UL Classified Concrete Blocks*. Max area of opening is 96 in. with max dimension of 12 in. (305 mm).

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Copper Tube** – A max of four nom 1-1/2 in. (38 mm) diam (or smaller) Type L (or heavier) copper tubing, symmetrically spaced within opening. Tubing to be rigidly supported on both sides of floor or wall assembly.

3. **Pipe Covering** – Nom 1 in. (25 mm) thick hollow cylindrical heavy density (min 3.5 pcf or 56 kg/m³) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. The annular space between adjacent insulated tubes shall be min 2-1/4 in. (57 mm). The annular space between insulated tubes and periphery of opening shall be min 2-1/8 in. (54 mm).

   See Pipe and Equipment Covering – Materials* (BRGU) category in Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Packing Material** – Min 3-1/2 in. (89 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor or from both surfaces of wall as required to accommodate the required thickness of fill material.

5. **Fill, Void or Cavity Material** – Caulk – Min 1 in. (25 mm) thickness of fill material applied within the annulus, flush with top surface of floor or with both surfaces of wall.

   **3M COMPANY** – Type FB-1000 NS, FB-1003SL (floors only), FB-2000 or FB-2000+.

*Bearing the UL Classification Mark

© 2013 UL LLC
1. **Floor or Wall Assembly** – Min 4-1/2 in. thick lightweight or normal weight (100-150 pcf) concrete. Wall may also be constructed of any UL Classified Concrete Blocks* Max area of square, rectangular or circular opening is 45 sq in. with max dimension of 9 in. See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Pipe** – Nom 3 in. diam (or smaller) Type L (or heavier) copper pipe or nom 2-1/2 in. diam (or smaller) Schedule 10 (or heavier) steel pipe. One or more insulated pipes may be installed with a min clearance of 1/2 in. maintained between insulated pipes and with a min clearance of 1/4 in. maintained between insulated pipe and sides of through opening. Pipes to be rigidly supported on both sides of floor or wall assembly.

3. **Pipe Insulation** – Plastics# – Nom 3/4 in. thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing with skin. When nom 2-1/2 or 3 in. diam insulated steel or copper pipe is used, T Rating is 1/2 hr. When max 2 in. diam insulated steel or copper pipe is used, T rating is 1 hr. See Plastics# (QMFZ2) category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL94 Flammability Classification of 94-5VA may be used.

4. **Fill, Void or Cavity Materials** – **Wrap Strip** – Nom 1/4 in. thick intumescent elastomeric material faced on one side with aluminum foil, supplied in 2 in. wide strips. One nom 2 in. wide strip tightly-wrapped around pipe insulation (Item 3) with the foil side exposed and slid into through opening such that the top edge is flush with top surface of floor. When a single insulated pipe is installed in a circular through opening and when the max annular space between the insulated pipe and the sides of the through opening is 3/8 in., the wrap strip layer may be secured in place with pressure-sensitive tape. In all other situations, the wrap strip layer shall be secured in place with min No. 18 gauge galv steel tie wire. In wall assemblies, the wrap strip layer is to be installed on the insulated pipe in the same manner used for floor assemblies but shall be installed symmetrically on both sides of the wall.

5. **Packing Material** – Min 1 in. thick mineral wool batt insulation firmly packed into opening with its top surface recessed min 1 in. from top surface of the floor. In wall assemblies, packing material to be firmly packed into opening on both sides of wall and recessed min 1 in. from wall surface. When a single insulated pipe (with wrap strip layer) is installed in a circular through opening and when the max annular space between the wrap strip layer and the sides of the through opening is 1/8 in., no forming material is required.

6. **Fill, Void or Cavity Materials** – **Caulk, Sealant or Sealant** – Applied to fill through opening to a min depth of 1 in. In floor assemblies, fill material to be installed flush with top surface of floor. In wall assemblies, fill material to be installed flush with wall surface on both sides of wall.

*Bearing the UL Classification Marking

Reprinted from the Online Certifications Directory with permission from Underwriters Laboratories Inc. Copyright © 2010 Underwriters Laboratories Inc.
1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick lightweight or normal weight (100-150 pcf or 1600 - 2400 kg/m³) concrete. Wall may also be constructed of any UL Classified **Concrete Blocks**. Diam of circular opening to be max 3/4 in. (19 mm) larger than outside diam of insulated pipe such that max annular space between insulated pipe and edge of opening is 3/8 in. (10 mm) Max diam of opening is 7 in. (178 mm).

   See **Concrete Blocks** (CAZT) category in Fire Resistance Directory for names of manufacturers.

2. **Nonmetallic Pipe** – Nom 4 in. (102 mm) diam (or smaller) Schedule 40 polyvinyl chloride (PVC) pipe centered in circular through opening. Nom 2-1/2 in. (64 mm) diam pipes may be used only in closed (process or supply) piping systems. Nom 2 in. (51 mm) diam (or smaller) pipes may be used in closed or vented (drain, waste and vent) piping systems. Pipe rigidly supported on both sides of floor or wall assembly.

3. **Pipe Covering** – Nom 1 in. (51 mm) thick hollow cylindrical heavy density (min 3.5 pcf or 56 kg/m³) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints sealed with metal fasteners or with butt strip tape supplied with the product.

   See **Pipe and Equipment Covering** – Materials (BRGU) category in Building Materials Directory for names of manufacturers. Any pipe covering materials meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

3A. **Pipe Insulation – Plastics** – As an alternate to Item 3, nom 5/8 in. (16 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing with skin may be used on nom 2 in. (51 mm) diam (or smaller) pipes.

   See **Plastics** (QMFZ2) category in the Recognized Component directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL94 Flammability Classification of 94-SVA may be used.

4. **Fill, Void or Cavity Materials** – **Wrap Strip** – Nom 1/4 in. (6 mm) thick intumescent elastomeric material faced on one side with aluminum foil, supplied in 2 in. (51 mm) wide strips. Nom 2 in. (51 mm) wide strips tightly-wrapped around insulated pipe (foil side exposed) with the top edges butted against the underside of the concrete floor. A min of three layers of wrap strip is required for nom 1/2 in and 2 in. (13 mm to 51 mm) diam pipes. A min of four layers of wrap strip is required for nom 2-1/2 in. and 3 in. (64 mm and 76 mm) diam pipes. A min of five layers of wrap strip is required for nom 3-1/2 in. and 4 in. (89 mm and 102 mm) diam pipes. Each layer of wrap strip to be installed with buttted seams in successive layers staggered. Wrap strip layers temporarily held in position with tape. In wall assemblies, the wrap strip layers are to be installed in the same manner used for floor assemblies but shall be installed symmetrically on both sides of the wall.

   **3M COMPANY** – Type FS-195+

5. **Steel Collar** – Nom 2 in. (51 mm) deep collar with 1-1/4 in. (32 mm) wide by 2 in. (51 mm) long anchor tabs and min 3/4 in. (19 mm) long tabs to retain wrap strip layers. Coils of precut 0.016 in. (41 mm) thick (30 gauge) galv sheet available from wrap strip manufacturer. Steel collar, with anchor tabs bent outward 90 degrees, wrapped tightly around wrap strip layers with min 1 in. (25 mm) overlap at seam. With steel collar anchor tabs pressed tightly against floor or wall surface, compress collar around wrap strip layers using a min 1/2 in. (13 mm) wide by 0.028 in. (71 mm) thick stainless steel band clamp with worm drive tightening mechanism at the collar midheight. Secure collar to floor or wall surface with 1/4 in. (6 mm) diam by min 1-1/2 in. (38 mm) long steel anchor bolts, or equivalent, in conjunction with min 1-1/4 in. (32 mm) diam steel fender washers. Four anchor bolts, symmetrically located, required for nom 2 in. (51 mm) diam pipes. Five anchor bolts, symmetrically located, required for nom 2-1/2 in. and 3 in. (64 mm and 76 mm) diam pipes. Six anchor bolts, symmetrically located, required for nom 3-1/2 in. and 4 in. (89 mm and 102 mm) diam pipes. As a final step, bend retainer tabs 90 deg toward pipe to lock wrap strip layers in position.

6. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Generous bead of caulk applied to outer perimeter of wrap strip at interface with floor or wall surface and to perimeter of pipe insulation at its egress from the wrap strip layers.

   **3M COMPANY** – CP 25WB+, IC 15WB+, FireDam 150+ caulk

*Bearing the UL Classification Mark*
**System No. C-AJ-5024**
January 02, 2009

F Ratings – 2 and 3 Hr (See Item 4A)
T Ratings – 1 and 1-1/2 Hr (See Item 4A)
L Rating At Ambient – 2 CFM/sq ft.
L Rating At 400 F – less than 1 CFM/sq ft.

1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick lightweight or normal weight (100-150 pcf or 1600 - 2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max diam of circular through opening is 21 in. (533 mm).
   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

1A. **Steel Sleeve** – (Optional, not shown) – Nom 21 in. (533 mm) (or smaller) Schedule 10 (or heavier) steel sleeve cast or grouted into floor or wall assembly. Sleeve may extend a max of 2 in. (51 mm) above top of floor or beyond either surface of wall. Sleeve may be used only when floor or wall assembly is min 4-1/2 in. (114 mm) thick. **F Rating is 2 hr when steel sleeve is used. T Rating is 1/2 Hr when nom 10 in. (254 mm) diam and smaller sleeve is used. T Rating is 0 when sleeves larger than nom 10 in. (254 mm) diam are used.**

2. **Through Penetrants** – One metallic pipe or tubing to be installed either concentrically or eccentrically within the firestop. Pipe or tubing to be rigidly supported on both sides of wall assembly. The following types and sizes of metallic pipes or tubing may be used:
   A. **Steel Pipe** – Nom 10 in. (254 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   B. **Copper Tubing** – Nom 4 in. (102 mm) diam (or smaller) Type L (or heavier) copper tubing.
   C. **Copper Pipe** – Nom 4 in. (102 mm) diam (or smaller) Regular (or heavier) copper pipe.

3. **Pipe Covering** – Nom 1, 2 or 3 in. (25, 51 or 76, mm) thick hollow cylindrical heavy density (min 3.5 pcf or 56 kg/m³) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt strip tape supplied with the product.
   See Pipe and Equipment Covering – Materials* (BRGU) category in Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Firestop System** – The details of the firestop system shall be as follows:
   4A. **Fill, Void or Cavity Materials** – Wrap Strip – Nom 1/4 in. (6 mm) thick intumescent elastomeric material faced on one side with aluminum foil, supplied in nom 2 in. (51 mm) wide strips. Nom 2 in. (51 mm) wide strip tightly-wrapped around pipe covering material (foil side exposed), secured with a steel wire tie and slid into annular space. In floors, the wrap strip layer is to be installed with its top edge recessed 1/8 to 1/2 in. (3.2 mm to 13 mm) from the top surface of the floor. In walls, the wrap strip layer is to be installed in the same manner used for floors but it shall be installed symmetrically on both sides of the wall assembly. The min number of wrap strip layers required is dependent upon the pipe covering material thickness, as shown in the following table:

<table>

4B. **Packing Material** – When an annular space is present between the wrap strip and the periphery, mineral wool batt insulation shall be tightly-packed into the annular space. In floors, the top surface of the packing material is to be recessed min 1 in. (25 mm) from the top surface of the floor. In walls, the packing material is to be installed in the same manner used for floors but it shall be installed symmetrically on both sides of the wall assembly.

4C. **Fill, Void or Cavity Materials – Caulk or Sealant** – Installed to fill annular space to a min depth of 1 in. (25 mm), flush with top surface of floor or both surfaces of wall, such that exposed edge of wrap strip layer is covered with a 1/8 to 1/2 in. (3.2 mm to 13 mm) thickness.

3M COMPANY – CP 25WB+, IC 15WB+ caulk or FB-3000 WT sealant.

*Bearing the UL Classification Marking

1. **Floor or Wall Assembly** – Lightweight or normal weight (100-150 pcf or 1600 - 2400 kg/m³) concrete. Min thickness of concrete floor or wall is 2-1/2 in. (64 mm) for 1 hr F Rating and 4-1/2 in. (114 mm) for 2 hr F Rating. Wall may also be constructed of any UL Classified Concrete Blocks*. Max area of opening 36 sq ft (3.4 m²) with one dimension of opening being 36 in. (914 mm) or less. See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Metallic Pipe** – Nom 12 in. (305 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe or nom 6 in. (152 mm) diam (or smaller) Type L (or heavier) copper tubing. Min clearance between insulated pipes 1 in. (25 mm) Min clearance between insulated pipe and wall of through opening 1/4 in. (6 mm) Pipes rigidly supported on both sides of floor or wall assembly.

3. **Pipe Covering** – Nom 1 in. to 2 in. (25 mm to 51 mm) thick hollow cylindrical heavy density (min 3.5 pcf or 56 kg/m³) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or with factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt strip tape supplied with the product. See Pipe and Equipment Covering – Materials* (BRGU) category in Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

3A. **Pipe Insulation – Plastics** – As an alternate to Item 3, nom 1 in. (25 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing with skin may be used with nom 4 in. (102 mm) diam (or smaller) pipes. See Plastics (QMFZ) category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL94 Flammability Classification of 94-V1 may be used.

4. **Fill, Void Or Cavity Materials* – Wrap Strip** – Nom 1/4 in. (6 mm) thick intumescent elastomeric material faced on one side with aluminum foil, supplied in strips. Min 2 in. (51 mm) wide strip wrapped around pipe insulation (foil side exposed) and secured in place with steel wire or aluminum foil tape. One layer of wrap strip is required when max 1 in. (25 mm) thick pipe covering is used. Two layers of wrap strip are required when nom 2 in. (51 mm) thick pipe covering is used. Wrap strip to extend approx 7/8 in. (22 mm) beyond each face of the intumescent sheet (Item 5).

5. **Fill, Void Or Cavity Materials* – Intumescent Sheet** – Rigid aluminum foil-faced sheet with galv steel sheet backer. Sheet cut to tightly follow the contours of the wrap strip on the pipe insulation and with a min lap of 2 in. (51 mm) on all sides of the through opening. Sheet to be installed with the galv steel sheet backer exposed (aluminum foil facing against floor or wall surface). Sheet secured to top surface of floor and both sides of wall using min 3/16 in. (5 mm) diam by 1-1/4 in. (32 mm) long steel masonry fasteners with min 1-1/4 in. (32 mm) diam steel washers. Max spacing of fasteners not to exceed 6 in. (152 mm) OC.

6. **Fill, Void Or Cavity Materials* – Graphite Seal, Caulk or Sealant** – One layer of 1/2 in. x 1/16 in. (13 mm by 1.6 mm) (13 mm by 1.6 mm) adhesive backed graphite intumescent seal positioned under intumescent sheet around entire perimeter of through opening or min 1/4 in. (6 mm) diam continuous bead of caul or putty applied to edge of intumescent sheet at its interface with surface of floor or wall around entire perimeter of through opening. Generous application of caul to be applied around the base of the wrap strip at its egress from the intumescent sheet(s) in addition to completely covering the wrap strip up to the interface(s) with the pipe insulation.

7. **Steel Cover Strip** – Min 2 in. (51 mm) wide strip of min 0.015 in. (.4 mm) thick (30 gauge) galv steel centered over entire length of slit made in intumescent sheet (Item 5) to permit installation about the insulated pipe. Prior to installation of the steel strip, slit in intumescent sheet covered with nom 1/4 in. (6 mm) diam bead of caul (Item 6). Steel cover strip secured to galv steel backer of intumescent sheet with steel sheet-metal screws or steel rivets spaced max 2 in. (51 mm) OC on each side of slit.
8. **Support Channel** – (Not Shown) – When area of through opening exceeds 1440 sq in., (9290 cm²) an intermediate support channel shall be installed flush with top surface of floor or both surfaces of wall. Support channels to be min 1-5/8 by 1-5/8 in. (41 mm by 41 mm) and formed of min 0.093 in. (2.4 mm) thick (No. 12 gauge) painted or galv steel. Ends of steel channel bolted or welded to steel angles anchored to inside walls of through opening. When steel support channels are centered beneath butted seams of intumescent sheets, no steel cover strip (Item 6) is required over butted seam. Intumescent sheet secured to steel support channels with steel sheet metal screws in conjunction with min 1-1/4 in. (32 mm) diam steel fender washers.

When support channel is used beneath butted seam of intumescent sheets, fasteners spaced max 3 in. (76 mm) OC on each side of butted seam. When support channel is located away from intumescent sheet seam, fasteners spaced max 6 in. (152 mm) OC. Prior to installation of the intumescent sheet(s), a nom 1/4 in. (6 mm) diam continuous bead of caulk, (Item 5) shall be applied as gasket over the steel support channel.

*Bearing the UL Classification Mark

1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks *. Max diam of opening is 32 in. (813 mm).

See Concrete Block (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through-Penetrants** – One metallic pipe or tubing to be installed either concentrically or eccentrically within the firestop system. Pipe or tubing to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of metallic pipes or tubing may be used:

   A. **Steel Pipe** – Nom 24 in. diam (or smaller) Schedule 10 (or heavier) steel pipe. When Type FB-1000 NS or FB-1003 SL sealant (see Item 6) is used, pipe diam shall not exceed nom 8 in. (203 mm).

   B. **Copper Tubing** – Nom 6 in. diam (or smaller) Type L (or heavier) copper tubing.

   C. **Copper Pipe** – Nom 6 in. diam (or smaller) Regular (or heavier) copper pipe. When Type FB-1000 NS or FB-1003 SL sealant (see Item 6) is used, pipe diam shall not exceed nom 4 in. (102 mm).

3. **Pipe Covering Materials** * – Used in conjunction with Item 4. Nom 3 in. (76 mm) thick unfaced mineral fiber pipe insulation sized to the outside diam of pipe or tube. Pipe insulation secured with min 8 AWG steel wire spaced max 12 in. (305 mm) OC. An annular space of min 1/2 in. (13 mm) to max 1-1/2 in. (38 mm) is required within the firestop system. 

   - **IIG MINWOOL L L C** – High Temperature Pipe Insulation 1200, High Temperature Pipe Insulation BWT or High Temperature Pipe Insulation Thermaloc

   3A. **Pipe Covering** * – Used as an alternate to Items 3 and 4. Nom 1 in. (25 mm) thick hollow cylindrical heavy density (min 3.5 pcf or 56 kg/m³) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints tightly butted and sealed with metal fasteners or factory applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. An annular space of min 1/2 in. (13 mm) to max 1-1/2 in. (38 mm) is required within the firestop system. When glass fiber pipe covering is used, the T, FT and FTH Rating is 1 hr.

   See Pipe and Equipment Covering – Materials (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specification and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Sheathing Material** – (Not shown) – Optionally, used in conjunction with Item 3. Foil-scrim-kraft or all service jacket material shall be wrapped around the outer circumference of the pipe covering material (Item 3) with the kraft side exposed. Longitudinal joints sealed with metal fasteners.

   See Sheathing Materials (BVDV) category in the Building Materials Directory for names of manufacturers. Any sheathing material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

5. **Packing Material** – Min 3 in. (76 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor or from both surfaces of wall as required to accommodate the required thickness of fill material.

6. **Fill, Void or Cavity Material** * – Sealant – Min 1/2 in. (13 mm) thickness of fill material applied within annulus, flush with top surface of floor or with both surfaces of wall.

   3M COMPANY – Type FB-1000 NS, FB-1003SL (floors only), FB-2000 or FB-2000+.

* Bearing the UL Classification Mark

© 2013 UL LLC
1. Floor or Wall Assembly — Min 2-1/2 in. (64 mm) thick lightweight or normal weight (100-150 pcf or 1600 - 2400 kg/m3) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. F Ratings and T ratings are dependent on the min thickness of floor or wall, as well as the max size of the pipe and the nom thickness of the cellular glass insulation, as noted in Item 3. Max diam of through opening is 38 in. (965 mm).

See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

1A. Steel Sleeve — (Optional, Not Shown) — Nom 16 in. (406 mm) diam (or smaller) Schedule 10 (or heavier) steel sleeve cast or grouted into floor or wall assembly. Sleeve may extend a max of 2 in. (51 mm) above top of floor or beyond either surface of wall. As an alternate, nom 16 in. (406 mm) diam (or smaller) sleeve fabricated from nom 0.028 in. (0.71 mm) thick galv steel cast or grouted into floor or wall assembly flush with floor or wall surfaces. T Rating is 0 Hr when sleeve is used.

2. Through Penetrants — One metallic pipe or tubing to be positioned within the firestop system. Pipe or tubing to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of metallic pipes or tubing may be used:

A. Steel Pipe — Nom 30 in. (762 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.

B. Copper Tubing — Nom 6 in. (152 mm) diam (or smaller) Type L (or heavier) copper tubing.

C. Copper Pipe — Nom 6 in. (152 mm) diam (or smaller) Regular (or heavier) copper pipe.

3. Pipe Covering Materials* — Cellular Glass Insulation — Nom 1-1/2 to 3 in. (38 to 76 mm) thick cellular glass units sized to the outside diam of the steel pipe and supplied in nom 24 in. (610 mm) long half sections or nom 18 in. (457 mm) long segments. Pipe insulation installed on pipe in accordance with the manufacturer’s instructions. The annular space between pipe insulation and sleeve or edge of opening shall be min 0 in. (point contact) to max 2-7/8 in. (0 mm to max 73 mm). The F and T Ratings are dependent on the items noted in the following table:

4. Packing Material — Min 1 in. (25 mm) thickness of tightly-packed mineral wool batt insulation material used as a permanent form. Packing material to be recessed min 1 in. (25 mm) from top surface of floor or from both surfaces of wall to accommodate the caulk fill material (Item 5).

5. Fill, Void or Cavity Materials* — Caulk or Sealant — Installed to fill annular space to a min depth of 1 in., (25 mm) flush with top surface of floor or both surfaces of wall. A min 1/2 in. (13 mm) diam bead of caulk shall be applied to the pipe insulation/concrete interface at the point contact location on the top surface of the floor and on both sides of walls.

3M COMPANY — CP 25WB+, IC 15WB+ caulk or FB-3000 WT sealant

6. Metal Jacket — Min 12 in. (305 mm) long jacket formed of min 0.010 in. (.25 mm) thick steel or aluminum sheet cut to wrap tightly around the pipe insulation with a min 2 in. (51 mm) lap and secured using bands and seals of similar material. Bands to be located within 2 in. (51 mm) of each end of the jacket and spaced max 10 in. (254 mm) OC. Jacket to be installed with edge abutting surface of caulk fill material (Item 5) on top surface of floor or both surfaces of wall. Metal jacket to be used in addition to any other jacketing material which may be required or desired on the pipe insulation.

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.
1. **Floor or Wall Assembly** – Min 4-1/2 in. thick reinforced lightweight or normal weight (100-150 pcf) concrete. Wall may also be constructed of any UL Classified **Concrete Blocks**. Max diam of opening is 11 in.

   See **Concrete Blocks** (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Steel Pipe** – Nom 6 in. diam (or smaller) Schedule 10 (or heavier) 6 steel pipe to be installed either concentrically or eccentrically within the firestop system. Pipe to be rigidly supported on both sides of floor or wall assembly.

3. **Pipe Covering** – Nom 1 in. thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints tightly butted and sealed with metal fasteners or factory applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. An annular space of min 3/4 in. to max 1-5/8 in. is required within the firestop system.

   See **Pipe and Equipment Covering – Materials** (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specification and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Packing Material** – Min 3 in. thickness of min 4 pcf mineral wool batt insulation tightly packed into opening as a permanent form. Packing material to be recessed from top surface of floor or from both surfaces of wall as required to accommodate the required thickness of fill material.

5. **Fill, Void or Cavity Material** – Sealant – Min 1/4 in. thickness of fill material applied within annulus, flush with top surface of floor or both surfaces of wall assembly. At the point contact location between pipe and concrete, a min 1/2 in. diam bead of sealant shall be applied at the concrete/pipe interface on the top surface of floor and on both surfaces of wall assembly.

**3M COMPANY – FB-2000+**

*Bearing the UL Classification Marking

1. **Floor or Wall Assembly** – Min 2-1/2 in. thick reinforced lightweight or normal weight (100-150 pcf) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max diam of opening is 7-1/2 in.

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through Penetrants** – One metallic pipe or tubing to be installed either concentrically or eccentrically within the firestop system. Pipe or tubing to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of metallic pipes or tubing may be used:
   A. **Steel Pipe** – Nom 4 in. diam (or smaller) Schedule 10 (or heavier) steel pipe.
   B. **Copper Tubing** – Nom 3 in. diam (or smaller) Type L (or heavier) copper tubing.
   C. **Copper Pipe** – Nom 3 in. diam (or smaller) Regular (or heavier) copper pipe.

3. **Pipe Insulation** – Plastics# – Nom 1/2 to 3/4 in. thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. An annular space of min 1/4 in. to max 1-1/4 in. is required within the firestop system.

   See Plastics (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component pipe insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-SVA may be used.

4. **Firestop System** – The firestop system shall consist of the following:
   A. **Fill, Void or Cavity Materials*** – Wrap Strip – Nom 1/4 in. thick intumescent elastomeric material faced on one side with aluminum foil, supplied in 2 in. wide strips. One nom 2 in. wide strip tightly-wrapped around pipe insulation with the foil side exposed and slid into through opening such that the top edge is flush with top surface of floor or extending a max of 1 in. above the top surface of floor. When insulated pipe is installed in through openings with a max annular space between the insulated pipe and the periphery of the opening of 1/4 to 3/8 in., the wrap strip layer may be secured in place with pressure-sensitive foil tape. In all other situations, the wrap strip layer shall be secured in place with min No. 18 gauge galv steel tie wire. In wall assemblies, the wrap strip layer is to be installed on the insulated pipe in the same manner used for floor assemblies but shall be installed symmetrically on both sides of the wall.

   3M COMPANY – Type FS-195+

   B. **Packing Material** – Min 1 in. thickness of min 4 pcf mineral wool batt insulation tightly packed into opening as a permanent form. Packing material to be recessed from top surface of floor or from both surfaces of wall as required to accommodate the required thickness of fill material.

   C. **Fill, Void or Cavity Material*** – Caulk or Sealant – Min 1 in. thickness of fill material applied within annulus, flush with top surface of floor or both surfaces of wall assembly. A min 1/4 in. diam bead of caulk shall be applied to edge of wrap strip on the top surface of floor and on both surfaces of wall assembly.

   3M COMPANY – CP 25WB+ caulk or FB-3000 WT sealant.

   (Note: W Rating applies only when FB-3000 WT sealant is used.)

1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified **Concrete Blocks**. Max diam of opening 8 in. (203 mm).

   See **Concrete Block** (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Steel Sleeve** – (Optional) – Nom 8 in. (203 mm) diam (or smaller) Schedule 10 (or heavier) steel sleeve cast or grouted into floor or wall assembly. As an alternate, nom 8 in. (203 mm) diam (or smaller) sleeve fabricated from nom 0.019 in. (0.48 mm) thick galv steel cast or grouted into floor or wall assembly flush with floor or wall surfaces.

3. **Through Penetrants** – One metallic pipe or tubing to be installed either concentrically or eccentrically within the firestop system. Penetrants rigidly supported on both sides of floor or wall assembly. The following types and sizes of metallic pipes or tubings may be used:
   A. **Steel Pipe** – Nom 4 in. (102 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
   B. **Iron Pipe** – Nom 4 in. (102 mm) diam (or smaller) cast or ductile iron pipe.
   C. **Copper Tubing** – Nom 2 in. (51 mm) diam (or smaller) Type L (or heavier) copper tube.
   D. **Copper Pipe** – Nom 2 in. (51 mm) diam (or smaller) Regular (or heavier) copper pipe.

4. **Tube Insulation** – **Plastics** – Nom 3/4 in. (19 mm) thick (or thinner) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. The annular space between the insulated pipe or tube and the edge of the through opening shall be min 3/4 in. (19 mm) to max 1-5/8 in. (41 mm).

   See **Plastics** (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5VA may be used.

5. **Firestop System** – The details of the firestop system shall be as follows:
   A. **Packing Material** – Min 4 in. (102 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor or from both surfaces of wall as required to accommodate the required thickness of fill material.
   B. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Min 1/4 in. (6 mm) thickness of fill material applied within the annulus, flush with top surface of floor or with both surfaces of wall.

   **3M COMPANY** – CP 25 WB+ or FB-3000 WT.
   (Note: W Rating applies only when FB-3000 WT is used.)

F Rating – 3 Hr
T Ratings – 1 and 1-1/2 Hr (See Item 2)

1. **Floor or wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max diam of opening is 6 in. (152 mm).

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Sleeves** – (Optional) – The following sleeves may be used:
   
   A. **Metallic Sleeve** – Nom 6 in. (152 mm) diam (or smaller) steel Schedule 10 (or heavier) steel pipe cast or grouted into floor or wall assembly, flush with floor or wall surfaces. As an alternate, nom 6 in. (152 mm) diam (or smaller) sleeve fabricated from nom 0.019 in. (0.48 mm) thick galv steel cast or grouted into floor or wall assembly flush with floor or wall surfaces. **T Rating is 1 Hr when metallic sleeve is used.**
   
   B. **Nonmetallic Sleeve** – Nom 6 in. diam (or smaller) Schedule 40 polyvinyl chloride (PVC) pipe cast or grouted into floor or wall assembly, flush with floor or wall surfaces. **T Rating is 1-1/2 Hr when PVC sleeve or no sleeve is used.**

3. **Through Penetrants** – One metallic pipe or tubing to be centered within the firestop system. Pipe or tubing to be rigidly supported on both sides of floor or wall assembly. The following types of pipe or tubing may be used:
   
   A. **Steel Pipe** – Nom 4 in. (102 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   
   B. **Copper Tubing** – Nom 3 in. (76 mm) diam (or smaller) Type M (or heavier) copper tubing.

4. **Pipe Covering** – Nom 1 in. (25 mm) thick hollow cylindrical heavy density (min 7 pcf or 112 kg/m3) mineral fiber units with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. A min annular space of 3/8 in. (10 mm) is required within the firestop system.

   See Pipe and Equipment Covering – Materials (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

5. **Firestop System** – The firestop system shall consist of the following:
   
   A. **Packing Material** – Min 3-3/4 in. (95 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form so that the width of the wool is compressed at least 50 percent. Packing material to be recessed from top surface of floor or from both surfaces of wall as required to accommodate the required thickness of fill material.

   B. **Fill, Void or Cavity Material** – **Sealant** – Min 1/4 in. (6 mm) thickness of sealant applied within the annulus, flush with the top surface of floor or with both surfaces of wall.

   **3M COMPANY** – FB-1000 NS, FB-3000 WT or FB-1003 SL (floors only)

*Bearing the UL Classification Mark

Reprinted from the Online Certifications Directory with permission from Underwriters Laboratories Inc. Copyright © 2010 Underwriters Laboratories Inc.*
1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max diam of opening is 7 in. (178 mm).

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

1A. **Steel Sleeve** – (Optional, Not Shown) - Nom 7 in. (178 mm) diam (or smaller) sleeve fabricated from nom 0.019 in. (0.48 mm) thick galv steel cast or grouted into floor or wall assembly flush with floor or wall surfaces.

2. **Through Penetrants** – One metallic pipe or tubing to be installed either concentrically or eccentrically within the firestop system. Penetrant to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of pipes or tubing may be used:

   A. **Steel Pipe** – Nom 3 in. (76 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   B. **Iron Pipe** – Nom 3 in. (76 mm) diam (or smaller) cast or ductile iron pipe.
   C. **Copper Tubing** – Nom 3 in. (76 mm) diam (or smaller) Type M (or heavier) copper tube.
   D. **Copper Pipe** – Nom 3 in. (76 mm) diam (or smaller) Regular (or heavier) copper pipe.

3. **Tube Insulation – Plastics**+ – Nom 1 in. (25 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. The annular space between the insulated penetrating item and the periphery of the opening shall be min 0 in. (point contact) to max 1-7/8 in. (48 mm).

   See Plastics (QMFZ2) category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5A may be used.

4. **Firestop System** – The details of the firestop system shall be as follows:

   A. **Packing Material** – Min 3-1/2 in. (89 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor to accommodate the required thickness of fill material.
   B. **Fill, Void or Cavity Materials**+ – Putty, Sealant or Caulk – Min 1/2 in. (13 mm) thickness of fill material applied within the annulus, flush with top surface of floor. Min 1/2 in. (13 mm) diam bead of fill material applied to the concrete/tube insulation interface at the point contact location on the top surface of floor.

   3M COMPANY – MPS-2+, CP 25WB+ or FB-3000 WT.

   (Note: W Rating applies only when FB-3000 WT is used.)

1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150pcf or 1600 - 2400 kg/m³) concrete floors or min 5 in. (127 mm) thick reinforcement lightweight or normal weight concrete walls. Wall may also be constructed of any UL Classified Concrete Blocks*. Max diam of opening 10 in. (254 mm).

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

   1A. **Steel Sleeve** – (Optional, Not Shown) - Nom 10 in. (254 mm) diam (or smaller) sleeve fabricated from nom 0.019 in. (0.48 mm) thick galv steel cast or grouted into floor or wall assembly flush with floor or wall surfaces.

2. **Through Penetrants** – One metallic pipe or tubing to be installed either concentrically or eccentrically within the firestop system. Penetrants rigidly supported on both sides of floor or wall assembly. The following types and sizes of metallic pipes or tubing may be used:

   A. **Steel Pipe** – Nom 6 in. (152 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   B. **Iron Pipe** – Nom 6 in. (152 mm) diam (or smaller) cast or ductile iron pipe.
   C. **Copper Tubing** – Nom 6 in. (152 mm) diam (or smaller) Type M (or heavier) copper tube.
   D. **Copper Pipe** – Nom 6 in. (152 mm) diam (or smaller) Regular (or heavier) copper pipe.

3. **Pipe Covering** – Nom 1/2 in. to 1 in. (13 to 25 mm) thick hollow cylindrical heavy density (min 3.5 pcf or 56 kg/m³) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with product. Annular space between pipe covering and periphery of opening shall be min 0 in. (point contact) to max 1-7/8 in. (0 mm to max 48 mm).

   See Pipe and Equipment Covering - Materials (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or T Rating is 1/2 hr when nominal 1 in. (25 mm) thick pipe insulation is used. T Rating is 0 hr when pipe insulation thickness is less than nom 1 in. (25 mm).

4. **Firestop System** – The details of the firestop system shall be as follows:

   A. **Packing Material** – Min 4 in. (102 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor or from both surfaces of wall as required to accommodate the required thickness of fill material.
   B. **Fill, Void or Cavity Materials** – **Caulk** – Min 1/2 in. (13 mm) thickness of fill material applied within the annulus, flush with top surface of floor or with both surfaces of wall. At point contact location between pipe covering and concrete, a min 1/4 in. (6 mm) diam bead of fill material shall be applied at the concrete/pipe covering interface on the top surface of floor or on both sides of wall.

   **3M COMPANY** – FireDam-150+, CP 25WB+ or IC 15WB+

   *Bearing the UL Classification Mark

1. **Floor or Wall Assembly** – Min 2-1/2 in. (64 mm) thick reinforced lightweight or normal weight (100-150pcf or 1600 - 2400 kg/m³) concrete floors or min 3 in. (76 mm) thick reinforced lightweight or normal weight concrete walls. Wall may also be constructed of any UL Classified Concrete Blocks*. Max diam of opening is 6 in. (152 mm).

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

   1A. **Steel Sleeve** – (Optional, Not Shown) - Nom 10 in. (254 mm) diam (or smaller) sleeve fabricated from nom 0.019 in. (0.48 mm) thick galv steel cast or grouted into floor or wall assembly flush with floor or wall surfaces.

2. **Through Penetrants** – One metallic pipe or tubing to be installed either concentrically or eccentrically within the firestop system. Penetrants rigidly supported on both sides of floor or wall assembly. The following types and sizes of metallic pipes or tubing may be used:

   A. **Steel Pipe** – Nom 3 in. (76 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.

   B. **Iron Pipe** – Nom 3 in. (76 mm) diam (or smaller) cast or ductile iron pipe.

   C. **Copper Tubing** – Nom 3 in. (76 mm) diam (or smaller) Type M (or heavier) copper tube.

   D. **Copper Pipe** – Nom 3 in. (76 mm) diam (or smaller) Regular (or heavier) copper pipe.

3. **Pipe Covering** – Nom 1/2 in. to 1 in. (13 mm to 25 mm) thick hollow cylindrical heavy density (min 3.5 pcf or 56 kg/m³) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with product. Annular space between the pipe covering and periphery of opening shall be min 0 in. (point contact) to max 7/8 in. (0 mm to max 22 mm).

   See Pipe and Equipment Covering – Materials – (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a smoke Developed Index of 50 or less may be used.

   The T, FT and FTH Ratings are 1/2 hr when nominal 1 in. (25 mm) thick pipe insulation is used. The T, FT and FTH Ratings are 0 hr when pipe insulation thickness is less than nom 1 in. (25 mm).

4. **Firestop System** – The details of the firestop system shall be as follows:

   A. **Packing Material** – Min 2 in. (51 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor or from both surfaces of wall as required to accommodate the required thickness of fill material.

   A1. **Forming Material** – As an alternate to the packing material in Item 4A, nom 4 in. (102 mm) wide strips of min 1/2 in (13 mm) thick compressible mat folded in half, lengthwise, and stacked to a thickness greater than the width of the annular space and compression-fitted, edge-first, to fill the annular space to a min 2 in. (51 mm) depth. Top of forming material to be recessed from top surface of floor or from both surfaces of wall as necessary to accommodate the required thickness of caulking fill material.

   3M COMPANY

   3M FIRE PROTECTION PRODUCTS – Fire Barrier Packing Material

   B. **Fill, Void or Cavity Materials** – Caulk or Sealant – Min 1/2 in. (13 mm) thickness of fill material applied within the annulus, flush with top surface of floor or with both surfaces of wall. At point contact location between pipe covering and concrete, a min 1/4 in. (6 mm) diam bead of fill material shall be applied at the concrete/pipe covering interface on the top surface of floor or on both sides of wall.

   3M COMPANY

   3M FIRE PROTECTION PRODUCTS – FireDam-150+ Caulk, CP 25WB+ Caulk, IC 15WB+ Caulk or FB-3000 WT Sealant

*Bearing the UL Classification Mark

© 2013 UL LLC
1. **Floor or Wall Assembly** – Min 2-1/2 in. thick reinforced lightweight or normal weight (100-150 pcf) concrete floors or min 3-1/4 in. thick reinforced lightweight or normal weight concrete walls. Wall may also be constructed of any UL Classified Concrete Blocks*. Max diam of opening 11 in. See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through Penetrants** – One metallic pipe or tubing to be installed either concentrically or eccentrically within the firestop system. Penetrant to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of metallic pipes or tubings may be used:
   - **Steel Pipe** – Nom 6 in. diam (or smaller) Schedule 10 (or heavier) steel pipe.
   - **Iron Pipe** – Nom 6 in. diam (or smaller) cast or ductile iron pipe.
   - **Copper Tubing** – Nom 2 in. diam (or smaller) Type M (or heavier) copper tube.
   - **Copper Pipe** – Nom 2 in. diam (or smaller) Regular (or heavier) copper pipe. F Rating is 2 hr for 6 in. (or smaller) steel and iron pipes with 1 in. thick pipe covering, 1-1/2 hr for 6 in. (or smaller) steel and iron pipes with 1-1/2 in. thick pipe covering and 1-1/2 hr for 2 in. (or smaller) copper tubing and pipes with 1 in. thick pipe covering. The hourly T Rating is 1/2 hr for 2 in. (or smaller) copper tubing and pipes with 1 in. pipe covering, 1 hr for 6 in. (or smaller) steel and iron pipes with 1 in. pipe covering and 1-1/4 hr for 6 in. (or smaller) steel and iron pipes with 1-1/2 in. pipe covering.

3. **Pipe Covering** – Nom 1 in. to 1-1/2 in. thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with product. Annular space between the pipe covering and periphery of opening shall be min 1/4 in. to max 1-1/4 in. Steel and iron pipes (Items 2A and 2B) are to be insulated with nom 1 or 1-1/2 in. thick pipe covering. Copper tubing and pipes (Items 2C and 2D) are to be insulated with nom 1 in. thick pipe covering only. See Pipe and Equipment Covering – Materials (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a smoke Developed Index of 50 or less may be used.

4. **Firestop System** – The details of the firestop system shall be as follows:
   - **Packing Material** – Min thickness of packing material is 2 in. when nom 1 in. thick pipe covering is used. Min thickness of packing material is 1-3/4 in. when nom 1-1/2 in. thick pipe covering is used. Packing material to be min 4 pcf mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor or from both surfaces of wall as required to accommodate the required thickness of fill material.
   - **Fill, Void or Cavity Materials** – **Caulk** – Min 1/2 in. thickness of caulk applied within the annulus, flush with top surface of floor or both surfaces of wall when nom 1 in. thick pipe covering is used. Min 3/4 in. of caulk applied within the annulus, flush with top surface of floor or both surfaces of wall when nom 1-1/2 in. thick pipe covering is used.

*3M COMPANY – FireDam 150+*

*Bearing the UL Classification Mark*

1. **Floor or Wall Assembly** – Min 2-1/2 in. (64 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600 - 2400 kg/m³) concrete floors or min 3 in. (76 mm) thick reinforced lightweight or normal weight concrete walls. Wall may also be constructed of any UL Classified Concrete Blocks*. Max diam of opening 9 in. (229 mm).

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Steel Sleeve** – (Optional) - Nom 9 in. (229 mm) diam (or smaller) Schedule 10 (or heavier) steel sleeve cast or grouted into floor or wall assembly. Steel sleeve may be installed flush or may project max 2 in. (51 mm) beyond the floor or wall surfaces. As an alternate, nom 9 in. (229 mm) diam (or smaller) sleeve fabricated from nom 0.019 in. (0.48 mm) thick galv steel cast or grouted into floor or wall assembly flush with floor or wall surfaces.

3. **Through Penetrants** – One metallic pipe to be installed concentrically or eccentrically within opening. Penetrant to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of metallic pipes may be used:
   A. **Steel Pipe** – Nom 4 in. (102 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   B. **Iron Pipe** – Nom 4 in. (102 mm) diam (or smaller) cast or ductile iron pipe.
   C. **Copper Tubing** – Nom 2 in. (51 mm) diam (or smaller) Type L (or heavier) copper tubing.
   D. **Copper Pipe** – Nom 2 in. (51 mm) diam (or smaller) Regular (or heavier) copper pipe.

   F Rating is 2 Hr for Penetrants A and B. F Rating is 1 Hr for Penetrants C and D.

4. **Pipe Covering** – Nom 1-1/2 in. (38 mm) thick (or less) hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with product. Annular space between the pipe covering and periphery of opening or sleeve shall be min 1/2 in. to max 1 in. (13 mm to 25 mm).

   See Pipe and Equipment Covering – Materials (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a smoke Developed Index of 50 or less may be used.

   T Rating is 3/4 Hr for nom 1-1/2 in. (38 mm) thick pipe covering for penetrants A and B. T Rating is 1 Hr for nom 1-1/2 in. (38 mm) thick pipe covering for Penetrants C and D. T Rating is 0 Hr for all Penetrants when pipe coverings less than nom 1-1/2 in. (38 mm) thick.

5. **Firestop System** – The details of the firestop system shall be as follows:
   A. **Packing Material** – Min 2 in. (51 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor or top edge of sleeve or from both surfaces of wall or both ends of sleeve as required to accommodate the required thickness of fill material. In floors constructed of hollow-core concrete, packing material to be recessed from top and bottom surfaces of floor or sleeve as required to accommodate the required thickness of fill material.

   B. **Fill, Void or Cavity Materials* – Caulk or Sealant** – Min 1/2 in. (13 mm) thickness of caulk applied within the annulus, flush with top surface of floor or top edge of sleeve or with both surfaces of wall or both ends of sleeves. In floors constructed of hollow-core concrete, min 1/2 in. (13 mm) thickness of caulk applied within the annulus, flush with top and bottom surfaces of floor or sleeve. Min 1/4 in. (6 mm) diam bead of caulk applied to the pipe covering/concrete or pipe covering/sleeve interface at the point contact location on the top surface of floor or both surfaces of wall or hollow-core concrete.

   3M COMPANY – IC 15WB+, CP 25WB+ Caulk, or FB-3000 WT Sealant

   *Bearing the UL Classification Mark

1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Floor assembly may also be constructed of any min 6 in. (152 mm) thick UL Classified hollow-core Precast Concrete Units*. Wall may also be constructed of any UL Classified Concrete Blocks*. Max diam of opening 14 in. (356 mm). Max diam of opening in floors constructed of hollow-core concrete is 7 in. (178 mm).

   See Concrete Blocks (CAZT) and Precast Concrete Units (CFTV) categories in Fire Resistance Directory for names of manufacturers.

2. **Steel Sleeve** – (Optional) – Nom 14 in. (356 mm) diam (or smaller) Schedule 10 (or heavier) steel sleeve cast or grouted into floor or wall assembly. Steel sleeve may be installed flush or may project max 2 in. (51 mm) beyond the floor or wall surfaces. As an alternate, nom 14 in. (356 mm) diam (or smaller) sleeve fabricated from nom 0.028 in. (0.71 mm) thick galv steel cast or grouted into floor or wall assembly flush with floor or wall surfaces.

3. **Through Penetrants** – One metallic pipe or tubing to be installed concentrically or eccentrically within opening. Penetrant to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of metallic pipes or tubes may be used:
   A. **Steel Pipe** – Nom 8 in. (203 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   B. **Iron Pipe** – Nom 8 in. (203 mm) diam (or smaller) cast or ductile iron pipe.
   C. **Copper Tubing** – Nom 4 in. (102 mm) diam (or smaller) Type M (or heavier) copper tube.
   D. **Copper Pipe** – Nom 4 in. (102 mm) diam (or smaller) Regular (or heavier) copper pipe.

4. **Pipe Covering** – Nom 2 in. (51 mm) thick (or less) hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with product. Annular space between the pipe covering and periphery of opening or sleeve shall be min 1/2 in. to max 1 in. (13 mm to max 25 mm).

   See Pipe and Equipment Covering – Materials – (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a smoke Developed Index of 50 or less may be used.

   The hourly F and T Ratings are dependent on the type of pipe or tube and the nom thickness of the pipe covering, as shown below:

A1. Forming Material* – As an alternate to the packing material in Item 5A, nom 4 in. (102 mm) wide strips of min 1/2 in (13 mm) thick compressible mat to be stacked to a thickness greater than the width of the annular space and compression-fitted, edge-first, to fill the annular space to a min 4 in. (102 mm) depth. Top of forming material to be recessed from top surface of floor or from both surfaces of wall as necessary to accommodate the required thickness of caulk fill material. In floors constructed of hollow-core concrete, forming material to be recessed from top and bottom surfaces of floor or sleeve as required to accommodate the required thickness of fill material.

3M COMPANY – Fire Barrier Packing Material

B. Fill, Void or Cavity Materials* – Caulk or Sealant – Min 1/2 in. (13 mm) thickness of caulk applied within the annulus, flush with top surface of floor or top edge of sleeve or with both surfaces of wall or both ends of sleeves. In floors constructed of hollow-core concrete, min 1/2 in. (13 mm) thickness of caulk applied within the annulus, flush with top and bottom surfaces of floor or sleeve.

3M COMPANY – IC 15WB+, CP 25WB+ caulk or FB-3000 WT sealant

*Bearing the UL Classification Mark
System No. C-AJ-5211
March 28, 2012

ANSI/UL1479 (ASTM E814)
F Rating – 2 Hr
T Ratings – 0 and 1/2 Hr (See Item 4)
W Rating – Class I (See Item 5)

CAN/ULC S115
F Rating – 2 Hr
FT Ratings – 0 and 1/2 Hr (See Item 4)
FH Rating – 2 Hr
FTH Ratings – 0 and 1/2 Hr (See Item 4)

1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600 - 2400 kg/m³) concrete. Floor assembly may also be constructed of any min 6 in. (152 mm) thick UL Classified hollow-core **Precast Concrete Units**.
   Wall may also be constructed of any UL Classified **Concrete Blocks**. Max diam of opening 8 in. (203 mm) Max diam of opening in floors constructed of hollow-core concrete is 7 in. (178 mm).

   See **Concrete Blocks** (CAZT) and **Precast Concrete Units** (CFTV) categories in Fire Resistance Directory for names of manufacturers.

2. **Steel Sleeve** – (Optional) - Nom 8 in. (203 mm) diam (or smaller) Schedule 10 (or heavier) steel sleeve cast or grouted into floor or wall assembly. Steel sleeve may be installed flush or may project max 2 in. (51 mm) beyond the floor or wall surfaces. As an alternate, nom 8 in. (203 mm) diam (or smaller) sleeve fabricated from nom 0.019 in. (0.48 mm) thick galv steel cast or grouted into floor or wall assembly flush with floor or wall surfaces.

3. **Through Penetrants** – One metallic pipe to be installed concentrically or eccentrically within opening. Penetrant to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of metallic pipes may be used:
   A. **Steel Pipe** – Nom 4 in. (102 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   B. **Iron Pipe** – Nom 4 in. (102 mm) diam (or smaller) cast or ductile iron pipe.
   C. **Copper Tubing** – Nom 2 in. (51 mm) diam (or smaller) Type L (or heavier) copper tubing.
   D. **Copper Pipe** – Nom 2 in. (51 mm) diam (or smaller) Regular (or heavier) copper pipe.

4. **Tube Insulation-Plastics** – Nom 3/4 in. (19 mm) thick (or less) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. Annular space between the insulated penetrating item and the periphery of the opening shall be min 1/2 in. to max 1-1/2 in. (13 mm to max 38 mm).

   See **Plastics** (QMFZ2) category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of ‘94-5A may be used.

   The T, FT and FTH Ratings are 1/2 Hr for nom 3/4 in. (19 mm) thick tube insulation. The T, FT and FTH Ratings are 0 Hr for tube insulations less than nom 3/4 in. (19 mm) thick.

5. **Firestop System** – The details of the firestop system shall be as follows:
   A. **Packing Material** – Min 3 in. (76 mm) thickness of min 4 pcf or 64 kg/m³ mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor or top edge of sleeve or from both surfaces of wall or both ends of sleeve as required to accommodate the required thickness of fill material. In floors constructed of hollow-core concrete, packing material to be recessed from top and bottom surfaces of floor or sleeve as required to accommodate the required thickness of fill material.

   A1. **Forming Material** – As an alternate to the packing material in Item 5A, nom 4 in. (102 mm) wide strips of min 1/2 in (13 mm) thick compressible mat to be stacked to a thickness greater than the width of the annular space and compression-fitted, edge-first, to fill the annular space to a min 4 in. (102 mm) depth. Top of forming material to be recessed from top surface of floor or from both surfaces of wall as necessary to accommodate the required thickness of caulk fill material. In floors constructed of hollow-core concrete, packing material to be recessed from top and bottom surfaces of floor or sleeve as required to accommodate the required thickness of fill material.
B. Fill, Void or Cavity Materials* – Caulk or Sealant – Min 1/2 in. (13 mm) thickness of caulk applied within the annulus, flush with top surface of floor or top edge of sleeve or with both surfaces of wall or both ends of sleeves. In floors constructed of hollow-core concrete, min 1/2 in. (13 mm) thickness of caulk applied within the annulus, flush with top and bottom surfaces of floor or sleeve.

3M COMPANY
3M FIRE PROTECTION PRODUCTS – IC 15WB+ Caulk, CP 25WB+ Caulk or FB-3000 WT Sealant
(Note: W Rating applies only when FB-3000 WT is used.)

*Bearing the UL Classification Mark
+Bearing the UL Recognized Component Mark

© 2013 UL LLC
1. **Floor or Wall Assembly** – Min 2-1/2 in. (64 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max area of opening is 56 in.² (363 cm²) with a max dimension of 12-1/2 in. (318 mm) for square devices. Max diam of opening is 2-1/2 in. (64 mm) for 2 in. round devices. Max diam of opening is 4-1/2 in. (114 mm) for 4 in. round devices. **When thickness of floor or wall assembly is less than 4-1/2 in. (114 mm), T Rating is 1/2 Hr. When thickness of floor or wall assembly is 4-1/2 in. (114 mm) or greater, T Rating is 3/4 hr.**

See Concrete Blocks (CAZT) category in Fire Resistance Directory for names of manufacturers.

2. **Through Penetrant** – One or more metallic pipe or tubing with tube insulation may be installed concentrically or eccentrically within each firestop device (Item 4A). Through penetrant to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of through penetrants may be used:
   A. **Steel Pipe** – Nom 3/4 in. (19 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   B. **Iron Pipe** – Nom 3/4 in. (19 mm) diam (or smaller) cast or ductile iron pipe.
   C. **Copper Tubing** – Nom 3/4 in. (19 mm) diam (or smaller) Type L (or heavier) copper tube.
   D. **Copper Pipe** – Nom 3/4 in. (19 mm) diam (or smaller) Regular (or heavier) copper pipe.

3. **Tube Insulation** – **Plastic**+ – Nom 1/2 in (13 mm) thick or smaller) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing with skin may be used on the copper tubes. If multiple insulated through penetrants are installed within the firestop device, the insulated through penetrants may be bundled together.

See Plastics+ (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5VA may be used.

4. **Firestop System** – The firestop system shall consist of the following:
   A. **Firestop Device** – A max of three square firestop devices may be ganged together. As an alternate, one round device may be centered within a round opening. Each device consists of a nom 2-1/2 by 2-1/2 by 10 in. (64 by 64 by 254 mm), a nom 4 by 4 in. (102 by 102 by 254 mm), a nom 2 in. (51 mm) diam by 10 in. (254 mm) or a nom 4 in. (102 mm) diam by 10 in. (254 mm) powder coated steel transit incorporating internal intumescent material, foam gaskets and mounting flanges. Firestop device to be centered within opening and installed with ends projecting an equal distance beyond each surface of the floor or wall assembly in accordance with the accompanying installation instructions. The annular space between the firestop device(s) and the periphery of the opening shall be nom 1/4 in. (6 mm). Firestop devices secured in place by means of fill material (Item 4B) and steel split mounting flanges sized to accommodate the firestop device. Steel split mounting flanges installed on both sides of floor or wall after installation of fill material and secured to together with supplied steel set screws. Nom 1 in. (25 mm) thick pre-cut foam plugs sized to accommodate the insulated through penetrant(s) and installed flush with each end of device on both sides of floor or wall assembly.

3M COMPANY – 3M Fire Barrier Pass-Through Device

B. **Fill, Void or Cavity Materials** – **Caulk or Putty** – Min 1 in. (25 mm) thickness of fill material applied within the annulus, flush with top surface of floor or with both surfaces of wall prior to the installation of the mounting flanges. When the annular space is 1/8 in. (3.2 mm) or less, the fill material in the annulus is optional. Also, as an option, the foam plugs may be recessed into device and the recess filled with putty or caulk flush with the ends of the device. L Rating applies only when fill material is applied at interface of floor or both sides of wall and device(s) prior to mounting flanges and with both ends of firestop device(s) filled with nominal 1/8 in. (3.2 mm) of Moldable Putty+.  

3M COMPANY – Moldable Putty+, CP 25WB+, IC 15WB+, 3000 WT

*Bearing the UL Classification Mark

1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Floor assembly may also be constructed of any min 6 in. (152 mm) thick UL Classified hollow-core **Precast Concrete Units**. Wall may also be constructed of any UL Classified **Concrete Blocks**. Diam of opening to be nom 2 in. (51 mm) larger than outside diam of pipe covering material (Item 3). Max diam of opening 12 in. (305 mm). Max diam of opening in floors constructed of hollow-core concrete is 7 in. (178 mm).

   See **Concrete Blocks** (CAZT) and **Precast Concrete Units** (CFTV) categories in Fire Resistance Directory for names of manufacturers.

2. **Through Penetrants** – One metallic pipe or tubing to be installed concentrically or eccentrically within opening. Penetrant to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of metallic pipes or tubes may be used:
   A. **Steel Pipe** – Nom 4 in. (102 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   B. **Iron Pipe** – Nom 4 in. (102 mm) diam (or smaller) cast or ductile iron pipe.
   C. **Copper Tubing** – Nom 4 in. (102 mm) diam (or smaller) Type M (or heavier) copper tube.
   D. **Copper Pipe** – Nom 4 in. (102 mm) diam (or smaller) Regular (or heavier) copper pipe.

3. **Pipe Covering** – Nom 3 in. (76 mm) thick (or less) hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with product. Annular space between the pipe covering and periphery of opening or sleeve shall be min 3/8 in. (10 mm) to max 1-1/2 in. (38 mm). When pipe covering material thickness is less than 3 in. (76 mm), **T Rating** is 0 Hr.

   See **Pipe and Equipment Covering – Materials** (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a smoke Developed Index of 50 or less may be used.

4. **Firestop System** – The details of the firestop system shall be as follows:
   A. **Packing Material** – (Optional, Not Shown) - Polyethylene backer rod or nom 1 in. (25 mm) thickness of tightly-packed mineral wool batt or glass fiber insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor or from both surfaces of wall as required to accommodate the required thickness of fill material. In floors constructed of hollow-core concrete, packing material to be recessed from top and bottom surfaces of floor or sleeve as required to accommodate the required thickness of fill material.

   A1. **Forming Material** – As an alternate to the packing material in Item 5A, nom 4 in. (102 mm) wide strips of min 1/2 in (13 mm) thick compressible mat folded in half lengthwise and stacked to a thickness greater than the width of the annular space and compression-fitted, edge-first, to fill the annular space to a min 2 in. (51 mm) depth. Top of forming material to be recessed from top surface of floor or from both surfaces of wall as necessary to accommodate the required thickness of caulking material. In floors constructed of hollow-core concrete, forming material to be recessed from top and bottom surfaces of floor or sleeve as required to accommodate the required thickness of fill material.

   3M COMPANY – Fire Barrier Packing Material

   B. **Fill, Void or Cavity Materials** – Sealant – Min 2 in. (51 mm) thickness of sealant applied within the annulus, flush with top surface of floor or with both surfaces of wall. In floors constructed of hollow-core concrete, min 2 in. (51 mm) thickness of sealant applied within the annulus, flush with top and bottom surfaces of floor or sleeve.

   3M COMPANY – FB-3000 WT

UL System No. C-AJ-5330
XHEZ - Through-penetration Firestop Systems

March 27, 2009

F Rating — 2 Hr
T Rating — 1-1/4 and 1-1/2 Hr (See Item 2)
L Rating at Ambient — Less Than 1 CFM/sq ft
L Rating at 400 F — 3 CFM/sq ft
W Rating — Class 1 (See Item 4A)

1. **Floor or Wall Assembly** — Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max diam of opening is 6 in. (152 mm).
   
   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Steel Sleeve** — (Optional)-Nom 6 in. (152 mm) diam (or smaller) Schedule 40 (or heavier) steel sleeve cast or grouted into floor or wall assembly. The T Rating is 1-1/4 Hr when sleeve is used, 1-1/2 Hr when no sleeve is used.

3. **Through-Penetrant** — One metallic pipe, or tubing to be centered within the firestop system. Pipe, or tubing to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of metallic pipes, or tubing may be used:
   
   A. **Steel Pipe** — Nom 3 in. (76 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   
   B. **Iron Pipe** — Nom 3 in. (76 mm) diam (or smaller) service weight (or heavier) cast iron soil pipe or Class 50 (or heavier) ductile iron pressure pipe.
   
   C. **Copper Tubing** — Nom 3 in. (76 mm) diam (or smaller) Type M (or heavier) copper tubing.
   
   D. **Copper Pipe** — Nom 3 in. (76 mm) diam (or smaller) Regular (or heavier) copper pipe.

4. **Pipe Covering** — Max 1 in. (25 mm) thick hollow cylindrical heavy density (min 3.5 pcf or 56 kg/m³) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. A nom annular space of 7/16 in. (11 mm) is required within the firestop system.
   
   See Pipe and Equipment Covering - Materials (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.
UL System No. C-AJ-5330 (cont.)

4A. PVC Jacket+ – (Optional, Not Shown) - An additional PVC jacket, supplied in sheet form, shall be tightly wrapped around the service jacket on the pipe covering with the longitudinal seam continuously sealed using the adhesive supplied with the jacket. The jacket is to be nom 48 in. (1.22 m) wide by nom 20 or 30 mil (0.5 or 0.8 mm) thick. The jacket shall extend downward into and/or through the opening from a point 36 to 40 in. (0.91 to 1.02 m) above the top surface of the floor assembly. The PVC jacket must be used for the W Rating to apply. The W Rating applies only with floor assemblies.

See Plastics (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component plastic material meeting the above specifications and having a UL 94 Flammability Classification of 94-V0A may be used.

5. Firestop System – The details of the firestop system shall be as follows:

A. Packing Material – Min 3-3/4 in. (95 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor or from both surfaces of wall as required to accommodate the required thickness of fill material.

B. Fill, Void or Cavity Materials*-Sealant – Min 1/4 in. (6 mm) thickness of fill material applied within the annulus, flush with top surface of floor or with both surfaces of wall.

3M COMPANY 3M FIRE PROTECTION PRODUCTS — FB-3000 WT sealant

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.
System No. C-AJ-5347

L Rating at 400 F - Less than 1 CFM/sq ft

1. **Floor or Wall Assembly** – Min 2-1/2 in. (64 mm) thick lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Max diam of opening is 12-1/2 in. (318 mm).

2. **Through-Penetrant** – One metallic pipe, conduit or tubing installed either concentrically or eccentrically within the firestop system. Pipe, conduit or tubing to be rigidly supported on both sides of floor. The following types and sizes of metallic pipes, conduits or tubing may be used:
   A. **Steel Pipe** – Nom 8 in. (203 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   B. **Iron Pipe** – Nom 8 in. (203 mm) diam (or smaller) service weight (or heavier) cast iron soil pipe, nom 12 in. diam (or smaller) or Class 50 (or heavier) ductile iron pressure pipe.
   C. **Conduit** – Nom 6 in. (152 mm) diam (or smaller) steel conduit or nom 4 in. (102 mm) diam (or smaller) steel electrical metallic tubing.
   D. **Copper Tubing** – Nom 4 in. (102 mm) diam (or smaller) Type L (or heavier) copper tubing.
   E. **Copper Pipe** – Nom 4 in. (102 mm) diam (or smaller) Regular (or heavier) copper pipe.

3. **Pipe and Equipment Covering Materials** – Nom 1 in. (25 mm) thick hollow cylindrical heavy density (nom 3.5 pcf or 56 kg/m³) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or butt tape supplied with the product. Annular space between the insulated through penetrant and periphery of opening shall be min 0 in. (point contact) to max 1-7/8 in. (48 mm).

See **Pipe and Equipment Covering Materials** (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Fill, Void or Cavity Material** – **Foam** – Min 2-1/2 in. (64 mm) thickness of fill material applied within the annulus, flush with top surface of floor or both surfaces of wall.

   **3M COMPANY** – Fire Barrier Rated Foam, FIP 1-Step

1. **Floor or Wall Assembly** – Min 5-1/2 in. thick reinforced lightweight or normal weight (100-150 pcf) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Diam of opening to be 1 in. to 1-1/4 in. larger than outside diam of insulated pipe. Max diam of opening is 18 in. 

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Pipe** – Nom 4 in. diam (or smaller) Type L (or heavier) copper pipe or nom 12 in. diam (or smaller) Schedule 10 (or heavier) steel pipe centered in the opening and rigidly supported on both sides of the floor or wall assembly. **When max 6 in. diam pipe is used, T Rating is 2 hr. When pipe is larger than 6 in. diam, T Rating is 1 hr.**

3. **Pipe Covering*** – Nom 1 or 2 in. thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt strip tape supplied with the product.

   See Pipe and Equipment Covering – Materials* (BRGU) category in Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Firestop System** – The details of the firestop system shall be as follows:

   **A. Fill, Void or Cavity Materials*** – **Wrap Strip** – Nom 1/4 in. thick intumescent elastomeric material faced on one side with aluminum foil, supplied in 2 in. wide by 24 in. long strips. Two layers of the nom 2 in. wide strips tightly-wrapped around pipe covering (foil side exposed) and slid into annular space on each side of the floor or wall assembly such that the exposed edges are recessed 1/4 to 1/2 in. from the floor or wall surfaces. Each layer is to be installed with a butted seam secured with aluminum foil tape.

   **3M COMPANY** – FS-195+

   **B. Fill, Void or Cavity Materials*** – **Caulk or Sealant** – Applied to fill the annular space (over edges of wrap strip layers) to a depth of 1/4 to 1/2 in., flush with both surfaces of floor or wall.

   **3M COMPANY** – CP 25WB+ caulk or FB-3000 WT sealant.

   *Bearing the UL Classification Marking

1. **Floor Assembly** – Min 4-1/2 in. (114 mm) thick lightweight or normal weight (100-150pcf or 1600-2400 kg/m³) concrete. Max area of opening 192 sq in. (1239 cm²) with max length of 24 in. (610 mm) and max width of 8 in. (203 mm).

2. **Pipe** – Nom 4 in. (102 mm) diam (or smaller) Type L (or heavier) copper tubing, Schedule 10 (or heavier) steel pipe, steel conduit or steel EMT to be installed with a min clearance of 1 in. (25 mm) and a max clearance of 2 in. (51 mm) from the sides of the through opening. A min separation of 1 in. (25 mm) shall be maintained between adjacent pipes. Pipes to be rigidly supported on both sides of floor assembly.

3. **Pipe Covering** – Nom 1/2 in. to 1 in. (13 mm to 25 mm) thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt strip tape supplied with the product.

   See **Pipe and Equipment Covering – Materials** (BRGU) category in Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

3A. **Pipe Insulation** – Plastics – As an alternate to Item 3, nom 3/4 in. (19 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing with skin may be used on steel pipes.

   See **Plastics** (QMFZ2) category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL94 Flammability Classification of 94-5VA may be used.

4. **Fill, Void or Cavity Materials** – **Wrap Strip** – Nom 1/4 in. (6 mm) thick intumescent elastomeric material faced on one side with aluminum foil, supplied in 2 in. (51 mm) wide strips. Nom 2 in. (51 mm) wide strip tightly-wrapped around pipe insulation (Item 3 or 3A) with the foil side exposed and slid into through opening such that the top edge is flush with the top surface of the floor. The wrap strip layer shall be secured in place with min No. 18 gauge galv steel tie wire.

   **3M COMPANY** – FS-195+

5. **Packing Material** – Min 1 in. (25 mm) thick mineral wool batt material insulation firmly packed into opening as a permanent form with its top surface recessed min 1 in. (25 mm) from top surface of floor.

6. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Applied to fill through opening to a min depth of 1 in. (25 mm), flush with top surface of floor, with a min 1/8 in. (3.2 mm) thickness of caulk applied over top edge of wrap strip layer (Item 4) on insulated pipe.

   **3M COMPANY** – IC 15WB+, CP 25WB+ caulk or FB-3000 WT sealant.

*Bearing the UL Classification Marking

1. **Floor Assembly** – The 3 Hr fire-rated concrete and steel floor assembly shall be constructed of the materials and in the manner specified in the individual D700 Series designs in the UL Fire Resistance Directory and as summarized below:
   A. **Concrete** – Min 3 in. (76 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete.
   B. **Steel Floor and Form Units** – Composite or non composite 3 in. (76 mm) deep fluted galv units as specified in the individual floor-ceiling design. Max size of opening is 14 in. (356 mm).
   C. **Spray-Applied Fire Resistive Materials** – Min 11/16 in. (17.5 mm) thickness spray-applied fire resistive material applied to all surfaces of steel floor units.

2. **Through Penetrants** – One metallic pipe to be centered within the opening. The pipe to be rigidly supported on both sides of the floor assembly. The following types and sizes of nonmetallic pipe or conduit may be used:
   A. **Steel Pipe** – Nom 10 in. (254 mm) diam (or smaller) Schedule 10 steel pipe.
   B. **Iron Pipe** – Nom 10 in. (254 mm) diam (or smaller) cast or ductile iron pipe.
   C. **Copper Tubing** – Nom 4 in. (102 mm) diam (or smaller) Type L (or heavier) copper tubing.
   D. **Copper Pipe** – Nom 4 in. (102 mm) diam (or smaller) Regular (or heavier) copper pipe.

3. **Pipe Covering** – Nom 1 in. (25 mm) thick hollow cylindrical heavy density (min 3.5 pcf or 56 kg/m³) glass fiber units jacketed on the outside with an all-service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. A nom annular space of 1/2 in. (13 mm) is required within the firestop system.

   See **Pipe and Equipment Covering Materials** (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Firestop System** – The firestop system shall consist of the following:
   A. **Packing Material** – Min 2-1/2 in. (38 mm) thickness of min 4 pcf or 64 kg/m³ density mineral wool batt insulation firmly packed into the annular space and recessed to accommodate the required thickness of fill material.
   B. **Fill, Void or Cavity Materials** – **Wrap Strip** – Nom 1/8 in. (3.2 mm) thick intumescent material supplied in 2 in. (51 mm) wide strips. Wrap strip tightly wrapped around pipe and secure with one layer of aluminum foil tape. Wrap strip to be recessed into opening 1/2 in. (13 mm) from top surface of floor.
   C. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Min 1/2 in. (13 mm) thickness of caulk applied within the annulus, flush with the top surface of the floor.

UL System No. F-A-5028
XHEZ – Through-penetration Firestop Systems

April 12, 2017

F Rating – 3 Hr
T Ratings – 1/2, 3/4, 1-3/4, 2-3/4 and 3 Hr (See Item 4)
L Rating at Ambient – Less Than 1 CFM/sq ft (See Item 5A)
L Rating at 400° F – Less Than 1 CFM/sq ft (See Item 5A)
W Rating – Class 1 (See Items 4B and 5A)

SECTION A-A

1. **Floor Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600 - 2400 kg/m³) concrete.

2. **Firestop Device** – Cast in place firestop device permanently embedded during concrete placement or grouted in concrete assembly in accordance with accompanying installation instructions. The device may be trimmed flush with top surface of floor or may project up to a max 3-1/2 in. (89 mm) above top surface of floor.
   - **3M COMPANY** – 3M Fire Barrier Cast-In Device 2MCID, 3MCID, 4MCID

3. **Through Penetrants** – One metallic pipe or tubing to be installed concentrically or eccentrically within opening. Penetrant to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of metallic pipes or tubes may be used:
   - **Steel Pipe** – Nom 2 in. (51 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
   - **Iron Pipe** – Nom 2 in. (51 mm) diam (or smaller) cast or ductile iron pipe.
   - **Copper Tubing** – Nom 2 in. (51 mm) diam (or smaller) Type L (or heavier) copper tubing.
   - **Copper Pipe** – Nom 2 in. (51 mm) diam (or smaller) Regular (or heavier) copper pipe.

4. **Pipe Covering** – The following types and sizes of pipe coverings may be used with the metallic pipes:
   - **Pipe Covering** – Nom 1-1/2 in. (38 mm) thick (or less) hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with product. Annular space between the pipe covering and periphery of opening or sleeve shall be min 0 in. (0 mm, point contact) to max 1 in. (25 mm).
     - See **Pipe and Equipment Covering - Materials** (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a smoke Developed Index of 50 or less may be used.
   - **PVC Jacket** – (Optional, Not Shown) – An additional PVC jacket, supplied in sheet form, shall be tightly wrapped around the all service jacket on the pipe covering (Item 4A) with the longitudinal seam continuously sealed using the self-sealing lap tape or adhesive
supplied with the jacket. The jacket is to be nominal 48 in. (1.22 m) wide by nominal 20 or 30 mil (0.5 or 0.8 mm) thick. The jacket shall extend downward into and/or through the opening from a point 36 to 40 in. (0.91 to 1.02 m) above the top surface of the floor assembly. The PVC jacket must be used for the W Rating to apply.

See Plastics (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component plastic material meeting the above specifications and having a UL 94 Flammability Classification of 94-V5A may be used.

C. Tube Insulation-Plastics++ – Nom 1 in. (25 mm) thick (or less) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. Annular space between the insulated penetrating item and the periphery of the opening shall be min 0 in. (0 mm) (point contact) to max 1 in. (25 mm).

See Plastics (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-V5A may be used.

The hourly T Ratings are dependent on the size of pipe or tube and the nominal thickness of the pipe covering, as shown below:

5. Packing Material – Not required if annular space is 1/4 in. (6 mm) or less. If annular space is greater than 1/4 in. (6 mm), min 2 in. (51 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed within annulus, flush with the top surface of floor.

5A. Fill, Void or Cavity Materials - Sealant, Caulk or Putty* – (Optional, Not Shown) - As an option, the packing material (Item 5) may be reduced in thickness by 1/4 to 1/2 in. (6 mm to 13 mm) and recessed from the top surface of floor to accommodate a 1/4 to 1/2 in. (6 mm to 13 mm) thickness of sealant, caulk or putty, installed within annulus, flush with the top surface of floor. If annular spaces are less than 1/4 in. (6 mm) and packing material is not used, sealant, caulk or putty may be installed within annulus, flush with the top surface of floor, but is not required. For W and L Ratings, a min 1/4 in. (6 mm) bead of sealant is required at the device/concrete interface on the top surface of the floor and a min 1/4 in. (6 mm) depth of sealant is required atop a min 1-3/4 in. (44 mm) thickness of mineral wool packing material in the annular space between the pipe and the inside of the device.

3M COMPANY – FB-1000 NS sealant, FB-1003 SL sealant, FB-3000 WT sealant, CP 25WB+ caulk, FireDam 150+ caulk, IC 15WB+ caulk or MP+ Stix putty

*Note - W and L Ratings apply only when FB-1000 NS, FB-1003 SL or FB-3000 WT sealants are used.

++- Bearing the UL Recognized Component Mark.

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

Reprinted from the Online Certifications Directory with permission from UL©
1. **Floor Assembly** – The fire-rated unprotected concrete and steel floor assembly shall be constructed of the materials and in the manner specified in the individual D900 Series designs in the UL Fire Resistance Directory and as summarized below:
   A. **Concrete** – Min 2-1/2 in. (64 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete.
   B. **Steel Floor and Form Units** – Composite or noncomposite max 3 in. (76 mm) deep fluted galv units as specified in the individual Floor-Ceiling design.

2. **Firestop Devices** – The firestop devices are cast in place and permanently embedded during concrete placement or grouted in concrete assembly in accordance with accompanying installation instructions.
   A. **Firestop Device** – Metal Deck Adapter – Nom 3 in. (76 mm) adapter, installed through opening in deck and secured to deck with four sheet metal screws in accordance with installation instructions.

3. **Through Penetrants** – One metallic pipe or tubing installed within the firestop system. Pipe or tubing to be rigidly supported on both sides of floor assembly. The following types of metallic pipes or tubes may be used:
   A. **Steel Pipe** – Nom 2 in. (51 mm) Schedule 5 (or heavier) steel pipe.
   B. **Iron Pipe** – Nom 2 in. (51 mm) cast or ductile iron pipe.
   C. **Copper Tubing** – Nom 2 in. (51 mm) Type L (or heavier) copper tubing.
   D. **Copper Pipe** – Nom 2 in. (51 mm) Regular (or heavier) copper pipe.

4. **Pipe Covering** – Nom 1/2 in. (13 mm) thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with product. Annular space between the pipe covering and periphery of opening or sleeve shall be min 0 in. (point contact) to max 1 in. (25 mm).

4A. **PVC Jacket** – (Optional, Not Shown) – An additional PVC jacket, supplied in sheet form, shall be tightly wrapped around the all service jacket on the pipe covering (Item 4) with the longitudinal seam continuously sealed using the self-sealing lap tape or adhesive supplied with the jacket. The jacket is to be nom 48 in. (1.22 m) wide by nom 20 or 30 mil (0.5 or 0.8 mm) thick. The jacket shall extend downward into and/or through the opening from a point 36 to 40 in. (0.91 to 1.02 m) above the top surface of the floor assembly. The PVC jacket must be used for the W Rating to apply.

5. **Packing Material** – (Not Shown) – Min 2 in. (51 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed into the top of the firestop device (Item 2B) a permanent form, flush with the top surface of the floor.

6. **Fill, Void or Cavity Materials – Sealant** – (Optional, Not Shown) – For W and L Ratings, a min 1/4 in. (6 mm) bead of sealant is required at the device/concrete interface on the top surface of the floor and a min 1/4 in. (6 mm) depth of sealant is required atop a min 1-3/4 in. (44 mm) thickness of mineral wool packing material in the annular space between the pipe and the inside of the device.

*Bearing the UL Classification Mark*

1. **Floor Assembly** – Min 2-1/2 in. (64 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Max diam of opening is 18 in. (457 mm).

2. **Steel Sleeve** – (Optional) – Nom 10 in. (254 mm) diam (or smaller) Schedule 10 (or heavier) steel sleeve cast or grouted into floor assembly. Sleeve may extend a max of 2 in. (51 mm) above top of floor. As an alternate, nom 10 in. (254 mm) diam (or smaller) sleeve fabricated from nom 0.019 in. (0.48 mm) thick galv steel cast or grouted into floor assembly flush with floor surfaces. **T Rating is 0 Hr when sleeve is used.**

3. **Through Penetrants** – One metallic pipe or tubing to be installed concentrically or eccentrically within opening. Penetrant to be rigidly supported on both sides of floor. The following types and sizes of metallic pipes or tubes may be used:
   - **Steel Pipe** – Nom 12 in. (305 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   - **Iron Pipe** – Nom 12 in. (305 mm) diam (or smaller) cast or ductile iron pipe.
   - **Copper Tubing** – Nom 4 in. (102 mm) diam (or smaller) Type M (or heavier) copper tube.
   - **Copper Pipe** – Nom 4 in. (102 mm) diam (or smaller) Regular (or heavier) copper pipe.

4. **Pipe Covering** – Nom 1/2 to 2 in. (13 to 51 mm) thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt strip tape supplied with the product.

See **Pipe and Equipment Covering – Materials** (BRGU) category in Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4A. **PVC Jacket** – An additional PVC jacketing, supplied in sheet form, shall be tightly wrapped around the all service jacket on the pipe covering with the longitudinal seam continuously sealed using the adhesive supplied with the jacket. The jacket is to be nom 48 in. (1219 mm) wide by nom 20 or 30 mil (0.5 or 0.8 mm) thick. The jacket shall be installed at a point 36 in. (914 mm) to 40 in. (1016 mm) above the top surface of the floor assembly and shall extend downward into and/or through the opening.

See **Plastics** (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5VA may be used.

5. **Firestop System** – The details of the firestop system shall be as follows:
   - **Packing Material** – Min 1 in. (25 mm) thickness of firmly packed mineral wool batt insulation used as a permanent form. Packing material to be recessed from top surface of floor or sleeve to accommodate the required thickness of fill material (Item 5B).
   - **Fill, Void or Cavity Material** – Sealant – Applied to fill the annular space flush with the top surface of the floor or sleeve. When nom pipe covering thickness is 2 in., (51 mm) min thickness of sealant is 2 in. (51 mm). When nom pipe covering thickness is 1-1/2 in. (38 mm) or less, min thickness of sealant is 1 in. (25 mm). The hourly F and T Ratings of the firestop system are dependent upon the thickness of the floor, the size of pipe, the thickness of pipe covering material and the size of the annular space between the pipe covering material and the periphery of the opening, as shown in the following table:

System No. W-J-5013
September 08, 2004
F Ratings – 1 and 2 Hr (See Item 4)
T Ratings – 1 and 1-1/2 Hr (See Item 4)

1. Wall Assembly – Min 4-1/2 in. thick lightweight or normal weight (100-150 pcf) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max diam of opening is 8-1/2 in.

See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. Through Penetrants – One metallic pipe or tubing installed either concentrically or eccentrically within the firestop system. Pipe, conduit or tubing to be rigidly supported on both sides of wall assembly. The following types and sizes of metallic pipes, conduits or tubing may be used:
   A. Steel Pipe – Nom 4 in. diam (or smaller) Schedule 10 (or heavier) steel pipe.
   B. Copper Tubing – Nom 4 in. diam (or smaller) Type L (or heavier) copper tubing.
   C. Copper Pipe – Nom 4 in. diam (or smaller) Regular (or heavier) copper pipe.

3. Pipe Covering* – Nom 1-1/2 in. thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied SSL tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. The annular space between the insulated pipe and the edge of the through opening shall be min zero in. (continuous point contact) to max 1-1/4 in.

See Pipe and Equipment Covering – Materials* (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. Fill, Void or Cavity Materials* – Caulk or Sealant – Min thickness of 5/8 in. and 1-1/4 in. of caulk or putty for 1 and 2 hr rated wall assemblies, respectively, applied within annulus between pipe covering and periphery of the opening, flush with both surfaces of wall assembly. A min 1/2 in. diam bead of caulk shall be applied to the pipe covering/wall interface at the point contact location on both sides of wall. The hourly F and T Ratings of the firestop system are 1 hr when installed in 1 hr fire rated wall assemblies. The hourly F Rating of the firestop system is 2 hr when installed in 2 hr fire rated wall assemblies. When installed in 2 hr fire rated wall assemblies, T Rating is 1 hr when copper tube is used and 1-1/2 hr when steel pipe is used.

   3M COMPANY – CP 25WB+ caulk or FB-3000 WT sealant

5. Packing Material (Optional) – Mineral wool or fiberglass insulation or polyethylene backer rod firmly packed into opening as a permanent form. Packing material to be recessed from both surfaces of wall as required to accommodate the required thickness of caulk fill material.

F Ratings – 1 and 2 Hr (See Item 4)
T Rating – 3/4 Hr

1. **Wall Assembly** – Min 4-1/2 in. (114 mm) thick lightweight or normal weight (100-150pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified **Concrete Blocks***. Max diam of opening is 7 in. (178 mm).

   See **Concrete Blocks** (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through Penetrants** – One metallic pipe or tubing installed either concentrically or eccentrically within the firestop system. Pipe, conduit or tubing to be rigidly supported on both sides of wall assembly. The following types and sizes of metallic pipes, conduits or tubing may be used:

   A. **Steel Pipe** – Nom 4 in. (102 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   B. **Copper Tubing** – Nom 4 in. (102 mm) diam (or smaller) Type L (or heavier) copper tubing.
   C. **Copper Pipe** – Nom 4 in. (102 mm) diam (or smaller) Regular (or heavier) copper pipe.

3. **Pipe Insulation** – **Plastics*** – Nom 3/4 in. (19 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. The annular space between the insulated pipe and the edge of the through opening shall be min 0 in. (point contact) to max 1-1/4 in. (0 mm to 32 mm).

   See **Plastics** (QMFZ2) category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL94 Flammability Classification of 94-5VA may be used.

4. **Fill, Void or Cavity Materials*** – **Caulk or Sealant** – Min thickness of 5/8 in. and 1-1/4 in. (16 mm and 32 mm) of caulk or putty for 1 and 2 hr rated wall assemblies, respectively, applied within annulus between pipe covering and periphery of the opening, flush with both surfaces of wall assembly. A min 1/2 in. (13 mm) diam bead of caulk shall be applied to the pipe covering/wall interface at the point contact location on both sides of wall.

   **3M COMPANY** – IC 15WB+, CP 25WB+ caulk or FB-3000 WT sealant

5. **Packing Material** (Optional, not shown) – Mineral wool or fiberglass insulation or polyethylene backer rod firmly packed into opening as a permanent form. Packing material to be recessed from both surfaces of wall as required to accommodate the required thickness of caulk fill material.

May 19, 2005
F Ratings – 1 and 2 Hr (See Item 5)
T Ratings – 1/2, 1 and 1-1/2 Hr (See Item 3)

1. **Wall Assembly** – Min 4-1/2 in. (114 mm) thick lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified **Concrete Blocks**. Max diam of opening is 20 in. (508 mm).

   See **Concrete Blocks** (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through Penetrants** – One metallic pipe or tubing installed either concentrically or eccentrically within the firestop system. Pipe, conduit or tubing to be rigidly supported on both sides of wall assembly. The following types and sizes of metallic pipes, conduits or tubing may be used:
   
   A. **Steel Pipe** – Nom 12 in. (305 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   
   B. **Copper Tubing** – Nom 6 in. (152 mm) diam (or smaller) Type L (or heavier) copper tubing.
   
   C. **Copper Pipe** – Nom 6 in. (152 mm) diam (or smaller) Regular (or heavier) copper pipe.

3. **Pipe Covering Materials** – **Cellular Glass Insulation** – Nom 1-1/2 in. or 3 in. (38 mm by 76 mm) thick cellular glass units supplied in nom 24 in. (610 mm) long half sections or nom 18 in. (457 mm) long segments. Pipe insulation installed on pipe in accordance with the manufacturer’s instructions. **T Rating** is 1/2 hr when nom 1-1/2 in. (38 mm) thick pipe insulation is used in 1 hr and 2 hr fire-rated wall assemblies. **T Rating** is 1 hr when nom 3 in. (76 mm) thick pipe insulation is used in 1 hr fire-rated wall assemblies. **T Rating** is 1-1/2 hr when nom 3 in. (76 mm) thick pipe insulation is used in 2 hr fire-rated wall assemblies.

   **PITTSBURGH CORNING CORP – FOAMGLAS**

4. **Metal Jacket** – Min 12 in. (305 mm) long jacket formed of min 0.010 in. (0.25 mm) thick steel or aluminum sheet cut to wrap tightly around the pipe insulation with a min 2 in. (51 mm) lap. Jacket secured with min 1/2 in. (13 mm) wide stainless steel hose clamps or bands located within 2 in. (51 mm) of each end of the jacket and spaced a max of 10 in. (254 mm) OC. Jacket to be installed with edges abutting surface of fill material (Item 5) on both surfaces of wall.

5. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Min thickness of 5/8 in. and 1-1/4 in. (16 mm and 32 mm) of caulk or putty for 1 and 2 hr rated wall assemblies, respectively, applied within annulus between pipe covering and periphery of the opening, flush with both surfaces of wall assembly. A min 1/2 in. (13 mm) diam bead of caulk shall be applied to the pipe covering/wall interface at the point contact location on both sides of wall.

   **3M COMPANY** – IC 15WB+, CP 25WB+ caulk or FB-3000 WT sealant

6. **Packing Material** (Optional, not shown) – Mineral wool or fiberglass insulation or polyethylene backer rod firmly packed into opening as a permanent form. Packing material to be recessed from both surfaces of wall as required to accommodate the required thickness of caulk fill material.

*Bearing the UL Classification Marking

1. **Wall Assembly** – Min 6 in. (152 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete wall. Wall may also be constructed of any UL Classified Concrete Blocks*. Max diam of opening is 12-1/2 in. (318 mm).

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through Penetrants** – One metallic pipe, conduit or tubing installed concentrically or eccentrically within opening. Penetrant to be rigidly supported on both sides of wall. The following types and sizes of penetrants may be used:
   
   - **A. Steel Pipe** – Nom 8 in. (203 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   - **B. Iron Pipe** – Nom 8 in. (203 mm) diam (or smaller) cast or ductile iron pipe.
   - **C. Copper Tubing** – Nom 4 in. (102 mm) diam (or smaller) Type L (or heavier) copper tubing.
   - **D. Copper Pipe** – Nom 4 in. (102 mm) diam (or smaller) Regular (or heavier) copper pipe.

3. **Pipe Covering** – Nom 1 in. (25 mm) thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied SSL tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. Annular space between pipe covering and periphery of opening to be min 0 in. (point contact) to max 1-7/8 in. (0 mm to max 48 mm).

   See Pipe and Equipment Covering-Materials (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Fill, Void or Cavity Material** – **Caulk or Sealant** – Min 5/8 in. (16 mm) thickness of caulk applied within annulus, flush with both surfaces of wall. Min 1/4 in. (6 mm) diam bead of caulk applied to pipe covering/wall interface at point contact location on both sides of wall.

   **3M COMPANY** – IC 15WB+, CP 25WB+ caulk or FB-3000 WT sealant

*Bearing the UL Classification Marking

1. **Wall Assembly** – Min 6 in. (152 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete wall. Wall may also be constructed of any UL Classified Concrete Blocks*. Max diam of opening is 7-1/2 in. (191 mm).

See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through Penetrants** – One metallic pipe or tubing installed concentrically or eccentrically within opening. Penetrant to be rigidly supported on both sides of wall assembly. The following types and sizes of metallic pipes or tubing may be used:
   - **Steel Pipe** – Nom 4 in. (102 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   - **Iron Pipe** – Nom 4 in. (102 mm) diam (or smaller) cast or ductile iron pipe.
   - **Copper Tubing** – Nom 2 in. (51 mm) diam (or smaller) Type L (or heavier) copper tubing.
   - **Copper Pipe** – Nom 2 in. (51 mm) diam (or smaller) Regular (or heavier) copper pipe.

3. **Tube Insulation–Plastics+** – Nom 3/4 in. (19 mm) thick (or less) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. Annular space between tube insulation and periphery of opening to be min 0 in. (point contact) to max 1-1/2 in. (0 mm to max 38 mm).

See Plastics (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5A may be used.

**T Rating** is 1 Hr for nom 3/4 in. (19 mm) thick tube insulation. **T Rating** is 0 Hr for tube insulations less than nom 3/4 in. (19 mm) thick.

4. **Fill, Void or Cavity Material* – Caulk or Sealant** – Min 5/8 in. (16 mm) thickness of caulk applied within annulus, flush with both surfaces of wall. Min 1/4 in. (6 mm) diam bead of caulk applied to pipe covering/wall interface at point contact location on both sides of wall.

   **3M COMPANY** – IC 15WB+, CP 25WB+ caulk or FB-3000 WT sealant

1. **Wall Assembly** – Min 6 in. (152 mm) thick reinforced lightweight or normal weight (100-150pcf or 1600 - 2400 kg/m³) concrete wall. Wall may also be constructed of any UL Classified **Concrete Blocks**. Opening shall be sized to be nom. 2 in. (51 mm) larger than outside diameter of pipe covering (Item 3).

   See **Concrete Blocks** (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through Penetrants** – One metallic pipe or tubing to be installed either concentrically or eccentrically within the firestop system. Pipe or tubing to be rigidly supported on both sides of wall assembly. The following types and sizes of metallic pipes of tubing may be used:
   A. **Steel Pipe** – Nom 6 in. (152 mm) diam (or smaller) Schedule 40 (or heavier) steel pipe.
   B. **Iron Pipe** – Nom 6 in. (152 mm) diam (or smaller) cast or ductile iron pipe.
   C. **Copper Tubing** – Nom 6 in. (152 mm) diam (or smaller) Type L (or heavier) copper tubing.
   D. **Copper Pipe** – Nom 6 in. (152 mm) diam (or smaller) Regular (or heavier) copper pipe.

3. **Pipe Covering** – Nom. 3 in. (76 mm) thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. The annular spacing between pipe covering and steel sleeve shall be min. 0 in. (point contact) to max. 2 in. (51 mm).

   See **Pipe and Equipment Covering – Materials** (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Fill, Void or Cavity Material** – Sealant – Min 1-1/4 in. (32 mm) thickness of sealant applied within the gypsum board annulus, flush with the finished side of the wall. Min 1/2 in. (13 mm) diameter bead of sealant applied to the penetrant/gypsum board interface at the point contact location on the finished side of the wall.

   **3M COMPANY** – FB-3000 WT

   *Bearing the UL Classification Mark

1. **Wall Assembly** – Min 6 in. (152 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max diam of opening is 4 in. (102 mm).

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through Penetrants** – One nonmetallic pipe to be installed either concentrically or eccentrically within the firestop system. Pipe to be rigidly supported on both sides of wall assembly. The following types and sizes of nonmetallic pipes or tubing may be used:

   A. **Polyvinyl Chloride (PVC) Pipe** – Nom 2 in. (51 mm) diam (or smaller) Schedule 40 solid core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

   B. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** – Nom 2 in. (51 mm) diam (or smaller) SDR13.5 CPVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

3. **Tube Insulation** – Plastics+ – Nom 1 in. (25 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. The annular space shall be min 0 in. (continuous point contact).

   See Plastics+ (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5VA may be used.

4. **Firestop System** – The firestop system shall consist of the following:

   A. **Fill, Void or Cavity Material – Caulk or Sealant** – (Not Shown) – Min 1/4 in. (6 mm) bead of fill material applied around the outer circumference of the insulated through penetrant at the concrete interface on each surface of the wall assembly.

   **3M COMPANY**
   3M FIRE PROTECTION PRODUCTS – IC 15WB+, CP 25WB+ or FB-3000 WT

   B. **Fill, Void or Cavity Materials* – Wrap Strip** – Nom 2 in. (51 mm) wide, nom 1/4 in. (6 mm) thick intumescent elastomeric material faced on one side with aluminum foil. Two layers of wrap strip tightly wrapped around insulated through penetrant (foil side exposed) and butted against the wall surface on both sides of the wall assembly. Each layer of wrap strip to be installed with butted seam with butted seams in successive layers staggered. Wrap strips temporarily held in position using aluminum foil tape, steel wire tie, or equivalent.

   **3M COMPANY**
   3M FIRE PROTECTION PRODUCTS – Ultra GS Wrap Strip

   C. **Steel Collar** – Nom 2 in. (51 mm) deep collar with 1-1/4 in. (32 mm) wide by 2 in. (51 mm) long anchor tabs and min 1/2 in. (13 mm) long tabs to retain wrap strip. Coils of precut min 0.016 in. (0.41 mm) in thick (30 gauge) galv sheet steel available from wrap strip manufacturer. As an alternate, collar may be field-fabricated from min 0.016 in. (0.41 mm) thick (30 gauge) galv sheet steel in accordance with instruction sheet supplied by wrap strip manufacturer. Collar, with anchor tabs bent outward 90 degrees, wrapped tightly around wrap strip with min 1 in. (25 mm) overlap at seam and compressed around wrap strip(s) using a min 1/2 in. (13 mm) wide by min 0.028 in. (0.71 mm) thick stainless steel band at the collar midpoint. As an alternate to the band clamps, collars may be secured by means of No. 10 by 3/8 in. (10 mm) long steel sheet metal screws installed in the vertical axis at the center of the 1 in. (25 mm) overlap along the perimeter joint of the collar. A min of three screws is required. Collar anchor tabs pressed tightly against wall surfaces and secured to wall surfaces with nom 3/16 in. (5 mm) diam steel concrete anchors, or equivalent, in conjunction with min 1-1/4 in. (32 mm) diam steel fender washers.

1. **Wall Assembly** – Min 6 in. (152 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete wall. Wall may also be constructed of any UL Classified **Concrete Blocks**. Diam of wall opening to be min 1 in. (25 mm) to max 1-1/2 in. (38 mm) larger than outside diam of insulated pipe or tube. See **Concrete Blocks** (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through Penetration** – One metallic pipe or tube to be installed eccentrically or concentrically within the firestop system. Pipe or tube to be rigidly supported on both sides of the floor or wall assembly. The following types and sizes of metallic pipes and tubes may be used:
   A. **Steel Pipe** – Nom 3 in. (76 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
   B. **Iron Pipe** – Nom 3 in. (76 mm) diam (or smaller) cast or ductile iron pipe.
   C. **Copper Pipe** – Nom 2 in. (51 mm) diam (or smaller) Regular (or heavier) copper pipe.
   D. **Copper Tube** – Nom 2 in. (51 mm) diam (or smaller) Type L (or heavier) copper tube.

3. **Pipe Insulation** – **Foamed Plastic** – Nom 1 in. (25 mm) thick polyisocyanurate foamed plastic units jacketed with an all service jacket. Longitudinal joints sealed with self-sealing lap tape. Transverse joints secured with butt tape. Annular space shall be min 1/4 in. (6 mm) to max 3/4 in. (19 mm).

   See **Foamed Plastic** (BRYX) category in the Building Materials Directory for names of manufacturers. Any foamed plastic pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less may be used.

4. **Band Clamp** – Nom 1/2 (13 mm) wide stainless steel band clamp with worm gear tightening mechanism. Band clamp to be secured around pipe insulation 1 in. (25 mm) from both surfaces of wall.

5. **Fill, Void or Cavity Material** – **Sealant** – Min 5/8 in. (16 mm) thickness of fill material applied within annulus, flush with both surfaces of wall, with a nominal 1/2 in. (13 mm) lap onto the wall surfaces.

**3M COMPANY**
**3M FIRE PROTECTION PRODUCTS** – Type CP-25WB+ Caulk, FB-3000WT Sealant

1. **Wall Assembly** – Min 6 in. (152 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600 - 2400 kg/m³) concrete wall. Wall may also be constructed of any UL Classified Concrete Blocks*. Diam of wall opening to be equal to the outside diam of insulated pipe or tube.

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through Penetrant** – One metallic pipe or tube to be installed eccentrically or concentrically within the firestop system. Pipe or tube to be rigidly supported on both sides of the wall assembly. The following types and sizes of metallic pipes and tubes may be used:
   
   A. **Steel Pipe** – Nom 2 in. (51 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
   B. **Iron Pipe** – Nom 2 in. (51 mm) diam (or smaller) cast or ductile iron pipe.
   C. **Copper Pipe** – Nom 2 in. (51 mm) diam (or smaller) Regular (or heavier) copper pipe.
   D. **Copper Tube** – Nom 2 in. (51 mm) diam (or smaller) Type L (or heavier) copper tube.

3. **Pipe Covering*** – Nom. 1-1/2 in. (38 mm) thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. The annular spacing between pipe covering and periphery of opening shall be min. 0 in. (continuous point contact).

   See Pipe and Equipment Covering-Materials (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Fill, Void or Cavity Material*** – Min 1/2 in. (13 mm) thickness of fill material applied at the pipe covering/gypsum board interface to lap onto the wall surfaces on both sides of wall.

Insulated Pipes
Through Penetrations

5000 Series
Gypsum

System No. W-L-5001
May 19, 2005
F Ratings – 1 and 2 Hr (See Item 1)
T Ratings – 3/4, 1 and 1-1/2 Hr (See Item 3)
L Rating At Ambient – 2 CFM/sq ft
L Rating At 400 F – less than 1 CFM/sq ft

1. **Wall Assembly** – The 1 or 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner described in the individual U300, U400 or V400 Series Wall or Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. **Studs** – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 in. by 4 in. (25 mm by 102 mm) lumber spaced 16 in. (406 mm) OC with nom 2 by 4 in. lumber end plates and cross braces. Steel studs to be min 3-5/8 in. (92 mm) wide by 1-3/8 in. (35 mm) deep channels spaced max 24 in. (610 mm) OC.
   
   B. **Gypsum Board** – Nom 5/8 in. (16 mm) thick, 4 ft (122 cm) wide with square or tapered edges. The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual U300 or U400 Series Design in the UL Fire Resistance Directory. Max diam of opening is 14-1/2 in (368 mm) for wood stud walls and 18 in. (457 mm) for steel stud walls.

   The hourly F Rating of the firestop system is 1 hr when installed in a 1 hr fire rated wall and 2 hr when installed in a 2 hr fire rated wall.

2. **Through Penetrants** – One metallic pipe or tubing to be centered within the firestop system. Pipe or tubing to be rigidly supported on both sides of wall assembly. The following types and sizes of metallic pipes or tubing may be used:
   
   A. **Steel Pipe** – Nom 12 in. (305 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   
   B. **Copper Tubing** – Nom 6 in. (152 mm) diam (or smaller) Type L (or heavier) copper tubing.
   
   C. **Copper Pipe** – Nom 6 in. (152 mm) diam (or smaller) Regular (or heavier) copper pipe.

3. **Pipe Covering** – Nom 1 in. or 2 in. (25 mm or 51 mm) thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints sealed with metal fasteners or with butt strip tape supplied with the product. When nom 1 in. (25 mm) thick pipe covering is used, the annular space between the pipe covering and the circular cutout in the gypsum board layers on each side of the wall shall be min 1/4 in. to max 3/8 in. (6 mm to max 10 mm). When nom 2 in. (51 mm) thick pipe covering is used, the annular space between the pipe covering and the circular cutout in the gypsum board layers on each side of the wall shall be min 1/2 in. to max 3/4 in. (13 mm to max 19 mm).

   See **Pipe and Equipment Covering – Materials** category in Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

   The hourly T Rating of the firestop system is 3/4 hr when nom 1 in. (25 mm) thick pipe covering is used. The hourly T Rating of the firestop system is 1 hr and 1-1/2 hr when nom 2 in. (51 mm) thick pipe covering is used with 1 hr and 2 hr fire rated walls, respectively.

4. **Firestop System** – Installed symmetrically on both sides of wall assembly. The details of the firestop system shall be as follows:
   
   A. **Fill, Void or Cavity Materials** – **Wrap Strip** – Nom 1/4 in. (6 mm) thick intumescent elastomeric material faced on one side with aluminum foil, supplied in 2 in. (51 mm) wide strips. Nom 2 in. (51 mm) wide strip tightly wrapped around pipe covering (foil side out) with seam butted. Wrap strip layer securely bound with steel wire or aluminum foil tape and slid into annular space approx 1-1/4 in. (32 mm) such that the exposed edge of the wrap strip fits into the pipe covering (foil side out) with seam butted. Two layers of wrap strip are required when nom 2 in. (51 mm) thick pipe covering is used.

   3M COMPANY – FS-195+

   B. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Min 1/4 in. (6 mm) diam continuous bead applied to the wrap strip/wall interface and to the exposed edge of the wrap strip layer approx 3/4 in. (19 mm) from the wall surface.

   3M COMPANY – CP 25WB+, IC 15WB+, FireDam 150+ caulking or FB-3000 WT sealant

May 19, 2005
F Ratings – 1 and 2 Hr (See Item 4)
T Ratings – 1 and 2 Hr (See Item 4)
L Rating At Ambient – 2 CFM/sq ft (See Item 4B)
L Rating At 400 F – less than 1 CFM/sq ft (See Item 4B)

1. **Wall Assembly** – The 1 or 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner described in the individual U300, U400 or V400 Series Wall or Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Studs** – Wall framing may consist of either wood studs (max 2 hr fire rated assemblies) or steel channel studs. Wood studs to consist of nom 2 in. by 4 in. (51 mm by 102 mm) lumber spaced 16 in. (406 mm) OC with nom 2 in. by 4 in. (51 mm by 102 mm) lumber end plates and cross braces. Steel studs to be min 3-5/8 in. (92 mm) wide by 1-3/8 in. (35 mm) deep channels spaced max 24 in. (610 mm) OC.
   B. **Gypsum Board** – Nom 5/8 in. (16 mm) thick, 4 ft (122 cm) wide with squared or tapered edges. The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual U300 or U400 Series Design in the UL Fire Resistance Directory.

2. **Pipe** – Nom 4 in. (102 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe or Type L (or heavier) copper pipe. A max of one pipe is permitted in the firestop system. Pipe to be installed near center of stud cavity width and to be rigidly supported on both sides of wall assembly.

3. **Pipe Covering** (Optional) – Nom 1 in. (25 mm) thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints sealed with metal fasteners or with butt strip tape supplied with the product. The max annular space between the pipe covering and the circular cutout in the gypsum board layers on each side of the wall shall be 3/16 in. (5 mm)

See **Pipe and Equipment Covering – Materials** (BRGU) category in Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Firestop System** – Installed symmetrically on both sides of wall assembly. The hourly F and T Ratings of the firestop system are 1 hr when used in a 1 hr fire rated wall and are 2 hr when used in a 2 hr fire rated wall. The details of the firestop system shall be as follows.
   A. **Fill, Void or Cavity Materials** – **Wrap Strip** – Nom 1/4 in. (6 mm) thick intumescent elastomeric material faced on one side with aluminum foil, supplied in 2 in. (51 mm) wide strips. Nom 2 in. (51 mm) wide strip, tightly wrapped around pipe covering (foil side out) with seam butted and with edge of wrap strip abutting wall surface. Wrap strip temporarily held in position with aluminum foil tape, steel wire tie or equivalent.
   B. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Generous bead of caulk applied to outer perimeter of wrap strip at interface with wall surface.
   C. **Steel Collar** – Nom 2 in. (51 mm) deep collar with 1-1/4 in. (32 mm) wide by 2 in. (51 mm) long anchor tabs and min 1/4 in. (6 mm) long tabs to retain wrap strip layer. Coils of precut 0.016 in. (0.41 mm) thick (No. 30 gauge) galv sheet steel available from wrap strip manufacturer. As an alternate, collar may be field-fabricated from min 0.016 in. (0.41 mm) thick (No. 30 gauge) galv sheet steel in accordance with instruction sheet supplied by wrap strip manufacturer. Steel collar, with anchor tabs bent outward 90 deg, wrapped tightly around wrap strip layer with min 1 in. (25 mm) overlap at seam. With steel anchor tabs pressed tightly against wall surface, compress collar around wrap strip layer using a min 1/2 in. (13 mm) wide by 0.028 in. (0.71 mm) thick stainless steel band clamp with worm drive tightening mechanism at the collar midheight. Secure collar to gypsum board with 3/16 in. (5 mm) diam steel toggle bolts (5/8 in. or 1-1/4 in. (16 mm or 32 mm) grip) in conjunction with min 1-1/4 in. (32 mm) diam steel washers. Four toggle bolts required, symmetrically located. As a final step, bend retainer tabs 90 deg toward pipe covering to lock wrap strip layer in position.

1. **Wall Assembly** – The fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner described in the individual U300, U400 or V400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Studs** – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 in. by 4 in. (51 mm by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 3-5/8 in. (92 mm) wide and spaced max 24 in. (610 mm) OC.

   B. **Gypsum Board* – Two layers of nom 5/8 in. (16 mm) thick gypsum board, as specified in the individual Wall and Partition Design. Diam of opening cut in gypsum board layers on each side of wall assembly (concentric with pipe, Item 2) to be 1/2 in. to 3/4 in. (13 mm to 19 mm) larger than outside diam of pipe insulation (Item 3) such that, when installed, a 1/4 in. to 3/8 in. (6 mm to 10 mm) annular space will be present between the pipe insulation and the gypsum board around the entire circumference of the opening. Max diam of opening is 4 in. (102 mm).

2. **Copper Pipe** – Nom 2 in. (51 mm) diam (or smaller) Type L (or heavier) copper pipe. A max of one pipe is permitted in the firestop system. Pipe to be installed near center of stud cavity width and is to be rigidly supported on both sides of wall assembly.

3. **Pipe Insulation – Plastic#** – Nom 5/8 in. (16 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam supplied in the form of tubes with skin. Pipe insulation to be sized to outside diam of copper pipe. See *Plastics (QMFZ2)* category in the Recognized Component Directory for names of manufacturers. Any Recognized Component pipe insulation material meeting the above specifications and having a UL94 Flammability Classification of 94-5VA may be used.

4. **Fill, Void or Cavity Materials* – Wrap Strip** – Nom 1/4 in. (6 mm) thick intumescent elastomeric material faced on one side with aluminum foil, supplied in 2 in. (51 mm) wide strips. Nom 2 in (51 mm) wide strip tightly wrapped around pipe insulation (foil side out) with seam butted. Wrap strip layer securely bound with steel wire or aluminum foil tape and slid into annular space approx 1-1/4 in. (32 mm) such that approx 3/4 in. (19 mm) of the wrap strip width protrudes from the wall surface. Wrap strip installed symmetrically on both sides of wall.

   **3M COMPANY – FS-195+**

5. **Fill, Void or Cavity Materials* – Caulk or Sealant** – Min 1/4 in. (6 mm) diam continuous bead applied to leading edge of wrap strip layer (Item 4) prior to insertion of wrap strip layer into annular space. After insertion of wrap strip layer in annular space, a nom 1/4 in. (6 mm) diam continuous bead is to be applied to the wrap strip/wall interface and to the exposed edge of the wrap strip layer approx 3/4 in. (19 mm) from the wall surface.

   **3M COMPANY – CP 25WB+, IC 15WB+, FireDam 150+ caulk or FB-3000 WT sealant**

1. **Wall Assembly** – The fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner described in the individual U300, U400 or V400 Series Wall or Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Studs** – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 in. by 4 in. (51 mm by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 3-5/8 in. (92 mm) wide and spaced max 24 in. (610 mm) OC.

   B. **Gypsum Board** – Two layers of nom 5/8 in. (16 mm) thick gypsum board, as specified in the individual Wall and Partition Design. Max diam of opening is 14-1/2 in. (368 mm) for wood stud walls and 18 in. (457 mm) for steel stud walls.

2. **Steel Pipe** – Nom 12 in. (305 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe. Pipes larger than nom 4 in. (102 mm) diam may only be used in walls constructed using steel channel studs. A max of one pipe is permitted in the firestop system. Pipe to be installed near center of stud cavity width and to be rigidly supported on both sides of wall assembly.

3. **Pipe Covering** – Nom 1 in. or 2 in. (25 mm or 51 mm) thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints sealed with metal fasteners or with butt strip tape supplied with the product.

   See **Pipe and Equipment Covering – Materials (BRGU)** category in Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Steel Sleeve** – Cylindrical sleeve fabricated from min 0.019 in. (0.48 mm) thick (No. 28 gauge) galv sheet steel and having a min 2 in. (51 mm) lap along the longitudinal seam. Length of steel sleeve to be equal to thickness of wall plus 1 in. (25 mm) such that, when installed, the ends of the sleeve will project approx 1/2 in. (13 mm) beyond the surface of the wall on both sides of the wall assembly. The diam of the openings cut in the gypsum board layers on each side of the wall assembly to be 1 to 2 in. (25 mm to 51 mm) larger than outside diam of pipe insulation such that, when the steel sleeve is installed, a min 1/2 in. to max 1-1/2 in. (13 mm to 38 mm) annular space will be present between the steel sleeve and the pipe insulation around the entire circumference of the pipe. Sleeve installed by coiling the sheet steel to a diam smaller than the through opening, inserting the coil through the openings and releasing the coil to let it uncoil against the circular cutouts in the gypsum board layers.

5. **Fill, Void or Cavity Materials** – **Wrap Strip** – Nom 1/4 in. (6 mm) thick intumescent elastomeric material faced on one side with aluminum foil, supplied in 2 in. (51 mm) wide strips. Nom 2 in. (51 mm) wide strips tightly wrapped around pipe insulation (foil side exposed) and slid into steel sleeve on both sides of wall assembly. Two layers of wrap strip are required. Each layer of wrap strip to be installed with butted seam, with butted seams in successive layers staggered. Wrap strip layers on each side of wall to be installed flush with edge of steel sleeve.

   **3M COMPANY** – FS-195+

6. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Generous application of caulk to be applied to exposed edges of wrap strip layers and around perimeter of steel sleeve at its egress from the wall on both sides of wall assembly. When an annular space is present between the wrap strip layers and the steel sleeve, the annular space shall be filled with a min 1 in. (25 mm) depth of caulking on each side of the wall. When the annular space exceeds 1/4 in. (6 mm), packing material (polyethylene backer rod or mineral wool batt insulation) should be inserted in annular space and recessed 1 in. (25 mm) from edge of sleeve to ensure a full 1 in. (25 mm) depth of caulk is installed.

   **3M COMPANY** – CP 25WB+, IC 15WB+, FireDam 150+ caulk or FB-3000 WT sealant

*Bearing the UL Classification Marking

System No. W-L-5011
September 07, 2004
(Formerly System No. 568)
F Ratings – 1 and 2 Hr (See Item 1)
T Ratings – 1/2 and 1 Hr (See Item 2)
L Rating At Ambient – 2 CFM/sq ft
L Rating At 400 F – less than 1 CFM/sq ft

1. **Wall Assembly** – The 1 or 2 hr fire-rated gypsum wallboard/stud wall assembly shall be constructed of the materials and in the manner described in the individual U300 or U400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Studs** – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. lumber spaced 16 in. OC with nom 2 by 4 in. lumber end plates and cross braces. Steel studs to be min 3-5/8 in. wide by 1-3/8 deep channels spaced max 24 in. OC.
   B. **Gypsum Board** – Nom 5/8 in. thick, 4 ft wide with square or tapered edges. The gypsum wallboard type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual U300 or U400 Series Design in the UL Fire Resistance Directory. Max diam of opening is 14-1/2 in. for wood stud walls and 17 in. for steel stud walls.
   The hourly F Rating of the firestop system is 1 hr when installed in a 1 hr fire rated wall and 2 hr when installed in a 2 hr fire rated wall.

2. **Through Penetrants** – One metallic pipe or tubing to be centered within the firestop system. Pipe or tubing to be rigidly supported on both sides of wall assembly. The following types and sizes of metallic pipes or tubing may be used:
   A. **Steel Pipe** – Nom 12 in. diam (or smaller) Schedule 10 (or heavier) steel pipe. When steel pipe is used, T Rating is 1 hr.
   B. **Copper Tubing** – Nom 6 in. diam (or smaller) Type L (or heavier) copper tubing. When copper tubing is used, T Rating is 1/2 and 1 hr when installed in 1 and 2 hr rated walls, respectively.
   C. **Copper Pipe** – Nom 6 in. diam (or smaller) Regular (or heavier) copper pipe. When copper pipe is used, T Rating is 1/2 and 1 hr when installed in 1 and 2 hr rated walls, respectively.

3. **Pipe Covering** – Nom 1 or 1-1/2 in. thick hollow cylindrical heavy density (min 3.5 pcf) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints sealed with metal fastener strip tape supplied with the product.
   See **Pipe and Equipment Coverings – Materials** – (BRGU) category in Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Steel Sleeve** – Cylindrical sleeve fabricated from min 0.019 in. thick (No. 28 gauge) galv sheet steel and having a min 2 in. lap along the longitudinal seam. Length of steel sleeve to be equal to thickness of wall plus 1 in. such that, when installed, the ends of the sleeve will project approx 1/2 in. beyond the surface of the wall on both sides of the wall assembly. The diam of the openings cut in the gypsum wallboard layers on each side of the wall assembly (concentric with pipe) to be 2 to 2-1/2 in. larger than outside diam of pipe insulation such that, when the steel sleeve is installed, a 1 to 1-1/4 in. annular space will be present between the steel sleeve and the pipe insulation around the entire circumference of the pipe. Sleeve installed by coiling the sheet steel to a diam smaller than the through opening, inserting the coil through the openings and releasing the coil to let it uncoil against the circular cutouts in the gypsum wallboard layers.

5. **Packing Material** – Polyethylene backer rod or min 1 in. thickness of mineral wool batt insulation firmly packed into steel sleeve on both sides of the wall assembly as permanent forms. Packing material to be recessed min 1 in. from end of steel sleeve (recessed min 1/2 in. into gypsum wallboard surface) on both sides of wall assembly.

6. **Fill, Void or Cavity Materials**
   A. **Caulk or Sealant** – Min 1 in. thickness of fill material applied within annulus on both sides of wall assembly. Thickness for fill material for nom 3 in. diam (or smaller) steel pipes or conduits may be reduced to a min 1/2 in. A nom 1/4 in. diam continuous bead of caulk shall be applied around the circumference of the steel sleeve at its egress from the gypsum wallboard layers on both sides of the wall assembly.
   
   **3M COMPANY** – CP 25WB+ caulk or FB-3000 WT sealant

*Bearing the UL Classification Mark

1. **Wall Assembly** – The fire-rated gypsum wallboard/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300 or U400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. **Studs** – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 2-1/2 in. (64 mm) wide and spaced max 24 in. (610 mm) OC. When steel studs are used and the diam at the opening exceeds the width of stud cavity, the opening shall be framed on all sides using lengths of steel stud installed between the vertical studs and screw-attached to the steel studs at each end. The framed opening in the wall shall be 7-1/2 in. (191 mm) wider and 7-1/2 in. (191 mm) higher than the diam of the penetrating item such that, when the penetrating item is centered in the opening, a 3-3/4 in. (95 mm) clearance is present between the penetrating item and the framing in all four sides.
   
   B. **Gypsum Board** – Two layers of 5/8 in. (16 mm) thick gypsum wallboard, as specified in the individual Wall and partition Design. Max diam of opening is 14-1/2 in. (368 mm) for wood stud walls and 31-1/2 in. (800 mm) for steel stud walls.
   
2. **Through-Penetrants** – One metallic pipe or tubing to be installed either concentrically or eccentrically within the firestop system. Pipe or tubing to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of metallic pipes or tubing may be used:
   
   A. **Steel Pipe** – Nom 24 in. (610 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   
   B. **Copper Tubing** – Nom 6 in. (152 mm) diam (or smaller) Type L (or heavier) copper tubing.
   
   C. **Copper Pipe** – Nom 6 in. (152 mm) diam (or smaller) Regular (or heavier) copper pipe.
   
3. **Pipe Covering Materials** – Used in conjunction with Item 4. Nom 3 in. (76 mm) thick unfaced mineral fiber pipe insulation sized to the outside diam of pipe or tube. Pipe insulation secured with min 8 AWG steel wire spaced max 12 in. (305 mm) OC. An nom annular space of 3/4 in. (19 mm) is required within the firestop system. **When mineral wool pipe covering is used, the T, FT and FTH Rating is 2 hr.**

   IIG MINWOOL L L C – High Temperature Pipe Insulation 1200, High Temperature Pipe Insulation BWT or High Temperature Pipe Insulation Thermaloc

3A. **Pipe Covering** – Used as an alternate to Item 3 and 4. Nom 1 in. (25 mm) thick hollow cylindrical heavy density (min 3.5 pcf or 56 kg/m³) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints tightly butted and sealed with metal fasteners or factory applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. A nom annular space of 3/4 in. (19 mm) is required within the firestop system. **When glass fiber pipe covering is used, the T, FT and FTH Rating is 1 hr.**

   See **Pipe and Equipment Covering – Materials** (BRGU) category in the Building Materials Directory for the names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Sheathing Material** – (Not shown) – Used in conjunction with Item 3. Foil-scrim-kraft or all service jacket material shall be wrapped around the outer circumference of the pipe covering material (Item 3) with the kraft side exposed. Longitudinal joints sealed with metal fasteners.

   See **Sheathing Materials (BVDV)** category in the Building Materials Directory for names of manufacturers. Any sheathing material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

5. **Fill, Void or Cavity Material** – Sealant – Min 1-1/4 in. (32 mm) thickness of fill material applied within the annulus on both surfaces of wall. Additional fill material to be installed such that a min 1/4 in. (6 mm) crown is formed around the penetrating item.

*Bearing the UL Classification Mark*
1. **Wall Assembly** — The fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400 or V400 Series Wall or Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   
   **A. Studs** — Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 3-5/8 in. (92 mm) wide and spaced max 24 in. (610 mm) OC.
   
   **B. Gypsum Board*** — Two layers of nom 5/8 in. (16 mm) thick gypsum board, as specified in the individual Wall and Partition Design. Max diam of opening in gypsum board layers is 11 in. (279 mm).

2. **Steel Pipe** — Nom 4 in. (102 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe. One pipe to be installed either concentrically or eccentrically within the firestop system. The annular space between the insulated pipe and the edge of the through opening shall be min 0 in. (0 mm, point contact) to max 1/2 in. (13 mm). Pipe to be rigidly supported on both sides of wall assembly.

3. **Pipe Covering Materials* — Cellular Glass Insulation** — Nom 1-1/2 to 3 in. (38 to 76 mm) thick cellular glass units sized to the outside diam of the steel pipe and supplied in nom 24 in. (610 mm) long half sections or nom 18 in. (457 mm) long segments. Pipe insulation installed on pipe in accordance with the manufacturer’s instructions.

4. **Fill, Void or Cavity Materials* — Caulk or Sealant** — Installed to fill annular space to a min depth of 1-1/4 in. (32 mm), flush with each surface of wall. A min 1/2 in. (13 mm) diam bead of caulk shall be applied to the pipe insulation/wallboard interface at the point contact location on both sides of wall.

   **3M COMPANY** — Type CP 25WB+, IC 15WB+ caulk or FB-3000 WT sealant

5. **Metal Jacket** — Min 12 in. (305 mm) long jacket formed of min 0.010 in. (0.25 mm) thick steel or aluminum sheet cut to wrap tightly around the pipe insulation with a min 2 in. (51 mm) lap and secured using bands and seals of similar material. Bands to be located within 2 in. (51 mm) of each end of the jacket and spaced max 10 in. (254 mm) OC. Jacket to be installed with edge abutting surface of caulk fill material (Item 5) on each side of wall. Metal jacket to be used in addition to any other jacketing material which may be required or desired on the pipe insulation.

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

1. **Wall Assembly** – The 1 or 2 hr fire-rated gypsum wallboard/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400, V400 or W400 Series Wall or Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. **Studs** – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 3-5/8 in. (92 mm) wide and spaced max 24 in. (610 mm) OC.
   
   B. **Gypsum Board** – Nom 5/8 in. (16 mm) thick, 4 ft (122 cm) wide with square or tapered edges. The gypsum wallboard type, number of layers, fastener type and sheet orientation shall be as specified in the individual Wall and Partition Design. Max diam of opening in wallboard layers is 13-3/4 in. (349 mm).
   
   The hourly F and FH Ratings of the firestop system are equal to the hourly fire rating of the wall assembly.

2. **Through Penetrant** – One metallic pipe or tube to be installed either concentrically or eccentrically within the firestop system. Pipe to be rigidly supported on both sides of wall assembly. The following types and sizes of pipe and tubing may be used:
   
   A. **Steel Pipe** – Nom 8 in. (203 mm) diam (or smaller) Sch 10 (or heavier) steel pipe.
   
   B. **Copper Tube** – Nom 4 in. (102 mm) diam (or smaller) Type L (or heavier) copper tubing.

3. **Pipe Covering** – Nom 1/2 to 2 in. (13 to 51 mm) thick hollow cylindrical heavy density (min 3.5 pcf or 24 kg/m³) glass fiber units for 1 hr rated assemblies, nom 1/2 to 1-1/2 in. (13 to 38 mm) thick cylindrical heavy density (min 3.5 pcf or 24 kg/m³) glass fiber units for 2 hr rated assemblies, jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied SSL tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. The annular space between the insulated pipe and the edge of the through opening shall be min 0 in. (continuous point contact) to max 1-1/4 in. (32 mm).
   
   The hourly T, FT and FTH Ratings are 0 hr when pipe covering less than nom 1-1/2 in. (38 mm) thick is used and/or when nom penetrant diam exceeds 4 in. (102 mm). When 1-1/2 in. (38 mm) thick pipe covering is used and penetrant diam does not exceed 4 in. (102 mm), the hourly T, FT and FTH Ratings are 1 hr when installed in 1 hr rated walls. When 1-1/2 in. (38 mm) thick pipe covering is used in 2 hr rated wall, the T, FT and FTH Ratings are 1 hr when copper tube is used and 1-1/2 hr when steel pipe not exceeding 4 in. (102 mm) diam is used.

   **See Pipe and Equipment Covering** – Materials (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.
4. **Fill, Void or Cavity Materials*** – Caulk or Sealant – Min 5/8 in. (16 mm) thickness of caulk applied within annular space flush with each surface of wall. A min 1/2 in. (13 mm) diam bead of caulk shall be applied to the pipe insulation/wallboard interface at the point contact location on both sides of wall.

3M COMPANY – Type CP 25WB+ or FB-3000 WT

1. **Wall Assembly** – The 1 or 2 hr fire-rated gypsum wallboard/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300 or U400 Series Wall or Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. **Studs** – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. lumber spaced 16 in. OC. Steel studs to be min 3-5/8 in. wide and spaced max 24 in. OC.
   
   B. **Gypsum Board*** – Nom 5/8 in. thick, 4 ft wide with square or tapered edges. The gypsum wallboard type, number of layers, fastener type and sheet orientation shall be as specified in the individual Wall and Partition Design. Max diam of opening in wallboard layers is 7 in.

   The hourly F Rating of the firestop system is 1 hr when installed in a 1 hr fire rated wall and 2 hr when installed in a 2 hr fire rated wall.

2. **Through Penetrants** – One metallic pipe or tubing to be installed either concentrically or eccentrically within the firestop system. Pipe or tubing to be rigidly supported on both sides of wall assembly. The following types and sizes of metallic pipes or tubing may be used:

   A. **Steel Pipe** – Nom 4 in. diam (or smaller) Schedule 10 (or heavier) steel pipe. **When steel pipe is used, T Rating is 3/4 hr.**

   B. **Copper Tubing** – Nom 4 in. diam (or smaller) Type L (or heavier) copper tubing. **T Rating is 3/4 hr for copper tubing of nom 2 in. diam and smaller. For copper tubing greater than nom 2 in. diam, T Rating is 1/4 and 1/2 hr when installed in 1 and 2 hr rated walls, respectively.**

   C. **Copper Pipe** – Nom 4 in. diam (or smaller) Regular (or heavier) copper pipe. **T Rating is 3/4 hr for copper pipe of nom 2 in. diam and smaller. For copper pipe greater than nom 2 in. diam, T Rating is 1/4 and 1/2 hr when installed in 1 and 2 hr rated wall respectively.**

3. **Pipe Insulation** – **Plastics#** – Nom 3/4 in. thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. The annular space between the insulated pipe and the edge of the through opening shall be min zero in. (point contact) to max 1-1/4 in. See **Plastics#** (QMFZ2) category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL94 Flammability Classification of 94-5VA may be used.

4. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Min 5/8 in. thickness of caulk applied within the annular space, flush with each surface of wall. A min 1/2 in. diam bead of caulk shall be applied to the pipe insulation/wallboard interface at the point contact location on both sides of wall.

   **3M COMPANY** – CP 25WB+ caulk or FB-3000 WT sealant

1. **Wall Assembly** — The 1 or 2 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Studs** — Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 3-5/8 in. (92 mm) wide and spaced max 24 in. (610 mm) OC.

   B. **Gypsum Board** — Nom 5/8 in. (16 mm) thick gypsum board, as specified in the individual Wall and Partition Design. Max diam of opening is 14-1/2 in. (368 mm) for wood stud walls and 20 in. (508 mm) for steel stud walls.

   1A. **Steel Sleeve** — (Optional, Not Shown) — Cylindrical sleeve fabricated from min 0.019 in. (0.48 mm) thick (No. 28 gauge) galv sheet steel and having a min 2 in. (51 mm) lap along the longitudinal seam. Length of steel sleeve to be equal to thickness of wall plus 1 in. (25 mm) such that, when installed, the ends of the sleeve will project approx 1/2 in. (13 mm) beyond the surface of the wall on both sides of the wall assembly. Sleeve installed by coiling the sheet steel to a diam smaller than the through opening, inserting the coil through the openings and releasing the coil to let it uncoil against the circular cutouts in the gypsum board layers.

2. **Through Penetrants** — One metallic pipe or tubing to be positioned within the firestop system. Pipe or tubing to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of metallic pipes or tubing may be used:

   A. **Steel Pipe** — Nom 12 in. (305 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.

   B. **Copper Tubing** — Nom 6 in. (152 mm) diam (or smaller) Type L (or heavier) copper tubing.

   C. **Copper Pipe** — Nom 6 in. (152) diam (or smaller) Regular (or heavier) copper pipe.

3. **Pipe Covering Materials** — **Cellular Glass Insulation** — Nom 1-1/2 to 3 in. (38 to 76 mm) thick cellular glass units sized to the outside diam of the steel pipe and supplied in nom 24 in. (610 mm) long half sections or nom 18 in. (457 mm) long segments. Pipe insulation installed on pipe in accordance with the manufacturer’s instructions. The annular space between insulation and sleeve or edge of opening shall be min 0 in. (0 mm, point contact) to max 1-1/4 in. (32 mm) T Rating is 1/2 hr when nom 1-1/2 in. (48 mm) thick pipe insulation is used in 1 hr and 2 hr fire rated wall assembly. T Rating is 1 hr when nom 3 in. (76 mm) thick pipe insulation is used in 1 hr fire rated wall assembly. T Rating is 1-1/2 hr when nom 3 in. (76 mm) thick pipe insulation is used in 2 hr fire rated wall assembly.

4. **Metal Jacket** — Min 12 in. (305 mm) long jacket formed of min 0.010 in. (.25 mm) thick steel or aluminum sheet cut to wrap tightly around the pipe insulation with a min 2 in. (51 mm) lap. Jacket secured with min 1/2 in. (13 mm) wide stainless steel hose clamps or bands located within 2 in. (51 mm) of each end of the jacket and spaced a max of 10 in. (254 mm) O.C. Jacket to be installed with edges abutting surface of caulk fill material (Item 5) on both surfaces of wall. Metal jacket to be used in addition to any other jacketing material which may be required or desired on the pipe insulation.

5. **Fill, Void or Cavity Materials** — **Caulk or Sealant** — Installed to fill annular space to a min depth of the gypsum board, flush with both surfaces of wall. A min 1/2 in. (13 mm) diam bead of caulk shall be applied to the pipe insulation/gypsum board interface at the point contact location on both sides of wall.

   **3M COMPANY** — CP 25WB+, IC 15WB+ caulk or FB-3000 WT sealant

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.
1. **Wall Assembly** – The fire rated gypsum wallboard/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300 or U400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Studs** – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. lumber spaced 16 in. OC. Steel studs to be min 3-1/2 in. wide and spaced max 24 in. OC.
   B. **Gypsum Board** – Two layers of nom 5/8 in. thick gypsum wallboard, as specified in the individual Wall and Partition Design. Diam of opening is 1-1/2 in. larger than the outside diam of pipe.

2. **Steel Pipe** – Nom 6 in. diam (or smaller) Schedule 10 (or heavier) 6 steel pipe to be centered within the firestop system. Pipe to be rigidly supported on both sides of floor or wall assembly.

3. **Pipe Covering** – Nom 1 in. thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints tightly butted and sealed with metal fasteners or factory applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. An annular space of 3/4 in. is required within the firestop system. See Pipe and Equipment Covering – Materials (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specification and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Forming Material** – Nom 1 in. diam polyethylene backer rod friction fitted into opening as a permanent form. Forming material to be recessed from both surfaces of wall as required to accommodate the required thickness of fill material.

5. **Fill, Void or Cavity Material** – **Sealant** – Min 5/8 in. thickness of fill material applied within annulus, flush with both surfaces of wall assembly.

   **3M COMPANY** – FB-2000+

1. **Wall Assembly** – The fire-rated gypsum wallboard/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300 or U400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. **Studs** – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. lumber spaced 16 in. OC. Steel studs to be min 2-1/2 in. wide and spaced max 24 in. OC.
   B. **Gypsum Board** – Two layers of nom 5/8 in. thick gypsum wallboard, as specified in the individual Wall and Partition Design. Max diam of opening is 21-3/4 in.

2. **Through Penetrant** – One metallic pipe, conduit or tubing installed either concentrically or eccentrically within the firestop system. Pipe, conduit or tubing to be rigidly supported on both sides of wall assembly. The following types of pipe, conduit or tubing may be used:
   
   A. **Steel Pipe** – Nom 16 in. diam (or smaller) Schedule 30 (or heavier) steel pipe.
   B. **Copper Tubing** – Nom 6 in. diam (or smaller) Type L (or heavier) copper tubing.
   C. **Copper Pipe** – Nom 6 in. diam (or smaller) Regular (or heavier) copper pipe.
System No. W-L-5089 continued

D. Conduit – Nom 4 in. diam (or smaller) steel electrical metallic tubing (EMT) or steel conduit.
The T Ratings are dependent on the types and sizes of pipes used in conjunction with the type and thickness of pipe coverings (Item 3) used as shown in the following table:

Firestop Configuration A

3. Pipe Covering* – Nom 1 or 1-1/2 in. thick hollow cylindrical heavy density (min 7.0 pcf) mineral fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. The annular space shall be min 1/2 in. to max 1-3/8 in.

See Pipe and Equipment Covering – Materials (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. Fill, Void or Cavity Material – Sealant – Min 1-1/4 in. thickness of fill material applied within the annular space, flush with both surfaces of wall.

3M COMPANY – FB-1000 NS or FB-3000 WT sealant

Firestop Configuration B

3. Pipe Covering* – Nom 1 or 1-1/2 in. thick hollow cylindrical heavy density (min 7.0 pcf) mineral fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. The annular space shall be min 1/2 in. to max 1-3/8 in.

See Pipe and Equipment Covering – Materials* (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. Firestop System – The firestop system shall consist of the following:

A. Metallic Sleeve – Cylindrical sleeve fabricated from min 0.018 in. thick (No. 28 gauge) galv sheet steel and having a min 1 in. lap along the longitudinal seam. Length of steel sleeve to be equal to thickness of wall. The inside diam of sleeve shall be 1 to 1-1/2 in. larger than the outside diam of pipe covering. Sleeve is secured with two min No. 18 AWG steel tie wires located 1 to 2 in. from each end of sleeve.

B. Packing Material – Polyethylene backer rod friction-fitted into annular space between the penetrating item and the sleeve on both sides of the wall and recessed a 1-1/4 in. from each end of the sleeve.

C. Fill, Void or Cavity Material* – Sealant – Min 1-1/4 in. thickness of fill material applied within the annular space between the steel sleeve and the periphery of the opening, flush with both surfaces of wall. Min 1-1/4 in. thickness of fill material applied within the annular space between the steel sleeve and the pipe covering, flush with both surfaces of wall.

3M COMPANY – FB-1000 NS or FB-3000 WT sealant

* Bearing the UL Classification Mark

1. **Wall Assembly** – The 4 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Studs** – Wall framing consists of steel channel studs. Steel studs to be min 2-1/2 in. wide and spaced max 16 in. OC. Additional steel studs used to completely frame area of opening.
   B. **Batts and Blankets** – Min 2 in. thickness of min 4 pcf mineral wool batt insulation was placed in the stud cavity.
   C. **Gypsum Board** – Two layers of nom 3/4 in. thick gypsum board, as specified in the individual Wall and Partition Design. Max size of opening is 29 in.

2. **Through Penetrants** – One metallic pipe, conduit or tubing installed either concentrically or eccentrically within the firestop system. Pipe, conduit or tubing to be rigidly supported on both sides of wall assembly. The following types and sizes of metallic pipes, conduits or tubing may be used:
   A. **Steel Pipe** – Nom 24 in. diam (or smaller) Schedule 10 (or heavier) steel pipe.
   B. **Copper Tubing** – Nom 4 in. diam (or smaller) Type L (or heavier) copper tubing.
   C. **Copper Pipe** – Nom 4 in. diam (or smaller) Regular (or heavier) copper pipe.

3. **Pipe Covering** – Min 1 in. to max 2 in. thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints tightly butted and sealed with metal fasteners or factory applied self-sealing lap tape. Annular space between the pipe covering and periphery of opening to be min of 1/4 in. to max of 3/4 in.

   See **Pipe and Equipment Coverings – Materials** (BRGU) category in the Building Materials Directory for the names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Firestop System** – The details of the firestop system shall be as follows:
   A. **Fill, Void or Cavity Materials** – **Wrap Strip** – Nom 1/8 in. thick intumescent material supplied in 2 in. wide strips. One layer of wrap strip required for 1 in. thick fiberglass pipe insulation. Two layers of wrap strip required for 1-1/2 and 2 in. thick fiberglass pipe insulation. Wrap strip layer(s) tightly wrapped around insulated pipe and held in place with 2 in. wide min 3 mil foil tape. Wrap strip to be slid into annular space on both sides of wall to be positioned to extend 1/4 in. beyond the wall surfaces. Min 18 gauge steel wire tie to be secured around middle of extending portion of wrap strip.

   **3M COMPANY** – Ultra GS

   B. **Fill, void or Cavity Materials** – **Caulk, Sealant or Putty** – Min thickness of 3/4 in. of fill material applied within annulus, flush with both surfaces of wall assembly.

   **3M COMPANY** – CP 25WB+, FB-3000 WT sealant or MP+ Stix putty

   *Bearing the UL Classification Mark

1. **Wall Assembly** – The 1 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Studs** – Wall framing may consist of min 2-1/2 in. wide steel channel studs spaced max 24 in. OC.
   B. **Gypsum* Board** – Thickness, type, number of layers and fasteners as required in the individual Wall and Partition Design. Max diam opening is 20-7/8 in.

2. **Through Penetrants** – Metallic pipes or tubing to be installed either concentrically or eccentrically within the firestop system. Pipe or tubing to be rigidly supported on both sides of wall assembly. The following types and sizes of metallic pipes or tubing may be used:
   A. **Metallic Pipes** – Max one metallic pipe or tubing. The annular space between penetrant and periphery of opening shall be min 0 in. to max 1-7/8 in. The following types and sizes of metallic pipes or tubing may be used:
      A1. **Steel Pipe** – Nom 16 in. diam (or smaller) Schedule 10 (or heavier) steel pipe.
      A2. **Iron Pipe** – Nom 16 in. diam (or smaller) cast or iron ductile pipe.
      A3. **Copper Tube** – Nom 6 in. diam (or smaller) Type L (or heavier) copper tube.
      A4. **Copper Pipe** – Nom 6 in. diam (or smaller) Regular (or heavier) copper pipe.
   B. **Pipe Covering*** – Max 1-1/2 in. thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all-service jacket. Longitudinal joints sealed with metal fasteners or factory applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. The annular space shall be min 0 in. (point contact) to max 1-7/8 in.

   See **Pipe and Equipment Covering – Materials** (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classified Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

3. **Fill, Void or Cavity Materials* – Sealant** – Min 5/8 in. thickness of fill material applied within the annulus, flush with both surfaces of the wall. Min 1/2 in. diam bead of fill material applied to the wallboard/penetrant interface at point contact location on both surfaces of wall.

   **3M COMPANY** – FB-1000 NS or FB-3000 WT sealant

*Bearing the UL Classification Mark

1. **Wall Assembly** – The 1 or 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400 or V400 Series Wall or Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Studs** – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 in. by 4 in. (51 mm by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 3-5/8 in. (92 mm) wide spaced max 24 in. (610 mm) OC.

   B. **Gypsum Board** – Nom 5/8 in. (16 mm) thick, 4 ft (122 cm) wide with square or tapered edges. The gypsum board type, number of layers, fastener type and sheet orientation shall be as specified in the individual Wall and Partition Design. Max diam of opening is 10-1/2 in. (267 mm).

   The hourly F and T Ratings for the firestop system are equal to the hourly fire rating of the wall assembly in which it is installed.

2. **Through Penetrants** – One metallic pipe or tubing to be installed either concentrically or eccentrically within the firestop system. Penetrants to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of metallic pipes or tubings may be used:

   A. **Steel Pipe** – Nom 6 in. (152 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.

   B. **Iron Pipe** – Nom 6 in. (152 mm) diam (or smaller) cast or ductile iron pipe.

   C. **Conduit** – Nom 6 in. (152 mm) diam (or smaller) steel conduit, or nom 4 in. (or smaller) steel electrical metallic tubing.

   D. **Copper Tubing** – Nom 2 in. (51 mm) diam (or smaller) Type M (or heavier) copper tube.

   E. **Copper Pipe** – Nom 2 in. (51 mm) diam (or smaller) Regular (or heavier) copper pipe.

3. **Pipe Covering** – Nom 1 in. or 1-1/2 in. (25 mm or 38 mm) thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied SSL tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. The annular space between the insulated pipe and the edge of the through opening shall be min 0 in. (point contact) to max 1-1/2 in. (0 mm to max 38 mm).

   See **Pipe and Equipment Covering – Materials** (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used

4. **Fill, Void or Cavity Material** – Caulk or Sealant – Min 5/8 in. (16 mm) thickness of fill material applied within the annulus, flush with both surfaces of wall. Min 1/2 in. (13 mm) diam bead of caulk applied to the pipe covering/gypsum board interface at the point contact location on both sides of wall.

   **3M COMPANY** – FireDam 150+, IC 15WB+ caulk or FB-3000 WT sealant.

*Bearing the UL Classification Mark

1. **Wall Assembly** – The 1 or 2 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner described in the individual U300, U400 or V400 Series Wall or Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   
   **A. Studs** – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 3-1/2 in. (89 mm) wide spaced max 24 in. (610 mm) OC.
   
   **B. Gypsum Board** – The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual Design in the UL Fire Resistance Directory. Max diam of opening is 12-1/2 in. (318 mm).

   The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed.

2. **Steel Sleeve** – (Optional) – Cylindrical sleeve fabricated from min 0.019 in. (0.49 mm) thick (28 gauge) galv sheet steel and having a min 2 in. (51 mm) lap along the longitudinal seam. Length of steel sleeve to be equal to thickness of wall or up to 2 in. (51 mm) longer than the thickness of wall such that, when installed, the ends of the sleeve will be flush with wall surface or project up to 1 in. (25 mm) beyond the surface of the wall on each side of the wall assembly. Sleeve installed by coiling the sheet steel to a diam smaller than the max 12-1/2 in. (318 mm) diam through opening, inserting the coil through the opening and releasing the coil to let it uncoil against the circular cutouts in the gypsum board layers.

   The hourly T Rating is 0 hr when optional sleeve is used.

3. **Through-Penetrants** – One metallic pipe or tubing installed concentrically or eccentrically within opening. Penetrant to be rigidly supported on both sides of wall. The following types and sizes of penetrants may be used:
   
   **A. Steel Pipe** – Nom 8 in. (203 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   
   **B. Iron Pipe** – Nom 8 in. (203 mm) diam (or smaller) cast or ductile iron pipe.
   
   **C. Copper Tubing** – Nom 4 in. (102 mm) diam (or smaller) Type L (or heavier) copper tubing.
   
   **D. Copper Pipe** – Nom 4 in. (102 mm) diam (or smaller) Regular (or heavier) copper pipe.
4. **Pipe Covering** – Nom 1 in. (25 mm), 1-1/2 in. (38 mm) or 2 in. (51 mm) thick hollow cylindrical heavy density (min 3.5 pcf or 56 kg/m³) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied SSL tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. Annular space between pipe covering and periphery of opening to be min 0 in. (0 mm, point contact) to max 1-7/8 in. (48 mm). When the steel sleeve (Item 2) is used the annular space between the pipe covering and the periphery of the opening is to be min 1/8 in. (3 mm) to max 1-3/4 in. (44 mm).

   See **Pipe and Equipment Covering-Materials (BRGU)** category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

   The hourly T Rating is 1-1/4 Hr for pipe coverings of nom 1 in. and 1-1/2 in. (25 mm and 38 mm) thick for 2 Hr rated assemblies. The hourly T Rating is 1-1/2 Hr for pipe coverings of nom 2 in. (51 mm) thick for 2 Hr rated assemblies. The hourly T Rating is 1/2 Hr for pipe coverings of nom 1 in. and 1-1/2 in. (25 mm and 38 mm) thick for 1 Hr rated assemblies. The hourly T Rating is 3/4 Hr for pipe coverings of nom 2 in. (51 mm) thick for 1 Hr rated assemblies.

5. **Fill, Void or Cavity Material** – Caulk or Sealant – Min 5/8 in. (16 mm) thickness of caulk applied within annulus, flush with both surfaces of wall. Min 1/4 in. (6 mm) diam bead of caulk applied to gypsum board/pipe covering interface or gypsum board/sleeve at point contact location on both sides of wall.

   **3M COMPANY** – IC 15WB+, CP 25WB+ caulk or FB-3000 WT sealant

---

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

1. **Wall Assembly** – The 1 or 2 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner described in the individual U300, U400 or V400 Series Wall or Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Studs** – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 in. by 4 in. (51 mm by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 3-1/2 in. (89 mm) wide spaced max 24 in. (610 mm) OC.
   B. **Gypsum Board** – The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual U300 or U400 Series Design in the UL Fire Resistance Directory. Max diam of opening is 7-1/2 in. (191 mm).

   The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed.

2. **Through Penetrants** – One metallic pipe or tubing installed concentrically or eccentrically within opening. Penetrant to be rigidly supported on both sides of wall assembly. The following types and sizes of metallic pipes or tubing may be used:
   A. **Steel Pipe** – Nom 4 in. (102 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   B. **Iron Pipe** – Nom 4 in. (102 mm) diam (or smaller) cast or ductile iron pipe.
   C. **Copper Tubing** – Nom 2 in. (51 mm) diam (or smaller) Type L (or heavier) copper tubing.
   D. **Copper Pipe** – Nom 2 in. (51 mm) diam (or smaller) Regular (or heavier) copper pipe.

3. **Tube Insulation-Plastics** – Nom 3/4 in. (19 mm) thick (or less) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. Annular space between tube insulation and periphery of opening to be min 0 in. (point contact) to max 1-1/2 in. (0 mm to 38 mm).

   See **Plastics** (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5A may be used.

   **T Rating** is 1 Hr for nom 3/4 in. (19 mm) thick tube insulation in 2 Hr rated assemblies. **T Rating** is 0 Hr for 3/4 in. (19 mm) thick tube insulation in 1 Hr rated assemblies. **T Rating** is 0 Hr for tube insulations less than nom 3/4 in. (19 mm) thick in 1 and 2 Hr rated assemblies.

4. **Fill, Void or Cavity Material** – **Caulk or Sealant** – Min 5/8 in. (16 mm) thickness of caulk applied within annulus, flush with both surfaces of wall. Min 1/4 in. (6 mm) diam bead of caulk applied to gypsum board/tube insulation interface at point contact location on both sides of wall.

   **3M COMPANY** – CP 25WB+, IC 15WB+ caulk or FB-3000 WT sealant

1. **Wall Assembly** – The 2 hr fire-rated shaft wall assembly shall be constructed of the materials and in the manner specified in the individual U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Steel Studs** – C-H shaped studs, 2-1/2 in. (64 mm) wide by 1-1/2 in. (38 mm) deep, spaced 24 in. (610 mm) OC.
   B. **Gypsum Board** – 1 in. (25 mm) thick gypsum board liner panels, supplied in nom 24 in. (610 mm) widths as specified in the individual Wall and Partition Design. Max diam of opening is 6 in. (152 mm).
   C. **Gypsum Board** – Two layers of 5/8 in. (16 mm) thick gypsum board as specified in the individual Wall and Partition Design. Max diam of opening is 6 in. (152 mm).

2. **Steel Sleeve** – Cylindrical sleeve fabricated from min 0.019 in. (0.49 mm) thick (28 gauge) galv sheet steel and having a min 2 in. (51 mm) lap along the longitudinal seam. Length of steel sleeve to be equal to thickness of wall or up to 2 in. (51 mm) longer than the thickness of wall such that, when installed, the ends of the sleeve will be flush with wall surface or project up to 1 in. (25 mm) beyond the surface of the wall on each side of the wall assembly. Sleeve installed by coiling the sheet steel to a diam smaller than the max 6 in. (152 mm) diam through opening, inserting the coil through the opening and releasing the coil to let it uncoil against the circular cutouts in the gypsum board layers.

3. **Through Penetrants** – One metallic pipe or tube installed within the firestop system. Pipe or conduit to be rigidly supported on both sides of wall assembly. The following types of metallic pipes or tubes may be used:
   A. **Steel Pipe** – Nom 2 in. (51 mm) (or smaller) Schedule 5 (or heavier) steel pipe.
   B. **Iron Pipe** – Nom 2 in. (51 mm) (or smaller) cast or ductile iron pipe.
   C. **Copper Tubing** – Nom 2 in. (51 mm) (or smaller) Type L (or heavier) copper tubing.
   D. **Copper Pipe** – Nom 2 in. (51 mm) (or smaller) Regular (or heavier) copper pipe.

4. **Pipe Covering** – Nom 1/2 in. to 1-1/2 in. (13 mm to 38 mm) thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with product. Annular space between the pipe covering and sleeve shall be min 1/8 in. to max 3/4 in. (3.2 mm to max 19 mm).

See **Pipe and Equipment Covering – Materials** (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a smoke Developed Index of 50 or less may be used.

**T Rating** is 3/4 Hr when nom 1-1/2 in. (38 mm) thick pipe covering is used. **T Rating** is 0 Hr when pipe covering is less than nom 1-1/2 in. (38 mm) thick.

5. **Firestop System** – The firestop system shall consist of the following:
   A. **Fill, Void or Cavity Materials** – **Wrap Strip** – Nom 1/8 in. (3.2 mm) thick intumescent material supplied in 2 in. (51 mm) wide strips. Min one layer of wrap strip tightly wrapped around pipe covering and held in position using foil tape. Wrap strip to be recessed from finished surface of wall (Item 1C) approx 1-3/4 in. (44 mm) such that the leading edge of wrap strip is flush with inner surface of gypsum board liner panel (Item 1B).
   **3M COMPANY** – Ultra GS

   B. **Packing Material** – Min 3 in. (76 mm) thickness of min 4 pf (64 kg/m²) mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from finished surface of wall to accommodate the required thickness of fill material.

   C. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Min 5/8 in. (16 mm) thickness of caulk applied within annulus, flush with finished surface of wall assembly.

   **3M COMPANY** – CP 25WB+, IC 15WB+ caulk or FB-3000 WT sealant

*Bearing the UL Classification Marking*
1. Wall Assembly – The 1 or 2 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner described in the individual U300, U400 or V400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. Studs – Wall framing may consist of either wood or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 3-1/2 in. (89 mm) wide spaced max 24 in. (610 mm) OC.
   B. Gypsum Board* – The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory. Max area of opening is 98-1/2 in.2 (635 cm2) with a max dimension of 12-1/8 in. (308 mm) for square devices. Max diam of opening is 2-1/4 in. (57 mm) for nom 2 in. (51 mm) round devices and 4-1/4 in. (108 mm) for 4 in. (102 mm) round devices.

   The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed.

2. Through-Penetrants – One or more metallic pipes or tubes with tube insulation may be installed within each firestop device (Item 4A). Through penetrants to be rigidly supported on both sides of wall assembly. The following types and sizes of through-penetrants may be used:
   A. Steel Pipe – Nom 3/4 in. (19 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   B. Iron Pipe – Nom 3/4 in. (19 mm) diam (or smaller) cast or ductile iron pipe.
   C. Copper Tubing – Nom 3/4 in. (19 mm) diam (or smaller) Type L (or heavier) copper tube.
   D. Copper Pipe – Nom 3/4 in. (19 mm) diam (or smaller) Regular (or heavier) copper pipe.

   Tube Insulation - Plastic+ – Nom 1/2 in (13 mm) thick or smaller) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing with skin may be used on the copper tubes. If multiple insulated through penetrants are installed within the firestop device, the insulated through penetrants may be bundled together.

   See Plastics+ (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-SVA may be used.

3. Firestop System – The firestop system shall consist of the following:
   A. Firestop Device* – A max of six square firestop devices may be ganged together. As an alternate, one round device may be centered in a round opening. Each device consists of a nom 2-1/2 by 2-1/2 by 10 in. (64 by 64 by 254 mm), a nom 4 by 4 by 10 in. (102 by 102 by 254 mm), a nom 2 in. (51 mm) diam by 10 in. (254 mm) or a nom 4 in. (102 mm) diam by 10 in. (254 mm) powder coated steel transit incorporating internal intumescent material, foam plugs and mounting flanges. Firestop device(s) to be installed within opening with ends projecting an equal distance beyond each surface of wall assembly in accordance with the accompanying installation instructions. The annular space between device(s) and periphery of opening shall be min 0 in. (0 mm, point contact) to max 1/8 in. (3 mm). Firestop device(s) secured in place by means of fill material (Item 3B) and steel split mounting flanges sized to accommodate the firestop device.
   B. Fill, Void or Cavity Materials – Putty or Caulk – Min 1/8 in. (3 mm) bead of fill material shall be applied at interface of gypsum board and firestop devices immediately prior to the installation of the mounting flanges. If three or less devices (Item 3A) are ganged together, the fill material may be optional. As an option, foam plugs may be recessed into device and the recess filled with putty or caulk flush with the ends of the device. L Rating applies only when fill material is applied at interface of gypsum board and device(s) prior to mounting flanges and with both ends of firestop device(s) filled with nominal 1/8 in. (3.2 mm) of Moldable Putty+.

   3M COMPANY – Moldable Putty+, CP 25WB+, IC 15WB+, 3000 WT

1. **Wall Assembly** – The 1 or 2 hr fire-rated gypsum board/stud shaft wall assembly shall be constructed of the materials and in the manner specified in the individual U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall incorporate the following construction features:

   A. **Steel Studs** – “C-H” or “C-T” shaped studs, min 2-1/2 in. (64 mm) wide by 1-1/2 in. (38 mm) deep, fabricated from min No. 25 gauge (0.6 mm thick) galv steel, spaced max 24 in. (610 mm) OC.

   B. **Gypsum Board** – 1 in. (25 mm) thick, 24 in. (610 mm) wide gypsum liner panels installed vertically. Diam of circular cutout in gypsum liner panel to be min 1 in. (25 mm) larger than OD of pipe covering (Item 3). Max diam of circular cutout is 13 in. (330 mm).

   C. **Gypsum Board** – 1/2 in. or 5/8 in. (13 or 16 mm) thick, 48 in. (1.2 m) wide gypsum boards. The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual Wall and Partition Design. Diam of circular cutout in gypsum board to be min 1 in. (25 mm) larger than OD of pipe covering (Item 3). Max diam of circular cutout is 13 in. (330 mm).

   The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed.

2. **Through Penetrant** – One metallic pipe or tubing installed either concentrically or eccentrically within the firestop system. Pipe or tubing to be rigidly supported on both sides of wall assembly. The following types and sizes of metallic pipes or tubing may be used:

   A. **Steel Pipe** – Nom 8 in. (203 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.

   B. **Iron Pipe** – Nom 8 in. (203 mm) diam (or smaller) service weight (or heavier) cast iron soil pipe, nom 8 in. (203 mm) diam (or smaller) or Class 50 (or heavier) ductile iron pressure pipe.

   C. **Copper Tubing** – Nom 6 in. (152 mm) diam (or smaller) Type L (or heavier) copper tubing

   D. **Copper Pipe** – Nom 6 in. (152 mm) diam (or smaller) Regular (or heavier) copper pipe.

3. **Pipe Covering** – Nom 1 in. (25 mm) or 1-1/2 in. (38 mm) thick hollow cylindrical heavy density (min 3.5 pcf or 56 kg/m3) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied SSL tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. Annular space between pipe covering and periphery of opening to be min 1/4 in. (6 mm) to max 1 in. (25 mm).

   See **Pipe and Equipment Covering – Materials** (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

   The hourly T Rating is 1/2 Hr for 1 Hr rated assemblies and 1-1/4 Hr for 2 Hr rated assemblies.

4. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Caulk or sealant applied within annulus at a thickness equal to the total thickness of the gypsum board on both sides of the wall.

   3M COMPANY – CP25WB+ Caulk or FB-3000 WT Sealant

*Bearing the UL Classification Mark

1. **Wall Assembly** – The 2 hour fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400, or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Studs** – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nominal 2 by 4 in. (51 by 102 mm) lumber spaced a maximum 16 in. (406 mm) OC. Steel studs to be minimum 3-1/2 in. (89 mm) wide and spaced a maximum 24 in. (610 mm) OC.

   B. **Wallboard, Gypsum*** – Two layers of min 5/8 in. (16 mm) thick, 4 ft. (1.2 m) wide with square or tapered edges as specified in the individual Wall and Partition Design. Opening shall be sized to be nom. 2 in. (51 mm) larger than outside diam. of pipe cover (Item 3).

2. **Through Penetrants** – One metallic pipe or tubing to be installed either concentrically or eccentrically within the firestop system. Pipe or tubing to be rigidly supported on both sides of wall assembly. The following types and sizes of metallic pipes of tubing may be used:

   A. **Steel Pipe** – Nom 6 in. (152 mm) diam (or smaller) Schedule 40 (or heavier) steel pipe.

   B. **Iron Pipe** – Nom 6 in. (152 mm) diam (or smaller) cast or ductile iron pipe.

   C. **Copper Tubing** – Nom 6 in. (152 mm) diam (or smaller) Type L (or heavier) copper tubing.

   D. **Copper Pipe** – Nom 6 in. (152 mm) diam (or smaller) Regular (or heavier) copper pipe.

3. **Pipe Covering*** – Nom. 3 in. (76 mm) thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. The annular spacing between pipe covering and the edge of the through-opening shall be min. 0 in. (point contact) to max. 2 in. (51 mm).

   See **Pipe and Equipment Covering-Materials** (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Fill, Void or Cavity Material*** – **Sealant** – Min 1-1/4 in. (32 mm) thickness of sealant applied within the gypsum board annulus, flush with the finished side of the wall. Min 1/2 in. (13 mm) diameter bead of sealant applied to the penetrant/gypsum board interface at the point contact location on the finished side of the wall.

© 2014 UL LLC
1. **Wall Assembly** — The 1 or 2 h fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner described in the individual U300, U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Studs** — Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 3-1/2 in. (89 mm) wide and spaced max 24 in. (610 mm) OC.

   B. **Gypsum Board** — Thickness, type, number of layers and fasteners as specified in the individual Wall and Partition Design. Max diam of opening is 2 in. (51 mm).

   The hourly F Rating of the firestop system is equal to the hourly assembly rating of the wall assembly in which it is installed.

2. **Through Penetrants** — One nonmetallic pipe to be installed either concentrically or eccentrically within the firestop system. Pipe to be rigidly supported on both sides of wall assembly. The following types and sizes of nonmetallic pipes or tubing may be used:

   A. **Polyvinyl Chloride (PVC) Pipe** — Nom 2 in. (51 mm) diam (or smaller) Schedule 40 solid core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

   B. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** — Nom 2 in. (51 mm) diam (or smaller) SDR13.5 CPVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

3. **Tube Insulation - Plastics+** — Nom 1 in. (25 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. The tube insulation should be compressed and installed with continuous point contact within the opening. See **Plastics+** (QMFZ2) (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5VA may be used.

4. **Firestop System** — The firestop system shall consist of the following:

   A. **Fill, Void or Cavity Material**—Caulk or Sealant — (Not Shown) Min 1/4 in. (6 mm) thickness of fill material applied around the outer circumference of the insulated through penetrant at the gypsum board interface on both sides of the wall assembly.

   B. **Fill, Void or Cavity Materials**—Wrap Strip — Nom 2 in. (51 mm) wide, nom 1/4 in. (6 mm) thick intumescent elastomeric material faced on one side with aluminum foil. Two layers of wrap strip tightly wrapped around insulated through penetrant (foil side exposed) and butted against the wall surface on both sides of the wall assembly. Each layer of wrap strip to be installed with butted seam in successive layers staggered. Wrap strips temporarily held in position using aluminum foil tape, steel wire tie, or equivalent.

   C. **Steel Collar** — Nom 2 in. (51 mm) deep collar with 1-1/4 in. (32 mm) wide by 2 in. (51 mm) long anchor tabs and min 1/2 in. (13 mm) long tabs to retain wrap strip. Coils of precut min 0.016 in. (0.41 mm) in thick (30 gauge) galv sheet steel available from wrap strip manufacturer. As an alternate, collar may be field-fabricated from min 0.016 in. (0.41 mm) thick (30 gauge) galv sheet steel in accordance with instruction sheet supplied by wrap strip manufacturer. Collar, with anchor tabs bent outward 90 degrees, wrapped tightly around wrap strip with min 1 in. (25 mm) overlap at seam and compressed around wrap strip(s) using a min 1/2 in. (13 mm) wide by min 0.028 in. (0.71 mm) thick stainless steel band at the collar midheight. As an alternate to the band clamps, collars may be secured by means of No. 10 by 3/8 in. (10 mm) long steel sheet metal screws installed in the vertical axis at the center of the 1 in. (25 mm) overlap along the perimeter joint of the collar. A min of three screws is required. Collar anchor tabs pressed tightly against wall surfaces and secured to wall surfaces with nom 3/16 in. (5 mm) diam steel toggle bolts, or equivalent, in conjunction with min 1-1/4 in. (32 mm) diam steel fender washers.

*+Bearing the UL Recognized Component Mark

* Indicates such products shall bear the UL or eUL Certification Mark for jurisdictions employing the UL or eUL Certification (such as Canada), respectively.
1. **Wall Assembly** – The 1 or 2 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner described in the individual U300, U400 or V400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Studs** – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 3-1/2 in. (89 mm) wide spaced max 24 in. (610 mm) OC.
   B. **Gypsum Board** – The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual U300, U400 or V400 Series Design in the UL Fire Resistance Directory. Diam of wall opening to be min 1 in. (25 mm) to max 1-1/2 in. (38 mm) larger than outside diam of insulated pipe or tube.

   The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed. The hourly T Rating of the firestop system is 1 hr and 1-1/2 hr for the 1 hr and 2 hr fire rated assemblies, respectively.

2. **Through Penetration** – One metallic pipe or tube to be installed eccentrically or concentrically within the firestop system. Pipe or tube to be rigidly supported on both sides of the floor or wall assembly. The following types and sizes of metallic pipes and tubes may be used:
   A. **Steel Pipe** – Nom 3 in. (76 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
   B. **Iron Pipe** – Nom 3 in. (76 mm) diam (or smaller) cast or ductile iron pipe.
   C. **Copper Pipe** – Nom 2 in. (51 mm) diam (or smaller) Regular (or heavier) copper pipe.
   D. **Copper Tube** – Nom 2 in. (51 mm) diam (or smaller) Type L (or heavier) copper tube.

3. **Pipe Insulation** – **Foamed Plastic** – Nom 1 in. (25 mm) thick polyisocyanurate foamed plastic units jacketed with an all service jacket. Longitudinal joints sealed with self-sealing lap tape. Transverse joints secured with butt tape. Annular space shall be min 1/4 in. (6 mm) to max 3/4 in. (19 mm).

   See **Foamed Plastic** (BRYX) category in the Building Materials Directory for names of manufacturers. Any foamed plastic pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less may be used.

4. **Band Clamp** – Nom 1/2 (13 mm) wide stainless steel band clamp with worm gear tightening mechanism. Band clamp to be secured around pipe insulation 1 in. (25 mm) from both surfaces of wall.

5. **Fill, Void or Cavity Material** – **Sealant** – Min 5/8 in. (16 mm) thickness of fill material applied within annulus, flush with both surfaces of wall, with a nominal 1/2 in. (13 mm) lap onto the wall surfaces.

**3M COMPANY**

**3M FIRE PROTECTION PRODUCTS** – Type CP-25WB+ Caulk, FB-3000WT Sealant

No mineral wool or sleeve required. Also known as FE5012. |
1. **Floor Assembly** – The fire rated wood truss or combination wood and steel truss Floor-Ceiling assembly shall be constructed of the materials and in the manner described in the individual L500-Series Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Trusses** – Min 12 in. (305 mm) deep parallel chord trusses fabricated from nom 2 in. by 4 in. (51 mm by 102 mm) lumber in conjunction with galv steel truss plates or **Structural Wood Members** with bridging as required.

   B. **Flooring** – Nom 3/4 in. (19 mm) thick plywood flooring with or without **Floor Topping Mixture**. Max diam of hole-sawed opening in flooring is 7 in. (178 mm).

   C. **Furring Channels** – Rigid or resilient galv steel furring channels installed perpendicular to bottom chord of trusses.

   D. **Gypsum Board** – Nom 4 ft (122 cm) wide by 5/8 in. (16 mm) thick, screw-attached to furring channels. Max diam of hole-sawed opening in gypsum wallboard ceiling is 7 in. (178 mm).

2. **Pipe** – Nom 4 in. (102 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe or nom 3 in. (76 mm) diam (or smaller) **Type L** (or heavier) copper pipe. Pipe to be installed approximately midway between trusses and centered in circular cutouts in flooring (Item 1B) and gypsum wallboard ceiling (Item 1D). Diam of circular cutouts in flooring and gypsum wallboard ceiling to be 1/2 in. to 3/4 in. (13 mm by 19 mm) larger than outside diam of pipe covering (Item 3) or tube insulation (Item 3A) on pipe. Pipe to be rigidly supported on both sides of Floor-Ceiling assembly.

3. **Pipe Covering** – Nom 1 in. (25 mm) thick hollow cylindrical heavy density (min 3.5pcf or 56 kg/m³) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt strip tape supplied with the product.

   **See Pipe and Equipment Covering – Materials** (BRGU) category in Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

3A. **Tube Insulation – Plastics** – As an alternate to the glass fiber pipe covering (Item 3), nom 1/2 in. or 5/8 in. (13 mm by 16 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing with skin may be used.

   **See Plastics** (QMFZ2) category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5VA may be used.

4. **Fill, Void or Cavity Materials** – **Wrap Strip** – Nom 1/4 in. thick intumescent elastomeric material faced on one side with aluminum foil, supplied in 2 in. wide strips. Nom 2 in. wide strip tightly wrapped around pipe covering or tube insulation (foil side exposed), secured with two steel tie wires and slid into hole-sawed opening in flooring (Item 1B) and in gypsum wallboard ceiling (Item 1D). Bottom edge of wrap strip to project 9/16 in. to 11/16 in. (14 mm to 17.5 mm) below bottom surface of flooring and below bottom (ceiling) surface of gypsum wallboard.

   **3M COMPANY** – FS-195, FS-195+

5. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Nom 1/4 in. (6 mm) thickness of caulk to be applied to the exposed edge of the wrap strip layer (top of flooring and bottom of gypsum wallboard ceiling). Generous application of caulk to be applied to fill all gaps at the wrap strip/flooring and wrap strip/gypsum wallboard ceiling interfaces.

   **3M COMPANY** – CP 25WB+, IC 15WB+, FireDam 150+ caulk or FB-3000 WT sealant

1. **Floor-Ceiling Assembly** – The 1 hr fire-rated solid or trussed lumber joist floor-ceiling assembly shall be constructed of the materials and in the manner specified in the individual L500 Series Floor-Ceiling Designs in the UL Fire Resistance Directory. The general construction details of the floor-ceiling assembly are summarized below:
   A. **Flooring System** – Lumber or plywood subfloor with finish floor of lumber, plywood or Floor Topping Mixture* as specified in the individual Floor-Ceiling Design. Max diam of opening is 8 in. (203 mm).
   B. **Wood Joists** – Nom 10 in. (254 mm) deep (or deeper) lumber, steel or combination lumber and steel joists, trusses or Structural Wood Members* with bridging as required and with ends firestopped.
   C. **Gypsum Board*** – Nom 4 ft (122 cm) wide by 5/8 in. (16 mm) thick as specified in the individual Floor-Ceiling Design. Max diam of opening is 8 in. (203 mm).

2. **Through Penetrants** – One metallic pipe, conduit, tubing or flexible metal pipe installed concentrically or eccentrically within opening. Penetrant to be rigidly supported on both sides of floor-ceiling. The following types and sizes of penetrants may be used:
   A. **Steel Pipe** – Nom 4 in. (102 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
   B. **Iron Pipe** – Nom 4 in. (102 mm) diam (or smaller) cast or ductile iron pipe.
   C. **Copper Tubing** – Nom 4 in. (102 mm) diam (or smaller) Type L (or heavier) copper tubing.
   D. **Copper Pipe** – Nom 4 in. (102 mm) diam (or smaller) Regular (or heavier) copper pipe.

3. **Pipe Coverings** – Pipe covering installed such that the annular space between pipe covering and periphery of opening shall be min 0 in. (point contact) to max 7/8 in. (0 mm to 22 mm). The following types of pipe coverings shall be used:
   A. **Pipe Coverings*** – Nom 1-1/2 in. (38 mm) thick (or less) hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied SSL tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product.
   See **Pipe and Equipment Covering- Materials** (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.
   B. **Tube Insulation-Plastics+** – Nom 3/4 in. (19 mm) thick (or less) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing.
   See **Plastics** (QMFZ2) category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5A may be used.

   **T Rating** is 1 Hr for nom 1-1/2 and 1 in. (25 mm) thick glass fiber units. **T Rating** is 0 Hr for glass fiber units less than nom 1 in. (25 mm) thick. **T Rating** is 3/4 Hr for nom 3/4 in. (19 mm) thick tube insulation. **T Rating** is 0 Hr for tube insulations less than nom 3/4 in. (19 mm) thick.

4. **Fill, Void or Cavity Materials*** – **Caulk or Sealant** – Min 3/4 in. (19 mm) thickness of caulk applied within annulus, flush with top surface of floor. Min 5/8 in. (16 mm) thickness of caulk applied within annulus, flush with bottom surface of ceiling. Min 1/4 in. (6 mm) diam bead of caulk applied at point contact locations at pipe covering/floor interface on top surface of floor and at pipe covering/ceiling interface.

   **3M COMPANY** – IC 15WB+, CP 25WB+ caulk or FB-3000 WT sealant

1. **Floor-Ceiling Assembly** – The 1 hr fire-rated solid or trussed lumber joist floor-ceiling assembly shall be constructed of the materials and in the manner specified in the individual L500 Series Floor-Ceiling Designs in the UL Fire Resistance Directory. The general construction details of the floor-ceiling assembly are summarized below:
   A. **Flooring System** – Lumber or plywood subfloor with finish floor of lumber, plywood or **Floor Topping Mixture** as specified in the individual Floor-Ceiling Design. Max diam of opening is 8 in. (203 mm).
   B. **Wood Joists** – Nom 10 in. (254 mm) deep (or deeper) lumber, steel or combination lumber and steel joists, trusses or **Structural Wood Members** with bridging as required and with ends firestopped.
   C. **Gypsum Board** – Nom 4 ft (122 cm) wide by 5/8 in. (16 mm) thick as specified in the individual Floor-Ceiling Design. Max diam of opening is 8 in. (203 mm).

2. **Through Penetrants** – One metallic pipe or tubing installed concentrically or eccentrically within opening. Penetrant to be rigidly supported on both sides of floor-ceiling. The following types and sizes of penetrants may be used:
   A. **Steel Pipe** – Nom 6 in. (151 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
   B. **Iron Pipe** – Nom 6 in. (151 mm) diam (or smaller) cast or ductile iron pipe.
   C. **Copper Tubing** – Nom 6 in. (151 mm) diam (or smaller) Type L (or heavier) copper tubing.
   D. **Copper Pipe** – Nom 6 in. (151 mm) diam (or smaller) Regular (or heavier) copper pipe.

3. **Pipe Coverings** – Nom 2 in. (51 mm) thick (hollow cylindrical heavy density (min 3.5pcf or 56 kg/m³) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied SSL tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. Pipe covering installed such that the annular space between pipe covering and periphery of opening shall be min 6 in. (point contact) to max 1-7/8 in. (48 mm).

   See **Pipe and Equipment Covering-Materials** (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Min 3/4 in. (19 mm) thickness of fill material applied within annulus, flush with top surface of floor. Min 5/8 in. (16 mm) thickness of fill material applied within annulus, flush with bottom surface of ceiling. Min 1/2in. (13 mm) diam bead of fill material applied at point contact locations at pipe covering/floor interface on top surface of floor and at pipe covering/ceiling interface.

1. **Floor-Ceiling Assembly** – The 1 hr fire rated concrete and steel joist Floor-Ceiling assembly shall be constructed of the materials and in the manner described in the individual G500 Series Design in the UL Fire Resistance Directory, as summarized below:

   A. **Flooring** – Normal or Lightweight concrete as specified in the individual G500 Series Design. Max diam of opening is 8 in. (203 mm).
   
   B. **Joists** – Steel joists or Structural Steel Members\* as specified in the individual G500 Series Design.
   
   C. **Gypsum Board\*** – Min 5/8 in. (16 mm) thick, screw-attached to furring channels as specified in the individual G500 Series Design. Max diam of opening is 8 in. (203 mm).

2. **Through Penetrants** – One metallic pipe, conduit, tubing or flexible metal pipe installed concentrically or eccentrically within opening. Penetrant to be rigidly supported on both sides of floor-ceiling. The following types and sizes of penetrants may be used:

   A. **Steel Pipe** – Nom 4 in. (102 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
   
   B. **Iron Pipe** – Nom 4 in. (102 mm) diam (or smaller) cast or ductile iron pipe.
   
   C. **Copper Tubing** – Nom 4 in. (102 mm) diam (or smaller) Type L (or heavier) copper tubing.
   
   D. **Copper Pipe** – Nom 4 in. (102 mm) diam (or smaller) Regular (or heavier) copper pipe.

3. **Pipe Coverings** – Pipe covering installed such that the annular space between pipe covering and periphery of opening shall be min 0 in. (point contact) to max 7/8 in. (22 mm). The following types of pipe coverings shall be used:

   A. **Pipe Coverings\*** – Nom 1-1/2 in. (38 mm) thick (hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied SSL tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. See Pipe and Equipment Covering-Materials (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.
   
   B. **Tube Insulation-Plastics\+** – Nom 3/4 in. (19 mm) thick (or less) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. See Plastics (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5A may be used.

   T Rating is 1 Hr for nom 1-1/2 in. and 1 in. (38 mm and 25 mm) thick glass fiber units. T Rating is 0 Hr for glass fiber units less than nom 1 in. (25 mm) thick. T Rating is 3/4 Hr for nom 3/4 in. (19 mm) thick tube insulation. T Rating is 0 Hr for tube insulations less than nom 3/4 in. (19 mm) thick.

4. **Fill, Void or Cavity Materials\* – Caulk or Sealant** – Min 3/4 in. (19 mm) thickness of caulk applied within annulus, flush with top surface of floor. Min 5/8 in. (16 mm) thickness of caulk applied within annulus, flush with bottom surface of ceiling. Min 1/4 in. (6 mm) diam bead of caulk applied at point contact locations at pipe covering/floor interface on top surface of floor and at pipe covering/ceiling interface.

3M™ Fire Barrier Self-Locking Pillows | Max. 23 in. x 4.5 in. aluminum busway penetrating a minimum 4.5 in. thick concrete floor or wall. Utilizing Fire Barrier Pillows and Putty. |
| **F-A-6001**  | 1, 2, 3    | 3M™ Fire Barrier Sealant CP 25WB+  
3M™ Fire Barrier Water Tight Sealant 3000 WT | 9” x 4” “I” steel & aluminum with copper bars rated for max 600V, 1600A. Max area of opening 144 sq. in. 12” max dimension. Support hanger required. Min 28 gauge steel cover plate required. Packing material required. 3 hour F Rating. Also referred as FA6001. |
1. **Floor or Wall Assembly** – Lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Min thickness of concrete floor or wall assembly is 2-1/2 in. (64 mm) for 2 hr F Rating and 4-1/2 in. (114 mm) for 3 hr F Rating. Wall may also be constructed of any UL Classified Concrete Blocks*. The size of the rectangular through opening shall be such that the annular space between the outside corners of the busway (Item 2) and the periphery of the through opening is in the range of 1/2 in. to 3 in. (13 mm to 76 mm).

See Concrete Blocks (CAZT) category in Fire Resistance Directory for names of manufacturers.

2. **Busway** – For 3 hr F Rating, the busway shall consist of a nom 9 in. (229 mm) wide (or smaller) by 4-1/2 in. (114 mm) deep (or smaller) “I”-shaped steel and aluminum enclosure containing factory mounted copper bars rated for max 600V, 1600A. For 2 hr F Rating, the busway shall consist of a nom 23 in. (584 mm) wide (or smaller) by 4-1/2 in. (114 mm) deep (or smaller) “I”-shaped aluminum or steel and aluminum enclosure containing factory mounted copper bars rated for max 600V, 4000A or aluminum bars rated for max 600V, 3000A. The busway shall bear the UL Listing Mark and shall be installed in accordance with all provisions of Article 364 of the National Electrical Code, NFPA No. 70. Busway to be installed with min 1/2 in. to max 3 in. (13 mm to max 76 mm) clearance from its outside corners to the sides of the rectangular floor or wall opening and shall be rigidly supported on both sides of floor or wall assembly.

See Busways and Associated Fittings (CWFT) category in the Electrical Construction Materials Directory for names of manufacturers.

3. **Fill, Void or Cavity Materials* – Wrap Strip** – Nom 1/4 in. (6 mm) thick intumescent elastomeric material faced on one side with aluminum foil, supplied in strips. Min 2 in. (51 mm) wide strip formed to follow the contours around the entire periphery of the busway (foil side exposed) and secured in place with steel wire. Busway wrap to extend 1 in. (25 mm) above and 1 in. (25 mm) below the top plane of the floor assembly. For wall assemblies, the busway wrap is to be installed in the same manner used for floor assemblies, but it shall be installed symmetrically on both sides of the wall assembly. When steel cover flange (Item 7) provided by the busway manufacturer is used, the busway wrap is not used.

**3M COMPANY** – FS-195+

4. **Fill, Void or Cavity Materials* – Intumescent Sheet** – Rigid aluminum foil-faced sheets with galv steel sheet backer. Sheet cut to tightly-follow the contours of the busway and with a min lap of 2 in. (51 mm) on all sides of the through opening. Sheets to be installed with the galv steel sheet backer exposed (aluminum foil facing against floor or wall surface). Sheet secured to top surface of floor and to both surfaces of wall using min 1/4 in. (6 mm) diam by 1-1/2 in. (38 mm) long steel expansion bolts, or equivalent, in conjunction with min 1-1/4 in. (32 mm) diam steel fender. Max spacing of sheet fasteners not to exceed 5 in. (127 mm) OC When steel cover flange (Item 7) supplied by the busway manufacturer is used, the sheet(s) shall be secured using the same fasteners used to secure the steel cover flange sections. Prior to installation of the sheet(s), a nom 1/4 in. (6 mm) diam bead of caulk (Item 5) shall be applied to the top surface of the floor and to both surfaces of the wall around the perimeter of the through opening.

**3M COMPANY** – CS-195+

5. **Fill, Void or Cavity Materials* – Graphite Seal, Caulk, Sealant or Putty** – One layer of 1/2 in. x 1/16 in. (13 mm by 1.6 mm) adhesive backed graphite intumescent seal positioned under intumescent sheet around entire perimeter of through opening or in 1/4 in. (6 mm) diam continuous bead of caulk or putty applied to edge of intumescent sheet at its interface with surface of floor or wall around entire perimeter of through opening. Generous application of caulk to be applied around the base of the busway or the busway wrap at its egress from the intumescent sheet (s) in addition to completely covering the busway wrap up to the interface (s) with the busway. All seams in the intumescent sheet (s) made to accommodate the busway to be covered with a generous bead of caulk.

**3M COMPANY** – E-FIS or Ultra GS seals, CP 25WB+, IC 15WB+ caulk, FB-3000 WT sealant or MP+ Stix putty.
System No. C-AJ-6001 continued

6. **Steel Cover Strip** (Not Shown) – Min 2 in. (51 mm) wide strip of min 0.020 in. (0.51 mm) thick (No. 26 gauge) galv steel centered over entire length of each slit made in intumescent sheet (Item 4) to permit installation about the busway. Prior to installation of the steel strip, the seam or slit in the intumescent sheet shall be covered with a nom 1/4 in. (6 mm) diam bead of caulk (Item 5). Steel cover strip secured to galv steel sheet backer of intumescent sheet with steel sheet metal screws or steel rivets spaced max 3 in. (76 mm) O.C. on each side of seam or slit.

7. **Steel Cover Flange** (Optional, Not Shown) – Four piece interlocking cover flange formed from nom 1/8 in. (3.2 mm) thick steel, supplied by busway manufacturer. Steel cover flange to lap min 2 in. (51 mm) on floor or wall surface on all sides of the through opening and secured to top surface of floor and to both surfaces of wall using min 1/4 in. (6 mm) diam by 2 in. (51 mm) long steel expansion bolts, or equivalent. Sheet fasteners installed in factory drilled and field-drilled holes in cover flange sections, through intumescent sheet; and spaced max 5 in. (127 mm) O.C. When steel cover flange is used, a generous application of caulk (Item 5) shall be applied around the base of the busway at its egress from the cover flange(s) and around the perimeter of the cover flange to cover the edges of the cover flange and the intumescent sheet.

(Formerly System No. 486)
F Rating – 3 Hr
T Rating – 0 Hr

1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight concrete (100-150 pcf or 1600-2400 kg/m³). Wall may also be constructed of any UL Classified **Concrete Blocks***. Max area of opening is 300 sq in. (1935 c/m²) with max dimension of 30 in. (762 mm).

   See **Concrete Blocks** (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Busway*** – Nom 23 in. (584 mm) wide (or smaller) by 4.5 in. (114 mm) deep “I” shaped aluminum enclosure containing factory mounted copper bars rated for 600 V, 5000 A or aluminum bars rated for 600 V, 4000 A. The busway shall bear the UL Listing Mark and shall be installed in accordance with all provisions of Article 364 of the National Electrical Code, NFPA No. 70. The annular space between the busway and the periphery of the opening shall be min 3/4 in. to max 1-3/4 in. (76 mm to max 44 mm).

3. **Firestop System** – The firestop system shall consist of the following components:
   
   A. **Packing Material** – Min 4 in. (102 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor or from both surfaces of wall as required to accommodate the required thickness of fill material.

   B. **Fill, Void or Cavity Material*** - **Sealant** – Min 1/2 in. (13 mm) thickness of fill material applied within annulus, flush with top surface of floor or with both surfaces of wall.

*+Bearing the UL Listing Mark

1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight concrete (100-150 pcf or 1600 - 2400 kg/m³). Wall may also be constructed of any UL Classified Concrete Blocks*. Max area of opening is 305 sq in. (0.2 m²) with max dimension of 29 in. (737 mm).

See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Busway+** – Nom 23 in. (584 mm) wide (or smaller) by 4.5 in. (114 mm) deep “I” shaped aluminum enclosure containing factory mounted copper bars rated for 600 V, 5000 A or aluminum bars rated for 600 V, 4000 A. The busway shall bear the UL Listing Mark and shall be installed in accordance with all provisions of the National Electrical Code, NFPA No. 70. The annular space between the busway and the periphery of the opening shall be min 1 in. (25 mm) to max 3 in. (76 mm).

3. **Firestop System** – The firestop system shall consist of the following:

   A. **Fill, Void or Cavity Material* – Pillows** – Nom 9 in. (229 mm) long by 4 or 6 in. (102 or 152 mm) wide by 2 or 3 in. (51 or 76 mm) thick plastic covered pillows. Pillows to be installed lengthwise through the opening and positioned to extend equally in both directions from the approximate center line of the floor or wall. Pillows tightly-packed into opening to fill the annular space between the busway and the periphery of the opening.

   3M COMPANY
   3M FIRE PROTECTION PRODUCTS – Fire Barrier Pillows or Fire Barrier Self-Locking Pillows

   B. **Fill, Void or Cavity Material* – Putty** – (Not Shown) – After installation of pillows (Item 3A), putty applied to seal any voids between or around the pillows on the top surface of the floor or on both sides of the wall assembly.

   3M COMPANY
   3M FIRE PROTECTION PRODUCTS – MP+

1. **Floor Assembly** – Min 4-1/2 in. thick lightweight or normal weight (100-150 lb per cu ft) concrete floor. Max area of through opening 144 sq in. with max dimension of 12 in.

2. **Feeder Busway** – Nominal 9 in. wide by 4 in. deep “I”-shaped steel and aluminum enclosure containing factory mounted insulated copper bars rated for max 600 v, 1600 a. The copper feeder busway shall bear the UL Listing Mark and shall be installed in accordance with all provisions of Article 364 of the National Electrical Code, NFPA No. 70.

3. **Support Hanger** – Min 0.134 in. diam (10 gauge) galv steel wire bent to form a “hat”-shape with each “brim” of the hat shape bearing 2 in. on the top surface of the floor and with the “crown” depth sufficient to accommodate the packing material (Item 4) and the required fill material (Item 5) thickness.

4. **Packing Material** – Used as a permanent form to prevent leakage of the fill material when in a plastic state. Packing material may consist of cardboard, glass fiber or mineral wool batt insulation.

5. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Applied to fill through opening to a min depth of 1 in. As measured from the top surface of the packing material.

6. **Steel Cover Plate** – Min 0.019 in. thick (28 gauge) galv steel cut to follow the contours of the busway with a min lap of 2 in. on all sides of the through opening. Steel cover plate secured to top surface of floor assembly with min 1/4 in. diam by 1-1/2 in. long steel expansion bolts in conjunction with steel nuts and washers. Max spacing of steel cover plate fasteners not to exceed 7 in. O.C. Prior to installation of the steel cover plate, a nom 1/4 in. diam bead of caulk (Item 5) shall be applied to the floor surface around the perimeter of the through opening.

Max 30 in. x 10 in. opening. Min 3/4 in. to max 1-3/4 in. annular space. 1 & 2 hour F. Mineral wool required. Also known as WL6022. |
1. **Wall Assembly** – The fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner described in the individual U300, U400 or V400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. **Studs** – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 in. by 4 in. (51 mm by 102 mm) lumber spaced max 16 in. (406 mm) OC. Steel studs to be min 3-5/8 in. (92 mm) wide and spaced max 24 in. (610 mm) OC. The opening in the wall to accommodate the cable trough (Item 2) shall be framed on all sides using lengths of stud installed between the vertical studs and secured to the studs at each end. The framed opening in the wall shall be min 4 in. to max 6 in. (102 mm to max 152 mm) wider and higher than the width and height of the cable trough such that, when the cable trough is centered in the opening, a 2 in. to 3 in. (51 mm to 76 mm) clearance is present between the cable trough and the framing on all four sides.

   B. **Gypsum Board** – Two layers of nom 5/8 in. (16 mm) thick gypsum board, as specified in the individual Wall and Partition Design.

2. **Cable Trough** – Max 7 in. (178 mm) wide by max 4 in. (102 mm) deep telecommunication cable trough formed from nom 0.105 in. (2.7 mm) thick polyvinyl chloride (PVC). Cable trough centered in framed opening and rigidly supported on both sides of wall assembly.

3. **Fiber Optic Cables** – Multiple fiber optical communication cable jacketed on the outside with PVC and having a max outside diam of 1/2 in. (13 mm) Aggregate cross-sectional area of cables in cable trough not to exceed 31 percent of the cross-sectional area of the cable trough.

4. **Fill, Void or Cavity Materials** – Moldable putty material kneaded by hand and packed tightly into cable interstices within cable trough. A min 2 in. (51 mm) wide strip of moldable putty shall be applied inside the cable trough and inside the cable bundle on each side of the assembly. The nom 2 in. (51 mm) wide moldable putty band shall extend approx 1 in. (25 mm) into the framed opening and approx 1 in. (25 mm) beyond the wall surface. After installation of the wrap strip (Item 5) and intumescent sheet (Item 6) fill materials, a nom 1/8 in. (3.2 mm) thickness of the moldable putty shall be applied to completely cover the wrap strip fill material at its egress from the intumescent sheet on each side of the wall.

   **3M COMPANY** – CP 25WB+, IC 15WB+ caulk, FB-3000 WT sealant, MPP+ putty

5. **Fill, Void or Cavity Materials** – Nom 1/4 in. (6 mm) thick intumescent elastomeric material faced on one side with aluminum foil, supplied in nom 2 in. (51 mm) wide strips. Nom 2 in. (51 mm) wide strip installed (foil side out) to tightly-follow the contours of the moldable putty band (Item 4) within the cable trough and also to the entire perimeter of the cable trough at its egress from the intumescent sheet (Item 6) on each side of the wall assembly. Narrow pieces of wrap strip to be inserted in the “support channels” of the cable trough. Wrap strips to project approx 7/8 in. (22 mm) beyond each face of the intumescent sheet (Item 6) on each side of the wall.

   **3M COMPANY** – FS-195+

6. **Fill, Void or Cavity Materials** – Rigid aluminum foil-faced sheet with galv steel sheet backer. Sheets cut to tightly-follow the contours of the wrap strip (Item 4) around the entire perimeter of the cable trough and cable fill. Sheets cut to lap a min of 2 in. (51 mm) on the wall on all sides of the opening on both sides of the wall. Prior to installation, a nom 1/8 in. by 1/2 in. (3.2 mm by 13 mm) ribbon of putty (Item 4) shall be applied as a gasket approx 1 in. (25 mm) from and on all sides of the through opening. Sheet to be installed with the galv steel sheet backer exposed (aluminum foil facing against wall surface) and secured to framing, through gypsum board layers, with steel screws or nails in conjunction with min 1-1/4 in. (32 mm) diam steel fender washers. Max spacing of fasteners not to exceed 6 in. (152 mm) with additional fasteners located on each side of butted seams or slits made to permit installation of the sheet around the cable trough.

   **3M COMPANY** – CS-195+

7. **Steel Cover Strip** – Min 2 in. (51 mm) wide strip of min 0.020 in. (0.51 mm) thick (26 gauge) galv steel sheet centered over entire length of each butted seam or slit made in the intumescent sheet (Item 6). Prior to installation of the steel strip, the seam or slit in the intumescent sheet shall be covered with a nom 1/8 in. by 1/2 in. (3.2 mm by 13 mm) ribbon of putty (Item 4). Steel cover strip secured to galv steel sheet backer of intumescent sheet with steel sheet metal screws or steel rivets spaced max 3 in. (76 mm) OC on each side of seam or slit.

1. **Wall Assembly** – The 1 or 2 Hr fire-rated gypsum wallboard/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Studs** – Wall framing to consist of min 3-1/2 in. (89 mm) wide steel channel studs spaced max 24 in. (610 mm) OC for 1 Hr rated walls. Steel studs to be min 2-1/2 in. (64 mm) wide and spaced max 24 in. (610 mm) OC for 2 Hr rated walls. Additional framing members to be installed in stud cavity containing busway to form a rectangular box around the opening.
   B. **Gypsum Board* – One or two layers of nom 5/8 in. (16 mm) thick gypsum wallboard, as specified in the individual Wall and Partition Design. Max area of opening is 300 sq in. (1935 cm²) with max dimensions of 30 in. (762 mm) wide by 10 in. (254 mm) high. The hourly F Rating of the firestop system is equal to the hourly rating of the wall.

2. **Busway+** – Nom 23 in. (584 mm) wide by 4.5 in. (114 mm) deep (or smaller) “I” shaped aluminum and steel enclosure containing factory mounted copper bars rated for 600 V, 5000A or aluminum bars rated 600V, 4000A. One busway to be installed within the opening. The annular space between the busway and the periphery of the opening shall be min 3/4 in. (19 mm) to max 1-3/4 in. (44 mm). Busway to be rigidly supported on both sides of wall assembly. The busway shall bear the UL Listing Mark and shall be installed in accordance with all provisions of Article 364 of the National Electrical Code, NFPA 70.

3. **Firestop System** – The firestop system shall consist of the following:
   A. **Packing Material** – Min 4 in. (102 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed and compressed to 50 percent into opening as a permanent form. Packing material to be recessed from both surfaces of wall as required to accommodate the required thickness of fill material.
   B. **Fill, Void or Cavity Material* – Sealant** – Min 1/2 in. (13 mm) thickness of fill material applied within the annular space, flush with both surfaces of wall.

*3M COMPANY 3M FIRE PROTECTION PRODUCTS – Types FB-2000, FB2000+, FB-1000NS or FB-3000WT.

</table>
1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified **Concrete Blocks**. Max diam of opening is 18 in. (457 mm).

   See **Concrete Blocks** (CAZT) category in the Fire Resistance Directory for names of manufacturers.

   1A. **Steel Sleeve** – Nom 6 in. (152 mm) diam (or smaller) Schedule 40 (or heavier) steel pipe sleeve, cast into floor or wall flush with floor or wall surfaces.

2. **Through Penetrant** – One steel duct to be installed either concentrically or eccentrically within the firestop system. An annular space of min 1/2 in. (13 mm) to max 1-1/2 in. (38 mm) is required within the firestop system. Steel duct to be rigidly supported on both sides of floor or wall assembly. The following sizes of steel ducts may be used:

   A. **Steel Duct** – Nom 16 in. (406 mm) diam (or smaller) No. 24 gauge (or heavier) spiral wound galv steel duct.

   B. **Steel Vent Duct** – Nom 10 in. (254 mm) diam (or smaller) No. 28 gauge (or heavier) galv steel vent duct.

3. **Firestop System** – The firestop system shall consist of the following:

   A. **Packing Material** – Nom 1 in. (25 mm) thickness of tightly-packed mineral wool batt insulation firmly packed into opening as a permanent form. Polyethylene backer rod or nom 1 in. (25 mm) thick glass fiber insulation may be used with steel vent ducts (Item 2B) in lieu of mineral batt insulation. Packing material to be recessed from top surface of floor or from both surfaces of wall as required to accommodate the required thickness of caulk fill material.

   B. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Min 1 in. (25 mm) thickness of fill material applied within the annulus, flush with top surface of floor or both surfaces of wall assembly. W Rating applies only when FB-3000 WT sealant is used. Water resistance of through penetrant (Item 2) must be considered in addition to water resistance of firestop system.

   **3M COMPANY** – CP 25WB+ or FB-3000 WT

   (Note: W Rating applies only when FB-3000 WT sealant is used.)

System No. C-AJ-7016
January 02, 2009
F Rating – 2 & 3 Hr (See Item 1)
T Rating – 0 Hr

1. **Floor or Wall Assembly** – Min 2-1/2 in. (64 mm) thick or min 4-1/2 in. (114 mm) thick lightweight or normal weight (100-150 pcf or 1600 -2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. The F Rating is 2 hr and 3 hr for min 2-1/2 in. (64 mm) or min 4-1/2 in. (114 mm) thick assemblies. Max area of opening is 576 sq in. (3716 c/m² with max dimension of 36 in. (914 mm) for 2 hr assemblies and 544 sq in. (3510 c/m² with max dimension of 34 in. (864 mm) for 3 hr assemblies.

See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through-Penetrants** – One steel duct to be installed either concentrically or eccentrically within the firestop system. An annular space of min 0 in. (point contact) to max 4 in. (0 mm to max 102 mm) is required within the firestop system for 2 hr assemblies and min 0 in. (point contact) to max 2 in. (0 mm to max 51 mm) is required within the firestop system for 3 hr assemblies. Steel duct to be rigidly supported on both sides of floor or wall assembly. The following sizes of steel ducts may be used:

   A. **Steel Duct** – Nom 32 in. by 14 (813 mm by 356 mm) (or smaller) No. 22 gauge (or heavier) galv steel duct.

   B. **Steel Duct** – Nom 30 in. by 12 (762 mm by 305 mm) (or smaller) No. 24 gauge (or heavier) galv steel duct.

3. **Firestop System** – The firestop system shall consist of the following:

   A. **Packing Material** – Nom 1 in. (25 mm) thickness of tightly packed mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor or from both surfaces of wall as required to accommodate the required thickness of caulk fill material.

   B. **Fill, Void or Cavity Material** – Caulk or Sealant – Min 1 in. (25 mm) thickness of fill material applied within annulus, flush with top surface of floor or both surfaces of wall assembly. At the point contact location between duct and concrete, a min 1/4 in. (6 mm) diam bead of sealant shall be applied to the concrete/duct interface on the top surface of floor and on both surfaces of wall assembly.

   3M COMPANY – CP 25WB+, FB-3000 WT or IC 15WB+

   C. **Retaining Angles** – Min 16 gauge galv steel angles sized to lap duct a min of 2 in. (51 mm) and lap top surface of floor or both surfaces of wall a min of 1 in. (25 mm) Angles attached to duct with min 1/2 in. (13 mm) long, No. 10 (or larger) sheet metal screws spaced a max of 1 in. (25 mm) from each end of duct and spaced a max of 6 in. (152 mm) OC.

1. **Floor or Wall Assembly** – Min 2-1/2 in. (64 mm) thick lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max area of opening is 720 sq in. (4645 cm²) with max dimension of 40 in. (1016 mm).

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through Penetration** – Max of two steel ducts, nom 12 in. by 14 in. (305 mm by 356 mm) (or smaller) No. 24 gauge (or heavier) to be installed either concentrically or eccentrically within the firestop system. An annular space of 0 in. (point contact) to max 5 in. (0 mm to max 127 mm) is required within the firestop system. A min 4 in. (102 mm) space shall be maintained between two ducts. Steel ducts to be rigidly supported on both sides of floor or wall assembly.

3. **Firestop System** – The firestop system shall consist of the following:

   A. **Fill, Void of Cavity Materials** – **Intumescent Sheet** – Rigid aluminum foil-faced sheet with galv steel sheet backer. Sheets cut to tightly follow the contours of the duct with a max 1/4 in. (6 mm) gap between the sheets and the ducts. Sheets cut to lap a min of 2 in. (51 mm) on the floor or wall surface on all sides of the opening. Sheet is required to be installed on the top surface of floor or both sides of wall assembly. Sheet to be installed with the galv steel sheet backer exposed (aluminum foil facing against floor or wall surface) and secured to floor or wall surface with min 3/16 in. (5 mm) diam by 1-1/4 in. (32 mm) long steel anchor screws, or equivalent, in conjunction with min 1-1/4 in. (32 mm) diam steel fender washers. Max spacing of fasteners not to exceed 6 in. (152 mm) with additional fasteners located on each side of butted seams made to permit installation of the sheet around the ducts.

   B. **Retaining Angles** – Min 16 gauge galv steel angles sized to lap duct a min of 2 in. (51 mm) and lap intumescent sheet on top surface of floor or both surfaces of wall a min of 2 in. (51 mm). Angles attached to duct and intumescent sheet with min 1/4 in. (6 mm) long, No. 10 (or larger) sheet metal screws spaced a max of 1 in. (25 mm) from each end of duct and spaced a max of 6 in. (152 mm) OC. Prior to the installation of the retaining angles, a min 1/4 in. (6 mm) diam bead of caulk (Item 3E) shall be applied at the intumescent sheet/duct interface on the top surface of floor and on both surfaces of wall assembly.

   C. **Support Channel** – Support channel shall be installed flush with top surface of floor or both surfaces of wall, centered between ducts. Support channels to be min 1-1/8 in. by 1-5/8 in. by 1-5/8 in. (41 mm by 41 mm) and formed of min 0.093 in. (2.4 mm) thick (No. 12 gauge) painted or galv steel. Ends of steel channel bolted or welded to steel angles anchored to inside walls of through opening. Intumescent sheet secured to steel support channels with steel sheet metal screws in conjunction with min 1-1/4 in. (32 mm) diam steel fender washers. When support channel is used beneath butted seam of intumescent sheets, fasteners spaced max 3 in. (76 mm) OC on each side of butted seam. When support channel is located away from intumescent sheet seam, fasteners spaced max 6 in. OC. Prior to installation of the intumescent sheet(s), a min 1/4 in. (6 mm) diam continuous bead of caulk (Item 3E) shall be applied as gasket over the steel support channel and the edge of intumescent sheet at its interface with surface of floor or wall around entire perimeter of through opening.

   D. **Steel Cover Strip** – Min 2 in. (51 mm) wide strip of min 0.019 in. (0.5 mm) thick (26 ga) galv steel centered over entire length of each butted seam made in the intumescent sheet. Prior to installation of the steel strip, the seams in the intumescent sheet shall be covered with a min 1/4 in. (6 mm) diam bead of caulk (Item 3E). Steel cover strip secured to galv steel sheet backer of intumescent sheet with steel sheet metal screws or steel rivets spaced max 3 in. (76 mm) OC on each side of seam or slit.

   E. **Fill, Void of Cavity Material** – **Graphite Seal, Caulk, Sealant or Putty** (Not Shown) – One layer of 1/2 in. x 1/16 in. (13 mm by 1.6 mm) adhesive backed graphite intumescent seal positioned under intumescent sheet around entire perimeter of through opening or min 1/4 in. (6 mm) diam continuous bead of caulk or putty applied to edge of intumescent sheet at its interface with surface of floor or wall around entire perimeter of through opening. Min 1/4 in. (6 mm) bead of caulk applied to fill all interstices between duct and intumescent sheet. A min 1/4 in. (6 mm) diam bead of caulk shall be applied at the intumescent sheet/duct interface, and to all seams in the intumescent sheet on the top surface of floor and on both surfaces of wall assembly.

* – Bearing the UL Classification Marking

Copyright © 2010 Underwriters Laboratories Inc.
1. **Floor or Wall Assembly** — Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. For rectangular ducts, max area of opening shall be 13.4 ft² (1.25 m²) with max dimension of 44 in. (1.11 m). For round ducts, max diam of opening shall be 44 in. (1.11 m). For oval shaped ducts, max dimension of opening shall be 44 in. (1.11 m) by 14 in. (0.37 m). See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through-Penetrants — Coated Ducts** — Rectangular, round or flat oval coated steel air duct. For rectangular duct, max perimeter dimension shall be 13.3 ft (4.06 m) with a max individual dimension of 40 in. (1.02 m). For round ducts, max diam shall be 40 in. (1.02 m) and for oval shaped ducts, max size of oval shall be 40 in. (1.02 m) by 10 in. (254 mm). Duct supplied coated with BW11 coating material. One duct to be centered within the firestop system with an annular space of 2 in. (51 mm). Reinforcement stiffener or transverse joint with bolted flanges shall be located approximately at the mid depth of the annular space. Duct to be rigidly supported on both sides of the floor or wall assembly. Duct sections shall be assembled using bolted flanges or SMACNA approved Transverse Joint Reinforcements.

3. **Firestop System** — The firestop system shall consist of the following:
   
   **A. Forms** — (Not Shown) — Used as a form to prevent leakage of fill material during installation. Forms to be a rigid sheet material, cut to fit the contour of the penetrating item and fastened to the underside of the floor or both sides of wall. Forms to be removed after fill material has cured.

   **B. Fill, Void or Cavity Material** — Mortar — Fill material applied within the annulus, flush with top and bottom surfaces of floor or with both surfaces of wall. Mortar is mixed with water in accordance with the mortar manufacturer’s installation instructions. A/D FIRE PROTECTION SYSTEMS INC — A/D Firebarrier Mortar

   HILTI CONSTRUCTION CHEMICALS, DIV OF HILTI INC — CP637 Mortar

   ISOLATEK INTERNATIONAL — Cafco TPS Mortar

   EGS NELSON FIRESTOP — Type CMP Mortar

   RECTORSEAL — Bio K10+ Mortar

   HOBEN INTERNATIONAL LTD — Firecrete Mortar

   SPECIFIED TECHNOLOGIES INC — SpecSeal Mortar

   TREMCO INC — TREMstop M mortar

   GCP APPLIED TECHNOLOGIES INC — Type KBS Mortar

   3M COMPANY — 3M Fire Barrier Mortar

   **C. Steel Angles** — (Optional, Not Shown) — Nom 4 by 4 by 1/4 in. (102 by 102 by 6 mm) thick steel angles installed around perimeter of opening on top surface of floor or both surfaces of wall. Steel angles shall lap a min of 2 in. (51 mm) onto the concrete on all sides of the opening. Steel angles shall be attached to through penetrant (Item 2) by means of nom 3/8 in. (9.5 mm) diam by 1-1/4 in. (32 mm) long steel bolts in conjunction with nom 3/8 in. (9.5 mm) by 1-1/2 in. (38 mm) diam steel fender washers spaced max 6 in. (152 mm) OC. Steel angles attached to concrete floor on all sides of the opening by means of nom 5/16 in. (8 mm) diam by 1-3/4 in. (45 mm) long concrete screws in conjunction with 3/8 in. (10 mm) by 1-1/2 in. (38 mm) diam steel fender washers spaced max 6 in. (152 mm) OC.

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

UL System No. C-AJ-7029
XHEZ - Through-penetration Firestop Systems
May 09, 2013
F Rating — 2 Hr
T Rating — 0 Hr
1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. For rectangular ducts, max area of opening shall be 1936 in². with max dimension of 44 in. (1118 mm). For oval shaped ducts, max dimension of opening shall be 44 in. (1118 mm) by 14 in. (356 mm).

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through-Penetrants – Coated Ducts** – Rectangular, round or flat oval coated steel air duct. For rectangular ducts, max perimeter dimension shall be 160 in. (4064 mm) and a max individual dimension shall be 40 in. (1016 mm). For round ducts, max diam shall be 40 in. (1016 mm) and for oval shaped ducts, max size of oval shall be 40 in. (1016 mm) by 10 in. (254 mm). Duct supplied coated with BW11 coating material. One duct to be centered within the firestop system with an annular space of 2 in. (51 mm). Reinforcement stiffener or transverse joint with bolted flanges shall be located approximately at the mid depth of the annular space. Duct to be rigidly supported on both sides of the floor or wall assembly. Duct sections shall be assembled using bolted flanges or SMACNA approved Transverse Joint Reinforcements.

   **FIRESPRAY INTERNATIONAL LTD** – FLAMEBAR BW11 FIRE RATED DUCTWORK

3. **Batts and Blankets** – Nom 2 in. (51 mm) thick unfaced mineral wool batts having a min density of 6 pcf (96 kg/m³). Single layer of mineral wool batt material installed on duct with all joints sealed with a 4 in. (102 mm) wide pressure sensitive aluminum foil tape at each transverse joint, insulation material shall be cut to provide an overlapping (strip lapped) joint of 1 in. (25 mm).

   See Batts and Blankets (BZJZ) category in the Fire Resistance Directory or Batts and Blankets* (BKNV) category in the Building Materials Directory for names of manufacturers.

4. **Insulation Collar** – Fabricated from the same mineral wool insulation material described in Item 3. Strips are 8 in. (203 mm) wide and are centered over each joint between adjacent ventilation duct sections, over each ventilation duct stiffener, and adjacent to each Firestop System.

5. **Steel Banding Straps** – (Not Shown) – Min 3/4 in. (19 mm) wide by 0.015 in. (0.38 mm) thick stainless steel banding strips used in conjunction with min 3/4 in. (19 mm) wide by 1 in. (25 mm) long stainless steel crimp clips. Banding strips spaced a max of 12 in. (305 mm) OC. Two banding strips used to secure each insulation collar (Item 4).

6. **Firestop System** – The firestop system shall consist of the following:

   A. **Forms** – (Not Shown) – Used as a form to prevent leakage of fill material during installation. Forms to be a rigid sheet material, cut to fit the contour of the penetrating item and fastened to the underside of the floor or both sides of wall. Forms to be removed after fill material has cured.

   B. **Fill, Void or Cavity Material** – **Mortar** – Fill material applied within the annulus, flush with top and bottom surfaces of floor or with both surfaces of wall. Mortar is mixed with water by volume in accordance with the mortar manufacturer’s installation instructions.

   **3M COMPANY** – 3M Fire Barrier Mortar

*Bearing the UL Classification Mark

© 2013 UL LLC
1. **Floor or Wall Assembly** – Min 4½ in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600 - 2400 kg/m³) concrete. Floor assembly may also be constructed of any min 6 in. thick UL Classified hollow-core **Precast Concrete Units**. Wall may also be constructed of any UL Classified **Concrete Blocks**. Max area of opening 640 sq in. (4129 cm²) with a max dimension of 32 in. (812 mm). Max area of in floors constructed of hollow-core concrete is 49 sq in. (316 cm² with a max dimension of 7 in. (178 mm). See **Concrete Blocks** (CAZT) and **Precast Concrete Units** (CFTV) categories in Fire Resistance Directory for names of manufacturers.

2. **Steel Duct** – Nom 30 by 18 in. (762 by 457 mm) (or smaller) steel duct to be installed concentrically or eccentrically within opening. The duct shall be constructed and reinforced in accordance with SMACNA construction standards. Annular space between duct and periphery of opening shall be min 0 in. (point contact) to max 2 in. (51 mm). Duct to be rigidly supported on both sides of floor or wall assembly.

3. **Firestop System** – The firestop system shall consist of the following:
   A. **Packing Material** – Min 3 in. (76 mm) thickness of min 4 pcf or 64 kg/m³ mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor or from both surfaces of wall as required to accommodate the required thickness of fill material. In floors constructed of hollow-core concrete, packing material to be recessed from top and bottom surfaces of floor as required to accommodate the required thickness of fill material.
   
   A1. **Forming Material** – As an alternate to the packing material in Item 3A, nom 4 in. (102 mm) wide strips of min 1/2 in (13 mm) thick compressible mat to be stacked to a thickness greater than the width of the annular space and compression-fitted, edge-first, to fill the annular space to a min 4 in. (102 mm) depth. Top of forming material to be recessed from top surface of floor or from both surfaces of wall as necessary to accommodate the required thickness of caulk fill material. In floors constructed of hollow-core concrete, forming material to be recessed from top and bottom surfaces of floor as required to accommodate the required thickness of fill material.

   B. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Min 1/2 in. (13 mm) thickness of caulk applied within the annulus, flush with top surface of floor or with both surfaces of wall. In floors constructed of hollow-core concrete, min 1/2 in. (13 mm) thickness of caulk applied within the annulus, flush with top and bottom surfaces of floor. Min 1/4 in. (6 mm) diam bead of caulk applied to the duct/concrete interface at the point contact location on the top surface of floor or both surfaces of wall or hollow-core concrete.

   C. **Retaining Angles** – Min 16 GA galv steel angles sized to lap duct a min of 2 in. (51 mm) and lap periphery of opening a min of 1 in. (25 mm). Angles attached to all four sides of steel duct on top surface of floor or both surfaces of wall with No. 10 (or larger) steel sheet metal screws spaced a max 1 in. (25 mm) from each end and max 6 in. (152 mm) OC.

*Bearing the UL Classification Mark

1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Floor assembly may also be constructed of any min 6 in. (152 mm) thick UL Classified hollow-core Precast Concrete Units*. Wall assembly may also be constructed of any UL Classified Concrete Blocks*. Max diam of opening is 18 in. (457 mm) Max diam of openings in floors constructed of hollow-core concrete is 7 in. (178 mm).

   See Concrete Blocks (CAZT) categories in Fire Resistance Directory for names of manufacturers.

2. **Through Penetrant** – One steel duct to be installed either concentrically or eccentrically within the firestop system. An annular space of min 1/2 in. to max 1-1/2 in. (13 mm to max 38 mm) is required within the firestop system. Steel duct to be rigidly supported on both sides of floor or wall assembly. The following sizes of steel ducts may be used:
   
   A. **Steel Duct** – Nom 16 in. (406 mm) diam (or smaller) No. 24 gauge (or heavier) spiral wound galv steel duct.
   
   B. **Steel Vent Duct** – Nom 10 in. (254 mm) diam (or smaller) No. 28 gauge (or heavier) galv steel vent duct.

3. **Firestop System** – The firestop system shall consist of the following:
   
   A. **Packing Material** – Min 3-1/2 in. (89 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor or from both surfaces of wall to accommodate the required thickness of fill material. In floors constructed of hollow-core concrete, packing material to be recessed from top and bottom surfaces of floor as required to accommodate the required thickness of fill material.
   
   B. **Fill Void or Cavity Materials* – Caulk or Sealant** – Min 1/2 in. (13 mm) thickness of caulk applied within the annulus, flush with top surface of floor or with both surfaces of wall. In floors constructed of hollow-core concrete, min 1/2 in. (13 mm) thickness of caulk applied within the annulus, flush with top and bottom surfaces of floor. **W Rating applies only when FB-3000 WT sealant is used.**

   Water resistance of through penetrant (Item 2) must be considered in addition to water resistance of firestop system.

   3M COMPANY – CP 25WB+, IC 15WB+ caulk or FB-3000 WT sealant.

   (Note: W Rating applies only when FB-3000 WT sealant is used.)

*Bearing the UL Classification Mark

1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced normal weight (140-150 pcf or 1600-2400 kg/m³) concrete floor or min 5-1/4 in. (133 mm) thick reinforced normal weight concrete wall. Wall may also be constructed of any UL Classified **Concrete Blocks***. Max area of opening is 15 ft² (1.4 m²) with max dimension of 70 in. (1.8 m).

   See **Concrete Blocks** (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Steel Air Duct** – Min 0.035 in. (0.9 mm) (20 gauge) thick (or heavier) steel duct having a max perimeter of 168 in (4.27 m) with max individual dimension of 60 in (1.52 m) and constructed in accordance with SMACNA HVAC Duct Construction standards. The sections shall be assembled using bolted flanges or SMACNA approved Transverse Joint Reinforcements. Duct to be rigidly supported in accordance with SMACNA requirement and as specified in Item 4. One steel duct to be installed concentrically or eccentrically within the firestop system. Duct to rigidly supported on both sides of floor or wall assembly.

3. **Firestop System** – The firestop system shall consist of the following:
   A. **Duct Wrap Materials*** – Min 1-1/2 in. (38 mm) thick blanket totally encapsulated within foil-scrim facers. The steel duct shall be wrapped with two layers of duct wrap installed in accordance with the Ventilation Assembly No. V-20. See Ventilation Duct Assemblies in Vol. 2 of the Fire Resistance Directory. The annular space between the insulated steel air duct and the periphery of the opening shall be a min of 1 in. (25 mm) to a max of 3 in. (76 mm).

      **3M COMPANY** – 3M FireBarrier Duct Wrap 15A, 3M FireBarrier Duct Wrap 20A, 3M FireBarrier Duct Wrap 615 or 3M FireBarrier Duct Wrap 615+

   A1. **Batts and Blankets*** – Collars – Min 1-1/2 in. (38 mm) thick, 6 in. (152 mm) wide collars, totally encapsulated within foil-scrim facers. The transverse butt joints shall be wrapped using a collar. The collars shall be installed in accordance with the Ventilation Assembly No. V-20. See Ventilation Duct Assemblies in Vol. 2 of the Fire Resistance Directory.

      **3M COMPANY** – 3M FireBarrier Duct Wrap 15A Collars, 3M FireBarrier Duct Wrap 20A Collars, 3M FireBarrier Duct Wrap 615 Collars or 3M FireBarrier Duct Wrap 615+ wCollars

   B. **Packing Material** – Min 4 in. (102 mm) thickness of unfaced scrap duct wrap material or min 3 pcf (48 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from the top surface of the floor or both surfaces of wall as required to accommodate the required thickness of fill material.

   C. **Fill, Void or Cavity Material*** – Sealant – Min 5/8 in. (16 mm) thickness of fill material applied within the annulus, flush with top surface of floor or with both surfaces of wall.

      **3M COMPANY** – FB 1000 N/S Sealant

1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max area of opening 952 sq in. (0.61 m²) with a max dimension of 34 in. (864 mm).

   See Concrete Blocks (CAZT) category in Fire Resistance Directory for names of manufacturers.

2. **Steel Duct** – Max 24 by 30 in. (610 by 762 mm) No. 22 gauge (or heavier) steel duct to be installed concentrically or eccentrically within opening. Annular space between duct and periphery of opening shall be shall be min 1 in. (25 mm) to max 3 in. (76 mm). Duct to be rigidly supported on both sides of floor or wall assembly.

3. **Firestop System** – The firestop system shall consist of the following:
   A. **Fill, Void or Cavity Material** – Pillows – Nom 9 in. (229 mm) long by 4 or 6 in. (102 or 152 mm) wide by 2 or 3 in. (51 or 76 mm) thick plastic covered pillows. Pillows to be installed lengthwise through the opening and positioned to extend equally in both directions from the approximate center line of the floor or wall. Pillows tightly-packed into opening to fill the annular space between the steel duct and the periphery of the opening.

   3M COMPANY – Fire Barrier Pillows or Fire Barrier Self-Locking Pillows

   B. **Fill, Void or Cavity Material** – Putty – (Not Shown) – After installation of pillows (Item 3A), putty applied to seal any voids between or around the pillows on the top surface of the floor or on both sides of the wall assembly.

   3M COMPANY – MP+

   *Bearing the UL Classification Mark

1. **Floor or Wall Assembly** – Min 4-1/2 in. thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete floor or min 5 in. (127 mm) thick reinforced lightweight or normal weight concrete wall. Wall may also be constructed of any UL Classified **Concrete Blocks**. Max diam of opening 42 in. (1067 mm).

   See [Concrete Blocks](CAZT) in the Fire Resistance Directory for names of manufacturers.

2. **Steel Duct** – Nom 36 in. diam (or smaller) No. 22 gauge (or heavier) spiral-wound galvanized steel duct to be installed either concentrically or eccentrically within the firestop system. The annular space between duct and periphery of opening shall be min 2 in. (51 mm) to max 4 in. (102 mm) Steel duct to be rigidly supported on both sides of floor or wall assembly.

3. **Pipe Covering** – Nom 2 in. (51 mm) thick hollow cylindrical heavy density (min 2.5 pcf or 40 kg/m³) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with product. Annular space between the pipe covering and periphery of opening or sleeve shall be min 0 in. (point contact) to max 2 in. (51 mm).

   See [Pipe and Equipment Covering – Materials](BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a smoke Developed Index of 50 or less may be used.

4. **Firestop System** – The firestop system shall consist of the following:

   **A.** **Fill, Void or Cavity Materials** – **Wrap Strip** – Nom 1/4 in. (6 mm) thick intumescent elastomeric material faced on one side with plastic, supplied in 2 in. (51 mm) wide strips. One nom 2 in. (51 mm) wide strip tightly-wrapped around pipe covering material (Item 3) with the plastic side exposed and slid into through opening to be recessed from top surface of floor or from both surfaces of wall to accommodate the required thickness of fill material Item 4C. Wrap strip held in place with pressure-sensitive tape, steel tie wire, or equivalent.

   **3M COMPANY
   3M FIRE PROTECTION PRODUCTS** – Tuck-In Wrap Strip

   **B.** **Packing Material** – Min 4 in. (102 mm) thickness of min 4 pcf mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor or from both surfaces of wall to accommodate the required thickness of fill material.

   **C.** **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Min 1/2 in. (13 mm) thickness of caulk applied within the annulus, flush with top surface of floor or with both surfaces of wall. In floors constructed of hollow-core concrete, min 1/2 in. (13 mm) thickness of caulk applied within the annulus, flush with top and bottom surfaces of floor. Min 1/2 in. (13 mm) diam bead of caulk applied to the pipe covering/concrete interface at the point contact location on the top surface of floor or both surfaces of wall or hollow-core concrete.

   **3M COMPANY
   3M FIRE PROTECTION PRODUCTS** – IC 15WB+, CP 25WB+ caulk, or FB-3000 WT Sealant

*Bearing the UL Classification Mark

Reprinted from the Online Certifications Directory with permission from UL © 2013 UL LLC
1. **Floor Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150pcf or 1600-2400 kg/m³) concrete. Max area of opening is 13.5 ft² (1.25 m²) with a max dimension of 48-1/4 in. (1.23 m).

2. **Fire Damper** – Max 24 in. (610 mm) wide by 30 in. (762 mm) high multi-blade 1-1/2 hr fire damper provided with min 16 ga (0.060 in. or 0.41 mm thick) galv steel sleeve. Damper installed within opening such that the damper blades are flush with the top surface of the floor assembly when the blades are in the closed position. The annular spaces between the damper and the periphery of the opening shall be min 2 in. (51 mm) to max 22-1/4 in. (565 mm). The damper is secured within the opening through the attachment to the mounting angles (Item 3) and the retaining angles (Item 4).

POTTORFF – FD-140 fire damper

3. **Mounting Angles** – Min 2 by 2 by 1/4 in. (51 by 51 by 6 mm) steel angles sized to span the length of the opening and overlap onto the floor assembly a min of 2 in. (51 mm) on both sides of the opening. Angles are placed along opposite sides of the damper and anchored to the floor assembly through the composite sheet (Item 5A) with min 1/4 in. (25 mm) diam by 1-1/4 in. (32 mm) long steel masonry screws in conjunction with min 1/4 by 1-1/4 in. (6 by 32 mm) diam steel fender washers. The damper is attached to the angles with min No. 10 by 3/4 in. (19 mm) long steel self-tapping screws located a max of 1 in. (25 mm) from each end of the damper and spaced a max of 3 in. (76 mm) OC.

4. **Retaining Angles** – Min 2 by 2 in. (51 by 51 mm) min 16 ga (0.060 in. or 0.41 mm thick) galv steel angles. Angles are placed along opposite sides of the damper to extend the entire distance between the mounting angles (Item 3) at the same elevation as the mounting angles. The retaining angles are attached to the damper with min No. 10 by 3/4 in. (19 mm) long steel self-tapping screws located a max of 1 in. (25 mm) from each end and a max of 6 in. (152 mm) OC. Additional angles are placed along opposite sides of the opening on the insides of the mounting angles to span the distance between the retaining angle on the damper and overlap onto the floor assembly a min of 2 in. (51 mm). The retaining angles are attached to the mounting angles with min No. 10 by 3/4 in. (19 mm) long steel self-tapping screws located a max of 1 in. (25 mm) from each end and spaced a max of 6 in. (152 mm) OC.

5. **Firestop System** – The firestop system shall consist of the following:

A. **Fill, Void or Cavity Material** – Intumescent Sheet – Rigid aluminum foil faced sheet with galv steel sheet backer. Intumescent sheet cut to lie within the mounting and retaining angles to cover all openings around the damper and overlap onto the floor assembly a min of 2 in. (51 mm) with galv steel side facing upward. A 1/4 in. (6 mm) spacing shall be maintained between the edge of the sheets and the vertical legs of the angles. Sheets are attached to the angles with min No. 10 by 1 in. (25 mm) long steel self-tapping screws in conjunction with min 3/16 by 1-1/4 in. (5 by 32 mm) diam steel fender washers located a max of 1 in. (25 mm) from each end and spaced a max of 6 in. (152 mm) OC. Sheets anchored to the floor assembly with min 1/4 in. (6 mm) diam by 1-1/4 in. (32 mm) long steel masonry screws in conjunction with min 1/4 by 1-1/4 in. (6 by 32 mm) diam steel fender washers.

3M COMPANY – CS-195+

B. **Fill, Void or Cavity Material** – Caulk – Min 1/4 in. (6 mm) diam bead of caulk to be applied around the perimeter of the intumescent sheets at the floor/sheet interfaces. Min 1/2 in. (13 mm) diam bead of caulk installed to fill the 1/4 in. (6 mm) spacing between the intumescent sheets and the vertical legs of the mounting and retaining angles, overlapping onto the intumescent sheets.

3M COMPANY – CP 25WB+

*Bearing the UL Classification Mark*
**Wall Assembly** – Min 6 in. (152 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete wall. Wall may also be constructed of any UL Classified **Concrete Blocks***. Max size of opening is 1015 sq. in. (6548 cm²) with a max dimension of 35 in. (889 mm).

See **Concrete Blocks** (CAZT) category in the Fire Resistance Directory for names of manufacturers.

**Steel Air Duct** – Nom 30 in. by 24 in. (762 mm by 610 mm) min 24 gauge (or heavier) galv steel air duct to be installed either concentrically or eccentrically within the opening. Duct to be rigidly supported on both sides of wall assembly.

**Duct Insulation*** – Nom 1-1/2 in (38 mm) thick glass fiber blanket insulation jacketed on the outside with foil-scrim-kraft facing. Longitudinal and transverse joints sealed with foil-scrim kraft tape. A nominal 1 in. (25 mm) annular space shall be maintained between the insulated duct and the periphery of the opening.

See **Batts and Blankets** (BKNV) category in the Building Materials Directory for names of manufacturers. Any batts and blankets material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

**Firestop System** – The firestop system shall consist of the following:

A. **Wrap Strip** – One layer of nom 1/8 in. (3.2 mm) thick intumescent material supplied in 2 in. (51 mm) wide strips tightly wrapped around duct insulation and held in place with 2 in. (51 mm) wide min 3 mil foil tape. Wrap strip slid into annulus on both sides of wall such that wrap strips extend approx 1/2 in. (13 mm) beyond both surfaces of wall. Exposed portion of wrap strip to be completely covered with min 3 mil foil tape.

   **3M COMPANY** – Ultra GS

B. **Fill, Void or Cavity Materials*** – **Caulk or Sealant** – Min 5/8 in. (16 mm) thickness of fill material applied within annulus, flush with both surfaces of wall assembly

   **3M COMPANY** – CP 25WB+, IC 15WB+ caulk or FB-3000 WT sealant

*Bearing the UL Classification Mark

1. **Wall Assembly** – Min 4-3/4 in. (121 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete wall. Wall may also be constructed of any UL Classified **Concrete Blocks***. Max size of opening is 9,800 sq. in. (6.32 m²) with a max dimension of 100 in. (254 cm).

   See **Concrete Blocks** (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Steel Duct** – Nom 96 by 96 in. (2.44 by 2.44 mm) (or smaller) galv steel duct to be installed within the opening. The duct shall be constructed and reinforced in accordance with SMACNA construction standards and provided with 2 in. (51 mm) standing seams. The annular space between the duct and the periphery of opening shall be a min 1 in. (25 mm) to a max 2 in. (51 mm) with the exception that the standing seams which shall be installed at point contact to the framing of the opening. Duct to be rigidly supported on both sides of opening.

   The hourly T Rating of the firestop system is 0 hr except that when the thickness of the steel duct is 18 ga, the T Rating is 3/4 hr.

3. **Firestop System** – The firestop system shall consist of the following.

   A. **Fill, Void or Cavity Material** – **Caulk or Sealant** – Min 5/8 in. (16 mm) thickness of caulk applied within annulus, flush with both surfaces of wall assembly.

   **3M COMPANY** – CP 25WB+ or FB-3000 WT

   B. **Steel Retaining Angles** – Min 16 gauge galv steel angles sized to lap duct a min of 2 in. (51 mm) and lap wall surface a min of 1 in. (25 mm) Angles attached to the duct on both sides of wall with No. 10 (or larger) steel sheet metal screws 1 in. (25 mm) from each end, and 6 in. (152 mm) OC. On the opposite side of wall, the screw pattern to be staggered.

   *Bearing the UL Classification Mark

1. **Wall Assembly** – Min 6 in. (152 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete wall. Wall may also be constructed of any UL Classified Concrete Blocks*. Max size of opening to be 640 sq in. (4129 cm²) with a max dimension of 32 in. (813 mm).

See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Steel Duct** – Nom 30 in. by 18 in. (762 mm by 457 mm) (or smaller) No. 24 gauge (or heavier) galv steel duct installed concentrically or eccentrically within opening. Annular space between duct and periphery of opening to be min 0 in. (point contact) to max 2 in. (0 mm to max 51 mm). Duct to be rigidly supported on both sides of wall assembly.

3. **Firestop System** – The firestop system shall consist of the following:
   A. **Fill, Void or Cavity Material* – Caulk or Sealant** – Min 5/8 in. (16 mm) thickness of caulk applied within annulus, flush with both surfaces of wall.

   **3M COMPANY** – CP 25WB+, IC 15WB+ caulk or FB-3000 WT sealant

   B. **Retaining Angles** – Min 16 gauge galv steel angles sized to lap duct a min of 2 in. (51 mm) and lap wall surfaces a min of 1 in. (25 mm). Angles attached to duct on both sides of wall with min 1/2 in. (13 mm) long, No. 10 (or larger) sheet metal screws spaced a max 1 in. (25 mm) from each end and spaced a max 6 in. (152 mm) OC.

*Bearing the UL Classification Marking

1. **Wall Assembly** – Min 6 in. (152 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600 - 2400 kg/m³) concrete wall. Wall may also be constructed of any UL Classified **Concrete Blocks***. Max size of opening is 1,617 in² (1.04 m²) with a max dimension of opening 42 in. (1.06 m).

   See **Concrete Blocks** (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Steel Duct** – Max 36 by 40 in. (914 by 1016 mm) by min 0.030 in. (0.76 mm) thick steel duct to be installed either concentrically or eccentrically within the opening. The annular space shall be min 1/2 in. (13 mm) to max 2 in. (51 mm). Duct to be rigidly supported on both sides of wall assembly.

3. **Fill, Void or Cavity Material* – Caulk or Sealant** – Min 5/8 in. (16 mm) thickness of fill material applied within the annulus, flush with both surfaces of the wall.

   3M COMPANY – IC 15WB+, CP 25WB+, FB-3000 WT

4. **Steel Reinforcement Angles** – Min 2 by 2 by 0.070 in. (51 by 51 by 1.78 mm) steel angles attached to all four sides of duct on both sides of wall 4 in. (102 mm) away from the surface of the wall. The angles shall be attached to the duct with min 1/8 in. (3 mm) diam steel rivets or No. 8 (or larger) sheet metal screws spaced max 1 in. (25 mm) from each end of duct and spaced a max of 3 in. (76 mm) OC.

*Bearing the UL Classification Mark

1. **Wall Assembly** – Min 6 in. (152 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max size of opening is 17.3 sq ft (1.61 m²) with a max width of 89 in. (2.26 m). See Concrete Blocks (CAZT) category in Fire Resistance Directory for names of manufacturers.

2. **Steel Air Duct** – Max 85 by 24 in. (2160 by 610 mm) by 0.030 in. (0.76 mm) thick (22 GA) galvanized steel duct to be installed either concentrically or eccentrically within the opening. The annular space shall be min 1 in. (25 mm) to max 3 in. (76 mm) within the framed opening. The duct shall be constructed and reinforced in accordance with SMACNA HVAC Duct Construction Standards - Metal and Flexible. Steel duct to be rigidly supported on both sides of wall assembly.

3. **Duct Wrap Materials** – Nom 1-1/2 in. (38 mm) thick ceramic fiber batt or blanket (min 6 pcf or 96 kg/m³) jacketed on the outside with a foil-scrim-poly facing, installed in a telescope, checkerboard or butt-joint-and-collar pattern with 3 in. (76 mm) transverse and longitudinal overlaps, in accordance with the requirements of Ventilation Assembly No. V-27. See Ventilation Duct Assemblies in Vol. 2 of the UL Fire Resistance Directory. Longitudinal and transverse joints sealed with aluminum foil tape.

4. **Firestop System** – The firestop system shall consist of the following:
   A. **Packing Material** – Min 4-3/4 (121 mm) thickness of min 6 pcf (96 kg/m³) duct insulation firmly packed into opening as a permanent form. Packing material to be recessed from both surfaces of wall as required to accommodate the required thickness of fill material.

   3M COMPANY
   3M FIRE PROTECTION PRODUCTS – 3M FireBarrier Duct Wrap 615 or 3M FireBarrier Duct Wrap 615+

   B. **Fill Void or Cavity Material** – Sealant – Min 5/8 in. (16 mm) thickness of fill material applied within annulus, flush with both surfaces of wall.

   3M COMPANY
   3M FIRE PROTECTION PRODUCTS – 3M FB-1000 NS

   C. **Steel Retaining Angles** – Stiffening angle 1-1/2 by 2 by 1/8 in. (38 by 52 by 3.2 mm), applied around the perimeter of the duct with the 2 in. (52 mm) leg against the sealant (Item 4B above). Angles attached to steel duct on both sides of wall with min No. 10 steel sheet metal screws spaced a max of 1 in. (25 mm) from each end of steel duct and spaced a max of 6 in. (152 mm) OC.

*Bearing the UL Classification Mark

1. **Wall Assembly** – Min 8 in. (203 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified **Concrete Blocks**. Max size of opening is 576 sq in. (0.37 m²) with a max dimension of 24 in. (610 mm).

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Steel Duct** – Nom 24 by 24 in. (610 by 610 mm) (or smaller) No. 22 gauge (or heavier) steel duct to be installed either concentrically or eccentrically within the opening. The annular space shall be min 3/4 in. (19 mm) to max 1-1/2 in (38 mm). Duct to be rigidly supported on both sides of wall assembly.

3. **Firestop System** – The firestop system shall consist of the following:
   A. **Packing Material** – Min 6 in. (152 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form, flush with both surfaces of wall.
   A1. **Forming Material** – As an alternate to the packing material in Item 3A, nom 4 in. (102 mm) wide strips of min 1/2 in (13 mm) thick compressible mat to be stacked to a thickness greater than the width of the annular space and compression-fitted, edge-first, to fill the annular space to a min 6 in. (152 mm) depth. Forming material to be recessed from both surfaces of wall as necessary to accommodate the required thickness of caulk fill material.

   **3M COMPANY**
   **3M FIRE PROTECTION PRODUCTS** – Fire Barrier Packing Material

   B. **Fill Void or Cavity Material** – **Caulk** – Min 5/8 in. (16 mm) thickness of fill material applied within annular space, flush with both sides of wall.

   **3M COMPANY**
   **3M FIRE PROTECTION PRODUCTS** – FB-3000 WT, IC 15WB+ or CP 25WB+

*Bearing the UL Classification Mark

1. **Wall Assembly** – Min 6 in. (152 mm) thick reinforced lightweight or normal weight 100-150 pcf (1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified **Concrete Blocks***. Max area of opening is 77.3 sq ft. (7.2 m²) with a max width of 105-1/2 in. (2.7 m). See **Concrete Blocks** (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Steel Duct** – Max 100 by 100 in. (2.5 by 2.5 m) steel duct to be installed within the framed opening. The duct shall be constructed and reinforced in accordance with SMACNA construction standards. Steel duct to be rigidly supported on both sides of wall assembly.

3. **Batts and Blankets*** – Nom 1-1/2 or 2 in. (38 or 51 mm) thick glass fiber batt or blanket (min 3/4 pcf or 12 kg/m³) jacketed on the outside with a foil-scrim-kraft facing. Longitudinal and transverse joints sealed with aluminum foil tape. During the installation of the fill material, the batt or blanket shall be compressed minimum 50% such that the annular space within the firestop system shall be min 1/2 in. (13 mm) to max 2 in. (51 mm).

   See **Batts and Blankets** (BKNV) category in the Building Materials Directory for names of manufacturers. Any batt or blanket meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index 50 or less may be used.

4. **Firestop System** – The firestop system shall consist of the following:
   A. **Packing Material** – Min 4-3/4 in. (121 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from both surfaces of wall to accommodate the required thickness of fill material.
   B. **Fill, Void or Cavity Material*** – Sealant – Min 5/8 in. (16 mm) thickness of fill material applied within annulus, flush with both surfaces of wall.

   **3M COMPANY**
   **3M FIRE PROTECTION PRODUCTS** – IC 15WB+, CP 25WB+, FB-3000 WT

   C. **Steel Retaining Angles** – Min No. 16 gauge (0.059 in. or 1.5 mm) galv steel angles sized to lap steel duct a min of 1 in. (25 mm) and lap wall surfaces a min of 2 in. (51 mm). Angles attached to steel duct on both sides of wall with min No. 10 steel sheet metal screws spaced a max of 1 in. (25 mm) from each end of steel duct and spaced a max of 6 in. (152 mm) OC.

1. **Wall Assembly** – Min 6 in. (152 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified **Concrete Blocks***. Max diam of opening is 14 in. (356 mm). See **Concrete Blocks** (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Steel Duct** – Nom 12 in. (305 mm) diam (or smaller) No. 26 gauge (or heavier) spiral wound or long seam galv steel duct. The duct shall be constructed and reinforced in accordance with SMACNA construction standards. Annular space between duct and periphery of opening to be min 0 in. (point contact) to max 2 in. (51 mm). Duct to be rigidly supported on both sides of the wall assembly.

3. **Fill, Void or Cavity Material*** – **Sealant** – Min 5/8 in. (16 mm) thickness of fill material applied within annulus, flush with both surfaces of wall assembly. At point contact location, min 1/4 in. (6 mm) diam bead of fill material applied at steel duct/concrete interface on both surfaces of wall.

**3M COMPANY**
**3M FIRE PROTECTION PRODUCTS** – IC 15WB+, CP 25WB+ or FB-3000 WT sealant

L Rating At Ambient — Less Than 1 CFM/sq ft
L Rating At 400 F — Less Than 1 CFM/sq ft

1. **Wall Assembly** — Min 6 in. (152 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max area of opening is 1024 in² (6606 cm²) with a max dimension of 32 in. (813 mm).

   See Concrete Blocks (CAZT) in the Fire Resistance Directory for names of manufacturers.

2. **Steel Duct** — Max 30 by 30 in. (762 by 762 mm) No. 22 gauge (or heavier) steel duct to be installed either concentrically or eccentrically within the opening. The annular space shall be min 1/2 in. (19 mm) to max 1-1/2 in (38 mm). Duct to be rigidly supported on both sides of wall assembly.

3. **Firestop System** — The firestop system shall consist of the following:

   A. **Fill, Void or Cavity Material* — Foam** — Foam to be injected into annular space to a min 6 in. (152 mm) thickness to completely fill the annular space between duct and opening to full thickness of wall, flush with both sides of wall.

   * Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

F Rating – 1 & 2 Hr (See Item 1)
T Ratings – 0 Hr

1. **Wall Assembly** – The 1 and 2 hr fire rated gypsum wallboard/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   - **Studs** – Wall framing shall consist of steel channel studs to be min 3-1/2 in. (89 mm) wide and spaced max 24 in. (610 mm) OC. Additional 3-1/2 in. (89 mm) wide steel studs shall be used to completely frame opening.
   - **Gypsum Board** – Thickness, type, number of layers and fasteners as required in the individual Wall and Partition Design. Max size of opening to be 1216 sq in. (188.5 cm²) with a max dimension of 38 in. (965 mm).

   The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed.

2. **Through Penetrant** – Nom 36 by 30 in. (914 by 762 mm) (or smaller) No. 24 gauge (or heavier) galv steel duct to be installed either concentrically or eccentrically within the firestop system. An annular space of min 0 in. (0 mm) (point contact) to max 2 in. (51 mm) is required within the firestop system. Steel duct to be rigidly supported on both sides of floor or wall assembly.

3. **Firestop System** – The details of the firestop system shall be as follows:
   - **Packing Material** (Optional) – Polyethylene backer rod, mineral wool batt insulation or fiberglass batt insulation friction-fit into annular space for 2 hr rated wall assemblies only. Packing material to be recessed from both surfaces of wall to accommodate the required thickness of fill material (Item 3B).
   - **Fill, Void or Cavity Material** – **Caulk or Sealant** – Min 5/8 in. (16 mm) thickness of fill material applied within annulus, flush with both surfaces of wall assembly. At the point contact location between duct and wallboard, a min 1/4 in. (6 mm) diam bead of sealant shall be applied at the wallboard/duct interface on both surfaces of wall assembly.
   - 3M COMPANY – CP 25WB+ caulk or FB-3000 WT sealant
   - **Retaining Angles** – Min 16 gauge galv steel angles sized to lap duct a min of 2 in. (51 mm) and lap wall surfaces of a min of 1 in. (25 mm). Angles attached to duct on both sides of wall with min 1/2 in. (13 mm) long, No. 10 (or larger) sheet metal screws spaced a max of 1 in. (25 mm) from each end of duct and spaced a max of 6 in. (152 mm) OC.

1. **Wall Assembly** – The 2 hr fire rated gypsum wallboard/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. **Studs** – Wall framing shall consist of steel channel studs to be min 3-1/2 in. wide and spaced max 24 in. OC.
   
   B. **Gypsum Board** – Two layers of min 5/8 in. thick gypsum wallboard, as specified in the individual Wall and Partition Design. Max diam of opening is 17-1/2 in.

2. **Through Penetration** – One steel duct to be installed either concentrically or eccentrically within the firestop system. An annular space of min 0 in. to max 1-1/2 in. is required within the firestop system. Steel duct to be rigidly supported on both sides of wall assembly. The following sizes of steel ducts may be used:
   
   A. **Steel Duct** – Nom 16 in. diam (or smaller) No. 24 gauge (or heavier) spiral wound galv steel duct.
   
   B. **Steel Duct** – Nom 10 in. diam (or smaller) No. 28 gauge (or heavier) galv steel vent duct.

3. **Fill, Void or Cavity Material** – **Caulk or Sealant** – Min 1-1/4 in. thickness of fill material applied within annulus, flush with both surfaces of wall assembly. At the point contact location between duct and wallboard, a min 1/4 in. diam bead of caulk shall be applied at the wallboard/duct interface on both surfaces of wall assembly.

   **3M COMPANY** – CP 25WB+ caulk or FB-3000 WT sealant

1. **Wall Assembly** – The 2 hr fire rated gypsum wallboard/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300 or U400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Studs** – Wall framing shall consist of either wood or steel studs. Wood studs to consist of nom 2 by 4 in lumber spaced max 16 in. OC. Steel studs to be min 3-1/2 in. wide and spaced max 24 in. OC.
   B. **Gypsum Board* – Thickness, type, number of layers and fasteners as required in the individual Wall and Partition Design. Max diam of opening is 5 in.

2. **Steel Vent Duct** – Nom 4 in. diam (or smaller) No. 28 gauge (or heavier) galv steel duct to be installed either concentrically or eccentrically within the firestop system. An annular space of min 0 in. (point contact) to max 1 in. is required within the firestop system. Duct to be rigidly supported on both sides of wall assembly.

3. **Firestop System** – The details of the firestop system shall be as follows:
   A. **Packing Material (Optional)** – Polyethylene backer rod, mineral wool batt insulation or fiberglass batt insulation friction-fit into annular space and recessed from both surfaces of wall to accommodate the required thickness of fill material (Item 3B).
   B. **Fill, Void or Cavity Material* – Caulk or Sealant** – Min 1/2 in. thickness of fill material applied within annulus, flush with both surfaces of wall assembly. At the point contact location between duct and wallboard, a min 1/2 in. diam bead of sealant shall be applied at the wallboard/duct interface on both surfaces of wall assembly.

1. **Wall Assembly** – The 1 hr or 2 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features.
   A. **Studs** – Wall framing shall consist of min 3-1/2 in. (89 mm) wide steel channel studs spaced max 24 in. (610 mm) OC. When diam of opening exceeds width of stud cavity, additional lengths of steel stud installed to frame out opening around steel duct (Item 2).
   B. **Gypsum Board** – Min 5/8 in. (16 mm) thick, 4 ft (1.22 m) wide with square or tapered edges. The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual U400 or V400 Series Design in the UL Fire Resistance Directory. Max diam of opening is 25-1/2 in. (648 mm).

   *The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed.*

2. **Steel Duct** – Max 24 in. (610 mm) diam No. 24 gauge (or heavier) spiral wound steel duct to be installed concentrically with a 3/4 in. (19 mm) annular space. Duct to be rigidly supported on both sides of wall assembly.

3. **Fill, Void or Cavity Material** – **Caulk or Sealant** – Min 5/8 in. (16 mm) thickness of fill material applied within annulus, flush with both surfaces of wall assembly.

   **3M COMPANY** – CP 25WB or FB-3000 WT

1. **Wall Assembly** – The 1 and 2 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features.

   A. **Studs** – Wall framing shall consist of min 3-1/2 in. (89 mm) wide steel studs spaced a max 24 in. (610 mm) OC. Additional min 3-1/2 in. (89 mm) wide steel studs shall be used to completely frame the opening.

   B. **Gypsum Board** – Thickness, type, number of layers and fasteners as specified in the individual Wall and Partition Design. Max size of opening is 35 in. by 29 in. (889 mm by 737 mm) opening.

   The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed. The hourly T Rating is 3/4 and 2 Hr for 1 and 2 Hr rated assemblies, respectively.

2. **Steel Air Duct** – Nom 30 in. by 24 in. (762 mm by 610 mm) min 24 gauge (or heavier) galv steel air duct to be installed either concentrically or eccentrically within the opening. Duct to be rigidly supported on both sides of wall assembly.

3. **Duct Insulation** – Nom 1-1/2 in. (38 mm) thick glass fiber blanket insulation jacketed on the outside with foil-scrim-kraft facing. Longitudinal and transverse joints sealed with foil-scrim kraft tape. A nominal 1 in. (25 mm) annular space shall be maintained between the insulated duct and the periphery of the opening.

   See **Batts and Blankets** (BKNV) category in the Building Materials Directory for names of manufacturers. Any batts and blankets material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Firestop System** – The firestop system shall consist of the following:

   A. **Wrap Strip** – One layer of nom 1/8 in. (3.2 mm) thick intumescent material supplied in 2 in. (51 mm) wide strips tightly wrapped around duct insulation and held in place with 2 in. (51 mm) wide min 3 mil foil tape. Wrap strip slid into annulus on both sides of wall such that wrap strips extend approx 1/2 in. (13 mm) beyond both surfaces of wall. Exposed portion of wrap strip to be completely covered with min 3 mil foil tape.

   **3M COMPANY** – Ultra GS

   B. **Fill, Void or Cavity Material** – **Caulk or Sealant** – Min 5/8 in. (16 mm) thickness of fill material applied within annulus, flush with both surfaces of wall assembly.

   **3M COMPANY** – CP 25WB+, IC 15WB+, FB-3000 WT

1. **Wall Assembly** – The 1 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features.
   
   A. **Studs** – Wall framing may consist of either wood studs or steel studs. Wood studs to consist of nom 2 by 4 in. (51 mm by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 3-1/2 in. (89 mm) wide and spaced max 24 in. (610 mm) OC.
   
   B. **Gypsum Board** – Thickness, type, number of layers and fasteners as required in the individual Wall and Partition Design. Max size of opening is 14 by 14 in. (356 mm by 356 mm) square.

2. **Steel Duct** – Nom 12 by 12 in. (305 mm by 305 mm) (or smaller) No. 24 gauge (or heavier) galv steel duct to be centered within opening with a nom annular space of 1 in. (25 mm). Duct to be rigidly supported on both sides of opening.

3. **Fill, Void or Cavity Material** – **Caulk or Sealant** – Min 5/8 in. (16 mm) thickness of caulk applied within annulus, flush with both surfaces of wall assembly.

   **3M COMPANY** – CP 25WB+, IC 15WB+ caulk or FB-3000 WT sealant

   *Bearing the UL Classification Mark*
1. **Wall Assembly** – The 2 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Studs** – Wall framing may consist of min 2-1/2 in. (64 mm) wide steel channel studs spaced max 24 in. (610 mm) OC.

   B. **Gypsum Board** – Thickness, type, number of layers and fasteners as required in the individual Wall and Partition Design. Max area of opening is 49 sq in. (316 cm²) with max dimension of 7 in. (178 mm).

2. **Steel Duct** – Nom 6 by 6 in. (152 mm by 152 mm) (or smaller) No. 24 gauge (or heavier) steel duct to be installed either concentrically or eccentrically within the opening. The annular space shall be min 1/4 in. to max 3/4 in. (6 mm to max 19 mm). Duct to be rigidly supported on both sides of wall assembly.

3. **Fill, Void or Cavity Materials** – **Caulk, Sealant or Putty** – Min 1-1/4 in. (32 mm) thickness of moldable putty, applied within the annulus flush with both surfaces of the wall.

   *Bearing the UL Classification Marking

   3M COMPANY – CP 25WB+, IC 15WB+ caulk, FB-3000 WT sealant or MP+ Stix putty

1. **Wall Assembly** – The 1 or 2 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. **Studs** – Wall framing may consist of steel channel studs. Steel studs to be min 3-1/2 in. (89 mm) wide and spaced max 24 in. (610 mm) OC. Additional steel studs shall be used to completely frame the opening.
   
   B. **Wallboard, Gypsum** – Thickness, type, number of layers and fasteners as required in the individual Wall and Partition Design. Max size of opening is 9,800 in² (6.32 m²) with a max dimension of 100 in. (254 cm).

   The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed.

2. **Steel Duct** – Nom 96 by 96 in. (244 by 244 cm, or smaller) galv steel duct to be installed within the opening. The duct shall be constructed and reinforced in accordance with SMACNA construction standards and provided with 2 in. (51 mm) standing seams. The annular space between the duct and the periphery of opening shall be a min 1 in. (25 mm) to a max 2 in. (51 mm) with the exception that the standing seams which shall be installed at point contact to the framing of the opening. Duct to be rigidly supported on both sides of opening.

   The hourly T Rating of the firestop system is 0 hr except that when the thickness of the steel duct is 18 ga, the T Rating is 3/4 hr.

3. **Firestop System** – The firestop system shall consist of the following:
   
   A. **Fill, Void or Cavity Material** – **Caulk or Sealant** – Min 5/8 in. (16 mm) thickness of caulk applied within annulus, flush with both surfaces of wall assembly.

   **3M COMPANY** – CP 25WB+ or FB-3000 WT

   B. **Steel Retaining Angles** – Min 16 gauge galv steel angles sized to lap duct a min of 2 in. (51 mm) and lap wall surface a min of 1 in. (25 mm). Angles attached to the duct on both sides of wall with No. 10 (or larger) steel sheet metal screws 1 in. (25 mm) from each end, and 6 in. (152 mm) OC. On the opposite side of wall, the screw pattern to be staggered.

1. **Wall Assembly** – The 1 or 2 hr fire rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400 or V400 Series Wall or Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Studs** – Wall framing shall consist of steel channel studs to be min 3-1/2 in. (89 mm) wide and spaced max 24 in. (610 mm) OC. Additional 3-1/2 in. (89 mm) wide steel studs shall be used to completely frame opening.
   B. **Gypsum Board** – Thickness, type, number of layers and fasteners as required in the individual Wall and Partition Design. Max size of opening to be 640 sq in. (4129 cm²) with a max dimension of 32 in. (813 mm)
   The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed.

2. **Steel Duct** – Nom 30 in. by 18 in. (762 mm by 457 mm) (or smaller) No. 24 gauge (or heavier) galv steel duct installed concentrically or eccentrically within opening. Annular space between duct and periphery of opening to be min 0 in. (point contact) to max 2 in. (0 mm to max 51 mm). Duct to be rigidly supported on both sides of wall assembly.

3. **Firestop System** – The firestop system shall consist of the following:
   A. **Fill, Void or Cavity Material** – **Caulk or Sealant** – Min 5/8 in. (16 mm) thickness of caulk applied within annulus, flush with both surfaces of wall.
      3M COMPANY – CP 25WB+, IC 15WB+ caulk or FB-3000 WT sealant
   B. **Retaining Angles** – Min 16 gauge galv steel angles sized to lap duct a min of 2 in. (51 mm) and lap wall surfaces a min of 1 in. (25 mm). Angles attached to duct on both sides of wall with min 1/2 in. (13 mm) long, No. 10 (or larger) sheet metal screws spaced a max 1 in. (25 mm) from each end and spaced a max 6 in. (152 mm) OC.

System No. W-L-7095
May 19, 2005
F Ratings – 1 & 2 Hr (See Item 1)
T Ratings – 0 & 1/4 Hr (See Item 1)

1. **Wall Assembly** – The 1 or 2 hr fire rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400 or V400 Series Wall or Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. **Studs** – Wall framing shall consist of steel channel studs to be min 3-1/2 in. (89 mm) wide and spaced max 24 in. (610 mm) OC. Additional 3-1/2 in. (89 mm) wide steel studs shall be used to completely frame opening.
   
   B. **Gypsum Board*** – Thickness, type, number of layers and fasteners as required in the individual Wall and Partition Design. Max diam of opening is 6-1/2 in. (165 mm).

   The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed. The hourly T Rating of the firestop system is 0 and 1/4 Hr for 1 and 2 Hr rated assemblies, respectively.

2. **Steel Duct** – Nom 5 in. (127 mm) diam (or smaller) No. 30 gauge (or heavier) galv steel duct installed concentrically or eccentrically within opening. Annular space between duct and periphery of opening to be min 0 in. (point contact) to max 1-1/2 in. (0 mm to max 38 mm). Duct to be rigidly supported on both sides of wall assembly.

3. **Fill, Void or Cavity Material*** – **Caulk or Sealant** – Min 5/8 in. (16 mm) thickness of caulk applied within annulus, flush with both surfaces of wall. An additional min 1/4 in. (6 mm) diam bead of caulk applied to the duct/gypsum board interface at the point contact locations on both sides of wall.

   **3M COMPANY** – CP 25WB+, IC 15WB+ caulk or FB-3000 WT sealant

1. **Wall Assembly** – The 2 hr fire-rated shaft wall assembly shall be constructed of the materials and in the manner specified in the individual U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. **Steel Studs** – C-H-shaped studs, min 2-1/2 in. (64 mm) wide by 1-1/2 in. (38 mm) deep, spaced 24 in. (610 mm) OC.
   
   B. **Gypsum Board** – 1 in. (25 mm) thick gypsum board liner panels, supplied in nominal 24 in. (610 mm) widths as specified in the individual Wall and Partition Design. Max area of opening is 72 in.2 (465 cm²) with a max dimension of 12 in. (305 mm).
   
   C. **Gypsum Board** – Thickness, type, number of layers and fasteners as required in the individual Wall and Partition Design. Max area of opening is 72 in.2 (465 cm²) with a max dimension of 12 in. (305 mm).

   The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed.

2. **Steel Sleeve** – Rectangular sleeve fabricated from min 0.019 in. (0.49 mm) thick galv sheet steel and sized to tightly fit into opening. Length of steel sleeve to be equal to thickness of wall.

3. **Steel Duct** – Nom 12 by 6 in. (305 by 152 mm) (or smaller) min 0.019 in. (0.49 mm) thick galv steel duct installed concentrically or eccentrically within opening. Annular space between duct and periphery of opening to be min 1/2 in. (13 mm) to max 1-1/2 in. (38 mm). Duct to be rigidly supported on both sides of wall assembly.

4. **Firestop System** – The firestop system shall consist of the following:
   
   A. **Packing Material** – Min 3-1/2 (89 mm) and 4-1/8 in. (105 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form for 1 and 2 hr rated assemblies, respectively. Packing material to be recessed from finished surface of wall (Item 1C) to accommodate the required thickness of fill material.
   
   B. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Min 5/8 in. (16 mm) thickness of caulk applied within annulus, flush with finished surface of wall assembly.

   **3M COMPANY** – IC 15WB+, CP 25WB+ caulk or FB-3000 WT sealant

   *Bearing the UL Classification Mark

1. **Wall Assembly** – The 1 or 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. **Studs** – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced max 16 in. (406 mm) OC. Steel studs to be min 2-1/2 in. (64 mm) wide and spaced max 24 in. (610 mm) OC.

   B. **Gypsum Board** – One or two layers of gypsum board, as specified in the individual Wall and Partition Design. Max diam of opening is 3-3/8 in. (86 mm). Max area of rectangular opening is 16.5 sq in. (106 cm²) with max dimension of 5 in. (127 mm).

   The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed.

2. **Through Penetrants** – One metallic strut, cable or rod service support to be installed within the firestop system. An annular space of min 1/8 in. (3 mm) to max 7/8 in. (22 mm) is required within the firestop system. Strut, cable or rod service support to be rigidly supported on both sides of wall assembly. The strut, cable or rod service support may be installed at an angle not greater than 45 degrees from the perpendicular. The following types and sizes of metallic strut, cable or rod service support may be used:
   
   A. **Steel Strut** – Max 1-5/8 by 1-5/8 in. (41 by 41 mm) channel strut formed from min 0.105 in. (2.7 mm) thick galv or painted steel.

   B. **Steel Strut** – Max 3-1/4 by 1-5/8 in. (83 by 41 mm) H strut formed from min 0.105 in. (2.7 mm) thick galv or painted steel.

   C. **Cable** – Max 3/8 in. (9.5 mm) diam unjacketed galv steel cable.

   D. **Threaded Rod** – Max 5/8 in. (16 mm) diam galv steel threaded rod.

3. **Fill, Void or Cavity Material** – **Caulk** – Min 5/8 in. (16 mm) thickness of fill material applied within the annulus, flush with both surfaces of wall.

   **3M COMPANY** – IC 15 WB+ caulk, CP 25WB+ caulk, 1000 NS sealant or FB-3000 WT sealant

1. **Wall Assembly** – The 1 or 2 hr fire rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400 or V400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. **Studs** – Wall framing shall consist of steel channel studs to be min 3-1/2 in. (89 mm) wide and spaced max 24 in. (610 mm) OC. Additional 3-1/2 in. (89 mm) wide steel studs shall be used to completely frame opening.
   
   B. **Gypsum Board** – Thickness, type, number of layers and fasteners as required in the individual Wall and Partition Design. Max area of opening to be 1080 sq in. (6968 cm²) with a max dimension of 36 in. (914 mm).

   The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed. The hourly T rating of the firestop system is 1 and 1-3/4 Hr for 1 and 2 Hr rated assemblies, respectively.

2. **Steel Duct** – Max 30 in. by 24 in. (762 mm by 610 mm) No. 24 gauge (or heavier) galv steel duct installed concentrically within opening. Duct to be rigidly supported on both sides of wall assembly.

3. **Duct Insulation** – Nom 2 in. (51 mm) thick glass fiber blanket insulation jacketed on the outside with foil-scrim-kraft facing. Longitudinal and transverse joints sealed with foil-scrim-kraft tape. A nominal 1 in. (25 mm) annular space shall be maintained between the insulated duct and the periphery of the opening.

   See **Batts and Blankets** (BKNV) category in the Building Materials Directory for names of manufacturers. Any batts and blankets material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Fill, Void or Cavity Material** – **Caulk or Sealant** – Min 5/8 in. (16 mm) thickness of caulk applied within annulus, flush with both surfaces of wall.

   **3M COMPANY** – FB-3000 WT sealant

1. **Wall Assembly** – The 1 or 2 hr fire-rated gypsum board/stud shaft wall assembly shall be constructed of the materials and in the manner specified in the individual U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall incorporate the following construction features:
   A. **Steel Studs** – “C-H” or “C-T” shaped studs, min 2-1/2 in. (64 mm) wide by 1-1/2 in. (38 mm) deep, fabricated from min No. 25 gauge (0.6 mm thick) galv steel, spaced max 24 in. (610 mm) OC.
   B. **Gypsum Board** – 1 in. (25 mm) thick, 24 in. (610 mm) wide gypsum liner panels installed vertically. Max diam of circular cutout in gypsum liner panel is 6 in. (152 mm).
   C. **Gypsum Board** – 1/2 in. or 5/8 in. (13 or 16 mm) thick, 48 in. (1.2 m) wide gypsum boards. The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual Wall and Partition Design. Max diam of circular cutout in gypsum board is 6 in. (152 mm).

   The hourly **F Rating** of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed.

2. **Steel Duct** – Nom 5 in. (127 mm) diam (or smaller) No. 30 gauge (or heavier) galv steel duct installed concentrically or eccentrically within opening. Annular space between duct and periphery of opening to be min 0 in. (0 mm, point contact) to max 1 in. (25 mm). Duct to be rigidly supported on both sides of wall assembly.

3. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Min 1 in. (25 mm) thickness of fill material applied within the gypsum board liner panel flush with the faces of the liner panel. Min 5/8 in. (16 mm) thickness of fill material applied within the gypsum board annulus, flush with the finished side of the wall. Min 1/2 in. (13 mm) diam bead of caulk applied to the penetrant/gypsum board interface at the point contact location on the finished side of the wall.

   **3M COMPANY** – CP25WB+ Caulk or FB-3000 WT Sealant

1. **Wall Assembly** — The 1 or 2 hr fire rated framed gypsum board wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400, V400, or W400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Studs** — Wall framing shall consist of steel channel studs or wood studs. Steel studs to be min 3-5/8 in. (92 mm) wide and spaced max 24 in. (610 mm) OC. Wood studs to be min 2 by 4 in. (51 by 102 mm) or larger and spaced max 16 in. (406 mm) OC. An additional framing member shall be used to form a shelf within the wall cavity to support the steel box (Item 2) and mat fill material (Item 3). The framed opening is to be 1 in. (25 mm) wider than the width of the steel box.

   B. **Gypsum Board*** — The gypsum board type, thickness, number of layers and orientation shall be, as specified in the individual Wall and Partition Design. Size of cutout made to accommodate steel box (Item 2) is to be 1 in. (25 mm) wider and 1 in. (25 mm) higher than the width and height of the steel box.

   The hourly F, T, FT, FH and FTH Ratings of the firestop system are equal to the hourly fire rating of the wall in which the firestop system is installed.

2. **Steel Box** — Max 19 in. (483 mm) wide by max 32 in. (813 mm) high by max 3 1/2 in. (89 mm) deep for steel stud walls. Max 12 in. (305 mm) wide by max 32 in. (813 mm) high by max 3 1/2 in. (89 mm) deep for wood stud walls. Box to be recessed box with hinged steel door and mounting flange. Steel box secured to steel studs with steel screws after application of mat material (Item 3) on exterior surfaces of steel box. Bottom and/or top of steel box may be penetrated by up to two max 1-1/2 in. (38 mm) diam copper, steel or iron pipes or tubes. Open pipes or tubes which terminate within the box shall be sealed with caulking (Item 4) or plugged with a ball of putty (Item 5).

3. **Fill, Void or Cavity Materials*** - **Mat** — Nominal 0.4 in. (10 mm) thick aluminum foil faced endothermic mat supplied in 24 in. wide rolls. Individual pieces of mat cut to cover four sides and back of box and laminated to box with high strength, fast, contact type adhesive (foil face exposed). The mat sections on the top and bottom of the box shall be cut to overlap the mat sections on the sides of the box. The mat section on the back of the box shall be cut to lap over the edge of the mat sections on the top, bottom and vertical sides of box. Circular cutouts made in the mat to accommodate the pipes or tubes to be 1/4 in. to 1/2 in. (6 to 13 mm) larger than outside diam of pipe or tube. All corners and butted seams in the mat are to be covered with min 2 mil aluminum foil tape.

   **3M COMPANY 3M FIRE PROTECTION PRODUCTS** — Type E-54A or E-5A-4 Mat

4. **Fill, Void or Cavity Materials*** - **Caulk or Sealant** — (Not Shown) - Nom 1/4 in. (6 mm) diam bead of caulk applied to the edge of the mat material around the perimeter of the box mounting flange. Additional caulking fill material shall be used to completely fill each circular cutout made in the mat material to accommodate a pipe or tube. The end of each open pipe or tube which terminates within the box shall be sealed with a min 1/2 in. (13 mm) depth of caulking.

   **3M COMPANY 3M FIRE PROTECTION PRODUCTS** — Type CP 25WB+ Caulk, FB-3000WT Sealant

5. **Fill, Void or Cavity Materials*** - **Putty** — (Not Shown) - As an alternate to the caulking (Item 4), the end of each open pipe or tube which terminates within the box may be sealed with a min 1/2 in. (13 mm) depth of putty fill material.

   **3M COMPANY 3M FIRE PROTECTION PRODUCTS** — Type MP+ Moldable Putty

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.
1. **Wall Assembly** – The 1 hr or 2 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Studs** – Wall framing shall consist of min 3-5/8 in. (92 mm) wide steel studs, spaced max 24 in. (610 mm) OC. Additional min 3-5/8 in. (92 mm) wide steel studs shall be used to completely frame the opening.

   B. **Gypsum Board*** – Min 5/8 in. (16 mm) thick, 4 ft (1.22 m) wide with square or tapered edges. The gypsum board type, thickness, number of layers and orientation shall be as specified in the individual design. Max area of opening is 11.2 ft² (1.04 m²) with a max dimension of 42 in. (1.06 m).

   The F Rating of the firestop system is equal to the fire rating of the wall assembly in which it is installed.

2. **Steel Duct** – Max 36 by 40 in. (914 by 1016 mm) by min 0.030 in. (0.76 mm) thick steel duct to be installed either concentrically or eccentrically within the opening. The annular space shall be min 1/2 in. (13 mm) to max 2 in. (51 mm). Duct to be rigidly supported on both sides of wall assembly.

3. **Fill, Void or Cavity Material*** – **Caulk or Sealant** – Min 5/8 in. (16 mm) thickness of fill material applied within the annulus, flush with both surfaces of the wall.

   **3M COMPANY**
   **3M FIRE PROTECTION PRODUCTS** – IC 15WB+, CP 25WB+, FB-3000 WT

4. **Steel Reinforcement Angles** – Min 2 by 2 by 0.070 in. (51 by 51 by 1.78 mm) thick steel angles attached to all four sides of duct on both sides of wall with protruding leg located 4 in. (102 mm) away from the surface of the wall. The angles shall be attached to the duct with min 1/8 in. (3.2 mm) diam steel rivets or No. 8 (or larger) steel sheet metal screws spaced max 1 in. (25 mm) from each end of duct and spaced a max of 3 in. (76 mm) OC.

1. **Wall Assembly** – The 1 hr or 2 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features.
   
   A. **Studs** – Wall framing shall consist of min 3-1/2 in. (89 mm) wide steel channel studs spaced max 24 in. (610 mm) OC. When diam of opening exceeds width of stud cavity, additional lengths of steel stud installed to frame out opening around steel duct (Item 2).
   
   B. **Gypsum Board** – Min 5/8 in. (16 mm) thick, 4 ft (1.22 m) wide with square or tapered edges. The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual U400 or V400 Series Design in the UL Fire Resistance Directory. Max diam of opening is 30 in. (762 mm).

   The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed. The hourly T rating of the firestop system is 1 and 1-3/4 Hr for 1 and 2 Hr rated assemblies, respectively.

2. **Steel Duct** – Max 24 in. (610 mm) diam No. 24 gauge (or heavier) spiral wound steel duct to be installed concentrically with a 3 in. (76 mm) annular space. Duct to be rigidly supported on both sides of wall assembly.

3. **Duct Insulation** – Nom 2 in. (51 mm) thick glass fiber blanket insulation jacketed on the outside with foil-scrim-kraft facing. Longitudinal and transverse joints sealed with foil-scrim-kraft tape. A nominal 1 in. (25 mm) annular space shall be maintained between the insulated duct and the periphery of the opening.

   See **Batts and Blankets (BKNV)** category in the Building Materials Directory for names of manufacturers. Any batts and blankets material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Fill, Void or Cavity Material** – Sealant – Min 5/8 in. (16 mm) thickness of fill material applied within annulus, flush with both surfaces of wall assembly.

   **3M COMPANY** – FB-3000 WT

   *Bearing the UL Classification Mark

1. **Wall Assembly** – The 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. **Studs** – Wall framing shall consist of steel “C” studs min 3-5/8 in. (92 mm) wide and spaced max 24 in. (610 mm) OC. Additional framing members shall be used to completely frame around opening.
   
   B. **Gypsum Board** – Min 5/8 in. (15.9 mm) thick, 4 ft (1220 mm) wide with square or tapered edges as specified in the individual U400 or V400 Wall and Partition Design.
   
   Max size of opening is 17.3 sq ft (1.61 m²) with a max width of 89 in. (2.26 m).
   
   See **Gypsum Board** (CKNX) category in the Fire Resistance Directory for names of manufacturers.

2. **Steel Air Duct** – Max 85 by 24 in. (2160 by 610 mm) 0.030 in. (0.76) mm thick (22 GA) galvanized steel duct to be installed either concentrically or eccentrically within the opening. The annular space shall be min 1 in. (25 mm) to max 3 in. (76 mm) within the framed opening. The duct shall be constructed and reinforced in accordance with SMACNA HVAC Duct Construction Standards - Metal and Flexible. Steel duct to be rigidly supported on both sides of wall assembly.

3. **Duct Wrap Materials** – Nom 1-1/2 in. (38 mm) thick ceramic fiber batt or blanket (min 6 pcf or 96 kg/m³) jacketed on the outside with a foil-scrim-poly facing, installed in a telescope, checkerboard or butt-joint-and-collar pattern with 3 in. (76 mm) transverse and longitudinal overlaps, in accordance with the requirements of Ventilation Assembly No. V-20. See Ventilation Duct Assemblies in Vol. 2 of the UL Fire Resistance Directory. Longitudinal and transverse joints sealed with aluminum foil tape.

3M COMPANY
3M FIRE PROTECTION PRODUCTS – 3M FireBarrier Duct Wrap 615 or 3M FireBarrier Duct Wrap 615+

4. **Firestop System** – The firestop system shall consist of the following:
   
   A. **Packing Material** – Min 4-3/4 (121 mm) thickness of min 6 pcf (96 kg/m³) duct insulation firmly packed into opening as a permanent form. Packing material to be recessed from both surfaces of wall as required to accommodate the required thickness of fill material.

3M COMPANY
3M FIRE PROTECTION PRODUCTS – 3M FireBarrier Duct Wrap 615 or 3M FireBarrier Duct Wrap 615+

B. **Fill Void or Cavity Material** – **Sealant** – Min 5/8 in. (16 mm) thickness of fill material applied within annulus, flush with both surfaces of wall.

3M COMPANY
3M FIRE PROTECTION PRODUCTS – 3M FB-1000 NS

C. **Steel Retaining Angles** – Stiffening angle 1-1/2 by 2 by 1/8 in. (38 by 52 by 3.2 mm), applied around the perimeter of the duct with the 2 in. (52 mm) leg against the sealant (Item 4B above). Angles attached to steel duct on both sides of wall with min No. 10 steel sheet metal screws spaced a max of 1 in. (25 mm) from each end of steel duct and spaced a max of 6 in. (152 mm) OC.

*Bearing the UL Classification Mark

1. **Wall Assembly** — The 1 hr fire rated framed gypsum board wall assembly shall be constructed of the materials and in the manner specified in the individual U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. **Studs** — Wall framing shall consist of min 6 in. (152 mm) wide steel channel studs spaced max 24 in. (610 mm) OC. Additional framing members shall be used to form a nominal 11 in. (279 mm) wide stud cavity to support and accommodate the dryer vent cabinet (Item 2).
   
   B. **Gypsum Board** — The gypsum board type, thickness, number of layers and orientation shall be as specified in the individual Wall and Partition Design. Size of cutout made to accommodate dryer vent cabinet (Item 2) to be nom 10 in. (254 mm) wide by 17 in. (432 mm) high.

2. **Cabinet** — Dryer vent cabinet kit consisting of a flanged steel cabinet with separate trim ring, precut pieces of mat material and foil tape installed per manufacturers' installation instructions in nom 10 by 17 in. (254 by 432 mm) opening on one side of the wall. The dryer cabinet may be provided with the mat material factory installed.

3. **Vent Duct** — Nom 4 in. diam duct formed of min No. 26 gauge galvanized steel.

4. **Firestop System** — The details of the firestop system shall be as follows.
   
   A. **Batts and Blankets** — Min 2 in. (51 mm) thickness of nom 4pcf (64 kg/m³) mineral wool batt insulation. For the nominal 6 in. (152 mm) deep cabinet mineral wool batt installed between gypsum board and vent duct above the back of the cabinet. For the nominal 4 in. (102 mm) deep dryer vent cabinet a min 2 in. (51 mm) thickness of nom 4pcf (64 kg/m³) mineral wool batt insulation to be installed to line the entire height of the stud cavity below, behind and above the cabinet.

   See Batts and Blankets (BZJZ) category for names of manufacturers.

   B. **Fill, Void or Cavity Material** — Caulk — Min 1/2 in. (13 mm) thickness of fill material applied to vent pipe/cabinet interface within the stud cavity.

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

---

**3M COMPANY 3M FIRE PROTECTION PRODUCTS** — CP 25WB+
1. **Wall Assembly** – The 1 or 2 hr fire rated framed gypsum board wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400, V400 or W400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. **Studs** – Wall framing shall consist of steel channel studs or wood studs. Steel studs to be min 6 in. (152 mm) wide and spaced max 24 in. (610 mm) OC. Wood studs to be nom 2 by 6 in. (51 by 152 mm) or larger and spaced max 16 in. (406 mm) OC. An additional framing member shall be used to form a shelf within the wall cavity to support the steel box (Item 2) and mat fill material (Item 3). The framed opening is to be 1 in. (25 mm) wider than the width of the steel box.
   
   B. **Gypsum Board** – The gypsum board type, thickness, number of layers and orientation shall be, as specified in the individual Wall and Partition Design. Size of cutout made to accommodate steel box (Item 2) is to be 1 in. (25 mm) wider and 1 in. (25 mm) higher than the width and height of the steel box.

The hourly F, T, FT, FH and FTH Ratings are equal to the hourly rating of the wall assembly.

2. **Steel Box** – Min 18 gauge, max 20 in. (508 mm) wide by max 48 in. (1.22 m) high by max 6 in. (152 mm) deep for steel stud walls. Min 18 gauge, max 12 in. (305 mm) wide by max 48 in. (1.22 m) high by max 5-1/2 in. (140 mm) deep for wood stud walls. Box to be recessed with hinged steel door and mounting flange. Steel box secured to steel studs with steel screws after application of mat material (Item 3) on exterior surfaces of steel box. Bottom and/or top of steel box may be penetrated by one 2 in. (51 mm) diam steel EMT conduit and up to twelve 1 in. (25 mm) max diam installed from the top and one in. (25 mm) and 3/4 in. (19 mm) diam conduits installed from the bottom of the box. Open pipes or tubes which terminate within the box shall be sealed with caulk (Item 4) or plugged with a ball of putty (Item 5).

3. **Fill, Void or Cavity Materials** – Nominal 0.4 in. (10 mm) thick aluminum foil faced endothermic mat supplied in 24 in. wide rolls. Individual pieces of mat cut to cover four sides and back of box and laminated to box with high strength, fast, contact type adhesive (foil face exposed). The mat sections on the top and bottom of the box shall be cut to overlap the mat sections on the sides of the box. The mat section on the back of the box shall be cut to lap over the edge of the mat sections on the top, bottom and vertical sides of box. Circular cutouts made in the mat to accommodate the pipes or tubes to be 1/4 in. to 1/2 in. (6 to 13 mm) larger than outside diam of pipe or tube. All corners and butted seams in the mat are to be covered with min 2 mil aluminum foil tape.

   **3M COMPANY 3M FIRE PROTECTION PRODUCTS** – Type E-54A or E-5A-4 Mat

4. **Fill, Void or Cavity Materials** – Nom 1/4 in. (6 mm) diam bead of caulk applied to the edge of the mat material around the perimeter of the box mounting flange. Additional caulk fill material shall be used to completely fill each circular cutout made in the mat material to accommodate a pipe or tube. The end of each open pipe or tube which terminates within the box shall be sealed with a min 1/2 in. (13 mm) depth of caulk.

   **3M COMPANY 3M FIRE PROTECTION PRODUCTS** – Type CP 25WB+ Caulk, FB-3000WT Sealant

5. **Putty** – As an alternate to the caulk (Item 4), the end of each open pipe or tube which terminates within the box may be sealed with a min 1/2 in. (13 mm) depth of putty fill material.

   **3M COMPANY 3M FIRE PROTECTION PRODUCTS** – Type MP+ Moldable Putty

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.
1. **Wall Assembly** – The 1 or 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Studs** – Wall framing shall consist of steel channel studs. Steel studs to be min 6 in. (152 mm) wide and spaced max 24 in. (60 mm) OC. Additional framing members shall be used to completely frame around opening.
   B. **Gypsum Board** – Min 5/8 in. (16 mm) thick, 4 ft (121 cm) wide with square or tapered edges. The gypsum board type, thickness, number of layers and orientation shall be as specified in the individual U400 or V400 Wall and Partition Design. Max area of opening is 676 sq in. (4362 sq cm) with a max dimension of 26 in.

   The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed.

2. **Steel Duct** – Max 24 by 24 in. (610 by 610 mm) No. 22 gauge (or heavier) steel duct to be installed either concentrically or eccentrically within the opening. The annular space shall be min 3/4 in. (19 mm) to max 1-1/2 in (38 mm). Duct to be rigidly supported on both sides of wall assembly.

3. **Firestop System** – The firestop system shall consist of the following:
   A. **Packing Material** – Min 6 in. (152 mm) or 7-1/4 in. (184 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation for 1 or 2 hr rated walls, respectively. Mineral wool to be firmly packed into opening as a permanent form and recessed from both surfaces of wall to accommodate the required thickness of fill material.
   A1. **Forming Material** – As an alternate to the packing material in Item 3A, nom 4 in. (102 mm) wide strips of min 1/2 in (13 mm) thick compressible mat to be stacked to a thickness greater than the width of the annular space and compression-fitted, edge-first, to fill the annular space to a min 6 in. (152 mm) depth for 1 hr rated walls and min 7-1/4 in. depth for 2 hr rated walls. Forming material to be recessed from both surfaces of wall as necessary to accommodate the required thickness of fill material.

   **3M COMPANY**
   **3M FIRE PROTECTION PRODUCTS** – Fire Barrier Packing Material
   **B. Fill Void or Cavity Material** – **Caulk** – Min 5/8 in. (16 mm) thickness of fill material applied within annular space, flush with both sides of wall.

   **3M COMPANY**
   **3M FIRE PROTECTION PRODUCTS** – FB-3000 WT, IC 15WB+ or CP 25WB+

*Bearing the UL Classification Mark

1. **Wall Assembly** — The 1 or 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Studs** — Wall framing shall consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced max 16 in. (406 mm) OC. Steel studs to be min 3-1/2 in. (89 mm) wide and spaced max 24 in. (610 mm) OC. Additional framing members shall be used to completely frame around opening.

   B. **Gypsum Board** — Min 5/8 in. (16 mm) thick, 4 ft (1.2 m) wide with square or tapered edges. The gypsum board type, thickness, number of layers and orientation shall be as specified in the individual U300, U400 or V400 Wall and Partition Design. Max size of opening is 210 sq in. (1355 cm²) with a max width of 14-1/2 in. (368 mm) for wood studs. Max area of opening is 77.3 sq ft. (7.2 m²) with a max width of 105-1/2 in. (2.7 m) for steel studs.

   The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall in which it is installed.

2. **Steel Duct** — Max 100 by 100 in. (2.5 by 2.5 m) steel duct to be installed within the framed opening. The duct shall be constructed and reinforced in accordance with SMACNA construction standards. Steel duct to be rigidly supported on both sides of wall assembly.

3. **Batts and Blankets** — Nom 1-1/2 or 2 in. (38 or 51 mm) thick glass fiber batt or blanket (min 3/4 pcf or 12 kg/m³) jacketed on the outside with a foil-scrim-kraft facing. Longitudinal and transverse joints sealed with aluminum foil tape. During the installation of the fill material, the batt or blanket shall be compressed minimum 50% such that the annular space within the firestop system shall be min 1/2 in. (13 mm) to max 2 in. (51 mm).

   See Batts and Blankets (BKNV) category in the Building Materials Directory for names of manufacturers. Any batt or blanket meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index 50 or less may be used.

4. **Firestop System** — The firestop system shall consist of the following:

   A. **Packing Material** — Min 3-5/8 (92 mm) or 4-7/8 in. (124 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form for 1 or 2 hr fire-rated walls, respectively. Packing material to be recessed from both surfaces of wall to accommodate the required thickness of fill material.

   B. **Fill, Void or Cavity Material** — Sealant — Min 5/8 in. (16 mm) thickness of fill material applied within annulus, flush with both surfaces of wall.

   C. **Steel Retaining Angles** — Min No. 16 gauge (0.059 in. or 1.5 mm) galv steel angles sized to lap steel duct a min of 1 in. (25 mm) and lap wall surfaces a min of 2 in. (51 mm). Angles attached to steel duct on both sides of wall with min No. 10 steel sheet metal screws spaced a max of 1 in. (25 mm) from each end of steel duct and spaced a max of 6 in. (152 mm) OC.

   * Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.
1. **Wall Assembly** – The 1 or 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400 or V400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Studs** – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 3-1/2 in. (89 mm) wide and spaced max 24 in. (610 mm) OC.

   B. **Gypsum Board** – Thickness, type, number of layers and fasteners as specified in the individual Wall and Partition Design. Diam of opening to be max 2 in. (51 mm) larger than OD of steel duct (Item 2). Max diam of opening is 14 in. (356 mm).

   The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed.

2. **Steel Duct** – Nom 12 in. (305 mm) diam (or smaller) No. 26 gauge (or heavier) spiral wound or long seam galv steel duct. The duct shall be constructed and reinforced in accordance with SMACNA construction standards. Annular space between duct and periphery of opening to be min 0 in. (point contact) to max 2 in. (51 mm). Duct to be rigidly supported on both sides of the wall assembly.

3. **Fill, Void or Cavity Material** – Sealant – Min 5/8 in. (16 mm) thickness of fill material applied within annulus, flush with both surfaces of wall assembly. At point contact location, min 1/4 in. (6 mm) diam bead of fill material applied at steel duct/gypsum board interface on both surfaces of wall.

1. **Wall Assembly** – The 1 or 2 hr fire rated framed gypsum board wall assembly shall be constructed of the materials and in the manner specified in the individual U400, V400 or W400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Studs** – Wall framing shall consist of min 3-5/8 in. (92 mm) wide steel channel studs spaced max 24 in. (610 mm) OC. Additional framing members shall be used to completely frame around opening.
   B. **Gypsum Board** – Thickness, type, number of layers and fasteners as required in the individual Wall and Partition Design. Max area of opening is 952 sq in. (0.61 m²) with a max dimension of 34 in. (864 mm).

   The hourly F and FH Ratings for the firestop system are equal to the hourly fire rating of the wall assembly in which it is installed.

2. **Steel Duct** – Max 24 by 30 in. (610 by 762 mm) No. 22 gauge (or heavier) steel duct to be installed concentrically or eccentrically within opening. Annular space between duct and periphery of opening shall be min 1 in. (25 mm) to max 4 in. (102 mm). Duct to be rigidly supported on both sides of wall assembly.

3. **Firestop System** – The firestop system shall consist of the following:
   A. **Fill, Void or Cavity Material** – Pillows – Nom 9 in. (229 mm) long by 4 or 6 in. (102 or 152 mm) wide by 2 or 3 in. (51 or 76 mm) thick plastic covered pillows. Pillows to be installed lengthwise through the opening and positioned to extend equally in both directions from the approximate center line of the wall. Pillows tightly-packed into opening to completely fill the annular space between the steel duct and the periphery of the opening.

   **3M COMPANY**
   **3M FIRE PROTECTION PRODUCTS** – Fire Barrier Pillows, Fire Barrier Self-Locking Pillows

   B. **Fill, Void or Cavity Material** – Putty – (Not Shown) – After installation of pillows (Item 3A), putty applied to seal any voids between or around the pillows on both sides of the wall assembly.

   **3M COMPANY**
   **3M FIRE PROTECTION PRODUCTS** – MP+*

1. **Wall Assembly** — The 1 hr or 2 hr fire rated framed gypsum board wall assembly shall be constructed of the materials and in the manner specified in the individual U400, V400 or W400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Studs** — Wall framing shall consist of steel channel studs. Steel studs to be min 6 in. (152 mm) wide and spaced max 24 in. (610 mm) OC. An additional framing member shall be used to form a shelf within the wall cavity to support the utility controller cabinet (Item 2). The framed opening is to be 1 in. (25 mm) wider than the steel enclosure of the cabinet.

   B. **Gypsum Board** — The gypsum board type, thickness, number of layers and orientation shall be as specified in the individual Wall and Partition Design. Size of cutout made to accommodate steel box (Item 2) is to be 1 in. (25 mm) wider and 1 in. (25 mm) higher than the width and height of the steel enclosure of the cabinet.

   The hourly F and T Ratings of the firestop system are equal to the hourly fire rating of the wall in which the firestop system is installed.

2. **Cabinet** — Recessed factory-protected utility control cabinet with hinged door and trim frame installed per manufacturers’ installation instructions in opening on one side of the wall. Mounting brackets at top and bottom of utility control cabinet secured to steel studs with steel screws through mounting brackets prior to installation of gypsum board on one or both sides of wall. Bottom and/or top of steel box may be penetrated by one 2 in. (51 mm) diam steel EMT conduit and up to twelve 1 in. (25 mm) max daim installed from the top and one 1 in. (25 mm) and one 3/4 in. (19 mm) diam conduits installed from the bottom of the box. Conduit which terminates within the box shall be internally plugged with a min 1/2 in. (13 mm) depth of caulk supplied with cabinet or with a ball of putty fill material (Item 3).

   ISIMET L L C — Series UtC-F2, LSP-F2 and S-F2

3. **Fill, Void or Cavity Materials** — Putty — (Not Shown) - As an alternate to the caulk supplied with the cabinet, the end of each conduit which terminates within the cabinet may be sealed with a min 1/2 in. (13 mm) depth of putty fill material.

   3M COMPANY
   3M FIRE PROTECTION PRODUCTS — Type MP+ Moldable Putty

ANSI/UL 1479 (ASTM E814)  
F Rating — 1 and 2 Hr (See Item 1)  
T Rating — 1 and 2 Hr (See Item 1)

CAN/ULC S115  
F Rating — 1 and 2 Hr (See Item 1)  
FT Rating — 1 and 2 Hr (See Item 1)  
FH Ratings — 1 and 2 Hr (See Item 1)  
FTH Rating — 1 and 2 Hr (See Item 1)

1. **Wall Assembly** — The 1 or 2 hr fire rated framed gypsum board wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400, V400 or W400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Studs** — Wall framing shall consist of steel channel studs or wood studs. Steel studs to be min 3-5/8 in. (92 mm) wide and spaced max 24 in. (610 mm) OC. Wood studs to be nom 2 by 4 in. (51 by 102 mm) or larger and spaced max 16 in. (406 mm) OC. An additional framing member shall be used to form a shelf within the wall cavity to support the steel box (Item 2) and mat fill material (Item 3). The framed opening is to be 1 in. (25 mm) wider than the width of the steel box.

   B. **Gypsum Board*** — The gypsum board type, thickness, number of layers and orientation shall be, as specified in the individual Wall and Partition Design. Size of cutout made to accommodate steel box (Item 2) is to be 1 in. (25 mm) wider and 1 in. (25 mm) higher than the width and height of the steel box. The hourly F, T, FT, FH and FTH Ratings are equal to the hourly rating of the wall assembly.

2. **Steel Box** — Min 18 gauge, max 11-7/8 in. (302 mm) wide by max 20 in. (508 mm) high by max 3-7/8 in. (98 mm) deep for steel and wood stud walls. Box to be recessed with hinged steel door and mounting flange. Steel box secured to steel studs with steel screws after application of mat material (Item 3) on exterior surfaces of steel box. Each vertical side of steel box may be penetrated by a maximum of two 1-1/2 in. (38 mm) max diam copper pipes or tubes. Pipes or tubes shall not terminate within the box and shall be contained in a closed system.

3. **Fill, Void or Cavity Materials*** — Mat — Nominal 0.4 in. (10 mm) thick aluminum foil faced endothermic mat supplied in 24 in. wide rolls. Individual pieces of mat cut to cover four sides and back of box and laminated to box with high strength, fast, contact type adhesive (foil face exposed). The mat sections on the top and bottom of the box shall be cut to overlap the mat sections on the sides of the box. The mat section on the back of the box shall be cut to lap over the edge of the mat sections on the top, bottom and vertical sides of box. Circular cutouts made in the mat to accommodate the pipes or tubes to be 1/4 in. to 1/2 in. (6 to 13 mm) larger than outside diam of pipe or tube. All corners and butted seams in the mat are to be covered with min 2 mil aluminum foil tape.

   3M COMPANY 3M FIRE PROTECTION PRODUCTS — Type E-54A or E-5A-4 Mat

4. **Fill, Void or Cavity Materials*** — Caulk or Sealant — (Not Shown) - Nom 1/4 in. (6 mm) diam bead of caulk applied to the edge of the mat material around the perimeter of the box mounting flange. Additional caulking shall be used to completely fill each circular cutout made in the mat material to accommodate a pipe or tube.

   3M COMPANY 3M FIRE PROTECTION PRODUCTS — Type CP 25WB+ Caulk, FB-3000WT Sealant

1. **Wall Assembly** — The 1 or 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. **Studs** — Wall framing shall consist of steel channel studs. Steel studs to be min 3-5/8 in. (92 mm) wide and spaced max 24 in. (610 mm) OC. Additional framing members shall be used to completely frame around opening.
   
   B. **Gypsum Board** — Min 5/8 in. (16 mm) thick, 4 ft (121 cm) wide with square or tapered edges. The gypsum board type, thickness, number of layers and orientation shall be as specified in the individual U400 or V400 Wall and Partition Design. Max area of opening is 928 sq in. (5987 sq cm) with a max dimension of 32 in. (813 mm).

   The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed. The hourly T, FT and FTH Rating of the firestop system is 0 hr when installed in 1 hr rated walls and ½ hr when installed in 2 hr rated walls.

2. **Steel Duct** — Max 27 by 30 in. (686 by 762 mm) No. 24 gauge (or heavier) steel duct to be installed either concentrically or eccentrically within the opening. The annular space shall be min 1/2 in. (19 mm) to max 1-1/2 in (38 mm). Duct to be rigidly supported on both sides of wall assembly.

3. **Firestop System** — The firestop system shall consist of the following:
   
   A. **Packing Material** — Min 3-5/8 in. (92 mm) or 5 in. (127 mm) thickness of min 4 pcf (64 kg/m^3) mineral wool batt insulation for 1 or 2 hr rated walls, respectively. Mineral wool to be firmly packed into opening as a permanent form and recessed from both surfaces of wall to accommodate the required thickness of fill material.

   A1. **Forming Material** — As an alternate to the packing material in Item 3A, nom 4 in. (102 mm) wide strips of min 1/2 in (13 mm) thick compressible mat to be stacked to a thickness greater than the width of the annular space and compression-fitted, edge-first, to fill the annular space to a min 3-5/8 in. (92 mm) or 5 in. (127 mm) depth for 1 hr and 2 hr rated walls respectively. Forming material to be recessed from both surfaces of wall as necessary to accommodate the required thickness of fill material.

   3M COMPANY 3M FIRE PROTECTION PRODUCTS — Fire Barrier Packing Material

   B. **Fill Void or Cavity Material** — Min 5/8 in. (16 mm) thickness of fill material applied within annular space, flush with both sides of wall.

   3M COMPANY 3M FIRE PROTECTION PRODUCTS — FB-3000 WT, IC 15WB+ or CP 25WB+

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

1. **Wall Assembly** — The 1 or 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Studs** — Wall framing shall consist of steel channel studs. Steel studs to be min 3-5/8 in. (92 mm) wide and spaced max 24 in. (610 mm) OC. Additional framing members shall be used to completely frame around opening.
   B. **Gypsum Board** — Min 5/8 in. (16 mm) thick, 4 ft (121 cm) wide with square or tapered edges. The gypsum board type, thickness, number of layers and orientation shall be as specified in the individual U400 or V400 Wall and Partition Design. Max area of opening is 676 sq in. (4362 sq cm) with a max dimension of 26 in. (660 mm).

   The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed. The hourly T, FT and FTH Rating of the firestop system is 0 hr when installed in 1 hr rated walls and ¼ hr when installed in 2 hr rated walls.

2. **Steel Duct** — Max 24 by 24 in. (610 by 610 mm) No. 22 gauge (or heavier) steel duct to be installed either concentrically or eccentrically within the opening. The annular space shall be min 1/2 in. (19 mm) to max 1-1/2 in (38 mm). Duct to be rigidly supported on both sides of wall assembly.

3. **Firestop System** — The firestop system shall consist of the following:
   A. **Packing Material** — Min 3-5/8 in. (92 mm) or 5 in. (127 mm) thickness of min 4 pcf (64 kg/m3) mineral wool batt insulation for 1 or 2 hr rated walls, respectively. Mineral wool to be firmly packed into opening as a permanent form and recessed from both surfaces of wall to accommodate the required thickness of fill material.
   A1. **Forming Material** — As an alternate to the packing material in Item 3A, nom 4 in. (102 mm) wide strips of min 1/2 in. (13 mm) thick compressible mat to be stacked to a thickness greater than the width of the annular space and compression-fitted, edge-first, to fill the annular space to a min 3-5/8 in. (92 mm) or 5 in. (127 mm) depth for 1 hr and 2 hr rated walls respectively. Forming material to be recessed from both surfaces of wall as necessary to accommodate the required thickness of fill material.

3M COMPANY 3M FIRE PROTECTION PRODUCTS — Fire Barrier Packing Material

B. **Fill Void or Cavity Material** — Caulk — Min 5/8 in. (16 mm) thickness of fill material applied within annular space, flush with both sides of wall.

3M COMPANY 3M FIRE PROTECTION PRODUCTS — FD 150+, FB-3000 WT, IC 15WB+ or CP 25WB+

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.
1. **Wall Assembly** — The 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Studs** — Wall framing shall consist of steel channel studs. Steel studs to be min 3-5/8 in. (92 mm) wide and spaced max 24 in. (610 mm) OC. Additional framing members shall be used to completely frame around opening.

   B. **Gypsum Board** — Min 5/8 in. (16 mm) thick, 4 ft (121 cm) wide with square or tapered edges. The gypsum board type, thickness, number of layers and orientation shall be as specified in the individual U400 or V400 Wall and Partition Design. Max area of opening is 1024 sq in. (6606 sq cm) with a max dimension of 32 in. (813 mm).

2. **Steel Duct** — Max 30 by 30 in. (762 by 762 mm) No. 22 gauge (or heavier) steel duct to be installed either concentrically or eccentrically within the opening. The annular space shall be min 1/2 in. (19 mm) to max 1-1/2 in (38 mm). Duct to be rigidly supported on both sides of wall assembly.

3. **Firestop System** — The firestop system shall consist of the following:

   A. **Fill, Void or Cavity Material** — Foam — Foam to be injected into annular space to a min 6-1/8 in. (156 mm) thickness to completely fill the annular space between duct and opening to full thickness of wall, flush with both sides of wall.

   **3M COMPANY 3M FIRE PROTECTION PRODUCTS** — Fire Barrier Rated Foam, FIP 1 - Step

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

1. **Wall Assembly** — The 1 or 2 hr fire rated shaft wall assembly shall be constructed of the materials and in the manner specified in the individual U400, V400 or W400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Studs** — C-H shaped studs, 2-1/2 in. (64 mm) wide by 1-1/2 in. (38 mm) deep, spaced 24 in. (610 mm) OC.
   
   B. **Gypsum Board*** — 1 in. (25 mm) thick gypsum board liner panels, supplied in nominal 24 in. (610 mm) widths as specified in the individual Wall and Partition Design. Max area of opening is 8 in. (52 sq cm) with a max dimension of 4 in. (102 mm). The opening cutout shall follow the contour of the penetrant when steel angle or steel channel is used.
   
   C. **Gypsum Board*** — One or two layers of 5/8 in. (16 mm) thick gypsum board for 1 or 2 Hr rated assemblies, respectively, as specified in the individual Wall and Partition Design.

   1A. **Alternate Wall Assembly** — (Not shown) As an alternate to the shaft wall described above, the 1 or 2 Hr fire rated wall assembly shall be constructed of the materials and in the manner specified in the individual U400, V400 or W400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

      A. **Studs** — Wall framing shall consist of min 2-1/2 in. (64 mm) steel channel studs spaced max 24 in. (610 mm) OC.
      
      B. **Gypsum Board*** — Thickness, type, number of layers and fasteners as required in the individual Wall and Partition Design. Max area of opening is 8.6 sq in. (55 sq cm) with a max dimension of 6-7/8 in. (175 mm). The opening cutout shall follow the contour of the penetrant when steel angle or steel channel is used.

   The hourly F and FH Ratings of the firestop system are equal to the hourly rating of the wall.

2. **Floor Assembly** — Min 2-1/2 and 4-1/2 in. (64 or 114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete for 1 and 2 hr rated assemblies, respectively. Floor may also be constructed of any min 6 in. (152 mm) UL Classified Precast Concrete Units*.

   See **Precast Concrete Units** (CFTV) category in the Fire Resistance Directory for names of manufacturers.

3. **Penetrants** — One metallic strut, steel angle or steel channel to be installed within the firestop system. An annular space of min 0 in. (point contact) to max 7/8 in. (22 mm) is required within the firestop system. Penetrant to terminate within the stud cavity and shall be secured to floor assembly within 2 in. (51 mm) of the fill material (Item 4) on either side of the fill material with at least one min 1/4 in. (6 mm) diam by min 1-1/4 in. (32 mm) long steel masonry anchor in conjunction with steel washers. The following types and sizes of metallic struts, angles or channels may be used:

   A. **Steel Strut** — Max 1-5/8 by 1-5/8 in. (41 by 41 mm) channel strut formed from min 0.105 in. (2.7 mm) thick galv or painted steel.
   
   B. **Steel Strut** — Max 3-1/4 by 1-5/8 in. (83 by 41 mm) H strut formed from min 0.105 in. (2.7 mm) thick galv or painted steel.
   
   C. **Steel Angle or Channel** — Max 2 by 2 in. (51 by 51 mm) by min 1/8 in. (3.2 mm) thick or max 3 by 3 in. (76 by 76 mm) by min 1/4 in. (6 mm) thick steel angle or C channel.

4. **Fill, Void or Cavity Material*** — Sealant — Fill material to be completely filled into the annular space within and around the penetrant, flush with the surface of the wall. The thickness of the fill material shall be the thickness of the gypsum board(s) in which it is installed. An additional min 1/2 in. (13 mm) diam bead of sealant to be installed at the point contact location at the penetrant/gypsum board interface.

**3M COMPANY 3M FIRE PROTECTION PRODUCTS** — CP 25WB+ or FB-3000 WT

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.
1. **Wall Assembly** — The 1 or 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400, V400 or W400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Studs** — Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced max 16 in. (406 mm) OC. Steel studs to be min 2-1/2 in. (64 mm) wide and spaced max 24 in. (610 mm) OC.

   B. **Gypsum Board** — One or two layers of gypsum board, as specified in the individual Wall and Partition Design. Max area of rectangular opening is 15 sq in. (96 cm²) with max dimension of 5 in. (127 mm). Max diam of circular opening is 3 in. (76 mm). The opening cutout shall follow the contour of the penetrant when steel angle is used.

   The F and FH Ratings of the firestop system are equal to the hourly fire rating of the wall assembly.

2. **Through Penetrants** — One metallic strut, cable, rod or angle service support to be installed within the firestop system. An annular space of min 1/8 in. (3 mm) to max 7/8 in. (22 mm) is required within the firestop system. The penetrant shall be rigidly supported on both sides of floor or wall assembly. The following types and sizes of metallic strut, cable, rod or angle service support may be used:

   A. **Steel Strut** — Max 1-5/8 by 1-5/8 in. (41 by 41 mm) channel strut formed from min 0.105 in. (2.7 mm) thick galv or painted steel.

   B. **Steel Strut** — Max 3-1/4 by 1-5/8 in. (83 by 41 mm) H strut formed from min 0.105 in. (2.7 mm) thick galv or painted steel.

   C. **Cable** — Max 3/8 in. (9.5 mm) diam unjacketed galv steel cable.

   D. **Threaded Rod** — Max 1 in. (25 mm) diam galv steel threaded rod.

   E. **Steel Angle** — 2 by 2 by 1/8 in. (51 by 51 by 3 mm) thick steel angle.

3. **Firestop System** — The firestop system shall consist of the following:

   A. **Fill, Void or Cavity Material** — Sealant — Min 5/8 in. (16 mm) thickness of fill material applied within the annulus and within the channel struts, flush with both surfaces of wall.

   **3M COMPANY 3M FIRE PROTECTION PRODUCTS** — IC 15 WB+ Sealant, CP 25WB+ Sealant or FB-3000 WT Sealant

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

1. **Wall Assembly** – The 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400, V400 or W400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Studs** – Wall framing shall consist of steel channel studs. Steel studs to be min 3-5/8 in. (92 mm) wide and spaced max 24 in. (610 mm) OC.

   B. **Gypsum Board*** – Min 5/8 in. (16 mm) thick, 4 ft (121 cm) wide with square or tapered edges. The gypsum board type, thickness, number of layers and orientation shall be as specified in the individual U400, V400 or W400 Wall and Partition Design. Max diam of opening is 22-1/2 in. (572 mm).

2. **Steel Duct** – Max 20 in. (508 mm) No. 26 gauge (or heavier) spiral wound steel duct or max 12 in. (305 mm) No. 28 gauge (or heavier) steel duct to be installed either concentrically or eccentrically within the opening. The annular space shall be min 0 in. to max 2-1/2 in (64 mm). Duct to be rigidly supported on both sides of wall assembly.

3. **Fill Void or Cavity Material*** — **Caulk** – Min 1-1/4 in. (32 mm) thickness of fill material applied within annular space, flush with both sides of wall. At point contact location, min 1/4 in. (6 mm) diam bead of caulk applied at the duct/gypsum board interface.

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

1. **Floor-Ceiling Assembly** – The 1 hr fire-rated wood joist floor-ceiling assembly shall be constructed of the materials and in the manner specified in the individual L500 Series Floor-Ceiling Designs in the UL Fire Resistance Directory, as summarized below:
   A. **Flooring System** – Lumber or plywood subfloor with finish floor of lumber, plywood or **Floor Topping Mixture** as specified in the individual Floor-Ceiling Design. Max diam of opening is 11 in.
   B. **Wood Joists** – Nom 2 by 10 in. lumber joists spaced 16 in. OC with nom 1 by 3 in. lumber bridging and with ends firestopped.
   C. **Gypsum Board** – Nom 4 ft wide by 5/8 in. thick as specified in the individual Floor-Ceiling Design. Max diam of opening is 11 in.

1.1 **Chase Wall** (Optional, not shown) – The through penetrants (Item No. 2) shall be routed through a 1 hr fire-rated single, double or staggered wood stud/gypsum wallboard chase wall constructed of the materials and in the manner specified in the individual U300 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Studs** – Nom 2 by 6 in. or double nom 2 by 4 in. lumber studs.
   B. **Sole Plate** – Nom 2 by 6 in. or parallel 2 by 4 in. lumber plates, tightly butted.
   C. **Top Plate** – The double top plate shall consist of two nom 2 by 6 in. or two sets of parallel 2 by 4 in. lumber plates, tightly butted. Max diam of opening is 5 in.
   D. **Gypsum Board** – Thickness, type, number of layers and fasteners shall be as specified in individual Wall and Partition Design.

2. **Steel Vent Duct** – Nom 4 in. diam (or smaller) No. 30 gauge (or heavier) galv steel vent duct or nom 10 in. diam (or smaller) No. 28 gauge (or Heavier) galv steel vent duct. Diam of openings to be max 1 in. larger than outside diam of duct. Duct to be installed approx midway between wood joists and installed either concentrically or eccentrically in opening. The annular space between the duct and the periphery of opening shall be min 0 in. (point contact) to max 1 in. Duct to be rigidly supported on both sides of floor-ceiling assembly.

3. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Min 3/4 in. thickness of fill material applied within the annulus, flush with top surface of floor or sole plate. Min 5/8 in. thickness of fill material applied within the annulus, flush with bottom surface of ceiling or top plate. An additional min 1/4 in. crown of fill material applied to perimeter of duct at its egress from the top of flooring and underside of ceiling or from top of sole plate and underside of top plate.

   **3M COMPANY** – CP 25WB+ caulk or FB-3000 WT sealant

1. **Floor-Ceiling Assembly** – The 1 hr fire-rated solid or trussed lumber joist floor-ceiling assembly shall be constructed of the materials and in the manner specified in the individual L500 Series Floor-Ceiling Designs in the UL Fire Resistance Directory. The general construction details of the floor-ceiling assembly are summarized below:
   A. **Flooring System** – Lumber or plywood subfloor with finish floor of lumber, plywood or **Floor Topping Mixture** as specified in the individual Floor-Ceiling Design. Max diam of opening is 5 in. (127 mm).
   B. **Wood Joists** – Nom 10 in. (254 mm) deep (or deeper) lumber, steel or combination lumber and steel joists, trusses or **Structural Wood Members** with bridging as required and with ends firestopped.
   C. **Gypsum Board** – Nom 4 ft (122 cm) wide by 5/8 in. (16 mm) thick as specified in the individual Floor-Ceiling Design. Gypsum board secured to wood joists or furring channels as specified in the individual Floor-Ceiling Design. Max of opening is 6 in. by 5-1/2 in. (152 mm by 140 mm).

1.1 **Chase Wall** (Optional, not shown) – The duct (Item 2) may be routed through a fire-rated single, double or staggered wood stud/gypsum board chase wall having a fire rating consistent with that of the floor-ceiling assembly. The chase wall shall be constructed of the materials and in the manner specified in the individual U300 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Studs** – Nom 2 in. by 6 in. (51 mm by 152 mm) or double nom 2 in. by 4 in. (51 mm by 102 mm) lumber studs.
   B. **Sole Plate** – Nom 2 in. by 6 in. (51 mm by 152 mm) or parallel 2 in. by 4 in. (51 mm by 102 mm) lumber plates, tightly butted.
   C. **Top Plate** – The double top plate shall consist of two nom 2 in. by 6 in. (51 mm by 152 mm) or two sets of parallel 2 in. by 4 in. (51 mm by 102 mm) lumber plates, tightly butted. Max of opening is 6 in. by 5-1/2 in. (152 mm by 140 mm).
   D. **Gypsum Board** – Thickness, type, number of layers and fasteners shall be as specified in individual Wall and Partition Design.

2. **Steel Duct** – Nom 4 in. (102 mm) diam (or Smaller) No. 30 gauge (or heavier) galv steel duct to be installed eccentrically or concentrically within the firestop system. The annular space between the duct and the periphery of opening shall be min 0 in. (0 mm) (point contact) to max 2 in. (51 mm) Duct to be rigidly supported on both sides of the Floor-Ceiling assembly.

3. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Min 3/4 in. (19 mm) thickness of caulk applied within the annulus, flush with top surface of floor or sole plate. Min 5/8 in. (16 mm) thickness of caulk applied within the annulus, flush with bottom surface of ceiling or top plate. Min 1/2 in. (13 mm) diam bead of caulk applied at the duct/floor or sole plate interface at point contact location on the top side of assembly and at the duct/ceiling or top plate interface at point contact location on bottom side of assembly.

3M COMPANY – FireDam 150+, CP 25WB+, IC 15WB+ caulk or FB-3000 WT sealant

1. **Floor-Ceiling Assembly** – The 1 hr fire-rated solid wood joist floor-ceiling assembly shall be constructed of the materials and in the manner described in the individual L500 Series Design in the UL Fire Resistance Directory. The general construction features of the floor-ceiling assembly are summarized below:
   A. **Flooring System** – Lumber or plywood subfloor with finish floor as specified in the individual Floor-Ceiling Design. Max size of opening is 55 by 27 in. (1387 by 686 mm).
   B. **Wood Joists** – Nom 10 in. (254 mm) deep (or deeper) wood joists with bridging as required and with ends firestopped. Opening to be framed on all 4 sides with sections of solid wood joist.
   C. **Gypsum Board*** – Thickness, type, number of layers and fasteners shall be as specified in individual Floor-Ceiling Design. Max size of opening is 55 by 27 in. (1387 by 686 mm).

2. **Steel Air Duct** – Max 48 by 20 in. (1220 by 508 mm), min 0.030 in. (0.76 mm) thick (22 GA) galvanized steel duct to be installed either concentrically or eccentrically within the opening. The duct shall be constructed and reinforced in accordance with SMACNA HVAC Duct Construction Standards - Metal and Flexible. Steel duct to be rigidly supported on both sides of wall assembly.

3. **Duct Wrap Materials*** – Nom 1-1/2 in. (38 mm) thick ceramic fiber batt or blanket (min 6 pcf or 96 kg/m³) jacketed with a foil-scrim-poly facing, installed in a telescope, checkerboard or butt-joint-and-collar pattern with 3 in. (76 mm) transverse and longitudinal overlaps, in accordance with the requirements of Ventilation Duct Assembly No. V-27. See Ventilation Duct Assemblies in Vol. 2 of the UL Fire Resistance Directory. Longitudinal and transverse joints sealed with aluminum foil tape. The annular space shall be min 1 in. (25 mm) to max 3 in. (76 mm) within the framed opening.

3M COMPANY
3M FIRE PROTECTION PRODUCTS – 3M FireBarrier Duct Wrap 615 or 3M FireBarrier Duct Wrap 615+

4. **Firestop System** – The firestop system shall consist of the following:
   A. **Packing Material*** – Min 9-1/2 in. (240 mm) thickness of min 6 pcf (96 kg/m³) density duct insulation compressed 33% minimum or min 5 pcf (80 kg/m³) density UL Classified mineral fiber compressed 50% minimum and installed into the opening. Packing material to be recessed from top surface of floor as required to accommodate the required thickness of fill material.

3M COMPANY
3M FIRE PROTECTION PRODUCTS – 3M FireBarrier Duct Wrap 615 or 3M FireBarrier Duct Wrap 615+

   B. **Fill Void or Cavity Material*** – Sealant – Min 1/4 in. (6.3 mm) thickness of fill material applied within annulus, flush with surface of floor.

1. **Floor-Ceiling Assembly** – The 1 hr fire rated concrete and steel joist Floor-Ceiling assembly shall be constructed of the materials and in the manner described in the individual G500 Series Design in the UL Fire Resistance Directory, as summarized below:
   A. **Flooring** – Normal or Lightweight concrete as specified in the individual G500 Series Design. Max diam of opening is 11 in. (279 mm).
   B. **Joists** – Steel joists or Structural Steel Members* as specified in the individual G500 Series Design.
   C. **Gypsum Board** – Min 5/8 in. (16 mm) thick, screw-attached to furring channels as specified in the individual G500 Series Design. Max diam of opening is 11 in. (279 mm).

2. **Steel Vent Duct** – Nom 4 in. (102 mm) diam (or smaller) No. 30 gauge (or heavier) galv steel vent duct or nom 10 in. (254 mm) diam (or smaller) No. 28 gauge (or heavier) galv steel vent duct. Diam of openings to be max 1 in. (25 mm) larger than outside diam of duct. Duct to be installed either concentrically or eccentrically in opening. The annular space between the duct and the periphery of opening shall be min 0 in. (point contact) to max 1 in. (0 to max 25 mm). Duct to be rigidly supported on both sides of floor-ceiling assembly.

3. **Fill, Void or Cavity Materials* – Caulk or Sealant** – Min 3/4 in. (19 mm) thickness of fill material applied within the annulus, flush with top surface of floor. Min 5/8 in. (16 mm) thickness of fill material applied within the annulus, flush with bottom surface of ceiling. An additional min 1/4 in. (6 mm) bead of fill material applied at the duct/ceiling interface at point contact location on the lower surface of ceiling.

1. **Floor or Wall Assembly** – Lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Min thickness of concrete floor or wall is 2-1/2 in. (64 mm) for 1 hr F Rating and 4-1/2 in. (114 mm) for 2 or 3 hr F Rating. Wall may also be constructed of any UL Classified Concrete Blocks*. Max area of opening 36 sq ft (3.4 m²) with one dimension of opening being 36 in. (914 mm) or less.

   See **Concrete Blocks (CAZT)** category in the Fire Resistance Directory for names of manufacturers.

2. **Pipe or Conduit** – Nom 12 in. (305 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe, nom 6 in. (152 mm) diam (or smaller) steel conduit, nom 4 in. (102 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe, steel EMT or nom 6 in. (152 mm) diam (or smaller) Type L (or heavier) copper tubing. Min clearance between pipes 1 in. (25 mm). Min clearance between pipe and wall of through opening 1/4 in. (6 mm). When single nom 4 in. (102 mm) diam (or smaller) pipe, conduit or EMT is installed in nom 7 in. (178 mm) diam (or smaller) circular through opening, min clearance between pipe, conduit or EMT and wall of through opening is 0 in. (0 mm) (point contact). Pipes and conduits rigidly supported on both sides of floor or wall assembly.

2A. **Pipe Covering** (Optional) – Nom 1 in. to 2 in. (25 mm to 51 mm) thick hollow cylindrical heavy density (min 3.5 pcf or 56 kg/m³) glass fiber units jacketed on the outside with an all service jacket may be used on nom 12 in. (305 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe or on nom 6 in. (152 mm) diam (or smaller) copper tubing. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt strip tape supplied with the product. When pipe covering material is used, max F Rating is 2 hr.

   See **Pipe and Equipment Covering – Materials** (BRGU) category in Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

2B. **Pipe Insulation** (Optional, Not Shown) – As an alternate to Item 2A, nom 1 in. to 2 in. (25 mm to 51 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing with skin may be used on nom 4 in. (102 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe or on nom 4 in. (102 mm) diam (or smaller) copper tubing. When pipe insulation material is used, max F Rating is 2 hr.

   See **Plastics (QMFZ2)** category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL94 Flammability classification of 94-5VA may be used.

2C. **Cables** – Nom 4 in. (102 mm) diam (or smaller) tight bundle of cable. When cable bundle is installed in through opening containing pipes or conduits, a min separation of 12 in. (305 mm) shall be maintained between cable bundle and pipe/conduit. Cable bundle rigidly supported on both sides of floor or wall assembly. The following types and sizes of cables may be used:

   A. Max 150 pair No. 24 AWG telephone cable; polyvinyl chloride (PVC) insulation and jacket materials. When telephone cable is used, F Rating is 2 hr.

   B. Max No. 2/0 AWG multi conductor power/control cable; cross-linked polyethylene (XLPE) insulation, PVC jacket. When power/control cable is used, F Rating is 3 hr.

   C. Max 350 kcmil single-conductor power cable; XLPE insulation. When power cable is used, F Rating is 3 hr.

   D. Multiple fiber optical communication cable jacketed with polyvinyl chloride and having a max outside diam of 5/8 in. (16 mm).

   E. Max 22 AWG coaxial data cable with polyethylene insulation and polyvinyl chloride jacket.
2D. Cable Tray – Max 36 in. (914 mm) wide by max 6 in. (152 mm) deep steel or aluminum open ladder cable tray. Cable tray to consist of channel-shaped side-rails with boxed channel rungs spaced 9 in. (229 mm) OC. Cable tray side-rails to be formed of min 0.056 in. (1.42 mm) thick (16 ga) galv steel or min 0.125 in. (3.2 mm) thick aluminum. Cable tray rungs to be formed of min 0.029 in. (0.72 mm) thick (22 ga) galv steel or min 0.080 in. (2 mm) thick aluminum. When more than one cable tray is installed in opening, min distance between cable trays is 24 in. (610 mm). Min annular space between cable tray and edge of opening is 0 in. (0 mm) (point contact). When annular space between cable tray and edge of opening exceeds 3 in. (76 mm), a support channel (Item 7) shall be installed between the cable tray and the edge of the opening to support the edge of the intumescent sheet (Item 4) parallel with the width dimension of the cable tray. Aggregate cross-sectional area of cables in cable tray not to exceed 39 percent of the cross-sectional area of the cable tray based on a max 3 in. (76 mm) loading depth within the cable tray. Any combination of the types and sizes specified in Item 2C may be used. Cable tray(s) rigidly supported on both sides of floor or wall assembly.

3. Fill, Void or Cavity Materials* – Wrap Strip – Nom 1/4 in. (6 mm) thick intumescent elastomeric material faced on one side with aluminum foil, supplied in strips. Min 2 in. (51 mm) wide strip wrapped around pipe/conduit, cable bundle, pipe insulation or cable fill within cable tray (foil side exposed) and secured in place with steel wire or aluminum foil tape. One layer of wrap strip is required when max 1 in. (25 mm) thick pipe covering is used. Two layers of wrap strip are required when nom 2 in. (51 mm) thick pipe covering is used. Wrap strip to extend approx 7/8 in. (22 mm) beyond each face of the intumescent sheet (Item 4). Prior to installation of the wrap strip on cable bundle or cable fill within cable tray, caulk (Item 5) to be forced into cable bundle to fill all interstices between cables throughout 2 in. (51 mm) width of wrap strip layer. When nom 6 in. (152 mm) diam (or smaller) uninsulated pipe, conduit or EMT is installed in through opening, no wrap strip is required on pipe, conduit or EMT for 2 hr F Rating.

3M COMPANY – FS-195+

4. Fill, Void or Cavity Materials* – Intumescent Sheet – Rigid aluminum foil-faced sheet with galv steel sheet backer. Sheet cut to tightly follow the contours of the pipe/cable wrap strip (or individual pipe) and with a min lap of 2 in. (51 mm) on all sides of the through opening. Sheet to be installed with the galv steel sheet backer exposed (aluminum foil facing against floor or wall surface). Sheet secured to top surface of floor and both sides of wall using min 3/16 in. (5 mm) diam by 1-1/4 in. (32 mm) long steel masonry fasteners with min 1-1/4 in. (32 mm) diam steel washers. Max spacing of fasteners not to exceed 6 in. (152 mm) OC. As an alternate when (1) the max pipe or conduit size is nom 4 in. (102 mm) diam, (2) each pipe or conduit is provided with a layer of wrap strip and (3) no bundled cables or insulated pipes are installed in the through opening, additional support channels are to be installed such that intumescent sheet is supported within 3 in. (76 mm) loading depth of the cable tray. When width of cable tray (Item 2D) exceed 24 in. (610 mm) and/or when more than one cable tray is installed in opening, no wrap strip is required on pipe, conduit or EMT for 2 hr F Rating.

3M COMPANY – CS-195+

5. Fill, Void or Cavity Materials* – Graphite Seal, Caulk, Sealant or Putty – One layer of 1/2 in. x 1/16 in. (13mm x 1.6 mm) adhesive backed graphite intumescent seal positioned under intumescent sheet around entire perimeter of through opening or min 1/4 in. (6 mm) diam continuous bead of caulk or putty applied to edge of intumescent sheet at its interface with floor or wall around entire perimeter of through opening. Generous application of caulk to be applied around the base of the wrap strip (or individual pipe) at its egress from the intumescent sheet(s) in addition to completely covering the wrap strip up to the interface(s) with the pipe, pipe insulation and/or cable bundle. All interstices between cables to be filled with caulk throughout the 2 in. (51 mm) height of the wrap strip.

3M COMPANY – E-FIS or GS seals, CP 25WB+, IC 15WB+ caulk, FB-3000 WT sealant or MP+ Stix putty.

6. Steel Cover Strip – Min 2 in. (51 mm) wide strip of min 0.015 in. (0.4 mm) thick (30 gauge) galv steel centered over entire length of slit made in intumescent sheet (Item 4) to permit installation about the pipe/cable bundle. Prior to installation of the steel sheet, slit in intumescent sheet covered with nom 1/4 in. (6 mm) diam bead of caulk (Item 5). Steel cover strip secured to galv steel backer of intumescent sheet with steel sheet-metal screws or steel rivets spaced max 2 in. (51 mm) OC on each side of slit.

7. Support Channels (Not Shown) – When area of through opening exceeds 1440 sq in. (9290 cm²), an intermediate support channel shall be installed flush with top surface of floor or both surfaces of wall. Support channels to be min 1-5/8 in. by 1-5/8 in. (41 mm by 41 mm) and formed of min 0.093 in. (2.4 mm) thick (No. 12 gauge) painted or galv steel. Ends of steel channel bolted or welded to steel angles anchored to inside walls of through opening. When width of cable tray (Item 2D) exceed 24 in. (610 mm) and/or when more than one cable tray is installed in the opening, additional support channels are to be installed such that intumescent sheet is supported within 3 in. (76 mm) of each side of the cable tray(s). When steel support channels are centered beneath butted seams of intumescent sheets, no steel cover strip (Item 6) is required over butted seam. Intumescent sheet secured to steel support channels with steel sheet metal screws in conjunction with min 1-1/4 in. (32 mm) diam steel fender washers.

When support channel is used beneath butted seam of intumescent sheets, fasteners spaced max 3 in. (76 mm) OC on each side of butted seam. When support channel is located away from intumescent sheet seam, fasteners spaced max 6 in. (152 mm) OC. Prior to installation of the intumescent sheet(s), a nom 1/4 in. (6 mm) diam continuous bead of caulk (Item 5) shall be applied as gasket over the steel support channel.

System No. C-AJ-8003
May 09, 2013
F Rating – 1 Hr
T Rating – 0 Hr
L Rating At Ambient – Less Than 1 CFM/sq ft
L Rating At 400 F – Less Than 1 CFM/sq ft

1. **Floor or Wall Assembly** – Min 5 in. (127 mm) thick reinforced normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max area of opening is 40 in. (1016 mm) with max dimension of 8 in. (203 mm).

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through-Penetrants** – One metallic pipe or conduit to be installed within the firestop system. The annular space between the pipe or conduit and periphery of opening shall be min 1/2 in. (13 mm). Pipe or conduit to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of metallic pipes or conduits may be used:
   A. **Steel Pipe** – Nom 3 in. (76 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
   B. **Conduit** – Nom 3 in. (76 mm) diam electrical metallic tubing or steel conduit.

3. **Cables** – Max five 7/C No. 12 AWG polyvinyl chloride (PVC) or cross-linked polyethylene (XLPE) insulated/PVC jacketed cables spaced a min of 1/2 in. (13 mm) apart and located a min of 2 in. (51 mm) from steel pipe and a min of 1/2 in. (13 mm) from periphery of opening.

4. **Packing Material** – Min 3 in. (76 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor as required to accommodate the required thickness of fill material. Packing material to be centered in walls mid-depth and recessed to allow for installation of fill material.

5. **Fill, Void or Cavity Material** – **Sealant** – Min 1/2 in. (13 mm) thickness of fill material applied within the annulus, flush with top surface of floor. In walls, fill material to be applied on each side of packing material. Sealant to be forced into interstices of cable group to max extent possible.

   **3M COMPANY** – Type FB-1000 NS, FB-1003SL (floors only), FB-2000 or FB-2000+.

   *Bearing the UL Classification Mark

Reprinted from the Online Certifications Directory with permission from UL
© 2013 UL LLC
1. **Floor or Wall Assembly** – Min 2-1/2 in. (64 mm) thick lightweight or normal weight (100-150pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max area of square, rectangular or circular opening is 45 sq in. (290 cm²) with max dimension of 9 in. (229 mm).

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Pipe** – Nom 3 in. (76 mm) diam (or smaller) Type L (or heavier) copper pipe, nom 2-1/2 in. (64 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe and/or nom 1 in. diam (or smaller) Schedule 40 (or heavier) polyvinyl chloride (PVC) pipe in closed (process or supply) or vented (drain, waste, vent) piping systems. One or more pipes may be installed with a min clearance of 1/2 in. (13 mm) maintained between pipes and with a min clearance of 1/4 in. (6 mm) maintained between pipe and sides of through opening. When pipe insulation material (Item 3) is used, a min clearance of 1/2 in. (13 mm) shall be maintained between insulated and/or uninsulated pipes and a min clearance of 1/4 in. (6 mm) shall be maintained between insulated pipe and sides of through opening. When cables (Item 3A) are used, a min clearance of 1/2 in. (13 mm) shall be maintained between cables and pipes and a min clearance of 1/4 in. (6 mm) shall be maintained between cables and sides of through opening. When PVC pipe is included in opening containing copper or steel pipes, each copper or steel pipe must be provided with pipe insulation (Item 3). Pipes to be rigidly supported on both sides of floor or wall assembly.

3. **Pipe Insulation** – Plastics* – (Optional) – Nom 3/4 in. (19 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing with skin. When uninsulated steel or copper pipes are used, T Rating is 1 hr. When nom 2-1/2 or 3 in. (64 mm or 76 mm) diam insulated steel or copper pipe is used, T Rating is 1/2 hr. When max 2 in. (51 mm) diam insulated steel or copper pipe is used, T Rating is 1 hr. When max 1 in. (25 mm) diam PVC pipe is used, T Rating is 3 hr.

   See Plastics* (QMFZ2) category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL94 Flammability Classification of 94-V0 may be used.

3A. **Cables** – (not show) – A max of two cables may be used. Max 8/C No. 12 AWG multiconductor power and control cables; XLPE or PVC insulation with XLPE or PVC jacket.

4. **Fill, Void or Cavity Materials** – Wrap Strip – Nom 1/4 in. (6 mm) thick intumescent elastomeric material faced on one side with aluminum foil, supplied in 2 in. (51 mm) wide strips. One nom 2 in. (51 mm) wide strip tightly-wrapped around pipe insulation (Item 3) and PVC pipe with the foil side exposed and slid into through opening such that the top edge is flush with top surface of floor. When a single insulated pipe is installed in a circular through opening and when the max annular space between the insulated pipe and the sides of the through opening is 3/8 in. (9.5 mm) the wrap strip layer may be secured in place with pressure-sensitive tape. In all other situations, the wrap strip layer shall be secured in place with min No. 18 gauge galv steel tie wire. In wall assemblies, the wrap strip layer is to be installed on the insulated pipe and PVC pipe in the same manner used for floor assemblies but shall be installed symmetrically on both sides of the wall. When no pipe insulation is used (bare copper or steel pipe with no PVC pipe in opening), no wrap strip material is required.

   **3M COMPANY** – Type FS-195+.

5. **Packing Material** – Min 1 in. (25 mm) thick mineral wool batt insulation firmly packed into opening with its top surface recessed min 1 in. (25 mm) from top surface of the floor. In wall assemblies, packing material to be firmly packed into opening on both sides of wall and recessed min 1 in. (25 mm) from wall surface. When a single insulated pipe (with wrap strip layer) is installed in a circular through opening and when the max annular space between the wrap strip layer and the sides of the through opening is 1/8 in. (3.2 mm), no forming material is required.

6. **Fill, Void or Cavity Materials** – Caulk or Sealant – Applied to fill through opening to a min depth of 1 in. (25 mm). In floor assemblies, fill material to be installed flush with top surface of floor. In wall assemblies, fill material to be installed flush with wall surface on both sides of wall.

   **3M COMPANY** – CP 25WB+ caulk or FB-3000 WT sealant.

*Note: Systems with Nonmetallic Through Penetrant(s) have not been evaluated with a pressure differential of 50 Pa between the exposed and unexposed surfaces as required by the National Building Code of Canada.
1. **Floor or Wall Assembly** – Min 2-1/2 in. (64 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified **Concrete Blocks**. Floor may also be constructed of any min 6 in. (152 mm) thick UL Classified hollow-core **Precast Concrete Units**. Max diam of opening is 4-1/2 in. (114 mm). See **Concrete Blocks** (CAZT) and **Precast Concrete Units** (CFTV) categories in the Fire Resistance Directory for names of manufacturers.

2. **Through Penetrants** – Pipes, conduits, tubing or cables to be bundled within the opening such that the aggregate cross-sectional area of penetrants in opening to be min 42 percent to max 54 percent of the cross-sectional area of the opening in floor or wall. A min 1/4 in. (6 mm) annular space shall be maintained around uninsulated metallic pipes. The space between penetrants and periphery of opening shall be min 1/4 in. (6 mm). Penetrants to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of penetrants may be used:

   A. **Metallic Pipes** – The following types and sizes of metallic pipes, conduits or tubing may be used:
      A1. **Steel Pipe** – Nom 3/4 in. (19 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
      A2. **Conduit** – Nom 3/4 in. (19 mm) diam (or smaller) electrical metallic tubing or steel conduit.
      A3. **Copper Tubing** – Nom 3/4 in. (19 mm) diam (or smaller) Type L (or heavier) copper tubing.
      A4. **Copper Pipe** – Nom 3/4 in. (19 mm) diam (or smaller) Regular (or heavier) copper pipe.
      All pipes, conduits or tubing larger than nom 1/2 in. (13 mm) diam shall be provided with pipe covering (Item 3).

   B. **Nonmetallic Pipes** – A max of one nonmetallic pipe or conduit may be used. A min 1/4 in. (6 mm) space must be maintained between uninsulated metallic pipes and nonmetallic pipes or conduits. The following types and sizes of nonmetallic pipes or conduits may be used:
      B1. **Polyvinyl Chloride (PVC) Pipe** – Nom 1-1/4 in. (32 mm) diam (or smaller) Schedule 40 solid core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping system.
      B2. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** – Nom 1-1/4 in. (32 mm) diam (or smaller) SDR13.5 CPVC pipe for use in closed (process or supply) piping systems.
      B3. **Rigid Nonmetallic Conduit** – Nom 1-1/4 in. (32 mm) diam (or smaller) Schedule 40 PVC conduit installed in accordance with Article 347 of the National Electrical Code (NFPA No. 70).

   C. **Cables** – Max 7/C No. 12 AWG multi conductor power and control cables; XLPE or PVC insulation with XLPE or PVC jacket.

   D. **Pipe Covering** – The following types and sizes of pipe coverings may be used with the metallic pipes:
      D1. **Tube Insulation** – **Plastics** – Nom 1/2 in. (13 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing.
      D2. **Pipe Covering** – Nom 1/2 in. (13 mm) thick hollow cylindrical heavy density (min 3.5 pcf or 56 kg/m³) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product.

See **Pipe and Equipment Covering** – **Materials** (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.
System No. C-AJ-8060 continued

3. **Firestop System** – The details of the firestop system shall be as follows:

   A. **Firestop Device** – Firestop device consisting of a steel collar lined with intumescent material and provided with steel clips for attachment to underside of floor or both sides of wall in accordance with accompanying installation instructions. The following firestop devices are to be used, dependent on the max opening size.

<table>
<thead>
<tr>
<th>Max Opening Size In. (mm)</th>
<th>Firestop Device</th>
</tr>
</thead>
<tbody>
<tr>
<td>3-1/2 (89)</td>
<td>PPD 3</td>
</tr>
<tr>
<td>4-1/2 (114)</td>
<td>PPD 4</td>
</tr>
</tbody>
</table>

   **3M COMPANY**

   B. **Fill, Void or Cavity Materials** – Caulk, Sealant or Putty – When PPD 3 firestop device is used, min 1 in. (25 mm) thickness of caulk or putty applied to completely fill annular space inside of firestop device and between penetrants, flush with the bottom surface of floor and extending downward. When PPD 4 firestop device is used, min 2 in. (51 mm) thickness of caulk or putty applied to completely fill annular space inside of firestop device and between penetrants, flush with the bottom surface of floor and extending downward. Min 5/8 in. (16 mm) thickness of caulk or putty applied within annular space between penetrants and periphery of opening flush with bottom surface of floor. Min 3/4 in. (19 mm) thickness of caulk or putty applied to completely fill annular space, flush with top surface of floor. In walls, min 5/8 in. (16 mm) thickness of caulk or putty applied within annular space between penetrants and periphery of opening flush with both surfaces of wall. Min 1 in. or 2 in. (25 mm or 51 mm) thickness of caulk or putty for PPD 3 and PPD 4 devices, respectively, applied to completely fill annular space inside of firestop devices and between penetrants, flush with both surfaces of wall and extending outward.

   **3M COMPANY** – CP25WB+, IC 15WB+ caulk, FB-3000 WT sealant or MP+ Stix putty.)
   (Note: CP 25WB+ not suitable for use with CPVC pipes.)

   **Note:** Systems with Nonmetallic Through Penetrant(s) have not been evaluated with a pressure differential of 50 Pa between the exposed and unexposed surfaces as required by the National Building Code of Canada.
1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified **Concrete Blocks**. Max area of opening 3 sq ft (2787 cm²) with max dimension of 36 in. (914 mm).

   See **Concrete Block** (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Support Channel** – Support channel shall be installed flush with bottom surface of floor or both sides of wall, midway in opening. Support channel not required for openings with a max dimension of 18 in. (457 mm) or less. Support channels to be min 1-5/8 in. by 1-5/8 in. (41 mm by 41 mm) and formed of min 0.093 in. (2.4 mm) thick (No. 12 gauge) painted or galv steel. Ends of steel channel bolted or welded to steel angles anchored to inside walls of through opening using min 1/4 in. (6 mm) diam by 1-1/2 in. (38 mm) long steel expansion bolts, or equivalent, in conjunction with steel nuts and washers.

3. **Through Penetrants** – Multiple metallic pipes, conduits or tubings to be installed either concentrically within the firestop system. Min 1 in. (25 mm) clearance between pipes. Min clearance between uninsulated penetrants and wall of through opening 1/4 in. (6 mm). When single nom 4 in. (102 mm) diam (or smaller) steel pipe or conduit or nom 2 in. (51 mm) diam (or smaller) copper tube or pipe is installed, min clearance between pipe, tube, conduit or EMT and wall of through opening is 0 in. (0 mm) (point contact). Clearance between penetrants shall be min 1 in. (25 mm). Pipe and conduits rigidly supported on both sides of floor or wall assembly. The following types and sizes of metallic pipes, conduits or tubing may be used:
   - **A. Steel Pipe** – Nom 6 in. (152 mm) diam (or smaller) Schedule 10 (or heavier) or nom 4 in. (102 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
   - **B. Iron Pipe** – Nom 6 in. (152 mm) diam (or smaller) cast or ductile iron pipe.
   - **C. Conduit** – Nom 4 in. (102 mm) diam (or smaller) steel electrical metallic tubing or steel conduit.
   - **D. Copper Tubing** – Nom 4 in. (102 mm) diam (or smaller) Type L (or heavier) copper tube.
   - **E. Copper Pipe** – Nom 4 in. (102 mm) diam (or smaller) Regular (or heavier) copper pipe.

4. **Tube Insulation** – **Plastics**++ – Nom 1/2 in. (13 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. For use with penetrants having a nom 2 in. (51 mm) diam and less. The annular space between the insulated pipe and the edge of the through opening shall be min 1/4 in. (6 mm).

   See **Plastics** (QMFZ2) category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL94 Flammability Classification of 94-5VA may be used.

5. **Firestop System** – The details of the firestop system shall be as follows:
   - **A. Fill, Void or Cavity Materials** – **Intumescent Sheet** – Rigid aluminum foil-faced sheets with galv steel sheet backer. Sheet cut to tightly follow the contours of the penetrants or wrap strip (Item 5B) and to lap a min of 3 in. (76 mm) on the floor surface on all sides of the through opening. Sheets to be installed with the galv steel sheet backer exposed (aluminum foil facing against floor or wall surfaces). Sheets secured to bottom side of floor or both sides of wall using min 1/4 in. (6 mm) diam by 1-1/2 in. (38 mm) long steel expansion bolts, or equivalent, in conjunction with steel nuts and washers.
 expansion bolts, or equivalent, in conjunction with steel nuts and washers. Max spacing of sheet fasteners not to exceed 4 in. (6 mm) OC.
Intumescent sheet secured to steel support channels (Item 2) with steel sheet metal screws in conjunction with min 1-1/4 in. (32 mm)
diam steel fender washers spaced max 3 in. (76 mm) OC. When support channel is used beneath butted seam of intumescent sheets,
fasteners spaced max 3 in. (76 mm) OC on each side of butted seam. Seams cut to permit installation around penetrants are provided
with min 2 in. (51 mm) wide strip of min 0.016 in. (0.41 mm) thick (28 gauge) galv steel (not shown) centered over entire length of seam.
Prior to installation of the steel strip, seam in intumescent sheet covered with nom 1/4 in. (6 mm) diam bead of caulk (Item 5C). Steel
cover strip secured to galv steel backer of intumescent sheet with steel sheet-metal screws or steel rivets spaced max 3 in. (76 mm) OC on
each side of seam.

3M COMPANY – CS-195+

B. Fill, Void or Cavity Materials* – Wrap Strip – Nom 1/4 in. (6 mm) thick intumescent material supplied in 2 in. (51 mm) wide strips.
Min one layer of wrap strip wrapped around penetrants and pipe insulation and secured in place with steel wire or aluminum foil tape.
Wrap strip to extend approx 7/8 in. (22 mm) beyond each face of the intumescent sheet (Item 5A). When nom 4 in. (102 mm) diam (or
smaller) uninsulated steel pipe or conduit or nom 2 in. (51 mm) diam (or smaller) uninsulated copper tube or pipe is installed in through
opening, no wrap strip is required.

3M COMPANY – FS-195+

C. Fill, Void or Cavity Materials* – Caulk or Sealant – Min 1/4 in. (6 mm) diam continuous bead applied to edge of intumescent sheet
at its interface with surface of floor around entire perimeter of through opening. Min 1/4 in. (6 mm) diam bead applied at perimeter of
penetrants not using wrap strips at the penetrant/intumescent sheet interface on bottom side of floor or both sides or wall.

3M COMPANY – CP 25WB+, IC 15WB+ caulk or FB-3000 WT sealant.

*Bearing the UL Classification Marking

System No. C-AJ-8072
September 07, 2004
F Rating – 2 Hr
T Ratings – 0, 1/4, 1/2, & 1 Hr (See Item 2)

1. **Floor or Wall Assembly** – Min 4-1/2 in. thick reinforced lightweight or normal weight (100-150 pcf) concrete floor or min 5 in. thick reinforced lightweight or normal weight concrete wall. Wall may also be constructed of any UL Classified Concrete Blocks*. Max area of opening 84 square in. with max dimension of 14 in.

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through Penetrants** – Multiple metallic pipes, conduits, tubings or cables to be installed within the firestop system. Min 1/2 in. clearance between penetrants. Min clearance between uninsulated penetrants or cables and wall of through opening 0 in. (point contact). Penetrants rigidly supported on both sides of floor or wall assembly. The following types and sizes of metallic pipes, conduits, tubings or cables may be used:

   A. **Steel Pipe** – Nom 2 in. diam (or smaller) Schedule 5 (or heavier) steel pipe.
   B. **Iron Pipe** – Nom 2 in. diam (or smaller) cast or ductile iron pipe.
   C. **Conduit** – Nom 2 in. diam (or smaller) steel electrical metallic tubing or steel conduit.
   D. **Copper Tubing** – Nom 2 in. diam (or smaller) Type L (or heavier) copper tube.
   E. **Copper Pipe** – Nom 2 in. diam (or smaller) Regular (or heavier) copper pipe.
   F. **Cable** – Max 7/C No. 12 AWG (or smaller) copper conductor cable with PVC insulation and jacket.

   The hourly T Rating is 1/4 hr when penetrants A, B and C are used, 0 hr when penetrants D and E are used and 1/2 hr when penetrant F is used. The hourly T Rating is 1 hr when penetrants A, B, C, D and E are used with pipe insulation (Item 3).

3. **Pipe Insulation** (Optional) – The following types of pipe insulation may be used:

   A. **Pipe Covering*** – Nom 1-1/2 in. thick (or thinner) hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. The annular space between the insulated pipe and the edge of the through opening shall be min 0 in. (point contact).

   See Pipe and Equipment Covering – Materials* (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

   B. **Tube Insulation** – Plastics++ – Nom 3/4 in. thick (or thinner) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. The annular space between the insulated pipe and the edge of the through opening shall be min 0 in. (point contact).

   See Plastics (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5VA may be used.

4. **Firestop System** – The details of the firestop system shall be as follows:

   A. **Packing Material** – Min 4 in. thickness of min 4 pcf mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor or from both surfaces of wall as required to accommodate the required thickness of fill material.

   B. **Fill, Void or Cavity Materials*** – **Caulk or Sealant** – Min 1/2 in. thickness of fill material applied within the annulus, flush with top surface of floor or with both surfaces of wall. Min 1/2 in. diam bead of caulk applied to the concrete/penetrant interface at the point contact location on the top surface of floor or both surfaces of wall.

   *Bearing the UL Classification Marking

1. **Floor or Wall Assembly** – Min 4-1/2 in. thick reinforced normal weight (140-150 pcf) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max area of opening is 24 sq ft with max dimension of 8 ft. See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through Penetrants** – A max of seven firestop configurations complying with Firestop Configuration A, B, C or D, and a max of four firestop configurations complying with Firestop Configuration E, F or G may be installed within the opening in any combination. The annular space between penetrating items and between penetrating items and periphery of opening shall be as specified in the individual firestop configurations. The maximum open area within the opening shall be 480 sq in. with smaller dimension not exceeding 10 in. Pipe, conduit, tubing, cable tray or cable to be rigidly supported on both sides of floor or wall assembly. The T Rating of the system is dependent on the firestop configuration, as shown in the table below:

**Firestop Configuration A**

2. **Metallic Penetrants** – One metallic pipe, conduit or tubing to be installed within this firestop configuration. The annular space between pipes, conduit and tubing with a nom diam of 4 in. or less and the periphery of the opening shall be min 1/4 in. The annular space between pipes, conduit and tubing with a nom diam greater than 4 in. and the periphery of the opening shall be min 4-1/4 in. The annular space between pipes, conduit or tubing with a diam of 4 in. or less and other non-insulated penetrating items shall be min 1/2 in. The annular space between pipes, conduit and tubing with a nom diam greater than 4 in. and other non-insulated penetrating items shall be min 4-3/4 in. The following types and sizes of metallic pipes, conduits or tubing may be used:

A. **Steel Pipe** – Nom 8 in. diam (or smaller) Schedule 40 (or heavier) steel pipe.
B. **Iron Pipe** – Nom 8 in. diam (or smaller) cast or ductile iron pipe.
C. **Conduit** – Nom 3 in. diam (or smaller) steel electrical metallic tubing or nom 6 in. diam (or smaller) steel conduit.
D. **Copper Tubing** – Nom 3 in. diam (or smaller) Type M (or heavier) copper tubing.
E. **Copper Pipe** – Nom 3 in. diam (or smaller) Regular (or heavier) copper pipe.

3. **Firestop System** – The firestop system shall consist of the following:

A. **Forms** (Not Shown) – Used as a form to prevent leakage of mortar during installation. Forms to be a rigid sheet material, cut to fit the contour of the penetrating item and fastened to the underside of floor or both sides of wall. Forms to be removed after mortar has cured.

B. **Fill, Void or Cavity Materials** – Mortar – Min 3 in. thickness of mortar applied within the annulus, flush with top surface of floor or with both surfaces of wall. Cementitious mortar mixed with water at a rate of 1.0 part dry mixture to 0.3 parts water by weight in accordance with the installation instructions supplied with the product.

3M COMPANY – 3M Fire Barrier Mortar

**Firestop Configuration B**

2. **Metallic Penetrants** – One metallic pipe or tubing to be installed within this firestop configuration. The following types and sizes of metallic pipes or tubing may be used:

A. **Steel Pipe** – Nom 3 in. diam (or smaller) Schedule 10 (or heavier) steel pipe.
B. **Iron Pipe** – Nom 3 in. diam (or smaller) cast or ductile iron pipe.
C. **Copper Tubing** – Nom 3 in. diam (or smaller) Type M (or heavier) copper tubing.
D. **Copper Pipe** – Nom 3 in. diam (or smaller) Regular (or heavier) copper pipe.

3. **Tube Insulation – Plastics** – Nom 3/4 in. thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. The annular space between the insulated pipe or tubing and periphery of opening shall be min 6-1/2 in. The annular space between insulated pipe or tubing and other adjacent insulated penetrating items shall be min 1 in. The annular space between insulated pipe or tubing and other adjacent uninsulated penetrating items or cable trays shall be min 5 in.

See **Plastics** category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5VA may be used.

4. **Firestop System** – The firestop system shall consist of the following:

A. **Fill, Void or Cavity Materials** – **Wrap Strip** – Nom 1/4 in. thick intumescent elastomeric material faced on one side with aluminum foil, supplied in 2 in. wide strips. One nom 2 in. wide strip tightly-wrapped around tube insulation (Item 3) with ends butted and foil side exposed, and slid into through opening such that the bottom edge is flush with bottom surface of mortar in floors or both surfaces of mortar in walls. Wrap strip held in place with pressure-sensitive tape, steel tie wire, or equivalent.

3M COMPANY – **FS-195+**

B. **Forms** (Not Shown) – Used as a form to prevent leakage of mortar during installation. Forms to be a rigid sheet material, cut to fit the contour of the penetrating item and fastened to the underside of floor or both sides of wall. Forms to be removed after mortar has cured.

C. **Fill, Void or Cavity Materials** – **Mortar** – Min 3 in. thickness of mortar applied within the annulus, flush with top surface of floor or with both surfaces of wall. Cementitious mortar mixed with water at a rate of 1.0 part dry mixture to 0.3 parts water by weight in
System No. C-AJ-8073 continued

acquainted with the installation instructions supplied with the product.

3M COMPANY – 3M Fire Barrier Mortar

Firestop Configuration C

2. **Metallic Penetrants** – One metallic pipe to be installed within the opening. The following types and sizes of metallic pipes may be used:
   A. **Steel Pipe** – Nom 3 in. diam (or smaller) Schedule 10 (or heavier) steel pipe.
   B. **Iron Pipe** – Nom 3 in. diam (or smaller) cast or ductile iron pipe.

3. **Pipe Covering Materials** – **Cellular Glass Insulation** – Nom 1 in. thick cellular glass units sized to the outside diam of pipe and supplied in nominal 24 in. long half sections or nom 18 in. long segments. Pipe insulation installed on pipe in accordance with the manufacturer’s instructions. The annular space between the insulated pipe and periphery of opening shall be min 6 in. The annular space between insulated pipe and other adjacent penetrating items shall be min 4-1/4 in.

4. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – (Not Shown) Nom 1/4 in. diam bead of caulk applied between adjacent sections of pipe covering material at longitudinal and transverse joints.
   3M COMPANY – CP 25WB+ caulk or FB-3000 WT sealant.

5. **Metal Jacket** – Jacket, formed of min 0.015 in. thick aluminum sheet cut to wrap tightly around the pipe insulation with a min 2 in. lap and secured using min 18 gauge steel tie wire spaced 16 in. OC and nom 3/8 in. diam steel screws, located 1/2 in. from top of floor or both surfaces of wall.

6. **Firestop System** – The firestop system shall consist of the following:
   A. **Forms** (Not Shown) – Used as a form to prevent leakage of mortar during installation. Forms to be a rigid sheet material, cut to fit the contour of the penetrating item and fastened to the underside of floor or both sides of wall. Forms to be removed after mortar has cured.
   B. **Fill, Void or Cavity Materials** – **Mortar** – Min 3 in. thickness of mortar applied within the annulus, flush with top surface of floor or with both surfaces of wall. Cementitious mortar mixed with water at a rate of 1.0 part dry mixture to 0.3 parts water by weight in accordance with the installation instructions supplied with the product.
   3M COMPANY – 3M Fire Barrier Mortar

Firestop Configuration D

2. **Metallic Penetrants** – One metallic pipe, conduit or tubing to be installed within the opening. The following types and sizes of metallic pipes, conduits or tubing may be used:
   A. **Steel Pipe** – Nom 10 in. diam (or smaller) Schedule 10 (or heavier) steel pipe.
   B. **Iron Pipe** – Nom 10 in. diam (or smaller) cast or ductile iron pipe.

3. **Pipe Covering Materials** – **Fiberglass Insulation** – Nom 2 in. thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or but tape fastened to the periphery of opening shall be min 2-1/4 in. The annular space between insulated pipe and other adjacent insulated penetrating items shall be min 1 in. The annular space between insulated pipe and other adjacent uninsulated penetrating items or cable trays shall be min 8 in.

See **Pipe and Equipment Covering – Materials** (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Firestop System** – The firestop system shall consist of the following:
   A. **Fill, Void or Cavity Materials** – **Wrap Strip** – Nom 1/4 in. thick integument elastomeric material faced on one side with aluminum foil, supplied in 2 in. wide strips. Two nom 2 in. wide strips tightly-wrapped around pipe covering material (Item 3) with the foil side exposed and slid into through opening such that the bottom edge is flush with bottom surface of mortar in floors or both surfaces of wall. Each layer of wrap strip to be installed with butted seam in successive layers staggered. Wrap strip held in place with pressure-sensitive tape, steel tie wire, or equivalent.
   3M COMPANY – FS-195+
   B. **Fill, Void or Cavity Materials** – **Caulk or Sealant** (Not Shown) – Generous bead of caulk applied to fill any voids which exist between pipe covering material and wrap strip.
   3M COMPANY – CP 25WB+ caulk or FB-3000 WT sealant.
   C. **Forms** (Not Shown) – Used as a form to prevent leakage of mortar during installation. Forms to be a rigid sheet material, cut to fit the contour of the penetrating item and fastened to the underside of floor or both sides of wall. Forms to be removed after mortar has cured.
   D. **Fill, Void or Cavity Materials** – **Mortar** – Min 3 in. thickness of mortar applied within the annulus, flush with top surface of floor or with both surfaces of wall. Cementitious mortar mixed with water at a rate of 1.0 part dry mixture to 0.3 parts water by weight in accordance with the installation instructions supplied with the product.
   3M COMPANY – 3M Fire Barrier Mortar

Firestop Configuration E

2. **Cable Tray** – Max 36 in. wide by max 6 in. deep open-ladder or solid back cable tray with channel-shaped side rails formed of galv steel and with rungs spaced 9 in. OC. The annular space between cable trays and the periphery of the opening shall be min 0 in. (point contact) to max 10 in. The annular space between cable trays and other adjacent uninsulated penetrating items shall be min 2 in. The annular space between adjacent cable trays shall be 10 in.

3. **Firestop System** – The firestop system shall consist of the following:
   A. **Forms** (Not Shown) – Used as a form to prevent leakage of mortar during installation. Forms to be a rigid sheet material, cut to fit the contour of the cable tray and fastened to the underside of floor or both sides of wall. Forms to be removed after mortar has cured.
   B. **Fill, Void or Cavity Materials** – **Mortar** – Min 3 in. thickness of mortar applied within the annulus, flush with top surface of floor.
System No. C-AJ-8073 continued

or with both surfaces of wall. Cementitious mortar mixed with water at a rate of 1.0 part dry mixture to 0.3 parts water by weight in accordance with the installation instructions supplied with the product.

3M COMPANY – 3M Fire Barrier Mortar

4. Cables – One cable to be centered in each of max two preformed or core-drilled openings within confines of cable tray. Diam of openings to be 1-3/8 in. Openings to be spaced min 21 in. OC and min 2-1/2 in. from back and sides of cable tray. Cables to be rigidly supported on both sides of floor or wall assembly. Any of the following types and sizes of cables may be used:

A. Max 1/C 1000 kcmil aluminum conductor cable with cross-linked polyethylene (XLPE) insulation and polyvinyl chloride (PVC) jacket.
B. Max 1/C No. 4/0 AWG aluminum conductor cable with cross-linked polyethylene (XLPE) insulation and polyvinyl chloride (PVC) jacket.
C. Max 1/C No. 6/0 AWG copper conductor cable with cross-linked polyethylene (XLPE) insulation and polyvinyl chloride (PVC) jacket.
D. Max 2/C No. 16 AWG shielded copper conductor cable with flame retardant polyvinyl chloride (FR-PVC) insulation and jacket.
E. Max 3/C No. 12 AWG copper conductor cable with flame retardant cross-linked polyethylene (FR-XLPE) insulation and polyvinyl chloride (PVC) jacket.
F. Max 4/C No. 4 AWG copper conductor TECK 90 cable with cross-linked polyethylene (XLPE) insulation and polyvinyl chloride (PVC) inner and outer jackets.

5. Fill, Void or Cavity Materials – Caulk, Sealant or Putty – Min 3 in. thickness of caulk or putty applied within the annulus around cables, flush with top surface of floor or with both surfaces of wall. Additional caulk to be installed such that a min 1/4 in. crown is formed around the cables and at any voids between the cable trays and mortar, and between the cable trays and concrete floor or wall.

3M COMPANY – CP 25WB+ caulk, FB-3000 WT sealant or MP+ Stix putty.

Firestop Configuration F

2. Cable Tray* – Max 36 in. wide by max 6 in. deep open-ladder or solid back cable tray with channel-shaped side rails formed of galv steel and with rungs spaced 9 in. OC. The annular space between cable trays and the periphery of the opening shall be min 0 in. (point contact) to max 10 in. The annular space between cable trays and other adjacent uninsulated penetrating items shall be min 2 in. The annular space between adjacent cable trays shall be 10 in.

3. Firestop System – The firestop system shall consist of the following:

A. Forms (Not Shown) – Used as a form to prevent leakage of mortar during installation. Forms to be a rigid sheet material, cut to fit the contour of the cable tray and fastened to the underside of floor or both sides of wall. Forms to be removed after mortar has cured.
B. Fill, Void or Cavity Materials – Mortar – Min 3 in. thickness of mortar applied within the annulus, flush with top surface of floor or with both surfaces of wall. Cementitious mortar mixed with water at a rate of 1.0 part dry mixture to 0.3 parts water by weight in accordance with the installation instructions supplied with the product.

3M COMPANY – 3M Fire Barrier Mortar

4. Cables – One cable to be centered in each of max two preformed openings within confines of cable tray. Size of opening to be maximum 1-1/2 by 2-1/2 in. Openings to be spaced min 21 in. OC and min 2-1/2 in. from back and sides of cable tray. Cables to be rigidly supported on both sides of floor or wall assembly. Any of the following types and sizes of cables may be used:

A. Max 1/C 1000 kcmil aluminum conductor cable with cross-linked polyethylene (XLPE) insulation and polyvinyl chloride (PVC) jacket.
B. Max 1/C No. 4/0 AWG aluminum conductor cable with cross-linked polyethylene (XLPE) insulation and polyvinyl chloride (PVC) jacket.
C. Max 1/C No. 6/0 AWG copper conductor cable with cross-linked polyethylene (XLPE) insulation and polyvinyl chloride (PVC) jacket.
D. Max 2/C No. 16 AWG shielded copper conductor cable with flame retardant polyvinyl chloride (FR-PVC) insulation and jacket.
E. Max 3/C No. 12 AWG copper conductor cable with flame retardant cross-linked polyethylene (FR-XLPE) insulation and polyvinyl chloride (PVC) jacket.
F. Max 3/C No. 4 AWG copper conductor TECK 90 cable with cross-linked polyethylene (XLPE) insulation and polyvinyl chloride (PVC) inner and outer jackets.

5. Fill, Void or Cavity Materials – Mortar – Min 3 in. thickness of mortar applied within the annulus around cables, flush with top surface of floor or with both surfaces of wall. Additional mortar to be installed such that a min 1/4 in. crown is formed around the cables. Cementitious mortar mixed with water at a rate of 1.0 part dry mixture to 0.3 parts water by weight in accordance with the installation instructions supplied with the product.

3M COMPANY – 3M Fire Barrier Mortar

6. Fill, Void or Cavity Materials – Caulk or Sealant (Not Shown) Min 1/4 in. bead of caulk to be installed at any voids between the cable trays and mortar, and between the cable trays and concrete floor or wall

3M COMPANY – CP 25WB+ caulk or FB-3000 WT sealant.

Firestop Configuration G

2. Cable Tray* – Max 36 in. wide by max 6 in. deep open-ladder or solid back cable tray with channel-shaped side rails formed of aluminum and with rungs spaced 9 in. OC. The annular space between cable trays and the periphery of the opening shall be min 0 in. (point contact) to max 10 in. The annular space between cable trays and other adjacent uninsulated penetrating items shall be min 2 in. The annular space between adjacent cable trays shall be 10 in.

3. Cables – Aggregate cross-sectional area of cables in cable tray to be max 51 percent of the cross-sectional area of the cable tray. Any of the following types and sizes of cables, up to the quantity shown, may be used:
System No. C-AJ-8073 continued

A. Max 10, max 1/C 1000 kcmil aluminum conductor cable with cross-linked polyethylene (XLPE) insulation and polyvinyl chloride (PVC) jacket.
B. Max 10, max 1/C 500 kcmil aluminum conductor cable with cross-linked polyethylene (XLPE) insulation and polyvinyl chloride (PVC) jacket.
C. Max 29, max 1/C No. 4/0 AWG aluminum conductor cable with cross-linked polyethylene (XLPE) insulation and polyvinyl chloride (PVC) jacket.
D. Max 8, max 1/C No. 6/0 AWG copper conductor cable with cross-linked polyethylene (XLPE) insulation and polyvinyl chloride (PVC) jacket.
E. Max 9, max 2/C No. 16 AWG shielded copper conductor cable with flame retardant polyvinyl chloride (FR-PVC) insulation and jacket.
F. Max 2, max 3/C No. 12 AWG copper conductor cable with flame retardant cross-linked polyethylene (FR-XLPE) insulation and polyvinyl chloride (PVC) jacket.
G. Max 2, max 3/C No. 4 AWG copper conductor TECK 90 cable with cross-linked polyethylene (XLPE) insulation and polyvinyl chloride (PVC) inner and outer jackets.

4. Firestop System – The firestop system shall consist of the following:
   A. Forms (Not Shown) – Used as a form to prevent leakage of mortar during installation. Forms to be a rigid sheet material, cut to fit the contour of the cable tray and cables, and fastened to the underside of floor or both sides of wall. Forms to be removed after mortar has cured.
   B. Fill, Void or Cavity Materials* – Mortar – Min 3 in. thickness of mortar applied within the annulus, flush with top surface of floor or with both surfaces of wall. Additional fill material to be installed such that a min 2 in. crown is formed around the cables and lapping 2 in. beyond the cables. Cementitious mortar mixed with water at a rate of 1.0 part dry mixture to 0.3 parts water by weight in accordance with the installation instructions supplied with the product.

3M COMPANY – 3M Fire Barrier Mortar

5. Fill, Void or Cavity Materials* – Caulk or Sealant (Not Shown) Min 1/4 in. bead of caulk to be installed at any voids between the cable trays and mortar, and between the cable trays and concrete floor or wall.
   3M COMPANY – CP 25WB+ caulk or FB-3000 WT sealant.

C-AJ-8075  1 of 3
3M Fire Protection Products
System No. C-AJ-8075 continued

1. **Floor or wall Assembly** – Min 4-1/2 in. thick reinforced lightweight or normal weight (100-150 pcf) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max area of opening is 3520 sq in. with max dimension of 88 in. See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through Penetrants** – A max of 8 firestop configurations may be installed within the opening. The space between firestop configurations shall be min 5-3/4 in. to max 7 in. The space between firestop configuration and periphery of opening shall be min 0 in. to max 17-1/2 in. Pipe, conduit, tubing or cable tray to be rigidly supported on both sides of floor or wall assembly. The T rating of the system is dependent on the firestop configuration, as shown in the table below. Any combination of the following firestop configurations detailed herein may be used:

**Firestop Configuration A**

2. **Cable Trays** – Max 36 in. wide by max 3-1/2 in. deep open-ladder or solid-back cable trays with channel-shaped side rails formed of min 0.050 in. thick steel. Cable trays are provided with min 0.050 in. thick steel rungs spaced a max of 12 in. apart, or a min 0.050 in. thick steel solid back. A max of 2 cable trays are permitted per opening.

3. **Cables** – Aggregate cross-sectional area of cables in cable trays to be max 40 percent of the cross-sectional area of the cable tray based on a max 3.0 in. cable loading depth within the cable tray. Any combination of the following types and sizes of copper conductor cables may be used:
   A. Max 1/C 500 kcmil cable with cross-linked polyethylene (XLPE) jacket and insulation.
   B. Max 4/C No. 2 AWG cable with XLPE jacket and insulation.

4. **Packing Material** – Min 3-3/4 in. thickness of min 4.5 pcf mineral wool batt insulation firmly packed into the opening as a permanent form so that the width of the wool is compressed at least 50 percent. Packing material to be recessed from top surface of floor or from both surfaces of wall as required to accommodate the required thickness of fill material.

5. **Fill, Void or Cavity Material* – Sealant** – Min 3/8 in. thickness of caulk applied within the annulus, flush with top surface of floor or with both surfaces of wall.

**Firestop Configuration B**

2. **Cable Tray** – Max 36 in. wide by max 3-1/2 in. deep open-ladder cable tray with channel-shaped side rails formed of min 0.091 in. thick aluminum. Cable trays are provided with min 0.091 in. thick aluminum rungs spaced a max of 12 in. apart. One cable tray to be installed in the opening.

3. **Nonmetallic Sleeve (Optional)** – Nom 3-1/2 in. diam (or smaller) Schedule 10 polyvinyl chloride pipe. In floors, sleeve installed with nom 2 in. projecting above floor. In walls, sleeve installed to project min 2 in. beyond each surface of the wall. A max of 2 nonmetallic sleeves to be installed in the cable tray. The space between the sleeves and the cable tray should be min 1 in.

4. **Cables** – A max of eleven 12/C No. 14 AWG cables with cross-linked polyethylene (XLPE) jacket and insulation to be installed within the cable tray. Within each sleeve a max of two 12/C No. 4 AWG cables may be installed.

5. **Packing Material** – Min 3-3/4 in. thickness of min 4.5 pcf mineral wool batt insulation firmly packed into the opening and sleeves as a permanent form so that the width of the wool is compressed at least 50 percent. Packing material to be recessed from top surface of floor or from both surfaces of wall as required to accommodate the required thickness of fill material.

6. **Fill, Void or Cavity Material* – Sealant** – Min 3/8 in. thickness of caulk applied within the annulus, flush with top surface of floor or with both surfaces of wall.

**Firestop Configuration C**

2. **Cable Tray** – Max 36 in. wide by max 3-1/2 in. deep open-ladder cable tray with channel-shaped side rails formed of min 0.050 in. thick steel. Cable trays are provided with min 0.050 in. thick steel rungs spaced a max of 12 in. apart. One cable tray to be installed in the opening.

3. **Cables** – A max of four 12/C No. 14 AWG cables with cross-linked polyethylene (XLPE) jacket and insulation to be installed within the cable tray.

4. **Packing Material** – Min 3-3/4 in. thickness of min 4.5 pcf mineral wool batt insulation firmly packed into the opening as a permanent form so that the width of the wool is compressed at least 50 percent. Packing material to be recessed from top surface of floor or from both surfaces of wall as required to accommodate the required thickness of fill material.

5. **Fill, Void or Cavity Material* – Sealant** – Min 3/8 in. thickness of caulk applied within the annulus, flush with top surface of floor or with both surfaces of wall.

**3M COMPANY** – FB-1000 NS (floors or walls), FB-1003 SL (floors only) or FB-3000 WT sealant.
System No. C-AJ-8075 continued

Firestop Configuration D

2. Cable Tray – Max 12 in. wide by max 3-1/2 in. deep open-ladder cable tray with channel-shaped side rails formed of min 0.063 in. thick steel. Cable trays are provided with min 0.051 in. thick steel rungs spaced a max of 12 in. apart. A max of four cable trays to be installed in the opening.

3. Packing Material – Min 3-3/4 in. thickness of min 4.5 pcf mineral wool batt insulation firmly packed into the opening as a permanent form so that the width of the wool is compressed at least 50 percent. Packing material to be recessed from top surface of floor or from both surfaces of wall as required to accommodate the required thickness of fill material.

4. Fill, Void or Cavity Material* – Sealant – Min 3/8 in. thickness of caulk applied within the annulus, flush with top surface of floor or with both surfaces of wall.

Firestop Configuration E

2. Steel Conduit – Nom 4 in. diam (or smaller) electrical metallic tubing or steel conduit. One conduit to be installed within the firestop system. Conduit to be rigidly supported on both sides of floor or wall assembly.

3. Packing Material – Min 3-3/4 in. thickness of min 4.5 pcf mineral wool batt insulation firmly packed into the opening as a permanent form so that the width of the wool is compressed at least 50 percent. Packing material to be recessed from top surface of floor or from both surfaces of wall as required to accommodate the required thickness of fill material.

4. Fill, Void or Cavity Material* – Sealant – Min 3/8 in. thickness of caulk applied within the annulus, flush with top surface of floor or with both surfaces of wall.

Firestop Configuration F

2. Copper Tubing – Nom 4 in. diam (or smaller) Type M (or heavier) copper tubing or nom 6 in. diam (or smaller) Type L (or heavier) copper tubing. One tube to be installed within the firestop system. Tube to be rigidly supported on both sides of floor or wall assembly.

3. Pipe Covering* – Nom 1 in. thick hollow cylindrical heavy density (min 7.0 pcf) mineral fiber units with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product.

See Pipe and Equipment Covering – Materials* (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. Packing Material – Min 3-3/4 in. thickness of min 4.5 pcf mineral wool batt insulation firmly packed into the opening as a permanent form so that the width of the wool is compressed at least 50 percent. Packing material to be recessed from top surface of floor or from both surfaces of wall as required to accommodate the required thickness of fill material.

5. Fill, Void or Cavity Material* – Sealant – Min 3/8 in. thickness of caulk applied within the annulus, flush with top surface of floor or with both surfaces of wall.

Firestop Configuration G

2. Cable Tray – Max 36 in. wide by max 3-1/2 in. deep open-ladder cable tray with channel-shaped side rails formed of min 0.050 in. thick steel. Cable trays are provided with min 0.050 in. thick steel rungs spaced a max of 12 in. apart. One cable tray to be installed in the opening.

3. Packing Material – Min 3-3/4 in. thickness of min 4.5 pcf mineral wool batt insulation firmly packed into the opening as a permanent form so that the width of the wool is compressed at least 50 percent. Packing material to be recessed from top surface of floor or from both surfaces of wall as required to accommodate the required thickness of fill material.

4. Fill, Void or Cavity Material* – Sealant – Min 3/8 in. thickness of caulk applied within the annulus, flush with top surface of floor or with both surfaces of wall.

Firestop Configuration H

2. Steel Pipe – Nom 16 in. diam (or smaller) Schedule 30 (or heavier) or nom 24 in. diam (or smaller) Schedule 40 (or heavier) steel pipe. Pipe to be rigidly supported on both sides of floor or wall assembly.

3. Pipe Covering* (Optional) – Nom 1 or 1-1/2 in. thick hollow cylindrical heavy density (min 7.0 pcf) mineral fiber units with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. T Rating is 0 Hr when pipe covering is not used.

See Pipe and Equipment Covering – Materials* (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. Packing Material – Min 3-3/4 in. thickness of min 4.5 pcf mineral wool batt insulation firmly packed into the opening as a permanent form so that the width of the wool is compressed at least 50 percent. Packing material to be recessed from top surface of floor or from both surfaces of wall as required to accommodate the required thickness of fill material.

5. Fill, Void or Cavity Material* – Sealant – Min 3/8 in. thickness of caulk applied within the annulus, flush with top surface of floor or with both surfaces of wall.

3M COMPANY – FB-1000 NS (floors or walls), FB-1003 SL (floors only) or FB-3000 WT sealant.

1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max area of opening is 108 sq. in. (697 cm²) with a max dimension of 18 in.

See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

1A. **Steel Sleeve** – (Optional, Not Shown) - Nom 11 in. (279 mm) diam (or smaller) circular sleeve fabricated from nom 0.019 in. (0.48 mm) thick galv steel cast or grouted into floor or wall assembly flush with floor or wall surfaces.

2. **Through Penetrations** – Metallic pipes, tubing, conduit or cable to be installed either concentrically or eccentrically within the firestop system. Penetrants to be rigidly supported on both sides of floor assembly. The following types and sizes of penetrants may be used:

   A. **Metallic Pipes** – Max five metallic pipes, conduit or tubing. The annular space between penetrant and periphery of opening shall be min 0 in. (point contact) to max 1-7/8 in. (48 mm). The following types and sizes of metallic pipes, conduit or tubing may be used:

      A1. **Steel Pipe** – Nom 4 in. (102 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.

      A2. **Iron Pipe** – Nom 4 in. (102 mm) diam (or smaller) cast or ductile iron pipe.

      A3. **Conduit** – Nom 4 in. (102 mm) diam (or smaller) rigid steel conduit or steel electrical metallic tubing.

      A4. **Copper Tubing** – Nom 4 in. (102 mm) diam (or smaller) Type L (or heavier) copper tube.

      A5. **Copper Pipe** – Nom 4 in. (102 mm) diam (or smaller) Regular (or heavier) copper pipe.

   B. **Tube Insulation** – Plastics* – Nom 1/2 in. (13 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. The tube insulation may be installed on all pipes or tubing. The annular space between the insulated penetrating item and the periphery of the opening shall be min 0 in. (0 mm) (point contact) to max 1-7/8 in. (48 mm). The annular space between the insulated penetrating item and uninsulated metallic pipes, conduit or tubing shall be min 1/2 in. (13 mm).

   See Plastics (QMFZ2) category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5A may be used.

   C. **Cables** – Max two 8/C No. 24 AWG (or smaller) control cable with polyvinyl chloride (PVC) insulation and jacket. Cable to be spaced min 0 in. (0 mm) (point contact) from tube insulation or min 1/2 in. (13 mm) from other penetrants. The annular space between cable and periphery of opening is min 0 in. (0 mm) (point contact) to max 1-7/8 in. (48 mm). Cable to be rigidly supported on both sides of floor or wall assembly.

3. **Firestop System** – The details of the firestop system shall be as follows:

   A. **Packing Material** – Min 3 in. (76 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor to accommodate the required thickness of fill material.

   B. **Fill, Void or Cavity Materials* – Sealant** – Min 1/4 in. (6 mm) thickness of fill material applied within the annulus, flush with top surface of floor. Min 1/2 in. (13 mm) diam bead of caulk applied to the penetrant/concrete interface at the point contact location on the top surface of floor or both surfaces of wall.

3M COMPANY – FB-1003 SL, FB-1000 NS or FB-3000 WT

*Bearing the UL Classification Mark
+ Bearing the UL Recognized Component Marking

1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified **Concrete Blocks**. Max diam of opening is 4 in. (102 mm).

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through Penetrants** – Metallic pipes, tubing or cable to be installed either concentrically or eccentrically within the firestop system. Penetrants to be rigidly supported on both sides of floor assembly. The following types and sizes of penetrants may be used:

   A. **Metallic Pipes** – Max two metallic pipes or tubing. The annular space between penetrant and periphery of opening shall be min 0 in. (point contact) to max 2-1/4 in. (57 mm). The following types and sizes of metallic pipes or tubing may be used:
      
      A1. **Copper Tubing** – Nom 1 in. (25 mm) diam (or smaller) Type M (or heavier) copper tube.
      
      A2. **Copper Pipe** – Nom 1 in. (25 mm) diam (or smaller) Regular (or heavier) copper pipe.

   B. **Tube Insulation** – Plastics – Nom 3/4 in. (19 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. The tube insulation may be installed on all tubing. The annular space between the insulated penetrating item and uninsulated metallic pipes, conduit or tubing shall be min 0 in. (point contact) to max 1-1/4 in. (32 mm). The annular space between the insulated penetrating item and the periphery of the opening shall be min 0 in. (point contact) to max 2-1/4 in. (57 mm). See Plastics (QMFZ2) category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5A may be used.

   C. **Cables** – Max two cables spaced min 0 in. (0 mm) (point contact) from tube insulation or min 1/2 in. (13 mm) from other penetrants. The annular space between cable and periphery of opening is min 0 in. (point contact) to max 2-1/4 in. (57 mm). Cable to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of cables may be used:
      
      C1. Max 7/C No. 24 AWG (or smaller) control cable with polyvinyl chloride (PVC) insulation and jacket.
      
      C2. Max 2/C No. 10 AWG (or smaller) thermostat wire.

3. **Firestop System** – The details of the firestop system shall be as follows:

   A. **Packing Material** – Min 3 in. (76 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor or from both surfaces of wall to accommodate the required thickness of fill material.

   B. **Fill, Void or Cavity Materials** – Putty, Sealant or Caulk – Min 1/2 in. (13 mm) thickness of fill material applied within the annulus, flush with top surface of floor or with both surfaces of wall. Min 1/2 in. (13 mm) diam bead of fill material applied to the penetrant/concrete interface at the point contact location on the top surface of floor or both surfaces of wall.

   **3M COMPANY** – CP 25WB+ caulk, FB-3000 WT Sealant, MP+ Stix putty or IC 15WB+ caulk

   (Note - W Rating applies only when FB-3000 WT is used.)

*Bearing the UL Classification Mark

+Bearing the UL Recognized Component Marking

1. **Floor or Wall Assembly** – Min 4-1/2 in. thick reinforced lightweight or normal weight (100-150 pcf) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max area of opening is 144 sq in. with a max dimension of 18 in. See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through Penetrants** – Metallic pipes, tubing or cable to be installed either concentrically or eccentrically within the firestop system. Penetrants to be rigidly supported on both sides of floor assembly. The following types and sizes of penetrants may be used.

   A. **Metallic Pipes** – Max five metallic pipes or tubing. The annular space between uninsulated penetrant and periphery of opening shall be min 0 in. (point contact) to max 2-3/4 in. The following types and sizes of metallic pipes or tubing may be used:
      
      A1. **Copper Tubing** – Nom 3 in. diam (or smaller) Type M (or heavier) copper tube.
      
      A2. **Copper Pipe** – Nom 3 in. diam (or smaller) Regular (or heavier) copper pipe.

   B. **Tube Insulation** – Plastics+ – Nom 1 in. thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. The tube insulation shall be installed on all tubing greater than nom 2 in. diam. The annular space between the insulated penetrating item and uninsulated metallic pipes, conduit or tubing shall be min 0 in. (point contact) to max 1-1/4 in. The annular space between the insulated penetrating item and the periphery of the opening shall be min 0 in. (point contact) to max 2-3/4 in. See Plastics (QMFZ2) category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5A may be used.

   C. **Cables** – Max one 2/C No. 18 AWG (or smaller) thermostat wire spaced min 0 in. (point contact) from tube insulation or min 1/2 in. from other penetrants. The annular space between cable and periphery of opening is min 0 in. (point contact) to max 2-3/4 in. Cable to be rigidly supported on both sides of floor or wall assembly.

3. **Firestop System** – The details of the firestop system shall be as follows:

   A. **Fill, Void or Cavity Materials** – Wrap Strip – Nom 1/8 in. thick intumescent material supplied in 2 in. wide strips. Min one layer of wrap strip wrapped around penetrants and pipe insulation and secured in place with steel wire or aluminum foil tape and recessed within the opening not more than 2 in. above the bottom of the floor. Wrap strip required around insulated penetrants which may be tightly bundled together. Wrap strip also required to be installed around insulated penetrants when installed less than 1/2 in. from uninsulated tubes or cables. In such cases where insulated penetrant is at point contact with uninsulated tubes or cables, wrap strip to be wedged between insulation and uninsulated tube or cable by compressing insulation. Wrap strip not required around insulated tubes installed 1/2 in. or greater from other penetrants.

   B. **Packing Material** – Min 3 in. thickness of min 4 pcf mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor to accommodate the required thickness of fill material.

   C. **Fill, Void or Cavity Materials** – Putty, Caulk or Sealant – Min 1/2 in. thickness of fill material applied within the annulus, flush with top surface of floor. Min 1/2 in. diam bead of fill material applied to the penetrant/concrete interface at the point contact location on the top surface of floor.

   3M COMPANY – Ultra GS

   3M COMPANY – MP+ Stix putty, CP 25WB+ caulk or FB-3000 WT sealant.

System No. C-AJ-8106
January 31, 2006
F Rating – 2 Hr
T Ratings – 0, 1 and 2 Hr (See Item 2)
**System No. C-AJ-8106 continued**

1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced low-density or normal-density (100 to 150pcf or 1600-2400 kg/m³) structural concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max area of the through opening is 21 sq ft (1.95 m²) with a maximum dimension of 7 ft (2.1 m).

   See Concrete Blocks (CAZT) in Volume 1 of the Fire Resistance Directory for names of manufacturers.

2. **Through Penetrants** – A max of eight firestop configurations may be installed within the opening. The space between firestop configurations shall be min 5-3/4 in. (146 mm) to max 7 in. (178 mm). The space between firestop configurations and periphery of opening shall be min 0 in. (0 mm) point contact to max 8 in. (203 mm). Pipe, conduit, tubing or cable tray to be rigidly supported on both sides of floor or wall assembly. The T rating of the system is dependent on the firestop configuration as shown in the table below. Any combination of the following firestop configurations detailed herein may be used:

**Firestop Configuration A**

2. **Cable Trays** – Max 36 in. (914 mm) wide by max 3-1/2 in. (89 mm) deep solid-back or open ladder galvanized steel cable tray with channel-shaped side rails formed of min 0.050 in. (1.3 mm) thick steel. Cable trays are provided with min 0.050 in. (1.3 mm) thick steel rungs spaced a max of 12 in. (305 mm) OC or min 0.050 in. (1.3 mm) thick steel solid back. The cable tray is to be installed min 3/4 in. (19 mm) and max 8 in. (203 mm) from edge of opening and min 6 in. (152 mm) from any other cable tray or pipe.

3. **Cables** – Aggregate cross-sectional area of cables in cable trays to be max 40 percent of the cable tray based on a max 3 in. (76 mm) cable loading depth within the cable tray. Any combination of the following types and sizes of copper conductor cables may be used.

   A. Max 2/C No.14 AWG cable with XLPE jacket and insulation. Cables can be installed in groups of eight (8) spaced a min 1 in. (25 mm) between bundles.

   B. Max. 3/C No. 2 AWG cable with XLPE jacket and insulation. Cables can be installed in groups of ten (10), spaced a min 1 in. (25 mm) between bundles.

4. **Forming Material** – Min 4 in. (102 mm) thickness of min 4 pcf (64 kg/m³) density mineral wool insulation compressed minimum 50 percent into the opening as a permanent form and recessed from the floor surface or both walls as required to accommodate the required thickness of fill material.

5. **Fill, Void or Cavity Material** – Material spray-applied or brushed over the mineral wool forming material to a min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) flush with top surface of floor or both sides of wall assembly. Additional material is sprayed to a min height of 1/2 in. (13 mm) on penetrating items and to overlap surface of floor or both surfaces of wall by 1/2 in. (13 mm) min.

   **3M COMPANY** – FireDam™ Spray 200

**Firestop Configuration B**

2. **Cable Trays** – Max 36 in. (914 mm) wide by max 3-1/2 in. (89 mm) deep solid-back or open ladder galvanized steel cable tray with channel-shaped side rails formed of min 0.050 in. (1.3 mm) thick steel. Cable trays are provided with min 0.050 in. (1.3 mm) thick steel rungs spaced a max of 12 in. (305 mm) OC or min 0.050 in. (1.3 mm) thick steel solid back. The cable tray is to be installed min 3/4 in. (19 mm) and max 8 in. (203 mm) from edge of opening and min 6 in. (152 mm) from any other cable tray or pipe.

3. **Cables** – A max of four (4) 1/C 500 MCM cable with XLPE jacket and insulation in a bundle or spaced 1 in. (25 mm) apart.

4. **Forming Material** – Min 4 in. (102 mm) thickness of min 4 pcf (64 kg/m³) density mineral wool insulation compressed min 50 percent into the opening as a permanent form and recessed from the floor surface or both walls as required to accommodate the required thickness of fill material.

5. **Fill, Void and Cavity Material** – Material spray-applied or brushed over the mineral wool forming material to a min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm thickness) flush with top surface of floor or both sides of wall assembly. Additional material is sprayed to a min height of 1/2 in. (13 mm) on penetrating items and to overlap surface of floor or both surfaces of wall by 1/2 in. (13 mm) min.

   **3M COMPANY** – FireDam™ Spray 200

**Firestop Configuration C**

2. **Cable Tray** – Max 36 in. (914 mm) wide by max 3-1/2 in. (89 mm) deep solid-back or open ladder galvanized steel cable tray with channel-shaped side rails formed of min 0.050 in. (1.3 mm) thick steel. Cable trays are provided with min 0.050 in. (1.3 mm) thick steel rungs spaced a max of 12 in. (305 mm) OC or min 0.050 in. (1.3 mm) thick steel solid back. The cable tray is to be installed min 3/4 in. (19 mm) and max 8 in. (203 mm) from edge of opening and min 6 in. (152 mm) from any other cable tray or pipe.

3. **Nonmetallic Sleeve** – Nom 4 in. (102 mm) diam (or smaller) Schedule 40 PVC pipe. Sleeve installed with a nom 2 in. (51 mm) projection above floor or both surfaces of wall. A max of two nonmetallic sleeves to be installed within the cable tray with a min of 1 in. (25 mm) between sleeves and from back of cable tray.

4. **Electrical Metallic Tubing** – (Optional) – Nom 4 in. (102 mm) diam (or smaller) EMT may be installed within the cable tray 10 in. (254 mm) away from the PVC Sleeve (Item 3).

5. **Forming Material** – Min 4 in. (102 mm) thickness of min 4 pcf (64 kg/m³) density mineral wool insulation compressed min 50 percent into the opening and within nonmetallic sleeve (Item 3) as a permanent form and recessed from the floor surface or both walls as required to accommodate the required thickness of fill material.

6. **Fill, Void or Cavity Material** – Material spray-applied or brushed over the mineral wool forming material to a min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) flush with top surface of floor or both sides of wall assembly. Additional material is sprayed to a min height of 1/2 in. (13 mm) on penetrating items and to overlap surface of floor or both surfaces of wall by 1/2 in. (13 mm) min.

   **3M COMPANY** – FireDam™ Spray 200

---

*Note: Concrete Blocks (CAZT) in Volume 1 of the Fire Resistance Directory for names of manufacturers.*
System No. C-AJ-8106 continued

8. Fill, Void or Cavity Material* – MP+ Moldable Putty installed over the mineral wool forming material in the PVC Sleeve (item 3) to a thickness of min 1 in. (25 mm) flush with top surface of floor or both sides of wall. Additional material is installed to form a crown of min 1/4 in. (6 mm) around the cables.

   3M COMPANY – MP+ Moldable Putty

Firestop Configuration D

2. Cable Trays – Max 12 in. (305 mm) wide by max 3-1/2 in. (89 mm) deep solid-back or open ladder galvanized steel cable tray with channel-shaped side rails formed of min 0.050 in. (1.3 mm) thick steel. Cable trays are provided with min 0.050 in. (1.3 mm) thick steel rungs spaced a maximum of 12 in. (305 mm) OC or min 0.050 in. (1.3 mm) thick steel solid back. The cable tray is to be installed min 3/4 in. (19 mm) and max 8 in. (203 mm) from edge of opening and min 6 in. (152 mm) from any other cable tray or pipe.

3. Forming Material – Min 4 in. (102 mm) thickness of min 4pcf (64 kg/m³) density mineral wool insulation compressed min 50 percent into the opening as a permanent form and recessed from the floor surface or both wall surfaces as required to accommodate the required thickness of fill material.

4. Fill, Void or Cavity Material* – Material spray-applied or brushed over the mineral wool forming material to a min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) flush with top surface of floor or both sides of wall assembly. Additional material is sprayed to a min height of 1/2 in. (13 mm) on penetrating items and to overlap surface of floor or both surfaces of wall by min 1/2 in. (13 mm).

   3M COMPANY – FireDam™ Spray 200

Firestop Configuration E

2. Copper Tubing – Nom 4 in. (102 mm) diam (or smaller) Type M (or heavier) copper tubing. Tube to be rigidly supported on both sides of floor or wall assembly.

3. Forming Material – Min 4 in. (102 mm) thickness of min 4pcf (64 kg/m³) density mineral wool insulation compressed min 50 percent into the opening as a permanent form and recessed from the floor surface or both wall surfaces as required to accommodate the required thickness of fill material.

4. Fill, Void or Cavity Material* – Material spray-applied or brushed over the mineral wool forming material to a min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) flush with top surface of floor or both sides of wall assembly. Additional material is sprayed to a min height of 1/2 in. (13 mm) on penetrating items and to overlap surface of floor or both surfaces of wall by min 1/2 in. (13 mm).

   3M COMPANY – FireDam™ Spray 200

Firestop Configuration F

2. Steel Pipe – Nom 16 in. (406 mm) diam (or smaller) Schedule 30 (or heavier) steel pipe. Pipe to be wrapped with pipe covering material (item 3), and rigidly supported on both sides of floor or wall assembly.

3. Pipe Covering* – Nom 1-1/2 in. (38 mm) hollow cylindrical mineral wool pipe insulation, min density 4 pcf (64 kg/m³). The pipe insulation is covered with an all service jacket. Longitudinal joints sealed with factory applied self-sealing lap tape. Transverse joints secured with butt tape supplied with the product.  T Rating is 0 hr when pipe covering is not used.

   HIG MINWOOL L L C – High Temperature Pipe Insulation 1200, High Temperature Pipe Insulation BWT or High Temperature Pipe Insulation Thermaloc

4. Forming Material – Min 4 in. (102 mm) thickness of min 4pcf (64 kg/m³) density mineral wool forming material compressed min 50 percent into the opening as a permanent form and recessed from the floor surface or both wall surfaces as required to accommodate the required thickness of fill material.

5. Fill, Void or Cavity Material* – Material spray-applied or brushed over the mineral wool forming material to a min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) flush with top surface of floor or both sides of wall assembly. Additional material is sprayed to a min height of 1/2 in. (13 mm) on penetrating items and to overlap surface of floor or both surfaces of wall by min 1/2 in. (13 mm).

   3M COMPANY – FireDam™ Spray 200

Firestop Configuration G

2. Copper Tubing – Nom 4 in. (102 mm) diam (or smaller) Type M (or heavier) copper tubing. Copper tube to be wrapped with pipe covering material (item 3), and rigidly supported on both sides of floor or wall assembly.

3. Pipe Covering* – Nom 1-1/2 in. (38 mm) thick hollow cylindrical mineral wool pipe insulation, 4 pcf (64 kg/m³) density min. The pipe insulation is covered with an all service jacket. Longitudinal joints sealed with factory applied self-sealing lap tape. Transverse joints secured with butt tape supplied with the product.  T Rating is 0 hr when pipe covering is not used.

   HIG MINWOOL L L C – High Temperature Pipe Insulation 1200, High Temperature Pipe Insulation BWT or High Temperature Pipe Insulation Thermaloc

4. Forming Material – Min 4 in. (102 mm) thickness of min 4pcf (64 kg/m³) density mineral wool forming material compressed min 50 percent into the opening as a permanent form and recessed from the floor surface or both wall surfaces as required to accommodate the required thickness of fill material.

5. Fill, Void or Cavity Material* – Material spray-applied or brushed over the mineral wool forming material to a min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness), flush with top surface of floor or both sides of wall assembly. Additional material is sprayed to a min height of 1/2 in. (13 mm) on penetrating items and to overlap surface of floor or both surfaces of wall by min 1/2 in. (13 mm).

   3M COMPANY – FireDam™ Spray 200

* Bearing the UL Classification Mark

System No. C-AJ-8123
June 19, 2007
F Rating – 2 Hr
T Rating – 1/4 Hr

1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Floor assembly may also be constructed of any min 6 in. (152 mm) thick UL Classified hollow-core Precast Concrete Units*. Wall may also be constructed of any UL Classified Concrete Blocks*. Max diam of opening 4 in. (102 mm).

See Concrete Blocks (CAZT) and Precast Concrete Units (CFTV) categories in Fire Resistance Directory for names of manufacturers.

2. **Steel Sleeve** (Optional) – Nom 4 in. (102 mm) diam (or smaller) Schedule 10 (or heavier) steel sleeve cast or grouted into floor or wall assembly. Steel sleeve may be installed flush or may project max 2 in. (51 mm) beyond the floor or wall surfaces.

3. **Through Penetrants** – A max of two pipes, conduits or tubes to be installed within the opening. Annular space between the penetrants and the periphery of the opening shall be min 0 in. (point contact) to max 2 in. (0 mm to max 51 mm). Penetrants to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of metallic pipes, conduits or tubing may be used:
   A. **Steel Pipe** – Nom 1 in. (25 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
   B. **Iron Pipe** – Nom 1 in. (25 mm) diam (or smaller) cast or ductile iron pipe.
   C. **Conduit** – Nom 1 in. (25 mm) diam (or smaller) rigid steel conduit or steel electrical metallic tubing (EMT).
   D. **Copper Pipe** – Nom 1 in. (25 mm) diam (or smaller) regular (or heavier) copper pipe.
   E. **Copper Tube** – Nom 1 in. (25 mm) diam (or smaller) Type L (or heavier) copper tube.

4. **Tube Insulation-Plastics** – A max of one pipe, tube or conduit to be provided with nom 3/4 in. (19 mm) thick (or less) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. The annular space between the insulated penetrant and the periphery of the opening shall be min 0 in. (point contact) to max 2 in. (0 mm to max 51 mm). The annular space between insulated penetrants and non-insulated penetrants shall be min 0 in. (point contact) to max 2 in. (0 mm to max 51 mm).

See Plastics (QMFZ2) category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5VA may be used.

5. **Cables** – Max two 8/C No. 12 AWG (or smaller) power and control cables with XLPE or PVC insulation with XLPE or PVC jacket. The annular space between the cable and the periphery of the opening shall be min 0 in. (point contact) to max 2 in. (0 mm to max 51 mm). The annular space between cable and insulated penetrants shall be min 0 in. (point contact) to max 2 in. (0 mm to max 51 mm). The annular space between cable and non-insulated penetrants shall be min 1/2 in. to max 2 in. (13 mm to max 51 mm).

6. **Firestop System** – The details of the firestop system shall be as follows:
   A. **Packing Material** – Min 3 in. (76 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor or top edge of sleeve or from both surfaces of wall or both ends of sleeve as required to accommodate the required thickness of fill material. In floors constructed of hollow-core concrete, packing material to be recessed from top and bottom surfaces of floor or sleeve as required to accommodate the required thickness of fill material.
   B. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Min 1/2 in. (13 mm) thickness of caulk applied within the annulus, flush with top surface of floor or top edge of sleeve or with both surfaces of wall or both ends of sleeves. In floors constructed of hollow-core concrete, min 1/2 in. (13 mm) thickness of caulk applied within the annulus, flush with top and bottom surfaces of floor or sleeve. Min 1/4 in. (6 mm) diam bead of caulk applied to the penetrant/concrete or penetrant/sleeve interface at the point contact location on the top surface of floor or both surfaces of wall or hollow-core concrete.

**3M COMPANY** – IC 15WB+, CP 25WB+ caulk or FB-3000 WT sealant.

1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max size of opening to be 192 in.² (1239 cm²) with a max dimension of 28 in. (711 mm).

See Concrete Blocks (CAZT) category in Fire Resistance Directory for names of manufacturers.

1A. **Steel Sleeve** – (Optional, Not Shown) - Nom 15 in. (381 mm) diam (or smaller) circular sleeve fabricated from nom 0.028 in. (0.71 mm) thick galv steel cast or grouted into floor or wall assembly flush with floor or wall surfaces.

2. **Through Penetrants** – Multiple pipes, conduits or tubes to be installed within the opening. Annular space between penetrants and periphery of opening shall be min 0 in. (0 mm) (point contact) to max 3 in. (76 mm). Annular space between non-insulated penetrants shall be min 1/4 in. (6 mm) to max 3 in. (76 mm). Penetrants to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of metallic pipes, conduits or tubing may be used:

   A. **Steel Pipe** – Nom 6 in. (152 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   B. **Iron Pipe** – Nom 6 in. (152 mm) diam (or smaller) cast or ductile iron pipe.
   C. **Conduit** – Nom 6 in. (152 mm) diam (or smaller) rigid steel conduit or nom 4 in. (102 mm) diam (or smaller) steel electrical metallic tubing (EMT).
   D. **Copper Pipe** – Nom 3 in. (76 mm) diam (or smaller) regular (or heavier) copper pipe.
   E. **Copper Tube** – Nom 3 in. (76 mm) diam (or smaller) Type L (or heavier) copper tube.

3. **Pipe Insulation** – (Optional) – The annular space between insulated penetrants and the periphery of the opening shall be min 0 in. (0 mm) (point contact) to max 3 in. (76 mm). The annular space between insulated penetrants shall be min 1/2 in. (13 mm) to max 3 in. (76 mm). The annular space between insulated penetrants and non-insulated penetrants shall be min 1/2 in. (13 mm) to max 3 in. (76 mm). The following types of pipe insulations may be used:

   A. **Pipe Covering** – Nom 1-1/2 in. (38 mm) thick (or thinner) hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product.

   Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

   B. **Tube Insulation-Plastics** – Nom 5/8 in. (16 mm) thick (or thinner) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing.

      See Plastics (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-V0 may be used.

4. **Firestop System** – The firestop system shall consist of the following:

   A. **Packing Material** – Min 3 in. (76 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor or from both surfaces of wall to accommodate the required thickness of fill material.

   B. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Min 1/2 in. (13 mm) thickness of caulk applied within the annulus, flush with top surface of floor or with both surfaces of wall. Min 1/4 in. (6 mm) diam bead of caulk applied to the penetrant/concrete interface at the point contact location on the top surface of floor or both surfaces of wall.

4M COMPANY – IC 15WB+, CP 25WB+ caulk, or FB-3000 WT sealant.

*Bearing the UL Classification Mark
++ Bearing the UL Recognized Component Mark

1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600–2400 kg/m³) concrete floor. Min 5 in. (127 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600–2400 kg/m³) concrete wall. Wall may also be constructed of any UL Classified Concrete Blocks*. Max diam of opening 5 in. (127 mm).

   See Concrete Blocks (CAZT) category in Fire Resistance Directory for names of manufacturers.

2. **Through Penetrants** – A max of five pipes, conduits or tubes and a max of two cables to be installed within the opening. Annular space between the penetrants and the periphery of the opening shall be min 0 in. (point contact) to max 2 in. (0 mm to max 51 mm). Penetrants to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of metallic pipes, conduits or tubing may be used:

   A. **Metallic Pipes** – A max of four metallic pipes, conduits or tubing may be used. The following types and sizes may be used:

   - A1. **Steel Pipe** – Nom 3/4 in. (19 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
   - A2. **Conduit** – Nom 1/2 in. (13 mm) diam (or smaller) electrical metallic tubing or rigid steel conduit.
   - A3. **Copper Tubing** – Nom 3/4 in. (19 mm) diam (or smaller) Type L (or heavier) copper tubing.
   - A4. **Copper Pipe** – Nom 3/4 in. (19 mm) diam (or smaller) Regular (or heavier) copper pipe.

   All pipes or tubing larger than nom 1/2 in. (13 mm) diam shall be provided with pipe covering (Item 3). Nom 1/2 in. (13 mm) diam (or smaller) pipes or tubing may or may not be provided with pipe covering.

   B. **Nonmetallic Pipes** – A max of one nonmetallic pipe or conduit may be used. A min 1/4 in. (6 mm) space must be maintained between uninsulated metallic pipes, conduits or tubing and nonmetallic pipes or conduits. The following types and sizes of nonmetallic pipes or conduits may be used:

   - B1. **Polyvinyl Chloride (PVC) Pipe** – Nom 1 in. (25 mm) diam (or smaller) Schedule 40 solid core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping system.
   - B2. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** – Nom 1 in. (25 mm) diam (or smaller) SDR13.5 CPVC pipe for use in closed (process or supply) piping systems.
   - B3. **Rigid Nonmetallic Conduit** – Nom 1 in. (25 mm) diam (or smaller) Schedule 40 PVC conduit installed in accordance with Article 347 of the National Electrical Code (NFPA No. 70.)

3. **Cables** – A max of two cables may be used. Max 8/C No. 12 AWG multiconductor power and control cables; XLPE or PVC insulation with XLPE or PVC jacket.

3. **Pipe Covering** – The following types and sizes of pipe coverings may be used with the metallic pipes or tubes:

   Note – W Rating applies only when Tube Insulation (Item 3A is used.)

   A. **Tube Insulation – Plastics** – Nom 1/2 in. (13 mm) thick acrylonitrile butadine/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing.

   See Plastics (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL94 Flammability Classification of 94-5VA may be used.
System No. C-AJ-8135 continued

B. **Pipe Covering** – Nom 1/2 in. (13 mm) thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product.

See **Pipe and Equipment Covering – Materials** (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Firestop System** – The details of the firestop system shall be as follows:

A. **Packing Material** – Min 4 in. (102 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor or from both surfaces of wall to accommodate the required thickness of fill material.

B. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Min 1/2 in. (13 mm) thickness of caulk applied within the annulus, flush with top surface of floor or with both surfaces of wall. Min 1/4 in. (6 mm) diam bead of caulk applied to the penetrant/concrete interface at the point contact location on the top surface of floor or both surfaces of wall.

3M COMPANY – IC 15WB+, CP 25WB+ caulk or FB-3000 WT sealant.

(Note: W Rating applies only when FB-3000 WT sealant is used. CP 25WB+ not suitable for use with CPVC pipes.)

F Rating — 2 Hr
T Rating — 0 Hr
L Rating At Ambient — 4 CFM/sq ft. (See Item 3B)
L Rating At 400 F — Less Than 1 CFM/sq ft. (See Item 3B)

1. **Floor or Wall Assembly** — Min 2-1/2 in. (64 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max area of opening is 56 in.² (363 cm²) with a max dimension of is 12-1/2 in. (318 mm) for square devices. Max diam of opening is 2-1/2 in. (64 mm) for nom 2 in. (51 mm) round devices and 4-1/2 in. (114 mm) for nom 4 in. (102 mm) round devices.

See Concrete Blocks (CAZT) category in Fire Resistance Directory for names of manufacturers.

2. **Through-Penetrants** — One or more metallic pipes, conduits or tubes, nonmetallic pipes, conduits or tubes, cables, and combinations of penetrants, as described below, may be installed within each firestop device (Item 3A) as further specified below. Through penetrants to be rigidly supported on both sides of wall assembly. The following types and sizes of through-penetrants may be used:

   A. **Metallic Penetrants** — One or more metallic pipe, tubing or conduit may be installed concentrically or eccentrically within each firestop device (Item 3A). Through penetrants to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of through penetrants may be used:

      A1. **Steel Pipe** — Nom 3 in. (76 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.

      A2. **Iron Pipe** — Nom 3 in. (76 mm) diam (or smaller) cast or ductile iron pipe.

      A3. **Copper Tubing** — Nom 3 in. (76 mm) diam (or smaller) Type L (or heavier) copper tube.

      A4. **Copper Pipe** — Nom 3 in. (76 mm) diam (or smaller) Regular (or heavier) copper pipe.

      A5. **Conduit** — Nom 3 in. (76 mm) diam (or smaller) steel electrical metallic tubing (EMT) or rigid steel conduit.

      A6. **Through Penetrating Product** - Flexible Metal Piping — Nom 1-1/4 in. diam (32 mm) diam (or smaller) steel flexible metal piping.

      OMEGA FLEX INC — TracPipe Flexible Gas Piping

   B. **Tube Insulation - Plastic** — Nom 1/2 in (13 mm) thick or smaller) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing with skin may be used on the copper tubes. If multiple insulated through penetrants are installed within the firestop device, the insulated through penetrants may be bundled together. If tube insulation is used, the max nom diam if the metallic through penetrant shall be 3/4 in. (19 mm).

   See Plastics+ (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-SVA may be used.

   C. **Nonmetallic Penetrants** — One or more nonmetallic pipes or tubes, as described in a single line item below, may be installed within each firestop device (Item 3A):

      C1. **Polyvinyl Chloride (PVC) Pipe** — One nom 2 in. (51 mm) diam (or smaller) Schedule 40 solid core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

      C2. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** — One nom 2 in. (51 mm) diam (or smaller) SDR11 CPVC pipe for use in closed (process or supply) piping systems.

      C3. **Rigid Nonmetallic Conduit** — One nom 2 in. (51 mm) diam (or smaller) Schedule 40 PVC conduit installed in accordance with the National Electrical Code (NFPA No. 70).
System No. C-AJ-8172 continued

See Rigid Nonmetallic, Schedule 40 and 80 PVC Conduit (DZYR) category in the Electrical Construction Equipment Directory for names of manufacturers.

C4. Electrical Nonmetallic Tubing (ENT)+ — One nom 2 in. (51 mm) diam (or smaller) ENT installed in accordance with the National Electrical Code (NFPA No. 70).

See Electrical Nonmetallic Tubing (FKHU) category in the Electrical Construction Equipment Directory for names of manufacturers.

C5. Optical Fiber/Communications/Signaling/Coaxial Cable Raceways+ — One nom 2 in. (51 mm) diam (or smaller) plenum rated raceways installed in accordance with the National Electrical Code (NFPA No. 70).

See Electrical Nonmetallic Tubing (FKHU) category in the Electrical Construction Equipment Directory for names of manufacturers.

C6. Acrylonitrile Butadiene Styrene (ABS) Pipe — One nom 2 in. (51 mm) diam (or smaller) Schedule 40 solid or cellular core ABS pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

D. Cables — One or more cables concentrically or eccentrically within each firestop device. The cable loading within the loading area of each firestop device module may represent a 0 to 100 percent visual fill. Any combination of the following types and sizes of cables may be used:

D1. Max 2/C No. 18 AWG copper conductor thermostat cable with polyvinyl chloride (PVC) insulation and jacket materials.
D2. Max 4 pair No. 24 AWG copper conductor Cat 5e or Cat 6 telephone cable with PVC insulation and jacket materials.
D3. Max RG/6 (or smaller) coaxial cable with foam high density polyethylene insulation and PVC jacket materials.
D4. Max 3/C (with ground) No. 14 AWG (or smaller) nonmetallic sheathed (Romex) cable with PVC insulation and jacket materials.
D5. Max 1/C No. 8 AWG copper conductor cable with PVC insulation and nylon jacket materials.
D6. Max 12 core No. 26 AWG shielded multi-coax cable with foam high density polyethylene insulation and PVC jacket.
D7. Max 468 MIL 5 micron fiber optic cables with having a min FT-6 rating.
D8. Max 62.5/125 micron fiber optic cables with having a min Riser rating.
D9. Max 1/C 3/0 AWG copper conductor cable with PVC insulation and jacket materials.

D10. Max three copper conductors (with ground) No. 12 AWG Metal Clad Cable+.
D11. Max four copper conductors No. 2 AWG Metal Clad Cable+.

AFC CABLE SYSTEMS INC

D12. Max 1/C 2/0 AWG non halogen copper conductor cable.
D13. Max 300 pair No. 24 AWG copper conductor telephone cable with PVC insulation and jacket materials.
D14. Max 30 pair No. 22 copper conductor shielded switchboard cable with PVC insulation and jacket materials.
D15. Max RG/6 (or smaller) coaxial cable with fluorinated ethylene (FE) or PVC insulation and jacket materials.
D16. Max RG/6 (or smaller) coaxial cable with fluorinated ethylene (FE) or PVC insulation and jacket materials.
D17. Max 7/C No. 12 AWG copper conductor cable with PVC insulation and jacket materials.
D18. Max 4 pair No. 23 AWG copper conductor Cat 6 telephone cable with PVC insulation and jacket materials.
D19. Max three copper conductors (with ground) No. 12 AWG steel Armored Cable+.
D20. Max 04-02 2.5M fiber optic cables having a max diameter of 0.450 in. (11.4 mm).
D22. Max 3/C with ground No. 2/0 AWG aluminum conductor SER cable with cross linked polyethylene (XLPE) insulation and PVC jacket.

3. Firestop System — The firestop system shall consist of the following:

A. Firestop Device* — A max of three square firestop devices may be ganged together. As an alternate, one round device may be centered within a round opening. Each device consists of a nom 2-1/2 by 2-1/2 by 10 in. (64 by 64 by 254 mm), a nom 4 by 4 by 10 in. (102 by 102 by 254 mm), a nom 2 in. (51 mm) diam by 10 in. (254 mm) or a nom 4 in. (102 mm) diam by 10 in. (254 mm) powder coated steel transit incorporating internal intumescent material, foam plugs and mounting flanges. Firestop device to be centered within opening and installed with ends projecting an equal distance beyond each surface of the floor or wall assembly in accordance with the accompanying installation instructions. The annular space between the firestop device and the periphery of the opening shall be nom 1/4 in. (6 mm).

Firestop devices secured in place by means of fill material (Item 4B) and steel split mounting flanges sized to accommodate the firestop device. Steel split mounting flanges installed on both sides of floor or wall after installation of fill material and secured to together with supplied steel set screws. Nom 1 in. (25 mm) thick pre-cut foam plugs sized to accommodate the through penetrant(s) and installed flush with each end of device on both sides of floor or wall assembly.

3M COMPANY — 3M Fire Barrier Pass-Through Device

B. Fill, Void or Cavity Materials* — Caulk or Putty — Min 1 in. (25 mm) thickness of fill material applied within the annulus, flush with top surface of floor or with both surfaces of wall prior to the installation of the mounting flanges. When the annular space is 1/8 in. (3 mm) or less, the fill material in the annulus is optional. Also, as an option, the foam plugs may be recessed into device and the recess filled with putty or caulking flush with the ends of the device. L Rating applies only when fill material is applied within annulus at interface of floor or both sides of wall and device(s) prior to mounting flanges and with both ends of firestop device(s) filled with nominal 1/8 in. (3.2 mm) of Moldable Putty+.

3M COMPANY — Moldable Putty+, CP 25WB+, IC 15WB+, 3000 WT. CP 25WB+ not suitable for use with CPVC pipes.

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

+ Bearing the UL Listing Mark
System No. C-AJ-8187
June 23, 2015
F Rating — 2 Hr
T Rating — 0 Hr

1. **Floor or Wall Assembly** — Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600 - 2400 kg/m³) concrete. Wall may also be constructed of any UL **Classified Concrete Blocks**. Max area of opening 7 ft² (6503 cm²) with max dimension of 34 in. (864 mm).

2. **Through Penetrants** — A max of six firestop configurations may be installed within the opening. The space between firestop configurations shall be min 1 in. (25 mm) to max 42-3/4 in. (109 cm). The annular space between firestop configurations and periphery of opening shall be 0 in. (0 mm, point contact). Penetrants to be rigidly supported on both sides of floor or wall assembly.

3. **Firestop System** — Fill, Void or Cavity Materials* — **Intumescent Sheet** — Rigid aluminum foil-faced sheets with galv steel sheet backer. Sheet cut to tightly follow the contours of the penetrants or wrap strip and to lap a min of 3 in. (76 mm) on the floor or wall surface on all sides of the through opening. Sheets to be installed with the galv steel sheet backer exposed (aluminum foil facing against floor or wall surfaces). Sheets secured to bottom side of floor or both sides of wall using steel Tapcon fasteners spaced max 6 in. (152 mm) OC.

3M COMPANY 3M FIRE PROTECTION PRODUCTS — CS-195+

3A. **Fill, Void or Cavity Material — Sealant (Not Shown)** — Min 1/4 in. (6 mm) diam continuous bead of fill material applied to edge of intumescent sheet at its interface with surface of floor or wall around entire perimeter of through opening on bottom surface of floor and both surfaces of wall.

3M COMPANY 3M FIRE PROTECTION PRODUCTS — MP+, CP-25WB+ Caulk or FB-3000 WT Sealant

Any combination of the following firestop configurations detailed herein may be used:

**Firestop Configuration A**

2. **Through Penetrants** — The details of the through penetrants are as follows:

   A. **Polyvinyl Chloride (PVC) Pipe** — Nom 4 in. (102 mm) diam (or smaller) Schedule 40 solid core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

   B. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** — Nom 4 in. (102 mm) diam (or smaller) SDR13.5 solid core CPVC pipe for use in closed (process or supply) piping systems.

   C. **Rigid Nonmetallic Conduit (RNC)** — Nom 4 in. (102 mm) diam (or smaller) Schedule 40 PVC conduit installed in accordance with the National Electrical Code (NFPA No. 70).
3. **Firestop Device** — Firestop device consisting of a steel collar lined with intumescent material sized to fit the specific diameter of the through penetrant. Firestop device provided with steel clips for attachment to underside of floor or both sides of wall in accordance with accompanying installation instructions.

**3M COMPANY 3M FIRE PROTECTION PRODUCTS** — Ultra PPD 3.0 or Ultra PPD 4.0

#### Firestop Configuration B

2. **Through Penetrants** — The details of the through penetrants are as follows:
   A. **Polyvinyl Chloride (PVC) Pipe** — Nom 6 in. (152 mm) diam (or smaller) Schedule 40 solid core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.
   B. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** — Nom 6 in. (152 mm) diam (or smaller) SDR13.5 solid core CPVC pipe for use in closed (process or supply) piping systems.
   C. **Rigid Nonmetallic Conduit (RNC)** — Nom 6 in. (152 mm) diam (or smaller) Schedule 40 PVC conduit installed in accordance with the National Electrical Code (NFPA No. 70).

3. **Firestop System** — The details of the firestop system shall be as follows:
   A. **Fill, Void or Cavity Material**
      1. **Wrap Strip** — Nom 1/8 in. (3 mm) thick intumescent elastomeric material supplied 2 in. (51 mm) wide strips. Two stacks of wrap strips, each consisting of three wrap strips are individually wrapped around the through-penetrant with the ends butted and held in place with masking tape. Butted ends in successive layers shall be offset. The edge of the wrap strips shall abut the surface of the composite sheet (Item 3). In floor assemblies the two stacks of wrap strips are installed on the bottom side of the composite sheet. In wall assemblies, the two stacks of wrap strips are installed on each side of the composite sheet. As an option, the penetrant may be wrapped with aluminum foil tape beneath the wrap strips.
   3M COMPANY 3M FIRE PROTECTION PRODUCTS — Interam Ultra GS
   B. **Steel Collar** — Steel restricting collar fabricated from No. 28 MSG (0.016 in., 0.405 mm) thick galvanized steel. Collar shall be nom 4 in. (102 mm) deep with 1-1/4 in. (32 mm) wide and 1-1/2 in. (38 mm) long anchor tabs and min 3/4 in. (19 mm) long tabs to retain the layers of intumescent material. Collar anchor tabs are bent outward 90°. Collar wrapped tightly around layers of intumescent material with min 1 in. (25 mm) overlap at seam and compressed around penetrant using steel hose clamps with worm drive tightening mechanism at the collar midheight. The collar is secured to the intumescent sheet surface with 1/4 in. (6 mm) diam by min 1-1/2 in. (38 mm) long steel toggle bolts in conjunction with 1-1/4 in. (32 mm) diam washers on bottom surface of floor and both surfaces of wall. As a final step, the retainer tabs shall be bent 90° towards the pipe to lock layers of intumescent material in position.

**Firestop Configuration C**

2. **Through Penetrants** — The details of the through penetrants are as follows:
   A. **Copper Tubing** — Nom 2 in. (51 mm) diam (or smaller) Type L (or heavier) copper tube.
   B. **Steel Pipe** — Nom 2 in. (51 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
   C. **Iron Pipe** — Nom 2 in. (51 mm) diam (or smaller) cast or ductile iron pipe.
   D. **Conduit** — Nom 2 in. (51 mm) diam (or smaller) rigid steel conduit or steel electrical metallic tubing.

3. **Fill, Void or Cavity Materials** — **Putty, Caulk or Sealant** — Min 1/4 in. (6 mm) rope of putty or 1/4 in. (6 mm) diam bead of sealant or caulk applied at point contact locations between penetrant and periphery of opening on bottom of composite sheet.

**3M COMPANY 3M FIRE PROTECTION PRODUCTS** — MP+, CP-25WB+ Caulk or FB-3000 WT Sealant. CP 25WB+ not suitable for use with CPVC pipes.

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

+Bearing the UL Listing Mark
1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max area of opening is 1024 sq in. (0.66 m²) with a max height of 32 in. (813 mm) when installed in a wall or a max width of 32 in. (813 mm) when installed in a floor. See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Air Conditioning (AC) Line Set** – One or two single or double AC line sets installed within opening. Each single AC line set consists of two metallic pipes or tubes (Item 2A), tubing insulation (Item 2B), one nonmetallic pipe (Item 2C) and a thermostat cable (Item 2D). Each double AC line set consists of four metallic pipes or tubes (Item 2A), tubing insulation (Item 2B), one nonmetallic pipe (Item 2C) and two thermostat cables (Item 2C). The space between the AC line sets shall be min 2 in. (51 mm) to max 6 in. (152 mm). The space between the AC line sets and the periphery of the opening shall be min 2 in. (51 mm) to max 6 in. (152 mm). The AC line sets shall be rigidly supported on both sides of the floor or wall assembly.
   
   A. **Metallic Pipe** – A max of two pipes or tubes to be installed in each AC line set. The following types and sizes of through metallic pipe may be used:
      a. **Copper Pipe** – Nom 3/4 in. (19 mm) diam (or smaller) Regular (or heavier) copper pipe.
      b. **Copper Tube** – Nom 3/4 in. (19 mm) diam (or smaller) Type L (or heavier) copper tube.
   
   B. **Tube Insulation – Plastics** – Nom 3/4 in. (19 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. The tube insulation may be installed on one max 3/4 in. (19 mm) diam pipe or tube in each single AC line set and on two max 3/4 in. (19 mm) diam pipes or tubes in each double AC line set. See Plastics (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation meeting the above specifications and having a UL 94 Flammability Classification of 94VA5 may be used.

   C. **Nonmetallic Pipe** – A max of one nonmetallic drain pipe to be installed in each AC line set. The following types and sizes of nonmetallic pipe may be used:
      a. **Polyvinyl Chloride (CPVC) Pipe** – Nom 1-1/4 in. (32 mm) diam (or smaller) Schedule 40 solid core PVC pipe.
      b. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** – Nom 1-1/4 in. (32 mm) diam (or smaller) SDR 13.5 CPVC pipe.

   D. **Cable** – Four pair No. 18 AWG (or smaller) thermostat cable with polyvinyl chloride (PVC) insulation and jacket materials. One thermostat cable may be installed with each single AC line set and two thermostat cables may be installed with each double AC line set.

3. **Firestop System** – The firestop system shall consist of the following items:
   
   A. **Fill, Void or Cavity Materials** – Wrap Strip – Nom 3/16 in. (5 mm) thick intumescent material supplied in nom 2-1/2 in. (64 mm) wide strips. One layer of wrap strip tightly wrapped around each AC line set and secured with glass fiber-reinforced strapping tape. Wrap strip to be recessed into floor opening such that the bottom edge of wrap strip is flush with bottom plane of floor. In walls, wrap strip to be centered in the wall thickness.

3M COMPANY
3M FIRE PROTECTION PRODUCTS – Fire Barrier Tuck-In WS Roll

System tested with a pressure differential of 2.5 Pa between the exposed and the unexposed surfaces with the higher pressure on the exposed side.
**System No. C-AJ-8205 continued**

B. **Fill, Void or Cavity Materials** – **Pillows** – Max 9 in. (229 mm) long by 6 in. (152 mm) wide by 2 and 3 in. (51 and 76 mm) thick plastic covered pillows tightly-packed to fill annular space between the AC line set and periphery of opening and the annular space between the AC line sets installed within the opening. Pillows installed with 9 in. (229 mm) dimension projecting through the floor or wall. In floors, pillows to be installed flush with top plane of floor or centered in floor thickness. In walls, pillows to be centered in wall thickness.

**3M COMPANY**
**3M FIRE PROTECTION PRODUCTS** – Fire Barrier Pillow or Fire Barrier Self-Locking Pillow

C. **Fill, Void or Cavity Materials** – **Putty** – (Not Shown) – Moldable putty material, installed within voids around penetrants and pillows to a min thickness of 1 in. (25 mm) on both sides of wall.

**3M COMPANY**
**3M FIRE PROTECTION PRODUCTS** – MP+ Moldable Putty

1. **Floor or Wall Assembly** — Min 2-1/2 in. (63 mm) thick reinforced lightweight or normal weight (100-150pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max area of opening is 1656 sq in. (1.07 m²) with max dimension of 46 in. (1168 mm). 
See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through Penetrants** — A max of seven penetrants to be installed in opening. Min clearance between pipes, conduits or tubing is 0 in. (point contact). Min clearance between pipe, conduit, or tubing and periphery of through opening is 0 in. (point contact). Pipe conduit or tubing to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of pipes, conduits, or tubing may be used:
   A. **Steel Pipe** — Nom 12 in. (305 mm) diam, or smaller, schedule 10, or heavier, steel pipe.
   B. **Copper Tubing** — Nom 4 in. (102 mm) diam, or smaller, Type L, or heavier, copper tubing.
   C. **Conduit** — Nom 4 in. (102 mm) diam, or smaller steel electrical metallic tubing or steel conduit.
   D. **PVC Pipe** — Nom 2 in. (50 mm) diam, or smaller, Schedule 40 solid-core PVC pipe for use in closed (process or supply), or vented (drain, waste, or vent) piping systems.

3. **Forms** — (Not Shown) — Used as a form to prevent leakage of fill material during installation. Forms to be a rigid sheet material, cut to fit the contour of the penetrating item and positioned as required to accommodate the required thickness of fill material. Forms to be removed after fill material has cured.

4. **Firestop System** — The firestop system shall consist of the following:
   A. **Packing Material** — (Optional, Not Shown) — For floors greater than 2-1/2 in. (63 mm) thick, mineral wool batt insulation firmly packed into opening as a permanent or temporary form and recessed from the top surface of floor, or both surfaces of wall, to accommodate the required thickness of the fill material, item 5B.
   B. **Fill, Void, or Cavity Material** — **Mortar** — Min 2-1/2 in. (63 mm) thickness of fill material applied within the annulus. Mortar to be mixed with water in accordance with manufacturer’s instructions. TAPCON concrete screws, spaced at max 12 in. (305 mm) OC, to be partially embedded into the vertical sides of opening all-around to key the mortar to the opening periphery. A Nom 1/4 in to 3/8 in (6 mm to 10 mm) high crown bead of mortar to be applied at the top surface of the floor or both surfaces of wall to cover the edges of the Wrap Strip, item 5C.
   C. **Fill, Void, or Cavity Material** — **Wrap Strip** — Nom 3/16 in. (5 mm) thick intumescent material supplied in nom 2-1/2 in. (64 mm) wide strips. One layer of wrap strip to be tightly wrapped around pipe and secured with glass-fiber reinforced strapping tape and positioned such that the top and bottom edges are approximately flush with the top and bottom floor surfaces. In walls, wrap strip to be flush with both surfaces of wall.

1. **Floor or Wall Assembly** – Min 2-1/2 in. (64 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m^3) concrete floor or min 3 in. (76 mm) reinforced lightweight or normal weight concrete wall. Wall may also be constructed of any UL Classified Concrete Blocks*. Max diameter of opening is 8 in. (203 mm).

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Metallic Sleeve** – (Optional) - Nom 8 in. (203 mm) diam (or smaller) Schedule 40 (or heavier) steel sleeve cast or grouted into floor or wall assembly, flush with floor or wall surfaces or extending a max of 3 in. (76 mm) above floor or beyond both surfaces of wall.

   2A. **Sheet Metal Sleeve** – (Optional, Not Shown) – Max 6 in. (152 mm) diam, min No. 26 ga galv steel sleeve provided with a No. 26 ga galv steel square flange spot welded to the sleeve at approx mid-height, or flush with bottom of sleeve in floors, and sized to be a min of 2 in. (51 mm) larger than the sleeve diam. The sleeve is to be cast in place and may extend a max of 4 in. (102 mm) below the bottom of the floor and a max of 1 in. (25 mm) above the top surface of the concrete floor.

   2B. **Sheet Metal Sleeve** – (Optional, Not Shown) – Max 8 in. (203 mm) diam, min No. 24 ga galv steel sleeve provided with a No. 24 ga galv steel square flange spot welded to the sleeve at approx mid-height, or flush with bottom of sleeve in floors, and sized to be a min of 2 in. (51 mm) larger than the sleeve diam. The sleeve is to be cast in place and may extend a max of 4 in. (102 mm) below the bottom of the floor and a max of 1 in. (25 mm) above the top surface of the concrete floor.

3. **Steel Tube** – Nom 6 in. (152 mm) diam (or smaller) No. 16 ga steel tube installed eccentrically within the opening. The annular space between the tube and the periphery of the opening shall be min 1/4 in. (6 mm) to max 1 3/4 in. (45 mm). Tube to be rigidly supported on both sides of floor or wall assembly.

4. **Cables** – Max of six nom 3/8 in. (10 mm) diam two pair No. 22 AWG foil shielded plenum rated communication cables with polyvinyl chloride (PVC) insulation and jacket. Min separation between cables and periphery of opening shall be 1/4 in. (6 mm). Separation between cables and tube shall be min 0 in. (point contact) to max 1 in. (25 mm). Cables to be rigidly supported on both sides of floor or wall assembly.

5. **Firestop System** – The firestop system shall consist of the following:
   A. **Packing Material** – Min 2 in. (51 mm) thickness of min 4 pcf (64 kg/m^3) mineral wool batt insulation firmly packed into opening as a permanent form. Packing material to be recessed from top surface of floor or from both surfaces of wall to accommodate the required thickness of fill material.

   A1. **Forming Material** – As an alternate to the packing material (Item 5A), nom 4 in. (102 mm) wide strips of min 1/2 in (13 mm) thick compressible mat cut in half lengthwise to a nom 2 in. (51 mm) width to be stacked to a thickness greater than the width of the annular space and compression-fitted, edge-first, to fill the annular space to a min 2 in. (51 mm) depth. As an option, the strips of min 1/2 in. (13 mm) thick compressible mat may be folded in half, lengthwise, and stacked to a thickness greater than the width of the annular space and compression-fitted, edge-first, to fill the annular space to a min 2 in. (51 mm) depth. Top of forming material to be recessed from top surface of floor or from both surfaces of wall as necessary to accommodate the required thickness of caulk fill material.

   **3M COMPANY**
   **3M FIRE PROTECTION PRODUCTS** – Fire Barrier Packing Material PM-4

   B. **Fill, Void or Cavity Material** – Sealant – Min 1/2 in. (13 mm) thickness of fill material applied within the annulus, flush with top surface of floor or with both surfaces of wall.

   **3M COMPANY**
   **3M FIRE PROTECTION PRODUCTS** – IC 15WB+ Sealant, CP 25WB+ Sealant or FB 3000 WT Sealant

   *Bearing the UL Classification Mark

System tested with a pressure differential of 2.5 Pa between the exposed and the unexposed surfaces with the higher pressure on the exposed side.

1. **Floor or Wall Assembly** – Min 2-1/2 in. (64 mm) thick lightweight or normal weight (100-150 pcf or 1600-2400 kg/m3) concrete. Max diam of opening 6 in. (152 mm).

2. **Through Penetrants** – A max of five pipes, conduits or tubes and a max of four cables to be installed within the opening. Annular space between the penetrants and the periphery of the opening shall be min 0 in. (point contact) to max 3-1/4 in. (83 mm). Penetrants to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of penetrants may be used:
   A. **Metallic Pipes** – A max of four metallic pipes, conduits or tubing may be used. The following types and sizes may be used:
      A1. **Steel Pipe** – Nom 1 in. (25 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
      A2. **Conduit** – Nom 1 in. (25 mm) diam (or smaller) electrical metallic tubing or rigid steel conduit.
      A3. **Copper Tubing** – Nom 1 in. (25 mm) diam (or smaller) Type L (or heavier) copper tubing.
      A4. **Copper Pipe** – Nom 1 in. (25 mm) diam (or smaller) Regular (or heavier) copper pipe.
   B. **Nonmetallic Pipes** – A max of one nonmetallic pipe or conduit may be used. The following types and sizes of nonmetallic pipes or conduits may be used:
      B1. **Polyvinyl Chloride (PVC) Pipe** – Nom 1 in. (25 mm) diam (or smaller) Schedule 40 solid core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping system.
      B2. **Rigid Nonmetallic Conduit**+ – Nom 1 in. (25 mm) diam (or smaller) Schedule 40 PVC conduit installed in accordance with the National Electrical Code (NFPA No. 70.)
   C. **Cables** – A max of four cables may be used. Max 4/C No. 18 AWG (or smaller) thermostat cables.

3. **Tube Insulation** – **Plastics**++ – Nom 1/2 in. (13 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing.

   See **Plastics** (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL94 Flammability Classification of 94-5VA may be used.

4. **Fill, Void or Cavity Material*** – **Foam** – Min 2-1/2 in. (64 mm) thickness of fill material applied within the annulus, flush with top surface of floor or both surfaces of wall. At any point contact location, a minimum 1/2 in. bead of fill material is required on the top surface of the floor or both sides of a wall assembly.

1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100–150 pcf or 1600–2400 kg/m³) concrete floor. Min 5 in. (127 mm) thick reinforced lightweight or normal weight (100–150 pcf or 1600–2400 kg/m³) concrete wall. Wall may also be constructed of any UL Classified Concrete Blocks*. Max size of opening is 1440 in.² (9,290 cm²) with a max dimension of 48 in. (1219 mm). See Concrete Blocks (CAZT) in the Fire Resistance Directory for names of manufacturers.

2. **Through-Penetrant** – One cable tray and/or one or more pipes, tubes or cable bundles may be installed within the opening. The total number of through-penetrants is dependent on the size of the opening and the types and sizes of the penetrants. Any combination of the penetrants described below may be used provided that the following parameters relative to the annular spaces are maintained. The annular space between cable tray and all other penetrants shall be min 3 in. (76 mm). The annular space between individual cables and cable bundles shall be a min 1/2 in. (13 mm). The annular space between individual cables and cable bundles and other penetrants shall be a min 1/2 in. (13 mm) except that a min 2 in. (51 mm) shall be maintained between the cables and copper pipes and tubes greater than a nom 3 in. (76 mm) diameter and steel and iron pipes and conduits greater than a nom 4 in. (102 mm) diam. The annular space between metallic pipes, conduit and tubes and insulated pipes and tubes shall be a min 2 in. (51 mm). The annular space between nom 3 in (76mm) diameter (and smaller) copper pipes and tubes and between nom 4 in (102mm) diameter (and smaller) steel and iron pipes and conduits shall be min 1/2 in. (13 mm). The annular space between nom 2 in. (51 mm) diameter (and smaller) metallic pipes and conduits shall be min 0 in. (point contact). The annular space between insulated penetrants or the cable tray and the periphery of opening shall be min 1/2 in. (13 mm). The annular space between all other penetrants and the periphery of opening shall be min 0 in. (point contact). A max annular space in the system shall be 17-1/2 in. (445 mm) for FB-3000WT sealant (Item 4B) and 12 in. (305 mm) for CP 25WB+ sealant (Item 4B). Penetrants to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of penetrants may be used.

A. **Metallic Pipes** – The following types of metallic pipes, tubes or conduits may be used:

1. **Copper Tubing** – Nom 6 in. (152 mm) diameter (or smaller) Type L (or heavier) copper tube.
2. **Copper Pipe** – Nom 6 in. (152 mm) diameter (or smaller) Regular (or heavier) copper pipe.
3. **Steel Pipe** – Nom 24 in. (610 mm) diameter (or smaller) Schedule 40 (or heavier) steel pipe.
4. **Iron Pipe** – Nom 24 in. (610 mm) diameter (or smaller) cast or ductile iron pipe.
5. **Conduit** – Nom 4 in. (102 mm) diameter (or smaller) electric metallic tubing (EMT) or nom 6 in. (152 mm) diameter (or smaller) rigid steel conduit.
UL System No. C-AJ-8231 (cont.)

B. Cables Bundles – Max 4 in. (102 mm) diameter tightly bundled cables. Any combination of the following types and sizes of cables may be used:

1. Max 500 kcmil single copper or aluminum conductor power cable with thermoplastic insulation and polyvinyl chloride (PVC) jacket.
2. Max 300 pair No. 24 AWG copper conductor telecommunication cables with PVC insulation and jacket material.
3. Max 7/C copper conductor No. 12 AWG multi-conductor power and control cables with PVC or cross-linked polyethylene (XLPE) insulation and PVC jacket.
4. Multiple fiber optical communication cables jacketed with PVC and having a max outside diameter of 1/2 in.
5. Max 3/C No. – 12 AWG steel clad cable with copper conductors and PVC insulation material.

C. Individual Cables – (Not shown) – Any of the following types and sizes of individual (non-bundled) cables may be used:

1. Max 3/C No. 0/0 AWG (or smaller) copper conductor PVC jacketed aluminum clad or steel clad TECK 90 cable.
2. Through Penetrating Product* – Any cables, Armored Cable+ or Metal Clad Cable+ currently Classified under the Through Penetrating Product category.
3. Max 500 kcmil single copper or aluminum conductor power cable with thermoplastic insulation and polyvinyl chloride (PVC) jacket.
4. Max 300 pair No. 24 AWG copper conductor telecommunication cables with PVC insulation and jacket material.
5. Max 7/C copper conductor No. 12 AWG multi-conductor power and control cables with PVC or cross-linked polyethylene (XLPE) insulation and PVC jacket.
6. Multiple fiber optical communication cables jacketed with PVC and having a max outside diameter of 1/2 in.
7. Max 3/C No. 12 AWG steel clad cable with copper conductors and PVC insulation material.
8. Max 4C/750 kcmil (or smaller) aluminum or copper conductor metal clad cable with aluminum or steel armor, with or without PVC jacket.

D. Cable Tray* – (Not shown) – Max 24 in. (610 mm) wide by 6 in. (152 mm) deep open-ladder steel or aluminum cable tray. Aggregate cross-sectional area of cable tray to be max 40 percent of the cross-sectional area of the cable tray based on a max 3 in. cable loading depth. Any combination of the types and sizes of cables described in Item 2B may be used. Cable tray to be rigidly supported on both sides of floor or wall assembly.

3. Pipe Insulation – (Optional) – Pipes and tubes of the sizes noted below may be provided with one of the following types of pipe insulations:

A. Pipe Covering* – Nom 1-1/2 in. (38 mm) thick (or thinner) hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket for pipes with a nom diameter of 8 in. (203 mm) (or smaller) or tubes with a nom diameter of 4 in. (102 mm) (or smaller). Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product.
   See Pipe and Equipment Covering – Materials (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

B. Pipe Covering* – Nom 2 in. (51 mm) thick (or thinner) hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket for pipes or tubes with a nom diameter of 2 in. (51 mm) (or smaller). Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product.
   See Pipe and Equipment Covering – Materials (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

C. Tube Insulation-Plastics+ – Nom 1 in. (25 mm) thick (or thinner) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing for pipes or tubes with a nom diameter of 2 in. (51 mm) (or smaller).
   See Plastics (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-SVA may be used.

4. Firestop System – The firestop system shall consist of the following:

A. Packing Materials – Min 4 in. (102 mm) thickness of 4 pcf (64 kg/m²) mineral wool batt insulation tightly packed into the opening as a permanent form. Packing material to be recessed from top surface of floor or both surfaces of wall to accommodate the required thickness of fill material.

B. Fill, Void or Cavity Material - Sealant* – Min 1/2 in. (13 mm) thickness of fill material applied within the annulus flush with the top surface of the floor or both surfaces of the wall.

3M COMPANY – CP 25 W8+ or FB-3000 WT

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

System tested with a pressure differential of 2.5 Pa between the exposed and the unexposed surfaces with the higher pressure on the exposed side.

1. **Floor or Wall Assembly** — Min 4-1/2 in. (114 mm) thick floor, or min 5-1/2 in. (140 mm) thick wall, of reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Floor may also be constructed of any min 6 in. (152 mm) thick hollow-core Precast Concrete Units*. Max diam of opening is 4-1/2 in. (114 mm).

   See Concrete Blocks (CAZT) or Precast Concrete Units (CFTV) categories in the Fire Resistance Directory for names of manufacturers.

2. **Air Conditioning (AC) Line Set** — One AC line set installed within opening. The AC line set consists of two metallic pipes or tubes (Item 2A), tubing insulation (Item 2B), one nonmetallic pipe (Item 2C) and two thermostat cables (Item 2D). The space between the AC line set and the periphery of the opening shall be min 1/4 in. (6 mm) to max 1-1/4 in. (32 mm). The AC line set penetrants shall be tightly bundled and rigidly supported on both sides of the floor or wall assembly.

   A. **Metallic Pipe** — A max of three pipes or tubes to be installed in each AC line set. Two of the pipes may exceed nom 1/2 in. (13 mm) in dia. The following types and sizes of through metallic pipe may be used:
      a. **Copper Pipe** — Nom 1 in. (25 mm) diam (or smaller) Regular (or heavier) copper pipe.
      b. **Copper Tube** — Nom 1 in. (25 mm) diam (or smaller) Type L (or heavier) copper tube.

   B. **Tube Insulation — Plastics** — Nom 1/2 in. (13 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. The tube insulation shall be installed on one 1 in. (25 mm) diam (or smaller) pipe or tube in each single AC one of the metallic pipes (Item 2A).

   See Plastics (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation meeting the above specifications and having a UL 94 Flammability Classification of 945V A may be used.

   C. **Nonmetallic Pipe** — A max of one nonmetallic drain pipe to be installed in each AC line set. The following types and sizes of nonmetallic pipe may be used:
      a. **Polyvinyl Chloride (CPVC) Pipe** — Nom 1 in. (25 mm) diam (or smaller) Schedule 40 solid core PVC pipe.
      b. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** — Nom 1 in. (25 mm) diam (or smaller) SDR 13.5 CPVC pipe.

   D. **Cable** — Two 8/C No. 12 AWG (or smaller) thermostat cables with polyvinyl chloride (PVC) insulation and jacket materials.

3. **Firestop System** — The firestop system shall consist of the following items:

   A. **Packing Material** — Min 3-1/2 in. (89 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation tightly packed into opening. Packing material to be installed flush with top surface of floor and recessed from bottom surface of floor to accommodate the required thickness of fill material. In walls, packing material to be recessed from both surfaces of wall to accommodate the required thickness of fill material.

   A1. **Forming Material** — As an alternate to the packing material in Item 3A, nom 3-1/2 in. (89 mm) wide strips of min 1/2 in (13 mm) thick compressible mat to be stacked to a thickness greater than the width of the annular space and compression-fitted, edge-first, to fill the annular space to a min 3-1/2 in. (89 mm) depth. Forming material to be recessed from bottom surface of floor or from both surfaces of wall to accommodate the required thickness of fill material.

**3M COMPANY 3M FIRE PROTECTION PRODUCTS** — Fire Barrier Packing Material
System No. C-AJ-8251 continued

B. Fill, Void or Cavity Materials* — Min 1 in. (25 mm) thickness of fill material applied within the annulus, flush with bottom surface of floor or with both surfaces of wall.

3M COMPANY 3M FIRE PROTECTION PRODUCTS — IC 15WB+ Sealant, CP 25WB+ Sealant or FB 3000 WT Sealant. CP 25WB+ not suitable for use with CPVC pipes

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

System tested with a pressure differential of 2.5 Pa between the exposed and the unexposed surfaces with the higher pressure on the exposed side.

1. **Floor or Wall Assembly** — Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete floor. Min 5 in. (127 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete wall. Wall may also be constructed of any UL Classified Concrete Blocks*. Max size of opening is 900 in. ² (5806 cm²) with a max dimension of 30 in. (762 mm). See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through Penetrants** — One cable tray and one or more pipes, tubes or cable bundles may be installed within the opening. The total number of through-penetrants is dependent on the size of the opening and the types and sizes of the penetrants. Any combination of the penetrants described below may be used provided that the following parameters relative to the annular spaces are maintained. The annular space between penetrants shall be min 3/4 in. (19 mm) to max 9-1/2 in. (241 mm) except for the following: the annular space between cable tray and cable bundle and all other penetrants shall be min 3 in. (76 mm); the annular space between metallic penetrants and insulated penetrants shall be a min 2 in. (51 mm); the annular space between metallic penetrants and non-metallic penetrants (Item 2B) shall be a min 2 in. (51 mm) and the annular space between nonmetallic penetrants shall be min 4 in. (102 mm). The annular space between penetrants and the periphery of opening shall be min 3/4 in. (19 mm) to max 14 in. (356 mm). Penetrants to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of penetrants may be used.

   A. **Metallic Penetrants** — One or more metallic pipe, conduit or tubing may be installed within the opening. The following types and sizes of metallic pipes, conduits or tubing may be used:
      1. **Steel Pipe** — Nom 8 in. (203 mm) diam (or smaller) Schedule 40 (or heavier) steel pipe.
      2. **Iron Pipe** — Nom 8 in. (203 mm) diam (or smaller) cast or ductile iron pipe.
      3. **Conduit** — Nom 4 in. (102 mm) diam (or smaller) steel electrical metallic tubing or nom 6 in. (152 mm) diam (or smaller) steel conduit.
      4. **Copper Tubing** — Nom 4 in. (102 mm) diam (or smaller) Type L (or heavier) copper tubing.
      5. **Copper Pipe** — Nom 4 in. (102 mm) diam (or smaller) Regular (or heavier) copper pipe.

      The hourly T, FT and FTH Rating is 1/2 hr except that when copper pipe/tube (Items 2A, 4 and/or 5) is used, the hourly T, FT and FTH Rating is 1/4 hr.

   B. **Nonmetallic Pipe** — One or more nonmetallic pipes may be installed within the firestop system. The following types and sizes of nonmetallic pipes, conduits or tubing may be used:
      1. **Polyvinyl Chloride (PVC) Pipe** — Nom 4 in. (102 mm) diam (or smaller) solid core Schedule 40 PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.
      2. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** — Nom 4 in. (102 mm) diam (or smaller) SDR 13.5 CPVC pipe for use in closed (process or supply) piping systems.

   C. **Cable Tray** — Max 24 in. (610 mm) wide by 6 in. (152 mm) deep open-ladder steel or aluminum cable tray. Aggregate cross-sectional area of cable tray to be max 45 percent of the cross-sectional area of the cable tray based on a max 4 in. (102 mm) cable loading depth. Any combination of the types and sizes of cables described below may be used.
      1. Max 1/C, 750 kcmil (or smaller) copper conductor cable with cross-linked polyethylene (XLPE) insulation and polyvinyl chloride
2. Max 7/C No. 12 AWG (or smaller) copper conductor power and control cables with cross-linked polyethylene (XLPE) insulation or polyvinyl chloride (PVC) jacket.
3. Max 3/C No. 2/0 AWG (or smaller) copper conductor SER cable with polyvinyl chloride (PVC) insulation and jacket.
4. Max 3/C No. 2/0 AWG (or smaller) copper conductor PVC jacketed aluminum clad or steel clad TECK 90 cable.
5. Max 300 pair (or smaller) No. 22 AWG copper conductor telephone cable with PVC insulation and jacket materials.
6. Max 110/125 fiber optic (F.O.) cable with PVC insulation and jacket.
7. Max 3/C (with ground) No. 14 AWG (or smaller) nonmetallic sheathed (Romex) cable with PVC insulation and jacket materials.
8. Max RG/U (or smaller) coaxial cable with fluorinated ethylene (FE) or PVC insulation and jacket material.
9. Max 4 pair No. 24 AWG (or smaller) copper conductor Cat 5e or Cat 6 telephone cable with PVC insulation and jacket materials.
11. Max three conductor No. 12 AWG (or smaller) MC (BX) copper cable with polyvinyl chloride insulation and jacket materials.

D. Cable Bundle — Max 3 in. (76 mm) diam tightly bundled cables may be installed within the opening. Any combination of the types and sizes of cables listed in Item 2C may be used.

E. Cable Bundle — Max 1-1/2 in. (38 mm) diam tightly bundled 110/125 fiber optic (F.O.) cables (with PVC insulation and jacket) may be installed within the opening.

3. Pipe Covering Material* — Fiberglass Insulation — (Optional) — May be installed on metallic penetrant Items 2A1 and 2A2. Nom 1-1/2 in. (38 mm) thick hollow cylindrical heavy density (min 3.5 pcf) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product.

See Pipe and Equipment Covering — Materials (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. Firestop System — The firestop system shall consist of the following:

A. Fill, Void or Cavity Materials* — Wrap Strip — (Not Shown) — Used with each Item 2B nonmetallic penetrant. Min 3/16 in. (5 mm) thick intumescent material supplied in 2-1/2 in. (64 mm) wide strips. Single layer of wrap strip, pre-cut to fit penetrant OD, tightly wrapped around nonmetallic pipe and secured with the adhesive closure tab. Wrap strip to be installed within the opening such that the edge of the wrap strip layer is flush with bottom surface of floor. For wall assemblies, wrap strip is to be installed on both sides of wall and installed in the wall such that the wrap strip is flush with both surfaces of wall.

3M COMPANY 3M FIRE PROTECTION PRODUCTS — Tuck-In Wrap Strip WS 200, WS 300 or WS 400

B. Fill, Void or Cavity Material* — Blocks installed with 5 in. (127 mm) dimension projecting through opening flush with bottom surface of floor or centered in wall. In solid concrete floors or walls thicker than 5 in. (127 mm), the fire block can be installed flush with top or bottom surface of floor or flush with one side of wall. In concrete block walls, fire block to fill the entire thickness of wall opening unless concrete block is solid filled. Blocks to be firmly packed to fill the opening area between and around all penetrants. Blocks can be cut to fit around penetrants and within smaller annular spaces.

3M COMPANY 3M FIRE PROTECTION PRODUCTS — 3M™ Fire Barrier Block B258, 3M™ Fire Barrier Plank PK39

C. Fill, Void or Cavity Materials* — Foam — Fill material to be forced between blocks and periphery of opening to the max extent possible. Fill material to be injected in-between blocks and penetrants to the full depth of the blocks, as well as in any visible voids/ openings between blocks (Item 4B). In addition, foam shall be injected to the maximum extent possible within the interstices between all cables in the cable tray and cable bundles.

3M COMPANY 3M FIRE PROTECTION PRODUCTS — Fire Barrier Rated Foam, FIP 1-Step

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete floor. Min 5 in. (127 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete wall. Wall may also be constructed of any UL Classified solid core Concrete Blocks*. Max size of opening is 1024 in.² (0.66 m²) with a max dimension of 32 in. (813 mm).

See **Concrete Blocks (CAZT)** in the Fire Resistance Directory for names of manufacturers.

2. **Through-Penetration** – The total number of through-penetrants installed in the opening is dependent on the size of the opening and the types and sizes of the penetrants. Any combination of the penetrants described below may be used provided that the parameters specified are maintained. The annular space between all penetrants and the periphery of opening shall be min 0 in. (point contact) unless otherwise noted below for the specific penetrants. A max annular space in the system shall be 17-1/2 in. (445 mm) for FB-3000WT sealant and 12 in. (305 mm) for CP 25WB+ sealant. Penetrants to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of penetrants may be used.

A. **Metallic Pipes** – The following types of metallic pipes, tubes or conduits may be used. The annular space between metallic pipes, conduit and tubes and insulated pipes and tubes shall be a min 2 in. (51 mm). The annular space between nom 3 in (76 mm) diam (and smaller) copper pipes and tubes and between nom 4 in (102 mm) diam (and smaller) steel and iron pipes and conduits shall be min 1/2 in. (13 mm). The annular space between nom 2 in. (51 mm) diam (and smaller) metallic pipes and conduits shall be min 0 in. (point contact).

1. **Copper Tubing** – Nom 6 in. (152 mm) diam (or smaller) Type L (or heavier) copper tube.
2. **Copper Pipe** – Nom 6 in. (152 mm) diam (or smaller) Regular (or heavier) copper pipe.
3. **Steel Pipe** – Nom 24 in. (610 mm) diam (or smaller) Schedule 40 (or heavier) steel pipe and nom 12 in. (305 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
4. **Iron Pipe** – Nom 24 in. (610 mm) diam (or smaller) cast or ductile iron pipe.
5. **Conduit** – Nom 4 in. (102 mm) diam (or smaller) electric metallic tubing (EMT) or nom 6 in. (152 mm) diam (or smaller) rigid steel conduit.
**B. Cables Bundles** – Max 4 in. (102 mm) diam tightly bundled cables. The annular space between cable bundles and other penetrants shall be a min 1/2 in. (13 mm) except that a min 2 in. (51 mm) shall be maintained between the cables and copper pipes and tubes greater than a nom 3 in. (76 mm) diam and steel and iron pipes and conduits greater than a nom 4 in. (102 mm) diam. Any combination of the following types and sizes of cables may be used:

1. Max 1000 kcmil single copper or aluminum conductor power cable with thermoplastic insulation and polyvinyl chloride (PVC) jacket.
2. Max 300 pair No. 24 AWG copper conductor telecommunication cables with PVC insulation and jacket material.
3. Max 7/C copper conductor No. 12 AWG multi-conductor power and control cables with PVC or cross-linked polyethylene (XLPE) insulation and PVC jacket.
4. Multiple fiber optical communication cables jacketed with PVC and having a max outside diameter of 1/2 in.
5. Max 3/C No. - 12 AWG steel clad cable with copper conductors and PVC insulation material.
6. Max RG/U coaxial cables with fluorinated ethylene jacket and insulation.
7. Max 4/C with ground No. 2/O AWG Metal-Clad Cable+.

**C. Busway+** – Nom 23 in. (584 mm) wide by 4.5 in. (114 mm) deep (or smaller) "I" shaped aluminum and steel enclosure containing factory mounted copper bars rated for 600 V, 5000A or aluminum bars rated 600V, 4000A. A maximum of one busway to be installed within the opening. The annular space between the busway and the periphery of the opening shall be min 2 in. (51 mm). Busway spaced min 6 in. (152 mm) from all other penetrants. Busway to be rigidly supported on both sides of wall assembly. The busway shall bear the UL Listing Mark and shall be installed in accordance with the National Electrical Code, NFPA 70. When Busway installed within opening, the FB-3000WT sealant (Item 4B) shall be used.

**D. Cable Tray** – Max 24 in. (610 mm) wide by 6 in. (152 mm) deep open-ladder steel or aluminum cable tray. A maximum of two cable trays may be installed within the opening. Aggregate cross-sectional area of cables in cable tray to be max 40 percent of the cross-sectional area of the cable tray based on a max 3 in. cable loading depth. The annular space between cable trays shall be a min of 4 in. (102 mm). The annular space between cable tray and all other penetrants shall be min 3 in. (76 mm). Any combination of the types and sizes of cables described in Item 2B may be used. Cable tray to be rigidly supported on both sides of floor or wall assembly.

**E. Nonmetallic Penetrants** – One or more nonmetallic pipes, conduits or tubes may be installed within the opening. Annulus between penetrants and periphery of opening is min 2 in. (51 mm). Separation between nonmetallic penetrants is min 4 in. (102 mm). Separation between nonmetallic penetrants and other types of penetrants is min 6 in. (152 mm). Penetrants rigidly supported on both sides of floor or wall assembly. The following types and sizes of nonmetallic pipes, conduits or tubing may be used:

- **E1. Polyvinyl Chloride (PVC) Pipe** – Nom 2 in. (51 mm) diam (or smaller) solid or cellular core Schedule 40 PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.
- **E2. Chlorinated Polyvinyl Chloride (CPVC) Pipe** – Nom 2 in. (51 mm) diam (or smaller) solid or cellular core Schedule 40 PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.
- **E3. Rigid Nonmetallic Conduit** – Nom 2 in. (51 mm) diam (or smaller) Schedule 40 PVC conduit installed in accordance with the National Electrical Code (NFPA 70).
- **E4. Electrical Nonmetallic Tubing (ENT)** – Nom 1 in. (25 mm) diam (or smaller) corrugated wall ENT formed of polyvinyl chloride (PVC) installed in accordance with the National Electrical Code (NFPA 70).

**F. Air Conditioning (AC) Line Set** – One or more AC line sets installed within opening. Each AC line set consists of two pipes or tubes, tubing insulation and a thermostat cable as specified below. The space between the AC line sets shall be min 2 in. (51 mm). The AC line sets shall be spaced min 6 in. from uninsulated metallic penetrants. The AC line set penetrants shall be tightly bundled shall be rigidly supported on both sides of the floor or wall assembly.

- **F1. Metallic Pipe** – One of the pipes may exceed nom 1/2 in. (13 mm) in diam. The following types and sizes of metallic pipe may be used:
  a. **Copper Pipe** – Nom 1 in. (25 mm) diam (or smaller) Regular (or heavier) copper pipe.
  b. **Copper Tube** – Nom 1 in. (25 mm) diam (or smaller) Type L (or heavier) copper tube.

- **F2. Tube Insulation — Plastics** – Nom 1/2 in. (13 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. The tube insulation shall be installed on one 1 in. (25 mm) diam (or smaller) pipe or tube in each single AC line set.

See **Plastics** (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation meeting the above specifications and having a UL 94 Flammability Classification of 945VA may be used.

**F3. Cable** – Max 4 pair No. 18 AWG (or smaller) thermostat cable with polyvinyl chloride (PVC) insulation and jacket materials.

**G. Steel Duct** – (Not Shown) Nom 12 in. (305 mm) diameter (or smaller) No. 24 GA (or heavier) steel duct installed within opening when opening contains no cables or cable tray. A max of two steel ducts may be installed within the through-opening. Ducts to be spaced min 4 in. (102 mm) apart and min 8 in. (203 mm) from insulated penetrants and nonmetallic penetrants. Steel ducts to be rigidly supported on both sides of floor or wall assembly.
3. **Pipe Insulation** – (Optional) – Pipes and tubes of the sizes noted below may be provided with one of the following types of pipe insulations:
   
   **A. Pipe Covering*** – Nom 1-1/2 in. (38 mm) thick (or thinner) hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket for steel and iron pipes with a nom diam of 8 in. (203 mm) (or smaller) or copper tubes and pipes with a nom diam of 4 in. (102 mm) (or smaller). Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product.

   See **Pipe and Equipment Covering – Materials** (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

   **B. Pipe Covering*** – Nom 2 in. (51 mm) thick (or thinner) hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket for pipes or tubes with a nom diam of 2 in. (51 mm) (or smaller). Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product.

   See **Pipe and Equipment Covering – Materials** (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

   **C. Tube Insulation-Plastics** – Nom 1 in. (25 mm) thick (or thinner) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing for pipes or tubes with a nom diam of 2 in. (51 mm) (or smaller).

   See **Plastics** (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5VA may be used.

4. **Firestop System** – The firestop system shall consist of the following:

   **A. Packing Materials** – Min 4 in. (102 mm) thickness of 4 pcf (64 kg/m³) mineral wool batt insulation tightly packed into the opening as a permanent form. Packing material to be recessed from top surface of floor or both surfaces of wall to accommodate the required thickness of fill material.

   **B. Fill, Void or Cavity Material - Sealant*** – Min 1/2 in. (13 mm) thickness of fill material applied within the annulus flush with the top surface of the floor or both surfaces of the wall. Additional fill material forced into interstices of grouped cables and grouped cables within cable trays, and to fill any voids evident in the firestop system. When Busway (Item 2C) is installed within opening, the FB-3000WT sealant shall be used.

   **3M COMPANY** – CP 25 WB+ or FB-3000 WT

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

Reprinted from the Online Certifications Directory with permission from UL©
1. **Floor or Wall Assembly** – Min 5-1/2 in. (140 mm) thick lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max area of opening 1500 sq in. (9677 cm²) with max dimension of 50 in. (1270 mm). See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Cables** – Individual cable or tightly-bound circular bundle of cables having a max bundle diam of 3 in. (76 mm). Min spacing between individual cables and/or cable bundles or between cables and pipe (Item 3) is 6 in. (152 mm). Cable rigidly supported on both sides of floor or wall assembly. The following types and sizes of copper conductor cables may be used:
   A. Max 100 pair No. 24 AWG telephone cable; polyvinyl chloride (PVC) insulation and jacket materials. When max 100 pr telephone cable is used, T Rating is 1-1/2 hr.
   B. Max 25 pr No. 24 AWG telephone cable; PVC insulation and jacket materials. When max 25 pr telephone cable is used, T Rating is 2 hr.
   C. Max No. 12 AWG multi conductor power and control cable; PVC or cross-linked polyethylene insulation, PVC jacket. When max No. 12 AWG multi conductor cable is used, T Rating is 2 hr.

When an individual cable of the types listed above is installed in a max 1 in. (25 mm) diam through opening in the intumescent sheets (Item 6) and when only caulk fill material (Item 10) is used around the base of the cable at its egress from the intumescent sheet, the T Rating is 1 hr.

3. **Pipe or Conduit** – Nom 12 in. (305 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe, nom 6 in. (152 mm) diam (or smaller) steel conduit, nom 4 in. (102 mm) diam (or smaller) steel EMT or nom 4 in. (102 mm) diam (or smaller) Type L (or heavier) copper pipe. Pipe, conduit or EMT rigidly supported on both sides of floor or wall assembly. When max 4 in. (102 mm) diam steel pipe, conduit or EMT is used, T Rating is 3/4 hr. When max 2 in. (51 mm) diam steel pipe, conduit or EMT is used, T Rating is 1-1/2 hr. When copper pipe is used or when steel pipe or conduit larger than 4 in. (102 mm) is used, T Rating is 0 hr.
4. **Pipe covering** (Optional) – Nom 1 in. or 2 in. (25 mm or 51 mm) thick hollow cylindrical heavy density (min 3.5pcf or 56 kg/m³) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt strip tape supplied with the product. When nom 1 in. (25 mm) thick pipe covering is used on max 12 in. (305 mm) diam steel pipe, T Rating is 3/4 hr. When nom 1 in. (25 mm) thick pipe covering is used on max 4 in. (102 mm) diam steel pipe, T Rating is 1-1/2 hr. When nom 1 in. (25 mm) thick pipe covering is used on max. 4 in. (102 mm) diam copper pipe, T rating is 1 hr. When nom 2 in. (51 mm) thick pipe covering is used, T Rating is 2 hr and T Rating is 1 hr.

See **Pipe and Equipment Covering – Materials** (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

5. **Fill, Void or Cavity Materials** – **Wrap Strip** – Nom 1/4 in. (6 mm) thick intumescent elastomeric material faced on one side with aluminum foil, supplied in nom 2 in. (51 mm) wide by 24 in. (610 mm) long strips. Single layer of wrap strip tightly-wrapped around each cable bundle, each copper pipe, each steel pipe or conduit larger than 4 in. (102 mm) diam and each pipe with nom 1 in. (25 mm) thick pipe covering material. Two layers of wrap strip required on each pipe with nom 2 in. (51 mm) thick pipe covering material. Wrap strip layer(s) installed with foil side exposed and secured in place with steel wire ties. When tight grouping of steel pipes, conduits or EMT does not readily permit tight installation of the intumescent sheet (Item 6) around the individual pipes, conduits or EMT, the grouping of steel pipes conduits or EMT shall be wrapped with a single piece of wrap strip drawn in between the individual pipes using steel wires so as to follow the contours of the pipe grouping as tightly as possible. Wrap strip to extend approx 7/8 in. (22 mm) beyond each face of the intumescent sheet (Item 6) on both sides of the floor or wall assembly. Wrap strip layer not required on individual nom 4 in. (102 mm) diam (or smaller) steel pipe, conduit or EMT.

**3M COMPANY** – **FS-195+**

6. **Fill, Void or Cavity Materials** – **Intumescent Sheet** – Rigid aluminum foil-faced sheet with galv steel sheet backer. Sheet cut to tightly-follow the contours of the individual pipes, conduits and EMT and the contours of the wrap strip (Item 5) on the cable bundles, pipes, insulated pipes and grouped pipes, conduits and EMT. Sheets to lap a min of 2 in. (51 mm) on the floor or wall surface on all sides of the opening on both sides of the floor or wall assembly. Sheet to be installed with the galv steel sheet backer exposed (aluminum foil facing against floor or wall surface) and secured to floor or wall surface with min 3/16 in. (5 mm) diam by 1-1/4 in. (32 mm) long steel masonry rivets spaced max 3 in. (76 mm) OC on each side of seam or slit.

**3M COMPANY** – **CS-195+**

7. **Steel Cover Strip** – Min 2 in. (51 mm) wide strip of min 0.020 in. (0.51 mm) thick (No. 26 ga) galv steel centered over butted seams of adjoining intumescent sheets and over entire length of each slit made made in intumescent sheet (Item 6) to permit installation about the penetrating items(s). Prior to installation of the steel strip, the seam of slit in the intumescent sheet shall be covered with a nom 1/4 in. (6 mm) diam bead of caulk (Item 10). Steel cover strip secured to galv steel sheet backer of intumescent sheet with steel sheet metal screws or steel rivets spaced max 3 in. (76 mm) OC on each side of seam or slit.

8. **Support Channel** – When area of through opening exceeds 750 sq in. (4838 cm²), an intermediate support channel shall be installed on each side of floor or wall assembly, flush with floor or wall surface. Support channels to be min 1-5/8 in. by 1-5/8 in. (41 mm by 41 mm) and formed of min 0.093 in. (2.4 mm) thick (No. 12 ga) painted or galv steel. Ends of steel channel bolted or welded to steel angles anchored to inside walls of through opening. When steel support channels are centered beneath butted seams of intumescent sheets, no steel cover strip (Item 7), is required over butted seam. Intumescent sheets secured to steel support channels with steel sheet metal screws in conjunction with min 1-1/4 in. (32 mm) diam steel fender washers. When support channel is used beneath butted seam of intumescent sheets, fasteners spaced max 3 in. (76 mm) OC on each side of butted seam. When support channel is located away from intumescent sheet sheet, fasteners spaced max 6 in. (152 mm) OC. Prior to installation of the intumescent sheet(s), a nom 1/4 in. (6 mm) diam continuous bead of caulk (Item 10) shall be applied as a gasket over the support channel. When steel support channels are used, T Rating is 1-1/2 hr.

9. **Packing Material** – When tightly-grouped steel pipes, conduits or EMT are encircled with a contoured wrap of wrap strip (Item 5), the interstices between the pipes within the wrap strip shall be firmly packed with a nom 1 in. (25 mm) thickness of mineral wool batt insulation. Packing material to be recessed 1 in. (25 mm) from edge of wrap strip on each side of floor or wall assembly.

10. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Generous application of caulk to be applied around the base of the individual cables, pipes, conduits, EMT and contour applied wrap strips at their egress from the intumescent sheet on both sides of the floor or wall assembly. An additional bead of caulk shall be applied to the exposed edges of the wrap strip at its interface with the grouped pipes, insulated steel pipe and cable bundle on both sides of floor or wall assembly. An additional 1/4 in. (6 mm) diam bead of caulk shall be applied to edge of intumescent sheet at its interface with floor or wall surface around entire perimeter. When tightly-grouped steel pipes, conduits, or EMT are encircled with a contoured wrap of wrap strip (Item 5), a min 1 in. (25 mm) thickness of caulk shall be applied over the packing material (Item 9) to completely fill the cavity within the wrap strip on each side of the floor or wall assembly.

**3M COMPANY** – **CP 25WB+; IC 15WB+ caulk or FB-3000 WT sealant.**

*Bearing the UL Classification Mark

1. **Floor or Wall Assembly** – Min 8 in. (203 mm) thick normal weight (min 140 pcf or 2242 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks. Max area of opening 1500 sq in. (9677 cm²) with max dimension of 50 in. (1270 mm). See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Cables** – Individual cables or tightly-bound circular bundle of cables having a max bundle diam of 3 in. (76 mm) Min spacing between individual cables and/or cable bundles or between cables and pipe (Item 3) is 6 in. (152 mm). Cables rigidly supported on both sides of floor or wall assembly. The following types and sizes of copper conductor cables may be used:
   A. Max 100 pair No. 24 AWG telephone cable; polyvinyl chloride insulation and jacket materials. **When max 100 pair telephone cable is used, T Rating is 1 hr.**
   B. Max 25 pair No. 24 AWG telephone cable; polyvinyl chloride insulation and jacket materials. **When max 25 pair telephone cable is used, T Rating is 1-1/2 hr.**
   C. Max No. 12 AWG multi conductor power and control cables; polyvinyl chloride or cross-linked polyethylene insulation, polyvinyl chloride jacket. **When max No. 12 AWG multi conductor cable is used, T Rating is 1 hr.**
   When an individual cable of the types listed above is installed in a max 1 in. (25 mm) diam through opening in the intumescent sheets (Item 4), the T Rating is 1-1/2 hr.

3. **Steel Pipe or Conduit** – Nom 4 in. (102 mm) diam (or smaller) Schedule 5S (or heavier) steel pipe, steel conduit or steel EMT. Pipe, conduit or EMT rigidly supported on both sides of floor or wall assembly. **When max 4 in. (102 mm) diam steel pipe, conduit or EMT is used, T Rating is 3/4 hr.). When max 2 in. (51 mm) diam steel pipe, conduit or EMT is used, T Rating is 1-1/2 hr.**

4. **Fill, Void or Cavity Materials** – Intumescent Sheet – Rigid aluminum foil-faced sheet with galv steel sheet backer. Sheet cut to tightly-follow the contours of individual pipes, conduits or EMT. For cable bundles and for tightly-grouped steel pipes, conduits and EMT, the intumescent sheet shall be cut to tightly follow the contours of the individual cable, cable bundle or pipe group but with a nom 1/4 in. to 3/8 in. (6 mm to 10 mm) wide annular space maintained between the penetrating item and the edges of the cutout in the intumescent sheet. Sheets to lap a min of 2 in. (51 mm) on the floor or wall surface on all sides of through opening on both sides of the floor or wall assembly. Sheet to be installed with the galv steel sheet backer exposed (aluminum foil facing against floor or wall surface) and secured to floor or wall surface with min 3/16 in. diam by 1-1/4 in. (10 mm to 32 mm) long steel masonry fasteners with min 1-1/4 in. (32 mm) diam steel washers. Max spacing of fasteners not to exceed 6 in. (152 mm) with additional fasteners located on each side of butted seams or slits made to permit installation of the sheet around individual penetrating items.

**3M COMPANY – CS-195+**
System No. C-BJ-8005 continued

5. **Steel Cover Strip** – Min 2 in. (51 mm) wide strip of min 0.020 in. (0.51 mm) thick galv steel centered over butted seams of adjoining intumescent sheets and over entire length of each slit made in intumescent sheet (Item 4) to permit installation about the penetrating item(s). Prior to installation of the steel strip, the seam or slit in the intumescent sheet shall be covered with a nom 1/4 in. (6 mm) diam bead of caulking (Item 7). Steel cover strip secured to galv steel sheet backer of intumescent sheet with steel sheet metal screws or steel rivets spaced max 3 in. (76 mm) O.C. on each side of seam or slit.

6. **Support Channel** – When area of through opening exceeds 750 sq in. (4838 cm²), an intermediate support channel shall be installed on each side of floor or wall assembly, flush with floor or wall surface. Support channels to be min 1-5/8 in. by 1-5/8 in. (41 mm by 41 mm) and formed of min 0.093 in. (2.4 mm) thick (No. 12 gauge) painted or galv steel. Ends of steel channel bolted or welded to steel angles anchored to inside walls of through opening. When steel support channels are centered beneath butted seams of intumescent sheets, no steel cover strip (Item 5) is required over butted seam. Intumescent sheets secured to steel support channels with steel sheet metal screws in conjunction with min 1-1/4 in. (32 mm) diam steel fender washers. When support channel is used beneath butted seam of intumescent sheets, fasteners spaced max 3 in. (76 mm) O.C. on each side of butted seam. When support channel is located away from intumescent sheet seam, fasteners spaced max 6 in. (152 mm) O.C. Prior to installation of the intumescent sheet(s), a nom 1/4 in. (6 mm) diam continuous bead of caulking (Item 7) shall be applied as a gasket over the support channel. **When support channel is used, T Rating is 1-1/2 hr.**

7. **Fill, Void or Cavity Material** – **Caulk or Sealant** – Generous application of caulking to be applied around the base of the individual steel pipes, conduits or EMT at their egress from the intumescent sheet on both sides of the floor or wall assembly. An additional 1/4 in. (6 mm) diam bead of caulking shall be applied to edge of intumescent sheet at its interface with floor or wall surface around entire perimeter.

   **3M COMPANY** – CP 25WB+, IC 15WB+ caulking or FB-3000 WT sealant.

8. **Fill, Void or Cavity Materials** – **Putty** – Moldable putty material kneaded by hand and packed into nom 1/4 in. to 3/8 in. (6 mm to 10 mm) annular space between individual cable, cable bundle or pipe group and edges of cutout in intumescent sheet on both sides of floor or wall assembly. Putty material to be “domed” min 1 in. (25 mm) beyond intumescent sheet around perimeter of individual cable, cable bundle or pipe group on both sides of floor or wall assembly. Interstices between pipes in pipe group to be tightly-packed with a min 1-1/4 in. (32 mm) thickness of putty material on both sides of floor or wall assembly.

   **3M COMPANY** – MP+ Stix

*Bearing the UL Classification Mark*
System No. F-A-8001
September 07, 2004
(Formerly System No. 152)
F Rating – 2 Hr
T Rating – 0 Hr
L Rating At Ambient – 2 CFM/sq ft.
L Rating At 400 F – Less Than 1 CFM/sq ft

1. **Floor Assembly** – Min 4-1/2 in. thick lightweight or normal weight (100-150 pcf) concrete. Max area of opening 192 sq in. with max length of 24 in. and max width of 8 in.

2. **Pipe or Conduit** – Nom 4 in. diam (or smaller) Type L (or heavier) copper tubing. Schedule 10 (or heavier) steel pipe, steel conduit or steel EMT to be installed with a min clearance of 1 in. and a max clearance of 2 in. from the periphery of the opening. A min separation of 1 in. shall be maintained between adjacent pipes. When pipes, conduits or tubings are provided with pipe covering (Item 3) or pipe insulation (Item 3A), a min 1/4 in. clearance between pipe covering or insulation and the periphery of the opening shall be maintained. A min 1/2 in. separation shall be maintained between insulated pipes, conduits and tubings of nom 3 in. diam (or smaller). A min 1 in. clearance shall be maintained between insulated pipes, conduits or tubings of greater than nom 3 in. diam. A min 1 in. clearance shall be maintained between any insulated pipe, conduit or tubing and any uninsulated pipe, conduit or tubing. Pipes, conduits or tubing to be rigidly supported on both sides of floor assembly.

3. **Pipe Covering** (Optional) – Nom 1/2 in. to 1 in. thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt strip tape supplied with the product.

See **Pipe and Equipment Covering – Materials** (BRGU) category in Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Development Index of 50 or less may be used.

3A. **Pipe Insulation** – **Plastics** (Optional) – As an alternate to Item 3, nom 3/4 in. thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing with skin may be used on steel pipes.

See **Plastics** (QMFZ2) category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having UL94 Flammability Classification of 94-5VA may be used.

4. **Fill, Void or Cavity Materials** – **Wrap Strip** – Nom 1/4 in. thick intumescent elastomeric material faced on one side with aluminum foil, supplied in 2 in. wide strips. Nom 2 in. wide strip tightly-wrapped around pipe insulation (Item 3 or 3A) with the foil side exposed and slid into through opening such that the top edge is flush with the top surface of the floor. The wrap strip layer shall be secured in place with min No. 18 gauge galv steel tie wire. Wrap strip material is required only when pipe insulation is used.

**3M COMPANY** – FS-195+

5. **Packing Material** – Min 1 in. thick mineral wool batt material insulation firmly packed into opening as a permanent form with its top surface recessed min 1 in. from top surface of floor.

6. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Applied to fill through opening to a min depth of 1 in., flush with top surface of floor, with a min 1/8 in. thickness of caulk applied over top edge of wrap strip layer (Item 4) on insulated pipe.

**3M COMPANY** – CP 25WB+ caulk or FB-3000 WT sealant.

System No. F-A-8007
January 09, 2007
F Rating – 3 Hr
T Rating – 0 Hr
L Rating at Ambient – Less Than 1 CFM/sq ft (See Items 3 and 5A)
L Rating at 400° F – Less Than 1 CFM/sq ft (See Items 3 and 5A)
W Rating – Class 1 (See Items 3, 4B and 5A)

1. **Floor Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete.

2. **Firestop Device** – Cast in place firestop device permanently embedded during concrete placement or grouted in concrete assembly in accordance with accompanying installation instructions. The device may be trimmed flush with top surface of floor or may project up to a max 3-1/2 in. (89 mm) above top surface of floor.
   - **3M COMPANY** – 3M Fire Barrier Cast-In Device 2MCID, 3MCID, 4MCID

2A. **Firestop Device – Height Adapter** – (Not Shown) – For use in floors greater than 8 in. (203 mm) thick. Adapter snaps onto top of firestop device (Item 2).
   - **3M COMPANY** – 3M Fire Barrier Cast-In Device Height Adapter, 2HA, 3HA, 4HA

3. **Through Penetrants** – Pipes, tubing or cable to be bundled within the opening. A min 1/4 in. (6 mm) annular space shall be maintained between uninsulated metallic pipes and cable (Item 3C). The annular space between uninsulated metallic pipes and other penetrants shall be min 0 in. (0 mm, point contact) to max 2 in. (51 mm). The space between penetrants and periphery of opening shall be min 0 in. (0 mm, point contact) to max 2 in. (51 mm). When W or L Ratings are required, the space between penetrants and the space between the penetrants and the inside of the firestop device (Item 2 or 2A) shall be min 1/4 in. (6 mm). Penetrants to be rigidly supported on both sides of floor assembly. The following types and sizes of penetrants may be used:
   - **A. Metallic Pipes** – The following types and sizes of metallic pipes, conduits or tubing may be used:
     1. **Copper Tubing** – Nom 1 in. (25 mm) diam (or smaller) Type L (or heavier) copper tubing.
     2. **Copper Pipe** – Nom 1 in. diam (or smaller) Regular (or heavier) copper pipe. All pipes or tubing larger than nom 1/2 in. (25 mm) diam shall be provided with pipe covering (Item 4).
   - **B. Polyvinyl Chloride (PVC) Pipe** – A max of one PVC nom 1 in. (25 mm) diam (or smaller) Schedule 40 solid core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping system.
   - **C. Cables** – A max of two cable, max 8/C No. 18 AWG (or smaller) thermostat cable; XLPE or PVC insulation with XLPE or PVC jacket.

4. **Pipe Covering** – The following types and sizes of pipe coverings may be used with the metallic pipes:
   - **A. Pipe Covering** – Max 3/4 in. (19 mm) thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with product.
     - See **Pipe and Equipment Covering – Materials** (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a smoke Developed Index of 50 or less may be used.
   - **B. PVC Jacket** – (Optional, Not Shown) – An additional PVC jacket, supplied in sheet form, shall be tightly wrapped around the all service jacket on the pipe covering (Item 4A) with the longitudinal seam continuously sealed using the self-sealing lap tape or adhesive supplied with the jacket. The jacket is to be nom 48 in. (1.22 m) wide by nom 20 or 30 mil (0.5 or 0.8 mm) thick. The jacket shall extend downward into and/or through the opening from a point 36 to 40 in. (0.91 to 1.02 m) above the top surface of the floor assembly. The PVC jacket must be used for the W Rating to apply.
     - See **Plastics** (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component plastic material meeting the above specifications and having a UL 94 Flammability Classification of 94-5VA may be used.
System No. F-A-8007 continued

C. Tube Insulation – Plastics+ – Max 3/4 in. (19 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing.

See Plastics (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5A may be used.

5. Packing Material – Min 2 in. (51 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed within annulus, flush with the top surface of floor.

5A. Fill, Void or Cavity Materials – Sealant, Caulk or Putty* – (Optional, Not Shown) - As an option, the packing material (Item 5) may be reduced in thickness by 1/4 to 1/2 in. (6 to 13 mm) and recessed from the top surface of floor to accommodate a 1/4 to 1/2 in. (6 to 13 mm) thickness of sealant, caulk or putty, installed within annulus, flush with the top surface of floor. For W and L Ratings, a min 1/4 in. (6 mm) bead of sealant is required at the device/concrete interface on the top surface of the floor and a min 1/4 in. (6 mm) depth of sealant is required atop a min 1 3/4 in. (44 mm) thickness of mineral wool packing material inside the firestop device (Item 2 or 2A).

3M COMPANY – FB-1000 NS sealant, FB-1003 SL sealant, FB-3000 WT sealant, CP 25WB+ caulk, FireDam 150+ caulk, IC 15WB+ caulk or MP+ putty

(Note: W and L Ratings apply only when FB-1000 NS, FB-1003 SL or FB-3000 WT sealants are used.)

Note: This system was tested with a pressure differential of 50 Pa between the exposed and unexposed surfaces with the higher pressure on the exposed side.
1. **Floor Assembly** – Min 2-1/2 in. (64 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete.

2. **Firestop Device** – Cast in place firestop device permanently embedded during concrete placement or grouted in concrete assembly in accordance with accompanying installation instructions. The device may be trimmed flush with top surface of floor or may project up to a max 3-1/2 in. (89 mm) above top surface of floor.

   **3M COMPANY** – 3M Fire Barrier Cast-In Device 2PCID, 3PCID, 4PCID

3. **Through Penetrants** – Pipes, tubing or cable to be bundled within the opening. The annular space between penetrants shall be min 0 in. (0 mm, point contact) to max 1 in. (25 mm). The space between penetrants and periphery of opening shall be min 0 in. (0 mm, point contact) to max 1 in. (25 mm). When W or L Ratings are required, the space between penetrants and the space between the penetrants and the inside of the firestop device shall be min 1/4 in. (6 mm). Penetrants to be rigidly supported on both sides of floor assembly. The following types and sizes of penetrants may be used:

   A. **Metallic Pipes** – A max of four pipes or tubes installed within opening. The following types and sizes of metallic pipes, conduits or tubing may be used:
      1. **Copper Tubing** – Nom 1 in. (25 mm) diam (or smaller) Type L (or heavier) copper tubing.
      2. **Copper Pipe** – Nom 1 in. (25 mm) diam (or smaller) Regular (or heavier) copper pipe. All pipes or tubing larger than nom 1/2 in. (13 mm) diam shall be provided with pipe covering (Item 4).

   B. **Polyvinyl Chloride (PVC) Pipe** – A max of one nom 1 in. (25 mm) diam (or smaller) Schedule 40 solid core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

   C. **Cables** – A max of two, max 8/C No. 18 AWG (or smaller) thermostat cables; XLPE or PVC insulation with XLPE or PVC jacket.

4. **Tube Insulation – Plastics** – Nom 1/2 in. (13 mm) thick (or less) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing.

   See **Plastics** (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5A may be used.

5. **Packing Material** – Min 2 in. (51 mm) thick of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed within annulus, flush with the top surface of floor.

5A. **Fill, Void or Cavity Materials – Sealant, Caulk or Putty** – (Optional, Not Shown) – As an option, the packing material (Item 5) may be reduced in thickness by 1/4 to 1/2 in. (6 to 13 mm) and recessed from the top surface of floor to accommodate a 1/4 to 1/2 in. (6 to 13 mm) thickness of sealant, caulk or putty, installed within annulus, flush with the top surface of floor. For W and L Ratings, a min 1/4 in. (6 mm) bead of sealant is required at the device/concrete interface on the top surface of the floor and a min 1/4 in. (6 mm) depth of sealant is required atop a min 1-3/4 in. (44 mm) thickness of mineral wool packing material inside the firestop device (Item 2).

   **3M COMPANY** – FB-1000 NS sealant, FB-1003 SL sealant, FB-3000 WT sealant, CP 25WB+ caul, FireDam 150+ caul, IC 15WB+ caul or MP+ putty

   (Note: W and L Ratings apply only when FB-1000 NS, FB-1003 SL or FB-3000 WT sealants are used.)

**Note:** This system was tested with a pressure differential of 50 Pa between the exposed and unexposed surfaces with the higher pressure on the exposed side.
1. **Floor Assembly** – Min 4–1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Max size of opening shall be 180 in² (1161 cm²) with a max dimension of 18 in. (457 mm).

2. **Through Penetrants** – Penetrants to be rigidly supported on both sides of floor assembly. Any combination of the following penetrants may be used:
   
   A. **Steel Duct** – Nom 4 in. (102 mm) (or smaller) 30 gauge (or heavier) steel duct installed concentrically or eccentrically within opening. The annular space between duct and periphery of opening shall be min 1/4 in. (6 mm) to max 4 in. (102 mm). The annular space between duct and other penetrant shall be min 2 in. (51 mm).
   
   B. **Nonmetallic Pipes** – Nonmetallic pipe or conduit installed concentrically or eccentrically within opening. The annular space between nonmetallic pipe or conduit and periphery of opening shall be min 2 in. (51 mm) to max 4 in. (102 mm). The annular space between nonmetallic pipe or conduit and other penetrant shall be min 2 in. (51 mm). The following types and sizes of nonmetallic pipes or conduits may be used:
      1. **Polyvinyl Chloride (PVC) Pipe** – Nom 4 in. (102 mm) diam (or smaller) Schedule 40 solid core or cellular core PVC pipe for use in vented (drain, waste or vent) piping system.
      2. **Acrylonitrile Butadiene Styrene (ABS) Pipe** – Nom 4 in. (102 mm) diam (or smaller) Schedule 40 solid core or cellular core ABS pipe for use in vented (drain, waste or vent) piping systems.
      3. **Fire Retardant Polypropylene (FRPP) Pipe** – Nom 4 in. (102 mm) diam (or smaller) Schedule 40 FRPP pipe for use in vented (drain, waste or vent) piping system.
   
   C. **Double HVAC Line Set** – Pipes, tubing or cable to be tightly bundled within the opening. The annular space between the line set bundle and periphery of opening shall be min 0 in. (0 mm) (point contact) to max 1 in. (25 mm). The annular space between the line set bundle and other penetrants shall be a min 2 in. (51 mm). The following types and sizes of penetrants may be used:
      1. **Metallic Pipes** – A max of four pipes or tubes installed within opening. The following types and sizes of metallic pipes, conduits or tubing may be used:
         1. **Copper Tubing** – Nom 3/4 in. (19 mm) diam (or smaller) Type L (or heavier) copper tubing.
         2. **Copper Pipe** – Nom 3/4 in. (19 mm) diam (or smaller) Regular (or heavier) copper pipe.
         All pipes or tubing larger than nom 1/2 in. (13 mm) diam shall be provided with tube insulation (Item C4).
      2. **Polyvinyl Chloride (PVC) Pipe** – A max of one nom 1 in. (25 mm) diam (or smaller) Schedule 40 solid core or cellular core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.
      3. **Cables** – A max of two, max 8/C No. 18 AWG (or smaller) thermostat cables; XLPE or PVC insulation with XLPE or PVC jacket.
      4. **Tube Insulation-Plastics** – Nom 1/2 in. (13 mm) thick (or less) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing.

See **Plastics (QMFZ2)** category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5A may be used.

D. **Single HVAC Line Set** – Pipes, tubing or cable to be bundled within the opening. The annular space between the line set penetrants shall be min 0 in. (0 mm) (point contact) to max 1 in. (25 mm). The annular space between the line set bundle and periphery of opening shall be min 1 in. (25 mm) to max 4 in. (102 mm). The annular space between the line set bundle and other penetrants shall be a min 2 in. (51 mm). The following types and sizes of penetrants may be used:
System No. F-A-8014 continued

1. **Metallic Pipes** – A max of two pipes or tubes installed within opening. The following types and sizes of metallic pipes, conduits or tubing may be used:
   A. **Copper Tubing** – Nom 3/4 in. (19 mm) diam (or smaller) Type L (or heavier) copper tubing.
   B. **Copper Pipe** – Nom 3/4 in. (19 mm) diam (or smaller) Regular (or heavier) copper pipe.
   All pipes or tubing larger than nom 1/2 in. (13 mm) diam shall be provided with pipe covering (Item D4).

2. **Cables** – One max 8/C No. 18 AWG (or smaller) thermostat cables; XLPE or PVC insulation with XLPE or PVC jacket.

3. **Tube Insulation-Plastics**+ – Nom 1/2 in. (13 mm) thick (or less) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing.

   See **Plastics** (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5A may be used.

   The hourly T Rating for the firestop system is 1/4 Hr for penetrants A and C, 1/2 Hr for penetrants B1, B2, and D and 3 for penetrants B3.

3. **Firestop System** – The firestop system shall consist of the following:
   A. **Forms** – Min 24 gauge (or heavier) galv sheet metal cut to the contour of the penetrants and secured to the underside of the floor with min 3/16 in. (4.8 mm) diam by min 1-1/4 in. (32 mm) steel masonry anchors as a permanent form.
   B. **Fill, Void or Cavity Material*** – **Wrap Strip** – Nom 1/8 in. (3.2 mm) thick intumescent material supplied in 2 in. (51 mm) wide strips. Wrap strip tightly wrapped around nonmetallic pipes or conduits (Item 2B) and around the double HVAC line set (Item 2C) below floor. The top edge of the wrap strips shall be tightly butted to the underside of the sheet metal form (Item 3A). For nom 2 in. (51 mm) diam (and smaller) pipes, two layers are required. For nom 2-1/2 in. (64 mm) to 3 in. (76 mm) diam pipes, three layers are required. For nom 3-1/2 in. (89 mm) and 4 in. (102 mm) diam pipes, four layers are required. For the double HVAC line set, three layers are required. Wrap strip layers temporarily held in position using aluminum foil tape, steel wire tie, or equivalent. Wrap strip not used for penetrants 2A and 2D.
   C. **Steel Collar** – Nom 2 in. (51 mm) deep collar with 1-1/4 in. (32 mm) wide by 2 in. (51 mm) long anchor tabs and min 1/2 in. (13 mm) long tabs to retain wrap strip layers. Coils of precut 0.016 in. (0.41 mm) thick (28 gauge) galv sheet steel available from wrap strip manufacturer. As an alternate, collar may be field-fabricated from min 0.016 in. (0.41 mm) thick (28 gauge) galv sheet steel in accordance with instruction sheet supplied by wrap strip manufacturer. Steel collar, with anchor tabs bent outward 90 deg, wrapped tightly around wrap strip layers with min 1 in. (25 mm) overlap at seam. Anchor tabs to be pressed tightly against floor or wall surface(s), and collar to be compressed around wrap strip layers using a min 1/2 in. (13 mm) wide by 0.028 in. (0.71 mm) thick stainless steel band clamp at the collar midheight. Collar to be secured to sheet metal form with min No. 10 by min 1/2 in. (13 mm) long steel sheet metal screws in conjunction with min 1-1/4 in. (32 mm) diam steel washers. Min of four screws, symmetrically located, for nom 2 in. diam (and smaller) pipes and for the double HVAC line set. Min six screws, symmetrically located, for nom 2-1/2 and 3 in. (64 and 76 mm) diam pipes. Min eight screws, symmetrically located, for nom 3 and 3-1/2 in. (76 and 89 mm) diam pipes.
   D. **Fill, Void or Cavity Material*** – **Mortar** – Mortar to be mixed with water in accordance with the manufacturer’s instructions. Min 3 in. (76 mm) thickness of mortar applied within the annulus.

   *Bearing the UL Recognized Component Mark
   *Bearing the UL Classification Mark

**Note:** This system was tested with a pressure differential of 50 Pa between the exposed and unexposed surfaces with the higher pressure on the exposed side.
1. Floor Assembly – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Max size of opening shall be 180 in² (1161 cm²) with a max dimension of 18 in. (457 mm).

2. Through Penetrants – Penetrants to be rigidly supported on both sides of floor assembly. Any combination of the following penetrants may be used:
   A. Steel Duct – Nom 4 in. (102 mm) (or smaller) 30 gauge (or heavier) steel duct installed concentrically or eccentrically within opening. The annular space between duct and periphery of opening shall be min 1/4 in. (6 mm) to max 4 in. (102 mm). The annular space between duct and other penetrant shall be min 2 in. (51 mm).
   B. Nonmetallic Pipes – Nonmetallic pipe or conduit installed concentrically or eccentrically within opening. The annular space between nonmetallic pipe or conduit and periphery of opening shall be min 2 in. (51 mm) to max 4 in. (102 mm). The annular space between nonmetallic pipe or conduit and other penetrant shall be min 2 in. (51 mm). The following types and sizes of nonmetallic pipes or conduits may be used:
      1. Polyvinyl Chloride (PVC) Pipe – Nom 4 in. (102 mm) diam (or smaller) Schedule 40 solid core or cellular core PVC pipe for use in vented (drain, waste or vent) piping system.
      2. Acrylonitrile Butadiene Styrene (ABS) Pipe – Nom 4 in. (102 mm) diam (or smaller) Schedule 40 solid core or cellular core ABS pipe for use in vented (drain, waste or vent) piping systems.
      3. Fire Retardant Polypropylene (FRPP) Pipe – Nom 4 in. (102 mm) diam (or smaller) Schedule 40 FRPP pipe for use in vented (drain, waste or vent) piping system.
   C. Double HVAC Line Set – Pipes, tubing or cable to be tightly bundled within the opening. The annular space between the line set bundle and periphery of opening shall be min 1 in. (25 mm) to max 4 in. (102 mm). The annular space between the line set bundle and other penetrants shall be min 2 in. (51 mm). The following types and sizes of penetrants may be used:
      1. Metallic Pipes – A max of four pipes or tubes installed within opening. The following types and sizes of metallic pipes, conduits or tubing may be used:
         1. Copper Tubing – Nom 3/4 in. (19 mm) diam (or smaller) Type L (or heavier) copper tubing.
         2. Copper Pipe – Nom 3/4 in. (19 mm) diam (or smaller) Regular (or heavier) copper pipe.
         All pipes or tubing larger than nom 1/2 in. (13 mm) diam shall be provided with tube insulation (Item C4).
      2. Polyvinyl Chloride (PVC) Pipe – A max of one nom 1 in. (25 mm) diam (or smaller) Schedule 40 solid core or cellular core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.
      3. Cables – A max of two, max 8/C No. 18 AWG (or smaller) thermostat cables; XLPE or PVC insulation with XLPE or PVC jacket.
      4. Tube Insulation-Plastics – Nom 1/2 in. (13 mm) thick (or less) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing.

See Plastics (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5A may be used.
System No. F-A-8015 continued

D. **Single HVAC Line Set** – Pipes, tubing or cable to be bundled within the opening. The annular space between the line set penetrants shall be min 0 in. (0 mm) (point contact) to max 1 in. (25 mm). The annular space between the line set bundle and periphery of opening shall be min 1 in. (25 mm) to max 4 in. (102 mm). The annular space between the line set bundle and other penetrants shall be a min 2 in. (51 mm). The following types and sizes of penetrants may be used:

1. **Metallic Pipes** – A max of two pipes or tubes installed within opening. The following types and sizes of metallic pipes, conduits or tubing may be used:
   
   A. **Copper Tubing** – Nom 3/4 in. (19 mm) diam (or smaller) Type L (or heavier) copper tubing. All pipes or tubing larger than nom 1/2 in. (13 mm) diam shall be provided with pipe covering (Item D4).
   
   B. **Copper Pipe** – Nom 3/4 in. (19 mm) diam (or smaller) Regular (or heavier) copper pipe.

2. **Cables** – One max 8/8 No. 18 AWG (or smaller) thermostat cables; XLPE or PVC insulation with XLPE or PVC jacket.

3. **Tube Insulation-Plastics** – Nom 1/2 in. (13 mm) thick (or less) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing.

   See **Plastics** (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5A may be used.

The hourly F Rating for the firestop system is 1/4 Hr for penetrants A and C, 1/2 Hr for penetrants B1, B2, and D and 3 for penetrants B3.

3. **Firestop System** – The firestop system shall consist of the following:

   A. **Forms** – Min 24 gauge (or heavier) galv sheet metal cut to the contour of the penetrants and secured to the underside of the floor with min 3/16 in. (4.8 mm) diam by min 1-1/4 in. (32 mm) steel masonry anchors as a permanent form.

   B. **Fill, Void or Cavity Material** – **Wrap Strip** – Nom 1/8 in. (3.2 mm) thick intumescent material supplied in 2 in. (51 mm) wide strips. Wrap strip tightly wrapped around nonmetallic pipes or conduits (Item 2B) and around the double HVAC line set (Item 2C) below floor. The top edge of the wrap strips shall be tightly butted to the underside of the sheet metal form (Item 3A). For nom 2 in. (51 mm) diam (and smaller) pipes, two layers are required. For nom 3-1/2 in. (89 mm) and 4 in. (102 mm) diam pipes, four layers are required. For the double HVAC line set, three layers are required. Wrap strip layers temporarily held in position using aluminum foil tape, steel wire tie, or equivalent. Wrap strip not used for penetrants 2A and 2D.

   **3M COMPANY** – **Ultra GS**

   C. **Steel Collar** – Nom 2 in. (51 mm) deep collar with 1-1/4 in. (32 mm) wide by 2 in. (51 mm) long anchor tabs and min 1/2 in. (13 mm) long tabs to retain wrap strip layers. Coils of precut 0.016 in. (0.41 mm) thick (28 gauge) galv sheet steel available from wrap strip manufacturer. As an alternate, collar may be field-fabricated from min 0.016 in. (0.41 mm) thick (28 gauge) galv sheet steel in accordance with instruction sheet supplied by wrap strip manufacturer. Steel collar, with anchor tabs bent outward 90 deg, wrapped tightly around wrap strip layers with min 1 in. (25 mm) overlap at seam. Anchor tabs to be pressed tightly against floor or wall surface(s), and collar to be compressed around wrap strip layers using a min 1/2 in. (13 mm) wide by 0.025 in. (0.71 mm) thick stainless steel band clamp at the collar midheight. Collar to be secured to sheet metal form with min No. 10 by min 1/2 in. (13 mm) long sheet metal screws in conjunction with min 1-1/4 in. (32 mm) diam steel washers. Min of four screws, symmetrically located, for nom 2 in. diam (and smaller) pipes and for the double HVAC line set. Min six screws, symmetrically located, for nom 2-1/2 and 3 in. (64 and 76 mm) diam pipes. Min eight screws, symmetrically located, for nom 3 and 3-1/2 in. (76 and 89 mm) diam pipes.

   **3M COMPANY** – **3M Fire Barrier Mortar**

   +Bearing the UL Recognized Component Mark

   *Bearing the UL Classification Mark

   Reprinted from the Online Certifications Directory with permission from Underwriters Laboratories Inc. © 2011 Underwriters Laboratories Inc.

   **Note:** This system was tested with a pressure differential of 50 Pa between the exposed and unexposed surfaces with the higher pressure on the exposed side.
1. **Floor Assembly** – Min 8 in. (203 mm) thick UL Classified hollow-core Precast Concrete Units* or min 8 in. (203 mm) thick reinforced lightweight or normal weight (100-150pcf or 1600-2400 kg/m³) concrete. Max diam of opening is 4-1/2 in. (114 mm).

   See Precast Concrete Units (CFTV) categories in the Fire Resistance Directory for names of manufacturers.

2. **Through Penetrants** – Pipes, conduits, tubing or cables to be bundled within the opening such that the aggregate cross-sectional area of penetrants in opening to be min 42 percent to max 54 percent of the cross-sectional area of the opening in floor or wall. A min 1/4 in. (6 mm) annular space shall be maintained around uninsulated metallic pipes. The space between penetrants and periphery of opening shall be min 1/4 in. (6 mm). Penetrants to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of penetrants may be used:

   A. **Metallic Pipes** – The following types and sizes of metallic pipes, conduits or tubing may be used:

      A1. **Steel Pipe** – Nom 3/4 in. (19 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.

      A2. **Conduit** – Nom 3/4 in. (19 mm) diam (or smaller) electrical metallic tubing or steel conduit.

      A3. **Copper Tubing** – Nom 3/4 in. (19 mm) diam (or smaller) Type L (or heavier) copper tubing.

      A4. **Copper Pipe** – Nom 3/4 in. (19 mm) diam (or smaller) Regular (or heavier) copper pipe.

      All pipes, conduits or tubing larger than nom 1/2 in. (13 mm) diam shall be provided with pipe covering (Item 3).

   B. **Nonmetallic Pipes** – A max of one nonmetallic pipe or conduit may be used. A min 1/4 in. (6 mm) space must be maintained between uninsulated metallic pipes and nonmetallic pipes or conduits. The following types and sizes of nonmetallic pipes or conduits may be used:

      B1. **Polyvinyl Chloride (PVC) Pipe** – Nom 1-1/4 in. (32 mm) diam (or smaller) Schedule 40 solid core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping system.

      B2. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** – Nom 1-1/4 in. (32 mm) diam (or smaller) SDR13.5 CPVC pipe for use in closed (process or supply) piping systems.

      B3. **Rigid Nonmetallic Conduit** – Nom 1-1/4 in. (32 mm) diam (or smaller) Schedule 40 PVC conduit installed in accordance with Article 347 of the National Electrical Code (NFP A No. 70.)

   C. **Cables** – Max two 8/C No. 12 AWG multiconductor power and control cables; XLPE or PVC insulation with XLPE or PVC jacket.

   D. **Pipe Covering** – The following types and sizes of pipe coverings may be used with the metallic pipes:

      D1. **Tube Insulation** – **Plastics** – Nom 1/2 in. (13 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. Tubing to be discontinuous from top of caulk or putty (Item 3D) at bottom and top sides of floor.

      See Plastics**++ (QMFZ) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL94 Flammability Classification of 94-5VA may be used.
D2. **Pipe Covering** – Nom 1/2 in. (13 mm) thick hollow cylindrical heavy density (min 3.5pcf or 56 kg/m³) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product.

See **Pipe and Equipment Covering – Materials** (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

3. **Firestop System** – The details of the firestop system shall be as follows:

A. **Steel Sleeve** – Min 28 gauge galv steel sleeve friction-fitted into opening with a min 2 in. (51 mm) overlap. Sleeve may be recessed a max of 1/2 in. (13 mm) below the top surface of floor or installed flush with top surface of floor. Not required for solid floors.

B. **Firestop Device** – Firestop device consisting of a steel collar lined with intumescent material and provided with steel clips for attachment to underside of floor or both sides of wall in accordance with accompanying installation instructions. The following firestop devices are to be used, dependent on the max opening size:

<table>
<thead>
<tr>
<th>Max Opening Size In. (mm)</th>
<th>Firestop Device</th>

<tr>
<td>4-1/2 (114)</td>
<td>PPD 4</td>
</tr>
</tbody>
</table>

3M COMPANY

C. **Packing Material** – Min 6-3/8 in. (162 mm) thickness of nom 4 pcf (64 kg/m³) (or heavier) mineral-wool batt insulation or ceramic (alumina silica) fiber blanket firmly packed into opening as a permanent form. Packing material to be recessed from top and bottom surfaces of floor as required to accommodate the required thickness of fill material (Item 3D).

D. **Fill, Void or Cavity Materials** – **Caulk, Sealant or Putty** – When PPD 3 firestop device is used, min 1 in. (25 mm) thickness of caulk or putty applied to completely fill annular space inside of firestop device and between penetrants, flush with the bottom surface of floor and extending downward. When PPD 4 firestop device is used, min 2 in. (51 mm) thickness of caulk or putty applied to completely fill annular space inside of firestop device and between penetrants, flush with the bottom surface of floor and extending downward. Min 5/8 in. (16 mm) thickness of caulk or putty applied within annular space between penetrants and periphery of opening flush with bottom surface of floor. Min 3/4 (19 mm) in thickness of caulk or putty applied to completely fill annular space, flush with top surface of floor.

3M COMPANY – CP 25WB+, IC 15WB+ caulk, FB-3000 WT sealant or MP+ Stix putty.

(Note: CP 25WB+ not suitable for use with CPVC pipes.)

**Note:** This system was tested with a pressure differential of 50 Pa between the exposed and unexposed surfaces with the higher pressure on the exposed side.
1. **Floor Assembly** – Min 6 in. (152 mm) thick UL Classified hollow-core Precast Concrete Units* or min 6 in. (152 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600 - 2400 kg/m³) concrete. Max diam of opening is 5 in. (127 mm).

See **Precast Concrete Units** (CFTV) categories in the Fire Resistance Directory for names of manufacturers.

2. **Steel Sleeve** – Cylindrical sleeve fabricated from min 0.018 in. (4.6 mm) thick galv sheet steel and having a min 2 in. (51 mm) lap along the longitudinal seam. Length of steel sleeve to be equal to thickness of floor. Sleeve installed flush with top and bottom surfaces of floor by coiling the sheet steel to a diam smaller than the through opening, inserting the coil through the opening and releasing the coil.

3. **Through Penetrants** – Pipes, tubing or cable to be bundled within the opening. The annular space between penetrants shall be min 0 in. (0 mm) (point contact) to max 1 in. (25 mm). The space between penetrants and sleeve shall be min 1/2 in. (13 mm) to max 1 in. (25 mm). Penetrants to be rigidly supported on both sides of floor assembly. The following types and sizes of penetrants may be used:

   A. **Metallic Pipes** – A max of four pipes or tubes installed within opening. The following types and sizes of metallic pipes, conduits or tubing may be used:
      1. **Copper Tubing** – Nom 1 in. (25 mm) diam (or smaller) Type L (or heavier) copper tubing.
      2. **Copper Pipe** – Nom 1 in. (25 mm) diam (or smaller) Regular (or heavier) copper pipe.

      All pipes or tubing larger than nom 1/2 in. (13 mm) diam shall be provided with pipe covering (Item 4).

   B. **Polyvinyl Chloride (PVC) Pipe** – A max of one nom 1 in. (25 mm) diam (or smaller) Schedule 40 solid core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

   C. **Cables** – A max of two, max 8/C No. 18 AWG (or smaller) thermostat cables; XLPE or PVC insulation with XLPE or PVC jacket.

4. **Tube Insulation–Plastics**+ – Nom 1/2 in. (13 mm) thick (or less) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing.

   See **Plastics** (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5A may be used.

5A. **Packing Material** – Min 3 in. (76 mm) thick of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed within annulus and recessed from the top surface of floor to accommodate the required thickness of fill material.

5B. **Fill, Void or Cavity Materials – Caulk, Sealant or Putty*** – Min 1/2 in. (13 mm) thickness of caulk or putty, installed within annulus, flush with the top surface of floor.

   3M COMPANY– CP 25WB+, IC 15WB+ caulk, FB-3000 WT sealant or MP+ putty.

**Note:** This system was tested with a pressure differential of 50 Pa between the exposed and unexposed surfaces with the higher pressure on the exposed side.
1. **Wall Assembly** – Min 6 in. (152 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete wall. Wall may also be constructed of any UL Classified **Concrete Blocks**. Max diam of opening is 5 in. (127 mm).

   See **Concrete Blocks** (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through Penetrants** – A max of two pipes or tubes and one cable installed eccentrically or concentrically within the opening. Annular space between penetrants and periphery of opening to be min 0 in. (point contact) to max 1-1/2 in. (0 mm to max 38 mm). Separation between penetrants to be min 0 in. (point contact) to max 1-1/2 in. (0 mm to max 38 mm). Penetrants to be rigidly supported on both sides of the wall. The following types and sizes of penetrants may be used:

   A. **Copper Tubing** – Nom 1 in. (25 mm) diam (or smaller) Type L (or heavier) copper tubing.
   B. **Copper Pipe** – Nom 1 in. (25 mm) diam (or smaller) Regular (or heavier) copper pipe.
   C. **Steel Pipe** – Nom 1 in. (25 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
   D. **Cables** – Max 7/C No. 12 AWG multiconductor power and control cables; XLPE or PVC insulation with XLPE or PVC jacket.

3. **Tube Insulation-Plastics** – Nom 3/4 in. (19 mm) thick (or less) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. The tube insulation may be installed on a max of one pipe or tube. Annular space between the tube insulation and periphery of opening to be min 0 in. (point contact) to max 1-1/2 in. (0 mm to max 38 mm). Space between insulated and uninsulated penetrants to be 0 in. (point contact) to max 1-1/2 in. (0 mm to max 38 mm).

   See **Plastics** (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5A may be used.

4. **Cables** – Max two 7/C (or less) No. 12 AWG (or smaller) multiconductor power and control cables with XLPE or PVC insulation with XLPE or PVC jacket. Cables to be spaced min 0 in. (point contact) to max 1 in. (0 mm to max 25 mm). From the insulated through penetrants and min 1/2 in. to max 1 in. (13 mm to max 25 mm) from non-insulated through penetrants. The space between the cables and the periphery of the opening shall be min 0 in. (point contact) to max 1 in. (0 mm to max 25 mm). Cables to be rigidly supported on both sides of wall assembly.

5. **Fill, Void or Cavity Material** – **Caulk or Sealant** – Min 5/8 in. (16 mm) thickness of caulk applied within annulus, flush with both surfaces of wall. Min 1/4 in. (6 mm) diam bead of caulk applied to penetrant/wall interface at point contact location on both sides of wall.

   **3M COMPANY** – CP 25WB+, IC 15WB+ caulk or FB-3000 WT sealant

   * Bearing the UL Classification Marking

Reprinted from the Online Certifications Directory with permission from Underwriters Laboratories Inc. Copyright © 2010 Underwriters Laboratories Inc.
1. **Wall Assembly** – Min 6 in. (152 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete wall. Wall may also be constructed of any UL Classified Concrete Blocks*. Max area of opening is 58 sq in. (375 sq cm) with a max dimension of 14-1/2 in. (368 mm).

See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through Penetrants** – A max of eight pipes or tubes and four cables installed eccentrically or concentrically within the opening. Annular space between penetrants and periphery of opening to be min 0 in. (point contact) to max 1-1/2 in. (0 mm to max 38 mm). Separation between penetrants to be min 0 in. (point contact) to max 1-1/2 in. (0 mm to max 38 mm). Penetrants to be rigidly supported on both sides of the wall. The following types and sizes of penetrants may be used:

   A. **Copper Tubing** – Nom 1 in. (25 mm) diam (or smaller) Type L (or heavier) copper tubing.
   B. **Copper Pipe** – Nom 1 in. (25 mm) diam (or smaller) Regular (or heavier) copper pipe.
   C. **Steel Pipe** – Nom 1 in. (25 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
   D. **Cables** – Max 7/C No. 12 AWG multiconductor power and control cables; XLPE or PVC insulation with XLPE or PVC jacket.

3. **Tube Insulation** – Plastics* – Nom 3/4 in. (19 mm) thick (or less) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. The tube insulation may be installed on a max of four pipes or tubes. Annular space between the tube insulation and periphery of opening to be min 0 in. (point contact) to max 1-1/2 in. (0 mm to max 38 mm). Space between insulated and uninsulated penetrants to be 0 in. (point contact) to max 1-1/2 in. (0 mm to max 38 mm).

See Plastics (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5A may be used.

4. **Fill, Void or Cavity Material** – **Caulk or Sealant** – Min 5/8 in. (16 mm) thickness of caulk applied within annulus, flush with both surfaces of wall. Min 1/4 in. (6 mm) diam bead of caulk applied to gypsum board/penetrant interface at point contact location on both sides of wall.

   3M COMPANY – CP 25WB+, IC 15WB+ caulk or FB-3000 WT sealant

* Bearing the UL Classification Marking

Copyright © 2010 Underwriters Laboratories Inc.®
1. **Wall Assembly** – Min 6 in. (152 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600 - 2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max size of opening to be 8 in. (114 mm) high by 16 in. (406 mm) wide. See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through-Penetrants** – Max two cables bundles and one optical fiber raceway as described below. Through penetrants to be rigidly supported on both sides of wall assembly. The following types and sizes of through-penetrants may be used:

   A. **Nonmetallic Penetrant** – One nonmetallic raceway as described in a single line item below.

   A1. Optical Fiber/Communications/Signaling/Coaxial Cable Raceways+ – Nom 1-1/4 in. (32 mm) diam (or smaller) plenum rated raceways installed in accordance with the National Electrical Code (NFPA No. 70). Raceway to be positioned in the center of the wall opening.

   See Optical Fiber/Communications/Signaling/Coaxial Cable Raceway (QAZM) category in the Electrical Construction Equipment Directory for names of manufacturers.

   B. **Cables** – Cables installed in a max of two bundles having a max bundle diam of 4 in. (102 mm). Cable bundles to be positioned in the middle of wall opening and a min of 2-1/2 in. (64 mm) from opening edge to center of bundle. Any combination of the following types and sizes of cables may be used:

   B1. Max 2/C No. 18 AWG copper conductor thermostat cable with polyvinyl chloride (PVC) insulation and jacket materials.

   B2. Max 4 pair No. 24 AWG copper conductor Cat 5e or Cat 6 telephone cable with PVC insulation and jacket materials.

   B3. Max 100 pair No. 24 AWG copper conductor telephone cable with PVC insulation and jacket materials.

   B4. Max 7/C No. 12 AWG copper conductor power and control cables with XLPE or PVC insulation with XLPE or PVC jacket.

   B5. Max 48 MM62.5 micron fiber optic cables with having a min FT-6 rating.

   B6. Max 62.5/125 micron fiber optic cables with having a min Riser rating.

   B7. Max 3/C (with ground) No. 12 AWG (or smaller) nonmetallic sheathed (Romex) cable with PVC insulation and jacket materials.

   B8. Max 1/C No. 8 AWG copper conductor cable with PVC insulation and nylon jacket materials.

   B9. Max 12 core No. 26 AWG shielded multi coax cable with foam high density polyethylene insulation and PVC jacket.

   B10. Max 48 MM62.5 micron fiber optic cables with having a min FT-6 rating.

   B11. Max 62.5/125 micron fiber optic cables with having a min Riser rating.

   B12. Max 1/C 3/0 AWG copper conductor cable with PVC insulation and jacket materials.

   B13. Max three copper conductors (with ground) No. 12 AWG Metal Clad Cable+.

   B14. Max four copper conductors No. 2 AWG Metal Clad Cable+.

   B15. Max 1/C 2/0 AWG non halogen copper conductor cable.

   B16. Max 300 pair No. 24 AWG copper conductor telephone cable with PVC insulation and jacket materials.

   B17. Max 30 pair No. 22 copper conductor shielded switchboard cable with PVC insulation and jacket materials.

   B18. Max RG/6 (or smaller) coaxial cable with fluorinated ethylene (FE) or PVC insulation and jacket materials.

   B19. Max 7/C No. 12 AWG copper conductors with PVC insulation and jacket materials.

---

*Concrete Blocks* is a category in the Fire Resistance Directory that lists manufacturers.
System No. W-J-8042 continued

B20. Max 4 pair No. 23 AWG copper conductor Cat 6 telephone cable with PVC insulation and jacket materials.
B21. Max three copper conductors (with ground) No. 12 AWG steel Armored Cable+.
B22. Max 04-02 2.5M fiber optic cables having a max diameter of 0.450 in. (11.4 mm).
B24. Max 3/C with ground No. 2/0 AWG aluminum conductor SER cable with cross linked polyethylene (XLPE) insulation and PVC jacket.
B25. Max nom. 0.75 in. diam water tight conduit.

3. Firestop System – The firestop system shall consist of the following:
   A. Fill, Void or Cavity Materials* – Pillows – Max 9 in. (229 mm) long by 6 in. (152 mm) wide by 2 and 3 in. (51 and 76 mm) thick plastic covered pillows tightly-packed to fill annular space between the cable bundles, raceway and periphery of opening and the annular space between the cable bundles and raceway installed within the opening. Pillows installed with 9 in. (229 mm) dimension projecting through wall and centered within the opening.

3M COMPANY
3M FIRE PROTECTION PRODUCTS – Fire Barrier Pillow or Fire Barrier Self-Locking Pillow

   B. Fill, Void or Cavity Materials* – Putty – Moldable putty material, installed within voids around penetrants and pillows to a min thickness of 1 in. (25 mm) on both sides of wall.

3M COMPANY
3M FIRE PROTECTION PRODUCTS – MP+ Moldable Putty

Copyright © 2011 Underwriters Laboratories Inc.®

Note: This system was tested with a pressure differential of 50 Pa between the exposed and unexposed surfaces with the higher pressure on the exposed side.
1. **Wall Assembly** — Min 6 in. (152 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max size of opening to be 36 in. (914 mm) high by 36 in. (914 mm) wide. See **Concrete Blocks** (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through-Penetrant** — One or more pipes, conduit, tubes, ducts, or steel members to be installed within the opening. The total number of through-penetrants is dependent on the size of the opening and the types and sizes of the penetrants. Any combination of the penetrants described below may be used provided that the following parameters relative to the annular spaces and the spacing between the through penetrants are maintained. The separation between the penetrants shall be min 1/2 in. (12 mm) to max 3 in. (76 mm). The annular space between penetrants and the periphery of opening shall be min 1/2 in. (12 mm) to max 6 in. (152 mm). Pipes, conduit tubes, ducts, or steel members to be rigidly supported on both sides of wall assembly. The following types and sizes of pipes, conduit tubes, ducts, or steel members may be used.
   
   A. **Conduit** — Max 20, nom 4 in. (102 mm) diam (or smaller) electrical metallic tubing (EMT) or ridged steel conduit.
   B. **Pipe** — Max 1, nom 6 in. (152 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   C. **Duct** — Max 1, nom 6 in. by 12 in. (or smaller) No 26 gauge (or heavier) steel duct.
   D. **Duct** — Max 1, nom 4 in. diam (or smaller) No. No 28 gauge (or heavier) steel duct.
   E. **Pipe** — Max 1, nom 3 in. (76 mm) diam (or smaller) service weight (or heavier) cast iron soil pipe.
   F. **Beam** — Max 1, W8 x 15 (or smaller) steel beam.
   G. **Tube Steel** — Max 1, nom 4 in. square (or smaller) 0.25 in. (or heavier) steel tube.
   H. **Pipe** — Max 1, nom 6 in. diam (or smaller) type L (or heavier) copper pipe.
   I. **Conduit** — Max 1, nom 1 in. (102 mm) diam (or smaller) electrical metallic tubing (EMT) or ridged steel conduit.
   J. **Pipe** — Max 1, nom 4 in. diam (or smaller) Schedule 40 (or heavier) steel pipe.

3. **Firestop System** — The details of the firestop system shall be as follows:
   
   A. **Fill, Void or Cavity Materials** — **Pillows** — Max 9 in. (229 mm) long by 6 in. (152 mm) wide by 2 and 3 in. (51 and 76 mm) thick plastic covered pillows tightly-packed to fill annular space between penetrants and periphery of opening. pillows installed with 9 in. (229 mm) dimension projecting through wall and centered within the opening.

   **3M COMPANY 3M FIRE PROTECTION PRODUCTS** — Fire Barrier Pillow or Fire Barrier Self-Locking Pillows

   B. **Fill, Void or Cavity Material** — **Foam** — Applied around and between all round interior penetrants, and between round penetrants, rectangular penetrants, and pillows where the annular space is 3 in. or less. Foam to be applied the entire depth of, and flush with both surfaces of wall. After installation of pillows (Item 3A) all voids within the opening shall be filled with a min 1 in. (25 mm) thickness foam.

   **3M COMPANY 3M FIRE PROTECTION PRODUCTS** — Fire Barrier Rated Foam, FIP 1-Step

3M Fire Protection Products
Applicators and Specifiers Guide

Combos • Gypsum • 1 of 1

3M.com/firestop 1-800-328-1687
1. **Wall Assembly** – The Fire-rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400 or V400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Studs** – Steel studs to be min 3-5/8 in. (92 mm) deep and spaced max 24 in. (610 mm) OC. The opening in the wall to accommodate the pipes and/or conduits (Item 2) shall be framed on all sides using lengths of steel stud installed between the vertical studs and screw-attached to the steel studs at each end. The framed opening in the wall shall be max 22-1/2 in. (572 mm) wide and 8 in. (203 mm) high.

   B. **Gypsum Board** – Two layers of nom 5/8 in. (16 mm) thick gypsum board, as specified in the individual Wall and Partition Design.

2. **Pipe or Conduit** – Nom 2 in. (51 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe, rigid steel conduit, steel EMT, Type L (or heavier) copper pipe or Schedule 40 polyvinyl chloride (PVC) pipe. Pipes may be for closed (process or supply) or vented (drain, waste or vent) piping systems. When PVC pipes are included in same opening with metallic pipes or conduits, a min separation of 2 in. (51 mm) shall be maintained between PVC pipe and nearest metal pipe. A min separation of 1 in. (25 mm) shall be maintained between pipe or conduit and periphery of opening. Pipes and conduits to be rigidly supported on both sides of wall assembly. When copper pipe is used, T Rating is 0 hr. When steel pipe is used, T Rating is 1 hr. When PVC pipe is used, T Rating is 1-1/2 hr.

3. **Fill, Void or Cavity Materials** – **Wrap Strip** – Nom 1/4 in. (6 mm) thick intumescent elastomeric material faced on one side with aluminum foil, supplied in nom 2 in. (51 mm) wide strips. Nom 2 in. (51 mm) wide strip tightly-wrapped around each PVC pipe (foil side exposed) and secured in place with steel wire ties. When two metallic pipes or conduits are in close proximity or in contact with one another such that the intumescent sheet (Item 4) can not readily be cut to follow their contours, a nom 2 in. (51 mm) wide wrap strip shall be tightly-wrapped around the two pipes and secured with steel wire ties. Wrap strips to project approx 7/8 in. (22 mm) beyond each face of the intumescent sheet (Item 4) on each side of wall. When diam of circular cutout in intumescent sheet is max 1/4 in. (6 mm) larger than diam of metallic pipe or conduit, no wrap strip is required on pipe or conduit.

   3M COMPANY – **FS-195**

4. **Fill, Void or Cavity Materials** – **Intumescent Sheet** – Rigid aluminum foil-faced sheet with galv sheet steel backer. Sheets cut to tightly-follow the contours of the individual metallic pipe or conduit or the wrap strip (Item 3) on the PVC pipe or grouped metallic pipes. Sheets cut to lap a min of 2 in. (51 mm) on the wall on all sides of the opening on both sides of the wall. Prior to installation, a min 1/4 in. (6 mm) diam bead of caulking (Item 6) shall be applied as a gasket approx 1 in. (25 mm) from and on all sides of the through opening. Sheet to be installed with the galv steel sheet backer exposed (aluminum foil facing against wall surface) and secured to steel framing, through gypsum board layers, with min 1/4 in. (6 mm) diam by 2-1/4 in. (57 mm) long steel screws in conjunction with min 1-1/4 in. (32 mm) diam steel fender washers. Max spacing of fasteners not to exceed 6 in. (152 mm) with additional fasteners located on each side of butted seams or slits made to permit installation of the sheet around the pipes or conduits.

   3M COMPANY – **CS-195**

5. **Steel Cover Strip** – Min 2 in. (51 mm) wide strip of min 0.020 in. (0.51 mm) thick (26 gauge) galv steel centered over entire length of each butted seam or slit made in the intumescent sheet (Item 4). Prior to installation of the steel strip, the seam or slit in the intumescent sheet shall be covered with a nom 1/4 in. (6 mm) diam bead of caulking (Item 6). Steel cover strip secured to galv steel sheet backer of intumescent sheet with steel sheet metal screws or steel rivets spaced max 3 in. (76 mm) OC on each side of seam or slit.

6. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Generous application of caulking to be applied around base of pipe or wrap strip at its egress from the intumescent sheet on each side of wall. An additional bead of caulking shall be applied to the exposed edge of each wrap strip layer. When two metallic pipes or conduits are grouped tightly together and enclosed in a single wrap strip, pieces of mineral wool batt packaging material shall be installed inside wrap strip layer and a min 1 in. (25 mm) depth of caulking shall be installed to fill all interstices between the pipes within the confines of the wrap strip.

   3M COMPANY – **CP 25WB+**, **IC 15WB+**, **FireDam 150+** caulking or **FB-3000 WT** sealant

*Bearing the UL Classification Marking*

Note: Systems with Nonmetallic Through Penetrant(s) have not been evaluated with a pressure differential of 50 Pa between the exposed and unexposed surfaces as required by the National Building Code of Canada.
1. **Wall Assembly** – The 1 or 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Studs** – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 in. by 4 in. (51 mm to max 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 3-5/8 in. (92 mm) wide and spaced max 24 in. (610 mm) OC.
   B. **Gypsum Board*** – Nom 5/8 in. (16 mm) thick gypsum board, as specified in the individual Wall and Partition Design. Max area of opening is 65-1/4 sq in. (421 cm²) with max dimension of 14-1/2 in. (368 mm). The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly.

2. **Through Penetrants** – A max of four pipes, conduits or tubing to be installed within the opening. The space between pipes, conduits or tubing shall be min 1/2 in to max 1-5/16 in. (13 mm to max 33 mm). The space between pipes, conduits or tubing and periphery of opening shall be min 1-3/16 in. (30 mm) for uninsulated copper tubes and copper pipes (Items 2C and 2D) and 0 in. (point contact) for insulated copper tubes and copper pipes and uninsulated steel pipes and conduit (Item 2B). The space between pipes, conduits or tubing and periphery of opening shall be max 1-5/16 in. (33 mm). Pipe, conduit or tubing to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of metallic pipes, conduits or tubing may be used:
   A. **Steel Pipe** – Nom 2 in. (51 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
   B. **Conduit** – Nom 2 in. (51 mm) diam (or smaller) steel electrical metallic tubing or steel conduit.
   C. **Copper Tubing** – Nom 2 in. (51 mm) diam (or smaller) Type L (or heavier) copper tubing.
   D. **Copper Pipe** – Nom 2 in. (51 mm) diam (or smaller) Regular (or heavier) copper pipe.

   When uninsulated steel pipe or conduit is used, T Rating is 3/4 hr and 1-1/2 hr for 1 and 2 hr rated assemblies, respectively.

   When uninsulated copper tubing or pipe is used, T Rating is 1/4 hr for both 1 and 2 hr rated assemblies.

3A. **Pipe Covering*** (Optional) – Nom 1 in. (25 mm) hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product.

   See **Pipe and Equipment Covering – Materials** (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

   When pipe covering is used on all through penetrants, T Rating is 1 hr and 1-3/4 hr for 1 and 2 hr rated assemblies, respectively.

3B. **Tube Insulation** – **Plastics**# (Optional) – Nom 3/4 in. (19 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing.

   See **Plastics** (QMFZ2) category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL94 Flammability Classification of 94-SVA may be used.

   **When tube insulation is used on all through penetrants, T Rating is 3/4 hr and 1-1/2 hr for 1 and 2 hr rated assemblies, respectively.**

4. **Fill, Void or Cavity Material*** – **Caulk or Sealant** – Min 5/8 in. or 1-1/4 in. (16 mm or 32 mm) thickness of fill material, for 1 or 2 hr walls, respectively, applied within the annulus, flush with both surfaces of wall. At point contact locations, a min 1/2 in. (13 mm) bead of fill material shall be applied at the wall/pipe and wall/pipe insulation interface on both surfaces of wall.

3M COMPANY – CP 25WB+, IC 15WB+ caulk or FB-3000 WT sealant

5. **Fill, Void or Cavity Materials** – **Wrap Strip** (Not Shown) – Min one layer of 2 in. (51 mm) wide, nom 1/4 in. (6 mm) thick intumescent elastomeric material faced on one side with aluminum foil, required only when tube insulation (Item 3B) is used in 2 hr rated assemblies. Wrap strip tightly wrapped around tube insulation (foil side exposed) within the opening on both sides of the wall, flush with both surfaces of the wall assembly.

3M COMPANY – FS-195+

#Bearing the UL Recognized Component Mark

*Bearing the UL Classification Marking

Reprinted from the Online Certifications Directory with permission from Underwriters Laboratories Inc.

Copyright © 2010 Underwriters Laboratories Inc.
1. **Wall Assembly** – The 1 or 2 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 or V400 Series Wall and Partition Design in the UL Fire Resistive Directory and shall include the following construction features.

   A. **Studs** – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 in. by 4 in. (51 mm by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 2-1/2 in. (64 mm) wide steel channel studs spaced max 24 in. (610 mm) OC.

   B. **Gypsum Board** – Thickness, type, number of layers and fasteners as required in the individual Wall and Partition Design. Max diam of opening is 4 in. (102 mm).

   The hourly F Rating of the firestop system is equal to the hourly rating of the wall assembly. The hourly T Rating of the firestop system is 0 and 3/4 Hr for 1 and 2 Hr rated assemblies, respectively.

2. **Through Penetrants** – Penetrants to be installed either concentrically or eccentrically within the firestop system. The annular space between penetrants shall be min 0 in. (point contact) to max 1-1/2 in. (0 mm to max 38 mm). The annular space between penetrants and periphery of opening shall be min 0 in. (point contact) to max 1-1/4 in. (0 mm to max 32 mm). Penetrants to be rigidly supported on both sides of wall assembly. The following types and sizes of penetrants may be used:

   A. **Metallic Pipes** – Max two metallic pipes or tubing. The following types and sizes of metallic pipes or tubing may be used:
      
      A1. **Copper Tubing** – Nom 1 in. (25 mm) diam (or smaller) Type M (or heavier) copper tube.
      
      A2. **Copper Pipe** – Nom 1 in. (25 mm) diam (or smaller) Regular (or heavier) copper pipe.

   B. **Tube Insulation** – Nom 3/4 in. (19 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. Tube insulation required for all copper tubes and pipes greater than nom 3/4 in. (19 mm) diam.

   See **Plastics** (QMFZ2) category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5VA may be used.

   C. **Cables** – Max one 2/C No. 18 AWG (or smaller) control cable with polyvinyl chloride (PVC) insulation and jacket. Cable to be rigidly supported on both sides of floor or wall assembly.

3. **Fill, Void or Cavity Materials** – **Caulk, Sealant or Putty** – Min 5/8 in. (16 mm) thickness of fill material applied within the annulus, flush with both surfaces of the wall. Min 1/2 in. (13 mm) diam bead of fill material applied to the wallboard/penetrant interface at point contact location on both surfaces of wall.

   **3M COMPANY** – CP 25WB+, IC 15WB+ caulk, FB-3000 WT sealant or MP+ Stix putty

1. **Wall Assembly** – The 1 or 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. **Studs** – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 in. by 4 in. (51 mm to max 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 3-5/8 in. (92 mm) wide and spaced max 24 in. (610 mm) OC.
   
   B. **Gypsum Board*** – Nom 5/8 in. (16 mm) thick gypsum board, as specified in the individual Wall and Partition Design. Max diam of opening is 4-1/2 in. (114 mm).

   The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly.

2. **Through Penetrants** – Pipes, conduits, tubing or cables to be bundled within the opening such that the aggregate cross-sectional area of penetrants in opening to be max 54 percent of the cross-sectional area of the opening in wall assembly. A min 1/4 in. (6 mm) annular space shall be maintained around uninsulated metallic pipes. The annular space between penetrants and periphery of opening shall be min 1/4 in. to max 1 in. (6 mm to max 25 mm). Penetrants to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of penetrants may be used:

   A. **Metallic Pipes** – The following types and sizes of metallic pipes, conduits or tubing may be used:
      
      1. **Steel Pipe** – Nom 3/4 in. (19 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
      2. **Conduit** – Nom 3/4 in. (19 mm) diam (or smaller) steel electrical metallic tubing or steel conduit.
      3. **Copper Tubing** – Nom 3/4 in. (19 mm) diam (or smaller) Type L (or heavier) copper tubing.
      4. **Copper Pipe** – Nom 3/4 in. (19 mm) diam (or smaller) Regular (or heavier) copper pipe.

   B. **Nonmetallic Pipes** – A max of one nonmetallic pipe or conduit may be used. The following types and sizes of nonmetallic pipes or conduits may be used:
      
      1. **Polyvinyl Chloride (PVC) Pipe** – Nom 1-1/4 in. (32 mm) diam (or smaller) Schedule 40 solid core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping system.
      2. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** – Nom 1-1/4 in. (32 mm) diam (or smaller) SDR13.5 CPVC pipe for use in closed (process or supply) piping systems.
      3. **Rigid Nonmetallic Conduit**++ – Nom 1-1/4 in. (32 mm) diam (or smaller) Schedule 40 PVC conduit installed in accordance with Article 347 of the National Electrical Code (NFPA No. 70).

   C. **Cables** – Max 7/C No. 12 AWG multi conductor power and control cables; XLPE or PVC insulation with XLPE or PVC jacket.

   T Rating when uninsulated metallic pipes are used is 1/4 hr for both 1 and 2 hr rated assemblies. T Rating when cables are used is 3/4 hr for 1 and 2 hr rated assemblies. T Ratings when nonmetallic pipes are used are 1 and 2 hr for 1 and 2 hr rated assemblies, respectively.
**System No. W-L-8021 continued**

3. **Pipe Covering** – The following types and sizes of pipe coverings may be used with the metallic pipes:

   A. **Tube Insulation – Plastics**+ – Nom 5/8 in. (16 mm) thick (or smaller) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing with skin may be used.

   See **Plastics**+ (QMFZ2) category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5VA may be used.

   B. **Pipe Covering**+ – Nom 1/2 in. (13 mm) thick hollow cylindrical heavy density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. The annular space between the insulated pipe and the edge of the through opening shall be min 1/4 in. to max 1 in. (6 mm to max 25 mm).

   See **Pipe and Equipment Covering – Materials**+ (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

   **T Rating** when insulated pipes are used is 3/4 hr and 1-1/4 hr for 1 and 2 hr rated assemblies, respectively.

4. **Firestop System** – The details of the firestop system shall be as follows:

   A. **Fill, Void or Cavity Materials**+ – **Wrap Strip** – Min one layer of 2 in. (51 mm) wide, nom 1/4 in. (6 mm) thick intumescent elastomeric material faced on one side with aluminum foil. Wrap strip tightly wrapped around penetrant bundle (foil side exposed) and recessed within the opening on both sides of the wall such that approximately 1/2 in. (13 mm) of wrap strip extends beyond both surfaces of the wall assembly. Wrap strip held in place with foil tape. **3M COMPANY** – FS-195+

   B. **Fill, Void or Cavity Material**+ – **Caulk or Sealant** – Min 5/8 in. (16 mm) thickness of caulk, applied within the annulus between wrap strip and periphery of opening, flush with both surfaces of wall. Min 1 in. (25 mm) thickness of caulk, applied within the annulus between penetrants and between penetrants and wrap strip, flush with outer edge of wrap strip on both sides of wall. Min 1/2 in. (13 mm) diam bead of caulk applied at the wall/wrap strip interface on both surfaces of wall. Min 1/4 in. (6 mm) diam bead of caulk applied along the outer edge of the wrap strip on both sides of wall. **3M COMPANY** – CP 25WB+, IC 15WB+ caulk or FB-3000 WT sealant (Note: CP 25WB+ not suitable for use with CPVC pipes.)

*Bearing the UL Classification Marking

**Note:** This system was tested with a pressure differential of 50 Pa between the exposed and unexposed surfaces with the higher pressure on the exposed side.
1. Wall Assembly – The 1 or 2 Hr fire-rated gypsum wallboard/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300 or U400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. Studs – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. lumber spaced 16 in. OC. Steel studs to be min 3-1/2 in. wide and spaced max 24 in. OC for 1 Hr rated walls. Steel studs to be min 2-1/2 in. wide and spaced max 24 in. OC for 2 Hr rated walls.
   B. Gypsum Board* – One or two layers of nom 5/8 in. thick gypsum wallboard, as specified in the individual Wall and Partition Design. Max area of opening is 585 sq in. with max dimensions of 21 in. wide by 27-7/8 in. high.

The hourly F Rating of the firestop system is equal to the hourly rating of the wall.

2. Through Penetrants – The total number of through-penetrants is dependent on the size of the opening and types and sizes of the penetrants. Any combination of the penetrants described for the two firestop configurations below may be used provided that the following parameters relative to the annular spaces and the spacings between the pipes are maintained. The T Ratings for the various configurations are also shown below. Where multiple T Ratings are shown, additional details are provided within the description of the specific configuration:

<table>

Firestop Configuration A

2. Through Penetrants – Metallic pipe, conduit or tubing installed within the firestop system. Pipe, conduit or tubing to be rigidly supported on both sides of wall assembly. The following types of pipe, conduit or tubing may be used:
   A. Steel Pipe – Nom 6 in. diam (or smaller) Schedule 30 (or heavier) steel pipe.
   B. Copper Tubing – Nom 6 in. diam (or smaller) Type L (or heavier) copper tubing.
   C. Copper Pipe – Nom 6 in. diam (or smaller) Regular (or heavier) copper pipe.
   D. Conduit – Nom 4 in. diam (or smaller) electrical metallic tubing (EMT) or steel conduit.

The T Rating is 1-1/4 Hr for nom 6 in. diam and smaller pipes. The T Rating is 1 Hr for pipes larger than nom 6 in. diam.
3. **Pipe Covering** – Nom 1 or 1-1/2 in. thick hollow cylindrical heavy density (min 7.0 pcf) mineral fiber units with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product.

See **Pipe and Equipment Covering – Materials** (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **Firestop System** – The firestop system shall consist of the following:
   A. **Packing Material** – Min 4 in. thickness of min 4 pcf mineral wool batt insulation packed at 50 percent compression into opening as a permanent form. Packing material to be recessed from both surfaces of wall as required to accommodate the required thickness of fill material.
   B. **Fill, Void or Cavity Material** – Min 3/8 in. thickness of fill material applied within the annular space between the pipe covering and the periphery of the opening, flush with both surfaces of wall.

3M COMPANY – FB-1000 NS or FB-3000 WT sealant

Firestop Configuration B

2. **Through Penetrants** – Metallic pipe, conduit or tubing installed within the firestop system. Pipe, conduit or tubing to be rigidly supported on both sides of wall assembly. The following types of pipe, conduit or tubing may be used:
   A. **Steel Pipe** – Nom 4 in. diam (or smaller) Schedule 5 (or heavier) steel pipe.
   B. **Copper Tubing** – Nom 3 in. diam (or smaller) Type L (or heavier) copper tubing.
   C. **Copper Pipe** – Nom 3 in. diam (or smaller) Regular (or heavier) copper pipe.
   D. **Conduit** – Nom 4 in. diam (or smaller) electrical metallic tubing (EMT) or steel conduit.

3. **Firestop System** – The firestop system shall consist of the following:
   A. **Packing Material** – Min 4 in. thickness of min 4 pcf mineral wool batt insulation packed at 50 percent compression into opening as a permanent form. Packing material to be recessed from both surfaces of wall as required to accommodate the required thickness of fill material.
   B. **Fill, Void or Cavity Material** – Min 3/8 in. thickness of fill material applied within the annular space between the pipe covering and the periphery of the opening, flush with both surfaces of wall.

3M COMPANY – FB-1000 NS or FB-3000 WT sealant

1. **Wall Assembly** – The 1 or 2 h fire-rated gypsum wallboard/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400 and V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Studs** – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 3-5/8 in. (92 mm) wide and spaced max 24 in. (610 mm) OC.

   B. **Gypsum Board** – One or two layers of nom 5/8 in. (16 mm) thick gypsum board as specified in the individual Wall and Partition Design. Max area of opening is 9 sq ft (0.84 m²) with max dimension of 36 in. (914 mm).

   The hourly F Rating of the firestop system is equal to the hourly rating of the wall.

2. **Through Penetrants** – A max of five firestop configurations may be installed within the opening. The space between firestop configurations shall be min 5-3/4 in. (146 mm) to max 7 in. (178 mm). The space between firestop configurations and periphery of opening shall be min 0 in. (0 mm, point contact) to max 8 in. (203 mm). Conduit, tubing or cable tray to be rigidly supported on both sides of wall assembly. The T rating of the system is dependent on the firestop configuration as shown in the table below. The firestop system may consist of any single or combination of the following firestop configurations detailed herein:

System No. W-L-8033 continued

Firestop Configuration A
2. **Steel Conduit** – Nom 4 in. (102 mm) diam (or smaller) electrical metallic steel conduit. A max of two pipes to be installed within the firestop system. Conduit to be min 6 in. (152 mm) from other penetrants and edge of opening and rigidly supported on both sides of wall assembly.

3. **Forming Material** – Min 4 in. (102 mm) thickness of min 4 pcf (64 kg/m³) density mineral wool insulation compressed min 50 percent into the opening as a permanent form and recessed from both wall surfaces as required to accommodate the required thickness of fill material.

4. **Fill, Void or Cavity Material** – Material spray-applied or brushed over the mineral wool forming material to a min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) flush with both sides of wall assembly. Additional material is sprayed to a min height of 1/2 in. (13 mm) on penetrating items and to overlap both surfaces of wall by min 1/2 in. (13 mm).

   **3M COMPANY** – FireDam™ Spray 200

Firestop Configuration B
2. **Cable Trays** – Max 12 in. (305 mm) wide by max 3-1/2 in. (89 mm) deep solid-back or open ladder galvanized steel cable tray with channel-shaped side rails formed of min 0.050 in. (1.3 mm) thick steel. Cable trays are provided with min. 0.050 in. (1.3 mm) thick steel rungs spaced a max of 12 in. (305 mm) OC or min 0.050 in. (1.3 mm) thick steel solid back. The cable tray is to be installed min 2-1/2 in. (64 mm) and max 8 in. (203 mm) from edge of opening and min 6 in. (152 mm) from any other cable tray or pipe. A max of two cable trays is permitted per opening.

3. **Forming Material** – Min 4 in. (102 mm) thickness of min 4 pcf (64 kg/m³) density mineral wool insulation compressed min 50 percent into the opening as a permanent form and recessed from both wall surfaces as required to accommodate the required thickness of fill material.

4. **Fill, Void or Cavity Material** – Material spray-applied or brushed over the mineral wool forming material to a min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) flush with both sides of wall assembly. Additional material is sprayed to a min height of 1/2 in. (13 mm) on penetrating items and to overlap both surfaces of wall by min 1/2 in. (13 mm).

   **3M COMPANY** – FireDam™ Spray 200

Firestop Configuration C
2. **Copper Tubing** – Nom 4 in. (102 mm) diam (or smaller) Type M (or heavier) copper tubing. One tube to be installed within the firestop system. Tube to be min 6 in. (152 mm) from other penetrants and edge of opening and rigidly supported on both sides of wall assembly.

3. **Forming Material** – Min 4 in. (102 mm) thickness of min 4 pcf (64 kg/m³) density mineral wool insulation compressed min 50 percent into the opening as a permanent form and recessed from both wall surfaces as required to accommodate the required thickness of fill material.

4. **Fill, Void or Cavity Material** – Material spray-applied or brushed over the mineral wool forming material to a min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) flush with both sides of wall assembly. Additional material is sprayed to a min height of 1/2 in. (13 mm) on penetrating items and to overlap both surfaces of wall by min 1/2 in. (13 mm).

   **3M COMPANY** – FireDam™ Spray 200

Firestop Configuration D
2. **Copper Tubing** – Nom 4 in. (102 mm) diam (or smaller) Type M (or heavier) copper tubing. Copper tube to be wrapped with pipe covering material (Item 3), and rigidly supported on both sides of wall assembly. One pipe to be installed within the opening.

3. **Pipe Covering** – Nom 1-1/2 in. (38 mm) thick hollow cylindrical mineral wool pipe insulation, min density 4 pcf (64 kg/m³). The pipe insulation is covered with an all service jacket. Longitudinal joints sealed with factory applied self-sealing lap tape. Transverse joints secured with butt tape supplied with the product. T rating is 0 hr when pipe covering is not used.

   **IIG MINWOOL L L C** – High Temperature Pipe Insulation 1200, High Temperature Pipe Insulation BWT or High Temperature Pipe Insulation Thermaloc

4. **Forming Material** – Min 4 in. (102 mm) thickness of min 4 pcf (64 kg/m³) density mineral wool insulation compressed min 50 percent into the opening as a permanent form and recessed from both wall surfaces as required to accommodate the required thickness of fill material.

5. **Fill, Void or Cavity Material** – Material spray-applied or brushed over the mineral wool forming material to a min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) flush with both sides of wall assembly. Additional material is sprayed to a min height of 1/2 in. (13 mm) on penetrating items and to overlap both surfaces of wall by min 1/2 in. (13 mm).

   **3M COMPANY** – FireDam™ Spray 200

Firestop Configuration E
2. **Steel Pipe** – Nom 16 in. (406 mm) diam (or smaller) Schedule 30 (or heavier) steel pipe. Pipe to be wrapped with pipe covering material (Item 3), and rigidly supported on both sides of wall assembly. One pipe to be installed within the opening.

3. **Pipe Covering** – Nom 1-1/2 in. (38 mm) thick hollow cylindrical mineral wool pipe insulation, min density 4 pcf (64 kg/m³). The pipe insulation is covered with an all service jacket. Longitudinal joints sealed with factory applied self-sealing lap tape. Transverse joints secured with butt tape supplied with the product. T rating is 0 hr when pipe covering is not used.

   **IIG MINWOOL L L C** – High Temperature Pipe Insulation 1200, High Temperature Pipe Insulation BWT or High Temperature Pipe Insulation Thermaloc

4. **Forming Material** – Min 4 in. (102 mm) thickness of min 4 pcf (64 kg/m³) density mineral wool insulation compressed min 50 percent into the opening as a permanent form and recessed from both wall surfaces as required to accommodate the required thickness of fill material.

5. **Fill, Void or Cavity Material** – Material spray-applied or brushed over the mineral wool forming material to a min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) flush with both sides of wall assembly. Additional material is sprayed to a min height of 1/2 in. (13 mm) on penetrating items and to overlap both surfaces of wall by min 1/2 in. (13 mm).

FIRESTOP CONFIGURATION D

W-L-8034 • 1 of 3
1. **Wall Assembly** – The 1 or 2 hr fire-rated gypsum wallboard/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Studs** – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 3-5/8 in. (92 mm) wide and spaced max 24 in. (610 mm) OC.

   B. **Gypsum Board** – One or two layers of nom 5/8 in. (16 mm) thick gypsum board as specified in the individual Wall and Partition Design. Max area of opening is 9 sq ft (0.84 m²) with max dimension of 36 in. (914 mm).

2. **Through Penetrants** – A max of four firestop configurations may be installed within the opening. The space between firestop configurations shall be min 5-3/4 in. (146 mm) to max 7 in. (178 mm). The space between firestop configurations and periphery of opening shall be min 0 in. (0 mm, point contact) to max 8 in. (203 mm). Pipe conduit, tubing or cable tray to be rigidly supported on both sides of wall assembly. The firestop system may consist of any single or combination of the following firestop configurations detailed herein:

### Firestop Configuration A

2. **Cable Tray** – Max 36 in. (914 mm) wide by max 3-1/2 in. (89 mm) deep solid-back or open ladder galvanized steel cable tray with channel-shaped side rails formed of min 0.050 in. (1.3 mm) thick steel. Cable trays are provided with min. 0.050 in. (1.3 mm) thick steel rungs spaced a max of 12 in. (305 mm) OC or min 0.050 in. (1.3 mm) thick steel solid back. The cable tray is to be installed min 3-4 in. (19 mm) and max 6 in. (152 mm) from edge of opening and min 6 in. (152 mm) from any other cable tray or penetrants. One cable tray per opening.

3. **Cables** – Aggregate cross-sectional area of cables in cable trays to be max 40 percent of the cable tray based on a max 3 in. (76 mm) cable loading depth within the cable tray. Any combination of the following types and sizes of copper conductor cables may be used.

   A. Max ten pieces of 2/C No.14 AWG cable with XLPE jacket and insulation

   B. Max twenty pieces of 4/C No.14 AWG cable with XLPE jacket and insulation.

   C. Max six pieces of 3/C No. 2 AWG cable with XLPE jacket and insulation.

   D. Max six pieces of 4/C No. 6 AWG cable with XLPE jacket and insulation.

   E. Max four pieces of 1/C 500 MCM cable with XLPE jacket and insulation.

   F. Max four pieces of 3/C 350 MCM cable with XLPE jacket and insulation.

   G. Max four pieces of 1/C 750 MCM cable with XLPE jacket and insulation.

   H. Max. ten pieces of 25 pair No 24 AWG Data Twist Communication cable.

4. **Forming Material** – Min 4 in. (102 mm) thickness of min 4 pcf (64 kg/m³) density mineral wool insulation compressed min 50 percent into the opening in between cables and cable tray as a permanent form and recessed from both wall surfaces as required to accommodate the required thickness of fill material.

5. **Fill, Void or Cavity Material** – Material spray-applied or brushed over the mineral wool forming material to a min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) flush with both sides of wall assembly. Additional material is sprayed to a min height of 1/2 in. (13 mm) on penetrating items and to overlap both surfaces of wall by min 1/2 in. (13 mm).

   **3M COMPANY** – FireDam™ Spray 200

6. **Fill, void or Cavity Material** – Caulk or Sealant – (Not shown) Caulk or sealant material installed to completely fill all the voids between cables and cable tray prior to the installation of the forming material (Item 4).

   **3M COMPANY** – CP 25WB+ or FB-3000 WT Sealant

### Firestop Configuration B

2. **Cable Trays** – Max 36 in. (914 mm) wide by max 2-1/2 in. (64 mm) deep solid-back or open ladder galvanized steel cable tray with channel-shaped side rails formed of min 0.050 in. (1.3 mm) thick steel. Cable trays are provided with min. 0.050 in. (1.3 mm) thick steel rungs spaced a max of 12 in. (305 mm) OC or min 0.050 in. (1.3 mm) thick steel solid back. The cable tray is to be installed min 3/4 in. (19 mm) and max 8 in. (203 mm) from edge of opening and min 6 in. (152 mm) from any other cable tray or penetrants. One cable tray to be installed in the opening.

3. **Cables** – Aggregate cross-sectional area of cables in cable trays to be max 25 percent of the cable tray based on a max 3 in. (76 mm) cable loading depth within the cable tray. Any combination of the following types and sizes of copper conductor cables may be used.

   A. Max ten pieces of 4/C No.6 AWG cable with XLPE jacket and insulation

   B. Max twenty pieces of 4/C No.14 AWG cable with XLPE jacket and insulation.

   C. Max six pieces of 3/C No. 2 AWG cable with XLPE jacket and insulation.

   D. Max six pieces of 3/C No. 2 AWG cable with XLPE jacket and insulation.

   E. Max four pieces of 1/C 500 MCM cable with XLPE jacket and insulation.

   F. Max four pieces of 1/C 500 MCM cable with XLPE jacket and insulation.

   G. Max four pieces of 1/C 750 MCM cable with XLPE jacket and insulation.

   H. Max. ten pieces of 200 pair No 24 AWG telephone cable.

4. **Forming Material** – Min 4 in. (102 mm) thickness of min 4 pcf (64 kg/m³) density mineral wool insulation compressed min 50 percent into the opening and between cables and cable tray as a permanent form and recessed from both wall surfaces as required to accommodate the required thickness of fill material.

5. **Fill, Void or Cavity Material** – Material spray-applied or brushed over the mineral wool forming material to a min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) flush with both sides of wall assembly. Additional material is sprayed to a min height of 1/2 in. (13 mm) on penetrating items and to overlap both surfaces of wall by min 1/2 in. (13 mm).

   **3M COMPANY** – FireDam™ Spray 200

6. **Fill, void or Cavity Material** – Caulk or Sealant – (Not shown) Caulk or sealant material installed to completely fill all the voids between cables and cable tray prior to the installation of the forming material (Item 4).

   **3M COMPANY** – CP 25WB+ or FB-3000 WT Sealant
System No. W-L-8034 continued

Firestop Configuration C

2. **Cable Tray** – Max 36 in. (914 mm) wide by max 3-1/2 in. (89 mm) deep solid-back or open ladder galvanized steel cable tray with channel-shaped side rails formed of min 0.050 in. (1.3 mm) thick steel. Cable trays are provided with min. 0.050 in. (1.3 mm) thick steel rungs spaced a max of 12 in. (305 mm) OC or min 0.050 in. (1.3 mm) thick steel solid back. The cable tray is to be installed min 3/4 in. (19 mm) and max 8 in. (203 mm) from edge of opening and min 6 in. (152 mm) from any other cable tray or pipe. One cable tray to be installed in the opening.

3. **Nonmetallic Sleeve** – Nom 4 in. (102 mm) diam (or smaller) Schedule 40 PVC pipe. Sleeve installed with a nom 2 in. (51 mm) projection on both surfaces of wall. A max of six nonmetallic sleeves to be installed within the cable tray with a min of 1 in. (25 mm) between sleeves and from back of cable tray.

4. **Pipes, Conduit and Cables** – The following pipes, conduits and cables are installed within the nonmetallic sleeves (Item 3):
   - A. Max three pieces of 1 in. (25 mm) diam Schedule 40 nonmetallic conduit installed as a bundle and centered within nonmetallic sleeve. Max three pieces of Type 62.5/12.5 mm Fiber Optic cable can be installed in each nonmetallic conduit.
   - B. Nom 2 in. (51 mm) diam electrical metallic tube (EMT) centered within nonmetallic sleeve. One pipe max per opening.
   - C. Max nine pieces of Type 62.5/12.5 mm Fiber Optic cable installed as a bundle and centered within sleeve.
   - D. Max seven pieces of 2/C No. 14 AWG cable with XLPE jacket and insulation installed as a bundle and centered within sleeve.
   - E. Max seven pieces of 25 pairs No. 24 AWG DataTwist communication cable installed as a bundle and centered within sleeve.
   - F. Max three pieces of 200 pairs No. 24 AWG Telephone cable installed as a bundle and centered within sleeve.

5. **Forming Material** – Min 4 in. (102 mm) thickness of min 4 pcf (64 kg/m³) density mineral wool insulation compressed min 50 percent into the opening and within nonmetallic sleeve (Item 3) as a permanent form and recessed from both wall surfaces as required to accommodate the required thickness of fill material.

6. **Fill, Void or Cavity Material** – Moldable putty material, installed within each of the nonmetallic sleeves (Item 3) to a min thickness of 1 in. (25 mm) on both sides of sleeve, flush with both surfaces of wall. Additional material is installed to form a min 1/4 in. (6 mm) high crown around the cables.
   - 3M COMPANY – MP+ Moldable Putty

7. **Fill, Void or Cavity Material** – Material spray-applied or brushed over the mineral wool forming material (Item 5) to a min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) flush with both sides of wall assembly. Additional material is sprayed to a min height of 1/2 in. (13 mm) on penetrating items and to overlap both surfaces of wall by min 1/2 in. (13 mm).
   - 3M COMPANY – FireDam™ Spray 200

8. **Fill, Void or Cavity Material** – Ultra GS Intumescent Wrap – (Not shown) - Three layers of material wrapped around the Fiber Optic cable bundle (Item 4C) at mid depth of the wall prior to installation of the MP+ Moldable Putty (Item 6).
   - 3M COMPANY – Ultra GS Intumescent Wrap

Firestop Configuration D

2. **Cables** – The following types of cable to be installed within the opening with min 4-3/8 in. (111 mm) between cables, edge of opening and other penetrants.
   - A. Max one piece of 3/C No. 6 AWG GP1 armored cable with XLPE jacket and insulation.
   - B. Max one piece of 3/C No. 2 AWG cable with XLPE jacket and insulation.
   - C. Max one piece of nom 1-1/4 in. (32 mm) diam Carlon Plenum Guard Optical Fiber Raceway with a max of three pieces of Type 62.5/12.5 mm Fiber Optic cable.

3. **Forming Material** – Min 4 in. (102 mm) thickness of min 4 pcf (64 kg/m³) density mineral wool insulation compressed min 50 percent into the opening and between cables as a permanent form and recessed from both wall surfaces of wall as required to accommodate the required thickness of fill material.

4. **Fill, Void or Cavity Material** – Material spray-applied or brushed over the mineral wool forming material to a min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) flush with top surface of both sides of wall assembly. Additional material is sprayed to a min height of 1/2 in. (13 mm) on penetrating items and to overlap both surfaces of wall by min 1/2 in. (13 mm).
   - 3M COMPANY – FireDam™ Spray 200

*Bearing the UL Classification Mark

1. **Wall Assembly** – The 1 or 2 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner described in the individual U300, U400 or V400 Series Wall or Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Studs** – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 in. by 4 in. (51 mm by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 3-1/2 in. (89 mm) wide spaced max 24 in. (610 mm) OC.
   B. **Gypsum Board** – The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual U300 or U400 Series Design in the UL Fire Resistance Directory. Max diam of opening is 4 in. (102 mm)

The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed. The hourly T Rating is 0 & 1/2 Hr for 1 and 2 Hr rated assemblies, respectively.

2. **Through Penetrants** – A max of two pipes or tubes and one cable installed eccentrically or concentrically within the opening. Annular space between penetrants and periphery of opening to be min 0 in. (point contact) to max 1-1/2 in. (0 mm to max 38 mm). Separation between penetrants to be min 0 in. (point contact) to max 1-1/2 in. (0 mm to max 38 mm). Penetrants to be rigidly supported on both sides of the wall. The following types and sizes of penetrants may be used:
   A. **Copper Tubing** – Nom 1 in. (25 mm) diam (or smaller) Type L (or heavier) copper tubing.
   B. **Copper Pipe** – Nom 1 in. (25 mm) diam (or smaller) Regular (or heavier) copper pipe.
   C. **Steel Pipe** – Nom 1 in. (25 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
   D. **Cables** – Max 7/C No. 12 AWG multiconductor power and control cables; XLPE or PVC insulation with XLPE or PVC jacket.

3. **Tube Insulation-Plastics+** – Nom 3/4 in. (19 mm) thick (or less) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. The tube insulation may be installed on a max of one pipe or tube. Annular space between the tube insulation and periphery of opening to be min 0 in. (point contact) to max 1-1/2 in. (0 mm to max 38 mm). Space between insulated and uninsulated penetrants to be 0 in. (point contact) to max 1-1/2 in. (0 mm to max 38 mm).

See **Plastics** (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5A may be used.

4. **Cables** – Max two 7/C (or less) No. 12 AWG (or smaller) multiconductor power and control cables with XLPE or PVC insulation with XLPE or PVC jacket. Cables to be spaced min 0 in. (point contact) to max 1 in. (0 mm to max 25 mm) from the insulated through penetrants and min 1/2 in. to max 1 in. (13 mm to max 25 mm) from non-insulated through penetrants. The space between the cables and the periphery of the opening shall be min 0 in. (point contact) to max 1 in. (0 mm to max 25 mm). Cables to be rigidly supported on both sides of wall assembly.

5. **Fill, Void or Cavity Material** – **Caulk or Sealant** – Min 5/8 in. (16 mm) thickness of caulk applied within annulus, flush with both surfaces of wall. Min 1/4 in. (6 mm) diam bead of caulk applied to gypsum board/penetrant interface at point contact location on both sides of wall.

   **3M COMPANY** – CP 25WB+, IC 15WB+ caulk or FB-3000 WT sealant

System No. W-L-8049
May 19, 2005
F Ratings – 1 & 2 Hr (See Item 1)
T Ratings - 3/4 Hr

1. **Wall Assembly** – The 1 or 2 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner described in the individual U300, U400 or V400 Series Wall or Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Studs** – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 in. by 4 in. (50 mm by 102 mm) lumber spaced 16 in. (405 mm) OC. Steel studs to be min 3-1/2 in. (89 mm) wide spaced max 24 in. (610 mm) OC.
   B. **Gypsum Board** – The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual U300 or U400 Series Design in the UL Fire Resistance Directory. Max area of opening is 58 sq in. (375 sq cm) with a max dimension of 14-1/2 in. (368 mm).

   The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed. The hourly T Rating of the firestop system is 0 and 3/4 Hr for 1 and 2 Hr rated assemblies, respectively.

2. **Through Penetrants** – A max of eight pipes or tubes and four cables installed eccentrically or concentrically within the opening. Annular space between penetrants and periphery of opening to be min 0 in. (point contact) to max 1-1/2 in. (0 mm to max 38 mm). Separation between penetrants to be min 0 in. (point contact) to max 1-1/2 in. (0 mm to max 38 mm). Penetrants to be rigidly supported on both sides of the wall. The following types and sizes of penetrants may be used:
   A. **Copper Tubing** – Nom 1 in. (25 mm) diam (or smaller) Type L (or heavier) copper tubing.
   B. **Copper Pipe** – Nom 1 in. (25 mm) diam (or smaller) Regular (or heavier) copper pipe.
   C. **Steel Pipe** – Nom 1 in. (25 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
   D. **Cables** – Max 7/C No. 12 AWG multiconductor power and control cables; XLPE or PVC insulation with XLPE or PVC jacket.

3. **Tube Insulation – Plastics** – Nom 3/4 in. (19 mm) thick (or less) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. The tube insulation may be installed on a max of four pipes or tubes. Annular space between the tube insulation and periphery of opening to be min 0 in. (point contact) to max 1-1/2 in. (0 mm to max 38 mm). Space between insulated and uninsulated penetrants to be 0 in. (point contact) to max 1-1/2 in. (0 mm to max 38 mm).

   See **Plastics** (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5A may be used.

4. **Fill, Void or Cavity Material** – **Caulk or Seallant** – Min 5/8 in. (16 mm) thickness of caulk applied within annulus, flush with both surfaces of wall. Min 1/4 in. (6 mm) diam bead of caulk applied to gypsum board/penetrant interface at point contact location on both sides of wall.

   **3M COMPANY** – CP 25WB+, IC 15WB+ caulk or FB-3000 WT sealant

*Bearing the UL Classification Marking*
1. Wall Assembly — The 1, 2, 3 or 4 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner described in the individual U300, U400 or V400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. Studs — Wall framing may consist of either wood or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 3-1/2 in. (89 mm) wide spaced max 24 in. (610 mm) OC.
   B. Gypsum Board* — The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory. Max area of opening is 98.5 in.² (635 cm²) with a max dimension of 12-1/8 in. (308 mm) for square devices. Max diam of opening is 2-1/4 in. (57 mm) for nom 2 in. (51 mm) round devices and 4-1/4 in. (108 mm) for 4 in. (102 mm) round devices.

The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed.

2. Through-Penetrants — One or more metallic pipes, conduits or tubes, nonmetallic pipes, conduits or tubes, cables, cables within cable trays, and miscellaneous combinations of penetrants, as described below, may be installed within each firestop device (Item 3A) as further specified below. Through penetrants to be rigidly supported on both sides of wall assembly. The following types and sizes of through-penetrants may be used:
   A. Metallic Penetrants — One or more metallic pipe, tubing or conduit may be installed concentrically or eccentrically within each firestop device (Item 3A). If multiple through penetrants are installed within the firestop device, a min 1/4 in. (6 mm) annular space is required between the through penetrants. Through penetrants to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of through-penetrants may be used:
      A1. Steel Pipe — Nom 3 in. (76 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
      A2. Iron Pipe — Nom 3 in. (76 mm) diam (or smaller) cast or ductile iron pipe.
      A3. Copper Tubing — Nom 3 in. (76 mm) diam (or smaller) Type L (or heavier) copper tube.
      A4. Copper Pipe — Nom 3 in. (76 mm) diam (or smaller) Regular (or heavier) copper pipe.
      A5. Conduit — Nom 3 in. (76 mm) diam (or smaller) steel electrical metallic tubing (EMT) or rigid steel conduit.
      A6. Through-Penetrating Product* - Flexible Metal Piping — Nom 1-1/4 in. (32 mm) diam (or smaller) steel flexible metal piping.

   B. Nonmetallic Penetrants — One or more nonmetallic pipes, conduits or tubes, as described in a single line item below, may be installed within each firestop device (Item 3A):
      B1. Polyvinyl Chloride (PVC) Pipe — One nom 2 in. (51 mm) diam (or smaller) Schedule 40 solid core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.
      B2. Rigid Nonmetallic Conduit+ — One nom 2 in. (51 mm) diam (or smaller) Schedule 40 PVC conduit installed in accordance with the National Electrical Code (NFPA No. 70).

See Rigid Nonmetallic, Schedule 40 and 80 PVC Conduit (DZYR) category in the Electrical Construction Equipment Directory for names of manufacturers.

B3. Chlorinated Polyvinyl Chloride (CPVC) Pipe — One nom 2 in. (51 mm) diam (or smaller) SDR11 CPVC pipe for use in closed (process or supply) piping systems.
B4. Crosslinked Polyethylene (PEX) Tubing — One nom 2 in. (51 mm) diam (or smaller) SDR 9 PEX tubing for use in closed (process or supply) piping systems.
B5. Electrical Nonmetallic Tubing (ENT)+ — Max four nom 1-1/4 in. (32 mm) diam (or smaller) ENT installed in accordance with the National Electrical Code (NFPA No. 70).
System No. W-L-8069 continued

See Electrical Nonmetallic Tubing (FKHU) category in the Electrical Construction Equipment Directory for names of manufacturers.

B6. Optical Fiber/Communications/Signaling/Coaxial Cable Raceways+ — Max four nom 1-1/4 in. (32 mm) diam (or smaller) plenum rated raceways installed in accordance with the National Electrical Code (NFPA No. 70).

See Optical Fiber/Communications/Signaling/Coaxial Cable Raceway (QAZM) category in the Electrical Construction Equipment Directory for names of manufacturers.

B7. Acrylonitrile Butadiene Styrene (ABS) Pipe — Nom 2 in. (51 mm) diam (or smaller) Schedule 40 cellular core ABS for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

C. Cables — The cable loading within the loading area of each firestop device module may represent a 0 to 100 percent visual fill. The min bundle diam shall be 1/2 in. (13 mm) if a single firestop device (Item 3A) is installed in the opening. If multiple firestop devices are ganged together, there is no min bundle size. Any combination of the following types and sizes of cables may be used:

C1. Max 2/C No. 18 AWG copper conductor thermostat cable with polyvinyl chloride (PVC) insulation and jacket materials.
C2. Max 4 pair No. 24 AWG copper conductor Cat5e or Cat 6 telephone cable with PVC insulation and jacket materials.
C3. Max RG/U (or smaller) coaxial cable with foam high density polyethylene insulation and PVC jacket materials.
C4. Max 3/C (with ground) No. 14 AWG (or smaller) nonmetallic sheathed (Romex) cable with PVC insulation and jacket materials.
C5. Max 1/C No. 8 AWG copper conductor cable with PVC insulation and nylon jacket materials.
C6. Max 12 core No. 26 AWG shielded multi coax cable with foam high density polyethylene insulation and PVC jacket.
C7. Max 48MM62.5 micron fiber optic cables having a min FT-6 rating.
C8. Max 62.5/125 micron micron fiber optic cables with having a min Riser rating.
C10. Max three copper conductors (with ground) No. 12 AWG Metal Clad Cable+.
C11. Max four copper conductors No. 2 AWG Metal Clad Cable+.

AFC CABLE SYSTEMS INC

C12. Max 1/C 2/0 AWG non halogen copper conductor cable.
C13. Max 300 pair No. 24 AWG copper conductor telephone cable with PVC insulation and jacket materials.
C14. Max 30 pair No. 22 copper conductor shielded switchboard cable with PVC insulation and jacket materials.
C15. Max RG/6 (or smaller) coaxial cable with fluorinated ethylene (FE) or PVC insulation and jacket materials.
C16. Max RG/U (or smaller) coaxial cable with fluorinated ethylene (FE) or PVC insulation and jacket materials.
C17. Max 7/C No. 12 AWG copper conductors with PVC insulation and jacket materials.
C18. Max 4 pair No. 23 AWG copper conductor Cat 6 telephone cable with PVC insulation and jacket materials.
C19. Max three copper conductors (with ground) No. 12 AWG steel armored Cable+.
C20. Max 04-02 2 5M fiber optic cables having a max diameter of 0.450 in. (11.4 mm).
C22. Max 3/C with ground No. 2/0 AWG aluminum conductor SER cable with cross linked polyethylene (XLPE) insulation and PVC jacket.

D. Cable Tray* — Nom 2 in. (51 mm) wide by 2 in. (51 mm) high (or smaller) welded wire basket cable tray formed from min 0.23 in. (5.8 mm) thick steel wires in the longitudinal direction and 0.19 in. (4.8 mm) wires in the transverse direction. Transverse wires shall be spaced max 4 in. (102 mm) OC. One cable tray may be installed within each firestop device (Item 4A). When installed within the 4 by 4 by 10 in. (64 by 64 by 254 mm) firestop device, the annular space between the cable tray and the periphery of the device shall be min 1/2 in. (13 mm) to max 1-1/2 in. (38 mm). The cables described in Item E below may be installed within the cable tray.

E. Cables — Cable fill within cable tray shall be a nom 2 in. (100 % visual fill). If three of more firestop devices (Item 4A) are ganged together, the cable fill may be less than 2 in. Any combination of the following types and sizes of cables may be used within the cable tray:

E1. Max 4 pair No. 23 AWG copper conductor Cat5e or Cat 6 telephone cable with PVC insulation and jacket materials.
E2. Mixed Penetrants — One of the following groupings of mixed penetrants may be installed within each firestop device:

F1. Air Conditioning (AC) Line Set — One or more AC line set, consisting of multiple metallic pipes, tube insulation, nonmetallic pipes and cables bundled within firestop device in any combination unless otherwise noted.
  1. Copper Tubing — Nom 3/4 in. (19 mm) diam (or smaller) Type L (or heavier) copper tube.
  2. Tube Insulation - Plastic+++ — Nom 1/2 in. (13 mm) thick or smaller acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam formed in the form of tubing with skin may be used on the copper tubes. If multiple insulated through penetrants are installed within the firestop device, the insulated through penetrants may be bundled together.

See Plastics+ (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-SVA may be used.

F2. Mixed Grouping — One or more metallic pipes, nonmetallic pipes and cables bundled within firestop device in any combination unless otherwise noted.
  1. Copper Tubing — Nom 1 in. (25 mm) diam (or smaller) Type L (or heavier) copper tube.
  2. Electrical Nonmetallic Tubing (ENT)+ — One nom 1-1/4 in. (32 mm) diam (or smaller) ENT installed in accordance with Article 362 of the National Electrical Code (NFPA No. 70).

See Electrical Nonmetallic Tubing (FKHU) category in the Electrical Construction Equipment Directory for names of manufacturers.

F3. Optical Fiber/Communications/Signaling/Coaxial Cable Raceways+ — One nom 1-1/4 in. (32 mm) diam (or smaller) plenum rated raceway installed in accordance with the National Electrical Code (NFPA No. 70).
See Optical Fiber/Communications/Signaling/Coaxial Cable Raceway (QAZM) category in the Electrical Construction Equipment Directory for names of manufacturers.

4. **Power Cable** — Max 1/C No. 750 kcmil copper conductors with PVC insulation and fabric jacket materials.

5. **Thermostat Cable** — Max 2/C No. 18 AWG copper conductor thermostat cable with polyvinyl chloride (PVC) insulation and jacket materials.

F3. **Mixed Grouping** — One or more flexible metal pipes and a max of two nonmetallic tubes or raceways bundled within firestop device in any combination.

1. **Through-Penetrating Product* - Flexible Metal Piping** — Nom 1-1/4 in. (32 mm) diam (or smaller) steel flexible metal piping.

**OMEGA FLEX INC** — TracPipe Flexible Gas Piping

2. **Electrical Nonmetallic Tubing (ENT)+** — Two nom 1-1/4 in. (32 mm) diam (or smaller) ENT installed in accordance with Article 362 of the National Electrical Code (NFPA No. 70).

See Electrical Nonmetallic Tubing (FKHU) category in the Electrical Construction Equipment Directory for names of manufacturers.

3. **Optical Fiber/Communications/Signaling/Coaxial Cable Raceways**+ — Two nom 1-1/4 in. (32 mm) diam (or smaller) plenum rated raceway installed in accordance with the National Electrical Code (NFPA No. 70).

See Optical Fiber/Communications/Signaling/Coaxial Cable Raceway (QAZM) category in the Electrical Construction Equipment Directory for names of manufacturers.

3. **Firestop System** — The firestop system shall consist of the following:

A. **Firestop Device*** — A max of six square firestop devices may be ganged together for 1 and 2 hr rated assemblies. A max of three square firestop devices may be ganged together for 3 and 4 hr rated assemblies. As an alternate, one round device may be centered in a round opening. Each device consists of a nom 2-1/2 by 2-1/2 by 10 in. (64 by 64 by 254 mm), a nom 4 by 4 by 10 in. (102 by 102 by 254 mm), a nom 2 in. (51 mm) diam by 10 in. (254 mm) or a nom 4 in. (102 mm) diam by 10 in. (254 mm) powder coated steel transit incorporating internal intumescent material, foam plugs and mounting flanges. Firestop device(s) to be installed within opening with ends projecting an equal distance beyond each surface of wall assembly in accordance with the accompanying installation instructions. The annular space between device(s) and periphery of opening shall be min 0 in. (0 mm, point contact) to max 1/8 in. (3 mm). Firestop device(s) secured in place by means of fill material (Item 3B) and steel split mounting flanges sized to accommodate the firestop device. Steel split mounting flanges installed on both sides of wall after installation of fill material, and secured together with supplied steel set screws. Nom 1 in. (25 mm) thick foam plugs cut to accommodate the through penetrants and installed flush with each end of device on both sides of wall assembly. The foam plug in one or both ends of the device is optional except when L Rating is required (See Item 3B).

**3M COMPANY** — 3M Fire Barrier Pass-Through Device

B. **Fill, Void or Cavity Materials* - Putty or Caulk** — Min 1/8 in. (3 mm) bead of fill material shall be applied at interface of gypsum board and firestop devices immediately prior to the installation of the mounting flanges. As an option, foam plugs may be recessed into device and the recess filled with putty or caulk flush with the ends of the device. L Rating applies only when fill material is applied at interface of gypsum board and device(s) prior to mounting flanges and with both ends of firestop device(s) filled with nominal 1/8 in. (3.2 mm) of Moldable Putty+.

**3M COMPANY** — Moldable Putty+, CP 25WB+, IC 15WB+, 3000 WT. CP 25WB+ not suitable for use with CPVC pipes.

System No. W-L-8069 continued
1. **Wall Assembly** – The 1 or 2 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner described in the individual U300, U400, V400 or W400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Studs** – Wall framing may consist of either wood or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 3-1/2 in. (89 mm) wide spaced max 24 in. (610 mm) OC.

   B. **Gypsum Board** – The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory. Max size of framed opening to be 8 in. (114 mm) high by 16 in. (406 mm) wide.

   The hourly F and FH Ratings of the firestop system are equal to the hourly fire rating of the wall assembly in which it is installed. The hourly T, FT and FTH Ratings are 0 Hr or 3/4 Hr when the fire rating of the wall assembly in which it is installed is 1 Hr or 2 Hr, respectively.

2. **Through-Penetrants** – Max two cables bundles and one optical fiber raceway as described below. Through penetrants to be rigidly supported on both sides of wall assembly. The following types and sizes of through-penetrants may be used:

   A. **Nonmetallic Penetrant** – One nonmetallic raceway as described in a single line item below.

      A1. Optical Fiber/Communications/Signaling/Coaxial Cable Raceways+ – Nom 1-1/4 in. (32 mm) diam (or smaller) plenum rated raceways installed in accordance with the National Electrical Code (NFPA No. 70). Raceway to be positioned in the center of the wall opening.

      See Optical Fiber/Communications/Signaling/Coaxial Cable Raceway (QAZM) category in the Electrical Construction Equipment Directory for names of manufacturers.

   B. **Cables** – Cables installed in a max of two bundles having a max bundle diam of 4 in. (102 mm). Cable bundles to be positioned in the middle of wall opening and a min of 2-1/2 in. (64 mm) from opening edge to center of bundle. Any combination of the following types and sizes of cables may be used:

      B1. Max 2/C No. 18 AWG copper conductor thermostat cable with polyvinyl chloride (PVC) insulation and jacket materials.

      B2. Max 4 pair No. 24 AWG copper conductor Cat 5e or Cat 6 telephone cable with PVC insulation and jacket materials.

      B3. Max 100 pair No. 24 AWG copper conductor telephone cable with PVC insulation and jacket materials.

      B4. Max 7/C No. 12 AWG copper conductor power and control cables with XLPE or PVC insulation with XLPE or PVC jacket.

      B5. Max 48 MM62.5 micron fiber optic cables with having a min FT-6 rating.

      B6. Max 62.5/125 micron fiber optic cables with having a min Riser rating.

      B7. Max 3/C (with ground) No. 12 AWG (or smaller) nonmetallic sheathed (Romex) cable with PVC insulation and jacket materials.

      B8. Max 1/C No. 8 AWG copper conductor cable with PVC insulation and nylon jacket materials.

      B9. Max 12 core No. 26 AWG shielded multi coax cable with foam high density polyethylene insulation and PVC jacket.

      B10. Max 48 MM62.5 micron fiber optic cables with having a min FT-6 rating.

System tested with a pressure differential of 2.5 Pa between the exposed and the unexposed surfaces with the higher pressure on the exposed side.
System No. W-L-8077 continued

B11. Max 62.5/125 micron fiber optic cables with having a min Riser rating.
B12. Max 1/C 3/0 AWG copper conductor cable with PVC insulation and jacket materials.
B13. Max three copper conductors (with ground) No. 12 AWG Metal Clad Cable+.
B14. Max four copper conductors No. 2 AWG Metal Clad Cable+.
B15. Max 1/C 2/0 AWG non halogen copper conductor cable.
B16. Max 300 pair No. 24 AWG copper conductor telephone cable with PVC insulation and jacket materials.
B17. Max 30 pair No. 22 copper conductor shielded switchboard cable with PVC insulation and jacket materials.
B18. Max RG/6 (or smaller) coaxial cable with fluorinated ethylene (FE) or PVC insulation and jacket materials.
B19. Max 7/C No. 12 AWG copper conductors with PVC insulation and jacket materials.
B20. Max 4 pair No. 23 AWG copper conductor Cat 6 telephone cable with PVC insulation and jacket materials.
B21. Max three copper conductors (with ground) No. 12 AWG steel Armored Cable+.
B22. Max 04-02 2.5M fiber optic cables having a max diameter of 0.450 in. (11.4 mm).
B24. Max 3/C with ground No. 2/0 AWG aluminum conductor SER cable with cross linked polyethylene (XLPE) insulation and PVC jacket.
B25. Max nom 0.75 in. diam water tight conduit.

3. Firestop System – The firestop system shall consist of the following:

A. Fill, Void or Cavity Materials – Pillows – Max 9 in. (229 mm) long by 6 in. (152 mm) wide by 2 and 3 in. (51 and 76 mm) thick plastic covered pillows tightly-packed to fill annular space between the cable bundles, raceway and periphery of opening and the annular space between the cable bundles and raceway installed within the opening. Pillows installed with 9 in. (229 mm) dimension projecting through wall and centered within the opening.

B. Fill, Void or Cavity Materials – Putty – Moldable putty material, installed within voids around penetrants and pillows to a min thickness of 1 in. (25 mm) on both sides of wall.

Note: Systems with Nonmetallic Through Penetrant(s) have not been evaluated with a pressure differential of 50 Pa between the exposed and unexposed surfaces as required by the National Building Code of Canada.
System No. W-L-8097

FT Rating – 0 Hr
FH Ratings – 1 and 2 Hr (See Item 1)
FTH Rating – 0 Hr

1. Wall Assembly – The 1 or 2 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400, V400 or W400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features.
   A. Studs – Wall framing shall consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 3-1/2 in. (89 mm) wide and spaced max 24 in. (610 mm) OC.
   B. Gypsum Board* – One or two layers of nom 5/8 in. (16 mm) thick gypsum board as specified in the individual Wall and Partition Design. Max diam of opening is 7 in. (178 mm).

   The hourly F and FH Ratings of the firestop system are equal to the hourly rating of the wall assembly.

2. Steel Sleeve – (Optional, Not Shown) – Cylindrical sleeve fabricated from min 0.018 in. (0.46 mm) thick (No. 28 gauge) galv sheet steel and having a min 1 in. (25 mm) lap along the longitudinal seam. Length of sleeve to be equal to or max 2 in. (51 mm) greater than the thickness of wall. Ends of sleeve to be flush with or extend max 1 in. (25 mm) beyond each surface of wall.

3. Steel Tube – Nom 6 in. (152 mm) diam (or smaller) No. 16 ga steel tube installed eccentrically within the opening. The tube may be installed at an angle not greater than 45 degrees from perpendicular. The annular space between the tube and the periphery of the opening shall be min 1/4 in. (6 mm) to max 3/4 in. (19 mm). Tube to be rigidly supported on both sides of wall assembly.

4. Cables – Max six nom 3/8 in (10 mm) diam two pair No. 22 AWG foil shielded communication cables with polyvinyl chloride (PVC) insulation and jacket. The cables may be installed at an angle not greater than 45 degrees from perpendicular in line with steel tube (Item 3). Min separation between cables and periphery of opening shall be 1/4 in. (6 mm). Separation between cables and tube shall be min 0 in. (point contact) to max 1 in. (25 mm). Cables to be rigidly supported on both sides of wall assembly.

5. Fill, Void or Cavity Material* – Sealant – Min 5/8 in. (16 mm) thickness of fill material applied within annulus, flush with each surface of the wall assembly. When optional steel sleeve projects beyond wall surfaces a min 1/4 in. (6 mm) diam bead of caulk applied to gypsum board/steel sleeve interface on both sides of wall.

1. **Wall Assembly** — The 1 or 2 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner described in the individual U400, V400 or W400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Studs** — Steel studs to be min 3-1/2 in. (89 mm) wide spaced max 24 in. (610 mm) OC. Additional studs used to completely frame the opening.
   B. **Gypsum Board** — The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory. Max size of framed opening to be 36 in. (914 mm) high by 36 in. (914 mm) wide.

   The hourly F and FH Ratings of the firestop system are equal to the hourly fire rating of the wall assembly in which it is installed.

2. **Through-Penetrant** — One or more pipes, conduit, tubes, ducts, or steel members to be installed within the opening. The total number of through-penetrants is dependent on the size of the opening and the types and sizes of the penetrants. Any combination of the penetrants described below may be used provided that the following parameters relative to the annular spaces and the spacing between the through penetrants are maintained. The separation between the penetrants shall be min 1/2 in. (12 mm) to max 3 in. (76 mm). The annular space between penetrants and the periphery of opening shall be min 1/2 in. (12 mm) to max 6 in. (152 mm). Pipes, conduit tubes, ducts, or steel members to be rigidly supported on both sides of wall assembly. The following types and sizes of pipes, conduit tubes, ducts, or steel members may be used.
   A. **Conduit** — Max 20, nom 4 in. (102 mm) diam (or smaller) electrical metallic tubing (EMT) or ridged steel conduit.
   B. **Pipe** — Max 1, nom 6 in. (152 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   C. **Duct** — Max 1, nom 6 in. by 12 in. (or smaller) No 26 gauge (or heavier) steel duct.
   D. **Duct** — Max 1, nom 4 in. diam (or smaller) No. 28 gauge (or heavier) steel duct.
   E. **Pipe** — Max 1, nom 3 in. (76 mm) diam (or smaller) service weight (or heavier) cast iron soil pipe.
   F. **Beam** — Max 1, W8 x 15 (or smaller) steel beam.
   G. **Tube Steel** — Max 1, nom 4 in. square (or smaller) 0.25 in. (or heavier) steel tube.
   H. **Pipe** — Max 1, nom 6 in. diam (or smaller) type L (or heavier) copper pipe.
   I. **Conduit** — Max 1, nom 1 in. (102 mm) diam (or smaller) electrical metallic tubing (EMT) or ridged steel conduit.
   J. **Pipe** — Max 1, nom 4 in. diam (or smaller) Schedule 40 (or heavier) steel pipe.

3. **Firestop System** — The details of the firestop system shall be as follows:
   A. **Fill, Void or Cavity Materials** — **Pillows** — Max 9 in. (229 mm) long by 6 in. (152 mm) wide by 2 and 3 in. (51 and 76 mm) thick plastic covered pillows tightly-packed to fill annular space between penetrants and periphery of opening. Pillows installed with 9 in. (229 mm) dimension projecting through wall and centered within the opening.
   B. **Fill, Void or Cavity Material** — **Foam** — Applied around and between all round interior penetrants, and between round penetrants, rectangular penetrants, and pillows where the annular space is 3 in. or less. Foam to be applied the entire depth of, and flush with both surfaces of wall. After installation of pillows (Item 3A) all voids within the opening shall be filled with a min 1 in. (25 mm) thickness foam.

System tested with a pressure differential of 2.5 Pa between the exposed and the unexposed surfaces with the higher pressure on the exposed side.

1. Wall Assembly – The 1 or 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400, V400 or W400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. Studs – Wall framing may consist of either wood studs or channel shaped steel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced max 16 in. (406 mm) OC. Steel studs to be min 3-1/2 in. (89 mm) wide and spaced max 24 in. (610 mm) OC. Additional framing members shall be installed in stud cavity containing through-penetrating item to form a rectangular box around the penetrants.
   B. Gypsum Board* – 5/8 in. (16 mm) thick with square or tapered edges. The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual U300, U400, V400 or W400 Wall and Partition Design. If the through penetrants are installed in a wood stud/gypsum board assembly, the max area of opening is 116 in.2 (748 cm2). with max dimension of 14-1/2 in. (368 mm). If the through penetrants are installed in a steel stud/gypsum board assembly, max area of opening is 182 in2. (1174 cm2) with max dimension of 22-3/4 in. (578 mm) wide.

   The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed.

2. Through-Penetrant – One or more pipes, conduit or tubes to be installed within the opening. The total number of through-penetrants is dependent on the size of the opening and the types and sizes of the penetrants. Any combination of the penetrants described below may be used provided that the following parameters relative to the annular spaces and the spacing between the through penetrants are maintained. The separation between the penetrants shall be min 1 in. (25 mm) to max 22 in. (560 mm). The annular space between penetrants and the periphery of opening shall be min 0 in. (0 mm, point contact) to max 22 in. (560 mm). Pipes, conduit or tubes to be rigidly supported on both sides of wall assembly. The following types and sizes of pipes, conduit or tubes may be used:
   A. Copper Tubing – Nom 3 in. (76 mm) diam (or smaller) Type L (or heavier) copper tube.
   B. Copper Pipe – Nom 3 in. (76 mm) diam (or smaller) Regular (or heavier) copper pipe.
   C. Steel Pipe – Nom 3 in. (76 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
   D. Iron Pipe – Nom 3 in. (76 mm) diam (or smaller) cast or ductile iron pipe.
3M Fire Protection Products
Applicator and Specifier Guide
http://3M.com/firestop 1-800-328-1687

UL System No. W-L-8102 (cont.)

E. Conduit – Nom 3 in. (76 mm) diam (or smaller) electric metallic tubing (EMT) or rigid steel conduit.

F. Polyvinyl Chloride (PVC) Pipe – Nom 2 in. (51 mm) diam (or smaller) Schedule 40 cellular or solid core PVC pipe for use in closed (process or supply) or vented (drain, waste, or vent) piping systems.

G. Chlorinated Polyvinyl Chloride (CPVC) Pipe – Nom 2 in. (51 mm) diam (or smaller) SDR 13.5 CPVC pipe for use in closed (process or supply) piping systems.

H. Rigid Nonmetallic Conduit (RNC+) – Nom 2 in. (51 mm) diam (or smaller) Schedule 40 PVC conduit installed in accordance with the National Electrical Code (NFPA No. 70).

I. Cross Linked Polyethylene Tubing – Nom 1 in. (25 mm) diam (or smaller) cross-linked polyethylene tubing for use in closed (process or supply) piping systems.

3. Pipe Insulation – One or more metallic penetrants (pipe or tubing) may be insulated with the following types of pipe coverings. The annular space between the insulated penetrants and the periphery of the opening shall be min 0 in. (0 mm, point contact) to max 5 in. (127 mm). The separation between the insulated penetrants and the other penetrants shall be min 1 in. (25 mm) to max 22 in. (560 mm):

A. Pipe Covering* – Min 1 in. (25 mm) to max 2 in. (51 mm) thick hollow cylindrical heavy density min 3.5 pcf (56 kg/m³) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product.

See Pipe and Equipment Covering - Materials (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

B. Tube Insulation-Plastics – Min 1/2 in. (13 mm) to max 3/4 in. (19 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing.

See Plastics (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5VA may be used.

C. Pipe Covering Materials* – Min 1 in. (25 mm) to max 2 in. (51 mm) thick unfaced mineral fiber pipe insulation having a nom density of 3.5 pcf (56 kg/m³) or heavier and sized to fit the outside diam of pipe or tube. Pipe insulation secured with min 18 SWG steel wire spaced 12 in. (305 mm) OC.

INDUSTRIAL INSULATION GROUP LLC – High Temperature Pipe Insulation 1200, High Temperature Pipe Insulation BWT and High Temperature Pipe Insulation Thermaloc

C1. Sheathing Material – (Not shown) – Optional, used in conjunction with Item 3C. Foil-scrim-kraft or all service jacket material shall be wrapped around the outer circumference of the pipe covering material (Item 3B) with the kraft side exposed. Longitudinal joints sealed with metal fasteners.

See Sheathing Materials (BVDV) category in the Building Materials Directory for names of manufacturers. Any sheathing material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread value of 25 or less and a Smoke Developed value of 50 or less may be used.

D. Pipe Covering Materials* – Cellular Glass Insulation – Nom 1-1/2 to 3 in. (38 to 76 mm) thick cellular glass units sized to the outside diam of the steel pipe and supplied in nom 24 in. (610 mm) long half sections or nom 18 in. (457 mm) long segments. Pipe insulation installed on pipe in accordance with the manufacturer’s instructions.

PITTSBURGH CORNING CORP – FOAMGLAS

E. Pipe Insulation - Foamed Plastic* – Nom 1 in. (25 mm) thick polysiocyanurate foamed plastic units jacketed with an all service jacket. Longitudinal joints sealed with self-sealing lap tape. Transverse joints secured with butt tape. Nom 1/2 (13 mm) wide stainless steel band clamp to be secured around pipe insulation 1 in. (25 mm) from both surfaces of wall.

See Foamed Plastic (BRYX) category in the Building Materials Directory for names of manufacturers. Any foamed plastic pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less may be used.

4. Cables – One max 4 in. (102 mm) diam bundle of cables installed within the opening and rigidly supported on both surfaces of wall. The annular space between the tightly-bundled cables and the periphery of the opening shall be min 0 in. (0 mm, point contact) to max 5 in. (127 mm). The separation between the cable bundle and the other penetrants shall be min 1 in. (25 mm) to max 22 in. (560 mm). Any combination of the following types and sizes of cables may be used:

A. Max 25 pair No. 24 AWG telephone cable with polyvinyl chloride (PVC) insulation and jacket.

B. Max 7/C No. 12 AWG copper conductor power and control cable with PVC or cross-linked polyethylene (XLPE) insulation and PVC jacket.

C. Multiple fiber optical communication cable jacketed with PVC and having a max outside diam of 1/2 in. (13 mm).

D. Max 3/C No. 8 AWG with bare aluminum ground, PVC insulated steel Metal-Clad+ Cable currently Classified under the Through Penetrating Product* (XHLY) category.

E. Max 3/C (with ground) No. 12 AWG (or smaller) nonmetallic sheathed (Romex) cable with PVC insulation and jacket materials.

F. RG/U coaxial cable with polyethylene (PE) insulation and polyvinyl chloride (PVC) jacket having a max outside diam of 1/2 in. (13 mm).
5. **Firestop System** – The firestop system shall consist of the following:

   **A. Packing Material** – In 2 hr fire rated wall assemblies, min 4-3/4 in. (121 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form. In 1 hr fire rated wall assemblies, min 3-1/2 in. (89 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form. Packing material recessed from both surfaces of the wall to accommodate the required thickness of fill material.

   **B. Fill, Void or Cavity Material* – Sealant** – Min 5/8 in. (16 mm) thickness of fill material applied within annulus, flush with both surfaces of wall. At the point contact location between through penetrants and gypsum board, a min 1/4 in. (6 mm) diam bead of fill material shall be applied at the gypsum board/through penetrant interface on both surfaces of wall.

   3M COMPANY 3M FIRE PROTECTION PRODUCTS – CP 25WB+ caulk or FB-3000 WT sealant

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

System tested with a pressure differential of 2.5 Pa between the exposed and the unexposed surfaces with the higher pressure on the exposed side.

1. Wall Assembly — The 1 or 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400, V400 or W400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. Studs — Wall framing to consist of wood studs or channel shaped steel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 3-1/2 in. (89 mm) wide and spaced max 24 in. (610 mm) OC. Additional studs shall be used to completely frame the opening.

   B. Gypsum Board* — The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory. Max area of opening is 900 in.² (5806 cm²) with a max dimension of 30 in. (762 mm).

   The hourly F and FH Ratings of the firestop system are equal to the hourly fire rating of the wall assembly in which it is installed.

2. Through Penetrants — One or more pipes, tubes or cable bundles may be installed within the opening. The total number of through-penetrants is dependent on the size of the opening and the types and sizes of the penetrants. Any combination of the penetrants described below may be used provided that the following parameters relative to the annular spaces are maintained. The annular space between penetrants shall be min 3/4 in. (19 mm) to max 9-1/2 in. (241 mm) except for the following: the annular space between cable tray and cable bundle and all other penetrants shall be min 3 in. (76 mm); the annular space between metallic penetrants and insulated penetrants shall be a min 2 in. (51 mm) and the annular space between nonmetallic penetrants shall be min 4 in. (102 mm). The annular space between penetrants and the periphery of opening shall be min 3/4 in. (19 mm) to max 14 in. (356 mm). Penetrants to be rigidly supported on both sides of wall assembly. The types and sizes of penetrants specified below may be used.

   The hourly T, FT and FTH Rating for the firestop system is 1/2 hr except that when uninsulated metallic penetrants (Item 2A) are used, the hourly T, FT and FTH Rating is 1/4 hr.

   A. Metallic Penetrants — One or more metallic pipe, conduit or tubing may be installed within the opening. The following types and sizes of metallic pipes, conduits or tubing may be used:

      1. Steel Pipe — Nom 8 in. (203 mm) diam (or smaller) Schedule 40 (or heavier) steel pipe.
      2. Iron Pipe — Nom 8 in. (203 mm) diam (or smaller) cast or ductile iron pipe.
      3. Conduit — Nom 4 in. (102 mm) diam (or smaller) steel electrical metallic tubing or nom 6 in. (152 mm) diam (or smaller) steel conduit.
      4. Copper Tubing — Nom 4 in. (102 mm) diam (or smaller) Type L (or heavier) copper tubing.
      5. Copper Pipe — Nom 4 in. (102 mm) diam (or smaller) Regular (or heavier) copper pipe.

   B. Nonmetallic Pipe — One or more nonmetallic pipes may be installed within the firestop system. The following types and sizes of nonmetallic pipes, conduits or tubing may be used:

      1. Polyvinyl Chloride (PVC) Pipe — Nom 4 in. (102 mm) diam (or smaller) solid core Schedule 40 PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.
System No. W-L-8106 continued

2. Chlorinated Polyvinyl Chloride (CPVC) Pipe — Nom 4 in. (102 mm) diam (or smaller) SDR 13.5 CPVC pipe for use in closed (process or supply) piping systems.

C. Cable Tray* — Max 24 in. (610 mm) wide by 6 in. (152 mm) deep open-ladder steel or aluminum cable tray. Aggregate cross-sectional area of cable tray to be max 45 percent of the cross-sectional area of the cable tray based on a max 4 in. (102 mm) cable loading depth. Any combination of the types and sizes of cables described below may be used.
1. Max 1/C, 750 kcmil (or smaller) copper conductor cable with cross-linked polyethylene (XLPE) insulation and polyvinyl chloride (PVC) jacket.
2. Max 7/C No. 12 AWG (or smaller) copper conductor power and control cables with cross-linked polyethylene (XLPE) insulation or polyvinyl chloride (PVC) jacket.
3. Max 3/C No. 2/0 AWG (or smaller) copper conductor SER cable with polyvinyl chloride (PVC) insulation and jacket.
4. Max 3/C No. 2/0 AWG (or smaller) copper conductor PVC jacketed aluminum clad or steel clad TECK 90 cable.
5. Max 300 pair (or smaller) No. 22 AWG (or smaller) nonmetallic sheathed (Romex) cable with PVC insulation and jacket materials.
6. Max 110/125 fiber optic (F.O.) cable with PVC insulation and jacket.
7. Max 3/C (with ground) No. 14 AWG (or smaller) nonmetallic sheathed (Romex) cable with PVC insulation and jacket materials.
8. Max RG/U (or smaller) coaxial cable with fluorinated ethylene (FE) or PVC insulation and jacket material.
9. Max 4 pair No. 24 AWG (or smaller) copper conductor Cat 5e or Cat 6 telephone cable with PVC insulation and jacket materials.
11. Max three conductor No. 12 AWG (or smaller) MC (BX) copper cable with polyvinyl chloride insulation and jacket materials.

D. Cable Bundle — Max 3 in. (76 mm) diam tightly bundled cables may be installed within the opening. Any combination of the types and sizes of cables listed in Item 2C may be used.

E. Cable Bundle — Max 1-1/2 in. (38 mm) diam tightly bundled 110/125 fiber optic (F.O.) cables (with PVC insulation and jacket) may be installed within the opening.

3. Pipe Covering Material* — Fiberglass Insulation — (Optional) — May be installed on metallic penetrant Items 2A1 and 2A2. Nom 1-1/2 in. (38 mm) thick hollow cylindrical heavy density (min 3.5 pcf) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product.

See Pipe and Equipment Covering — Materials (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. Firestop System — The firestop system shall consist of the following:

A. Fill, Void or Cavity Materials* — Wrap Strip — (Not Shown) — Used with each nonmetallic penetrant (Item 2B). Min 3/16 in. (5 mm) thick intumescent material supplied in 2-1/2 in. (64 mm) wide strips. Single layer of wrap strip, pre-cut to fit penetrant OD, tightly wrapped around nonmetallic pipe and secured with the adhesive closure tab. Wrap strip to be installed within the opening at each side such that the edge of the wrap strip layer is flush with both surfaces of wall.

3M COMPANY 3M FIRE PROTECTION PRODUCTS — Tuck-In Wrap Strip WS 200, WS 300 or WS 400

B. Fill, Void or Cavity Material* — Blocks installed with 5 in. (127 mm) dimension projecting through opening and centered in wall such that it is recessed max 1/2 in. (13 mm) from each surface of wall. Blocks to be firmly packed to fill the opening area between and around all penetrants. Blocks can be cut to fit around penetrants and within smaller annular spaces.

3M COMPANY 3M FIRE PROTECTION PRODUCTS — 3M™ Fire Barrier Block B258, 3M™ Fire Barrier Plank PK39

C. Fill, Void or Cavity Materials* — Foam — Fill material to be forced between blocks and periphery of opening to the max extent possible. Fill material to be injected in-between blocks and penetrants to the full depth of the blocks, as well as in any visible voids/ openings between blocks (Item 4B). In addition, foam shall be injected to the maximum extent possible within the interstices between all cables in the cable tray and cable bundles.

3M COMPANY 3M FIRE PROTECTION PRODUCTS — Fire Barrier Rated Foam, FIP 1-Step

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

1. **Wall Assembly** – The 1 or 2 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Studs** – Wall framing shall consist of steel channel studs. Steel studs to be min 3-1/2 in. (89 mm) wide and spaced max 24 in. (610 mm) OC. Additional stud members shall be used to frame a rectangular opening around the through penetrant. The width of the framed opening shall be maximum 2 in. (51 mm) greater than the largest beam (Item 2) width. The height of the framed opening shall be maximum 2 in. (51 mm) greater than the total height of the beam (Item 2) stack.

   B. **Gypsum Board** – One or two layers of gypsum board, as specified in the individual Wall and Partition Design. Gypsum board shall be secured to the studs framing the opening, and within the framed opening, the gypsum board shall be cut to contour, to the profile of the through penetrant with a min 3/4 in. (19 mm) to max 1 in. (25 mm) annular space provided between gypsum board and the periphery of the through penetrant.

   The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed.

2. **Through Penetrants** – A grouping of through penetrants consisting of maximum three stacked service support beams shall be installed within the firestop system, centered within the framed opening. Steel beams are intended as service supports and are to be rigidly supported on both sides of wall assembly. Beams shall be connected together at the periphery of the mating edges with min 1 in. (25 mm) long fillet welds spaced max 4 in. (102 mm) on center. The following types and sizes of beams may be used, stacked in the specific configuration depicted above. An annular space of min 3/4 in. (19 mm) to max 1 in. (25 mm) annular space provided between gypsum board and the periphery of the through penetrant.

   A. **W14** (or smaller) x 48 (or heavier) steel beam service support passing through the opening, perpendicular to wall.

   B. **W6** (or smaller) x 25 (or heavier) steel beam service support. A 20 in. (508 mm) length (or smaller) is centered within the thickness of the wall and oriented parallel to wall studs with web penetrating the opening and the exposed face of the flanges located flush (+1/2 in. or 13 mm, - 0 in.) with both sides of wall.

   C. **W18** (or smaller) x 76 (or heavier) steel beam service support passing through the opening, perpendicular to wall.
3. Firestop System – The firestop system shall consist of the following items:

A. **Fill, Void or Cavity Material* - Sealant** – Min 5/8 in. (16 mm) thickness of fill material applied to completely fill the annular space around steel beam service supports, flush with each surface of wall.

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

System tested with a pressure differential of 2.5 Pa between the exposed and the unexposed surfaces with the higher pressure on the exposed side.

1. **Wall Assembly** – The 1 or 2 h fire-rated gypsum wallboard/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U300, U400, V400 or W400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   
   **A. Studs** – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC. Steel studs to be min 3-5/8 in. (92 mm) wide and spaced max 24 in. (610 mm) OC. Additional stud framing members shall be used to frame all sides of opening.

   **B. Gypsum Board** – One or two layers of nom 5/8 in. (16 mm) thick gypsum board as specified in the individual Wall and Partition Design. Max area of opening is 1024 in² (0.66 m²) with max dimension of 32 in. (813 mm). When wood studs are used, interior of through opening to be lined with sheets of gypsum board around entire periphery to a total thickness of 5/8 in. (16 mm) or 1-1/4 in. (32 mm) for 1 or 2 hr wall assemblies, respectively.

   The hourly F Rating of the firestop system is equal to the hourly rating of the wall.

2. **Cable Tray** – Max 24 in. (610 mm) wide by max 4 in. (102 mm) deep open ladder cable tray with channel-shaped side rails formed from min 0.060 in. (1.5 mm) thick (No. 16 MSG) galv steel or min 0.060 in. (1.5 mm) thick aluminum with rungs spaced max 9 in. (229 mm) OC. A max of two cable trays may be installed within the opening, with a min vertical separation of 6 in. (152 mm). Annulus between the cable tray and the periphery of the opening is min 3/4 in. (19 mm) to max 22 in. (559 mm) for FB-3000WT sealant and 12 in. (305 mm) for CP 25WB+ sealant. Separation between cable tray and metallic or nonmetallic penetrants is min 6 in. (152 mm). Aggregate cross-sectional area of cables in cable tray not to exceed 40 percent of the cross-sectional area of the cable tray based on a max 3 in. (76 mm) cable loading depth within tray. Any combination of the cable types specified in Item 3 may be used.

3. **Cables** – Max 4 in. (102 mm) diam tightly bundled cables. The annular space between cable bundles and other penetrants shall be a min 6 in. (152 mm). Any combination of the following types and sizes of copper conductor cables may be used.
   
   **A.** Max 2/C No.14 AWG cable with XLPE jacket and insulation.
   **B.** Max 2/C No.14 AWG cable with XLPE jacket and insulation.
   **C.** Max 3/C No. 2 AWG cable with XLPE jacket and insulation.
D. Max 4/C No. 6 AWG cable with XLPE jacket and insulation.
E. Max 1000 kcmil single-conductor copper or aluminum power cable; cross-linked polyethylene insulation.
F. Max 3/C 350 MCM cable with XLPE jacket and insulation.
G. Max 1/C 750 MCM cable with XLPE jacket and insulation.
H. Max. 25 pair No 24 AWG Data Twst Communication cable.
I. Max 400 pair No. 24 AWG telephone cable.
J. Max 7/C - No. 12 AWG cable with PVC-nylon insulation and PVC jacket.
K. Max RG/U coaxial cables with plenum rated or fluorinated ethylene jacket and insulation.
L. Multiple fiber optical communication cable jacketed with PVC and having a max outside diam of 5/8 in. (16 mm).

M. Through Penetrating Product — Any cables, Armor Cable+ or Metal Clad Cable+ currently Classified under the Through Penetrating Product category. See Through Penetrating Product (XHLY) category in the Fire Resistance Directory for names of manufacturers.

4. Busway+ — Nom 23 in. (584 mm) wide by 4.5 in. (114 mm) deep (or smaller) "I" shaped aluminum and steel enclosure containing factory mounted copper bars rated for 600 V, 5000A or aluminum bars rated 600V, 4000A. A maximum of one busway to be installed within the opening. The annular space between the busway and the periphery of the opening shall be min 2 in. (51 mm) to max 22 in. (559 mm). Busway spaced min 6 in. (152 mm) from all other penetrants. Busway to be rigidly supported on both sides of wall assembly. The busway shall bear the UL Listing Mark and shall be installed in accordance with the National Electrical Code, NFPA 70. When Busway (Item 10B) is used in the opening, the FB-3000WT sealant shall be used.

5. Metallic Penetrants — One or more metallic pipes, conduits or tubes to be installed within the opening. Annulus between penetrants is min 0 in. (point contact) to max 22 in. (559 mm) for FB-3000WT sealant and 12 in. (305 mm) for CP 25WB+ sealant, except that when the nom pipe diam exceeds 3 in. (76 mm), the minimum annular space between metallic penetrants and other types of penetrants is 6 in. (152 mm). Annulus between penetrants and periphery of opening is 0 in. (point contact) to max 22 in. (559 mm) for FB-3000WT sealant and 12 in. (305 mm) for CP 25WB+ sealant except that the min annular space to periphery of opening is 3 in. (76 mm) when nom pipe diam exceeds 3 in. (76 mm). Penetrants rigidly supported on both sides of wall assembly. The following types and sizes of metallic pipes, conduits or tubing may be used:

A. Steel Pipe — Nom 12 in. (305 mm) diam (or smaller) Schedule 10 (or heavier) steel pipe.
B. Iron Pipe — Nom 12 in. (305 mm) diam (or smaller) cast or ductile iron pipe.
C. Conduit — Nom 6 in. (152 mm) diam (or smaller) rigid steel conduit, nom 4 in. (102 mm) diam (or smaller) electrical metallic tubing (EMT), or nom 4 in. (102 mm) diam (or smaller) steel Flexible Metal Conduit#.
D. Copper Tube — Nom 6 in. (152 mm) diam (or smaller) Regular (or heavier) copper pipe or Type L (or heavier) copper tube.
E. Copper Pipe — Nom 6 in. (152 mm) diam (or smaller) Regular (or heavier) copper pipe or Type L (or heavier) copper tube.

6. Pipe Insulation — One or more max 3 in. (76 mm) diam (or smaller) metallic penetrants (pipe or tubing) may be insulated with the following types of pipe coverings. The annular space between the insulated penetrants and the periphery of the opening shall be min 0 in. (point contact) to max 5 in. (127 mm). The separation between the insulated penetrants and the other penetrants shall be a min 6 in. (152 mm) to max 22 in. (559 mm) for FB-3000WT sealant and 12 in. (305 mm) for CP 25WB+ sealant:

A. Pipe Covering* — Min 1 in. (25 mm) to max 2 in. (51 mm) thick hollow cylindrical heavy density min 3.5 pcf (56 kg/m3) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product.

See Pipe and Equipment Covering - Materials (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

B. Tube Insulation-Plastics+ — Min 1/2 in. (13 mm) to max 3/4 in. (19 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing.

See Plastics+ (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5V may be used.

C. Pipe Covering Materials* — Min 1 in. (25 mm) to max 2 in. (51 mm) thick unfaced mineral fiber pipe insulation having a nom density of 3.5 pcf (56 kg/m3) or heavier and sized to fit the outside diam of pipe or tube. Pipe insulation secured with min 18 SWG steel wire spaced 12 in. (305 mm) OC.

See Plastics+ (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5V may be used.

INDUSTRIAL INSULATION GROUP L L C — High Temperature Pipe Insulation 1200, High Temperature Pipe Insulation BWT and High Temperature Pipe Insulation Thermaloc
C. Sheathing Material – (Not shown) – Optional, used in conjunction with Item 6C. Foil-scrim-kraft or all service jacket material shall be wrapped around the outer circumference of the pipe covering material (Item 3B) with the kraft side exposed. Longitudinal joints sealed with metal fasteners.

See Sheathing Materials (BVDV) category in the Building Materials Directory for names of manufacturers. Any sheathing material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread value of 25 or less and a Smoke Developed value of 50 or less may be used.

D. Pipe Covering Materials – Cellular Glass Insulation – Nom 1-1/2 to 3 in. (38 to 76 mm) thick cellular glass units sized to the outside diam of the steel pipe and supplied in nom 24 in. (610 mm) long half sections or nom 18 in. (457 mm) long segments. Pipe insulation installed on pipe in accordance with the manufacturer's instructions.

PITTSBURGH CORNING CORP – FOAMGLAS

E. Metal Jacket – Used in conjunction with Item 6D. Min 12 in. (305 mm) long jacket formed from min 0.010 in. (0.25 mm) thick aluminum sheet cut to wrap tightly around the pipe insulation with a min 2 in. (51 mm) lap and secured using bands and seals of a similar material or min No. 18 AWG steel tie wire. Bands or steel tie wire to be located within 2 in. (51 mm) of each end of the jacket and spaced max 10 in. (254 mm) OC. Jacket installed with edge abutting surface of fill material on both surfaces of wall.

F. Pipe Insulation - Foamed Plastic* – Nom 1 in. (25 mm) thick polyisocyanurate foamed plastic units jacketed with an all service jacket. Longitudinal joints sealed with self-sealing lap tape. Transverse joints secured with butt tape. Nom 1/2 (13 mm) wide stainless steel band clamp to be secured around pipe insulation 1 in. (25 mm) from both surfaces of wall.

See Foamed Plastic (BRYX) category in the Building Materials Directory for names of manufacturers. Any foamed plastic pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less may be used.

7. Nonmetallic Penetrants – One or more nonmetallic pipes, conduits or tubes may be installed within the opening. Annulus between penetrants and periphery of opening is min 1 in. (25 mm) to max 22 in. (559 mm) for FB-3000WT sealant and 12 in. (305 mm) for CP 25WB+ sealant. Separation between metallic and nonmetallic penetrants is min 6 in. (152 mm). Penetrants rigidly supported on both sides of wall assembly. The following types and sizes of nonmetallic pipes, conduits or tubing may be used:

A. Polyvinyl Chloride (PVC) Pipe – Nom 2 in. (51 mm) diam (or smaller) solid or cellular core Schedule 40 PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

B. Chlorinated Polyvinyl Chloride (CPVC) Pipe – Nom 2 in. (51 mm) diam (or smaller) SDR13.5 CPVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

C. Rigid Nonmetallic Conduit+ – Nom 2 in. (51 mm) diam (or smaller) Schedule 40 PVC conduit installed in accordance with the National Electrical Code (NFPA 70).

D. Electrical Nonmetallic Tubing (ENT)+ – Nom 2 in. (51 mm) diam (or smaller) corrugated wall ENT formed of polyvinyl chloride (PVC) installed in accordance with the National Electrical Code (NFPA 70).

E. Cross Linked Polyethylene Tubing – Nom 1 in. (25 mm) diam (or smaller) cross-linked polyethylene tubing for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

8. Air Conditioning (AC) Line Set – One or more AC line sets installed within opening. Each AC line set consists of two pipes or tubes, tubing insulation and a thermostat cable as described below. The space between the AC line sets shall be min 2 in. (51 mm). The space between the AC line sets and the periphery of the opening shall be min 0 in. (point contact) to max 22 in. (559 mm) for FB-3000WT sealant and 12 in. (305 mm) for CP 25WB+ sealant. The AC line sets shall be spaced min 6 in. (152 mm) from uninsulated metallic penetrants and shall be rigidly supported on both sides of the wall assembly.

8A. Metallic Pipes – A max of two pipes or tubes shall be installed in each AC line set. The following types and sizes of metallic pipes or tubing may be used:

A. Steel Pipe – Nom 1 in. (25 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.

B. Iron Pipe – Nom 1 in. (25 mm) diam (or smaller) cast or ductile iron pipe.

C. Copper Pipe – Nom 1 in. (25 mm) diam (or smaller) Regular (or heavier) copper pipe.

D. Copper Tube – Nom 1 in. (25 mm) diam (or smaller) Type L (or heavier) copper tube.

8B. Tube Insulation - Plastics# – Nom 3/4 in. (19 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. Tube insulation required for all copper tubes and pipes greater than nom 3/4 in. (19 mm) diam.

See Plastics (QMFZ2) category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation meeting the above specifications and having a UL 94 Flammability Classification of 94-SVA may be used.

8C. Cables – Max one 2/C No. 18 AWG (or smaller) control cable with polyvinyl chloride (PVC) insulation and jacket. Cable to be rigidly supported on both sides of wall assembly.

9. Steel Duct – (Not Shown) – Nom 12 in. (305 mm) diam (or smaller) No. 26 gauge (or heavier) spiral wound or long seam galv steel duct may be installed within opening when opening contains no cables or cable tray. The duct shall be constructed and reinforced in accordance with SMACNA construction standards. A max of two steel ducts may be installed within the opening. Ducts to be spaced min 4 in. (102 mm) apart and min 8 in. (203 mm) from insulated penetrants and nonmetallic penetrants. Annulus between the steel duct and the periphery of the opening shall be min 0 in. (point contact) to max 22 in. (559 mm) for FB-3000WT sealant and 12 in. (305 mm) for CP 25WB+ sealant. Steel ducts to be rigidly supported on both sides of wall assembly.
10. Firestop System – The firestop system shall consist of the following items:

A. Packing Material – Min 4 in. (102 mm) thickness (2 hr walls) or min 3-1/2 in. (89 mm) thickness (1 hr walls) of min 4pcf (64 kg/m³) mineral wool batt insulation compressed min 50 percent and tightly packed into opening between and around all penetrants as a permanent form, to full depth of the wall. Packing material recessed from both surfaces of wall to accommodate the required thickness of fill material.

B. Fill, Void or Cavity Materials*–Sealant – Min 5/8 in. (16 mm) depth of fill material applied within the annulus, flush with both surfaces of the wall assembly. Additional fill material forced into interstices of all grouped cables, grouped penetrants, and grouped cables within cable trays. At point contact locations between through penetrants and gypsum board, a min 1/2 in. (13 mm) diam bead of fill material shall be applied at through penetrant/gypsum board interface on both surfaces of the wall. When Busway (Item 4) is used in the opening, the FB-3000WT sealant shall be used.

3M COMPANY — CP 25 WB+ or FB-3000WT (CP 25WB+ not suitable for use with CPVC pipes)

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

System No. F-C-8012
May 19, 2005
F Rating – 1 Hr
T Rating – 1 Hr

1. **Floor-Ceiling Assembly** – The 1 hr fire-rated solid or trussed lumber joist floor-ceiling assembly shall be constructed of the materials and in the manner specified in the individual L500 Series Floor-Ceiling Designs in the UL Fire Resistance Directory, as summarized below:
   A. **Flooring System** – Lumber or plywood subfloor with finish floor of lumber, plywood or **Floor Topping Mixture** as specified in the individual Floor-Ceiling Design. Max diam of floor opening is 4-1/2 in. (114 mm).
   B. **Joists** – Nom 10 in. (254 mm) deep (or deeper) lumber, steel or combination lumber and steel joists, trusses or **Structural Wood Members** with bridging as required and with ends firestopped.
   C. **Gypsum Board** – Nom 4 ft (122 cm) wide by 5/8 in. (16 mm) thick as specified in the individual Floor-Ceiling Design. Wallboard nailed to wood joists. Max diam of ceiling opening is 4-1/2 in. (114 mm).

1.1 **Chase Wall** – (Optional, not shown) – The through penetrants (Item 2) may be routed through a 1 hr fire-rated single, double or staggered wood stud/gypsum wallboard chase wall constructed of the material and in the manner specified in the individual U300 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Studs** – Nom 2 in. by 6 in. (51 mm by 152 mm) or double nom 2 in. by 4 in. (51 mm by 102 mm) lumber studs.
   B. **Sole Plate** – Nom 2 in. by 6 in (51 mm by 152 mm) or parallel 2 in. by 4 in. (51 mm by 102 mm) lumber plates, tightly butted.
   C. **Top Plate** – The double top plate shall consist of two nom 2 in. by 6 in. (51 mm by 152 mm) or two sets of parallel 2 in. by 4 in. (51 mm by 102 mm) lumber plates, tightly butted. Max diam of opening is 4-1/2 in. (114 mm).
   D. **Gypsum Board** – Thickness, type, number of layers and fasteners shall be as specified in individual Wall and Partition Design.

2. **Through Penetrants** – Pipes, conduits, tubing or cables to be bundled within the opening such that the aggregate cross-sectional area of penetrants in opening to be min 42 percent to max 54 percent of the cross-sectional area of the opening in floor-ceiling. A min 1/4 in. (6 mm) annular space shall be maintained around uninsulated metallic pipes. The space between penetrants and periphery of opening shall be min 1/4 in. (6 mm). Penetrants to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of penetrants may be used:
   A. **Metallic Pipes** – The following types and sizes of metallic pipes, conduits or tubing may be used:
      A1. **Steel Pipe** – Nom 3/4 in. (19 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
      A2. **Conduit** – Nom 3/4 in. (19 mm) diam (or smaller) steel electrical metallic tubing or steel conduit.
      A3. **Copper Tubing** – Nom 3/4 in. (19 mm) diam (or smaller) Type L (or heavier) copper tubing.
      A4. **Copper Pipe** – Nom 3/4 in. (19 mm) diam (or smaller) Regular (or Heavier) copper pipe.
      All pipes, conduits or tubing larger than nom 1/2 in. (13 mm) diam shall be provided with pipe covering (Item 2D).
   B. **Nonmetallic Pipes** – A max of one nonmetallic pipe or conduit may be used. A min 1/4 in. (6 mm) space shall be maintained between uninsulated metallic pipes and nonmetallic pipes or conduits. The following Types and sizes of nonmetallic pipes or conduits may be used:
      B1. **Polyvinyl Chloride (PVC) Pipe** – Nom 1-1/4 in. (32 mm) diam (or smaller) Schedule 40 solid core PVC pipe for use in closed (Process or supply) or vented (drain, waste or vent) piping system.
      B2. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** – Nom 1-1/4 in. (32 mm) diam (or smaller) SDR13.5 CPVC pipe for use in closed (process or supply) piping systems.
      B3. **Rigid Nonmetallic Conduit** – Nom 1-1/4 in. (32 mm) diam (or smaller) Schedule 40 PVC conduit installed in accordance with Article 347 of the National Electrical Code (NFPA No. 70).
System No. F-C-8012 continued

C. **Cables** – Max 7/C No. 12 AWG multi-conductor power and control cables; XLPE or PVC insulation with XLPE or PVC jacket.

D. **Pipe Covering** – The following types and sizes of pipe coverings may be used with the metallic pipes:

D1. **Tube Insulation** – **Plastics**+ – Nom 1/2 in. (13 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing.

   See **Plastics**+ (QMFZ2) category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5VA may be used.

D2. **Pipe Covering**+ – Nom 1/2 in. (13 mm) thick hollow cylindrical heavy (min 3.5 pcf or 56 kg/m³) density glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with but tape supplied with the product.

   See **Pipe and Equipment Covering – Materials** (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

3. **Firestop System** – The details of the firestop system shall be as follows:

   A. **Fill, Void or Cavity Materials**+ – **Wrap Strip** – Nom 1/4 in. (6 mm) thick intumescent material supplied in 2 in. (51 mm) wide strips. One wrap strip tightly wrapped around perimeter of penetrants (foil side exposed) and held in position using two steel wire ties. Wrap strip recessed in opening such that 3/4 in. to 1 in. (19 mm to 51 mm) extends below the bottom surface of the gypsum wallboard ceiling or top plate when optional chase wall is used.

   **3M COMPANY** – FS-195+

   B. **Fill, Void or Cavity Materials**+ – **Caulk, Sealant or Putty** – Min 3/4 in. (19 mm) thickness of caulk or putty applied to completely fill annular space inside of wrap strip and between penetrants, flush with the bottom surface of ceiling and extending downward. Min 5/8 in. (16 mm) thickness of caulk or putty applied within annular space between wrap strip and periphery of opening flush with bottom surface of ceiling or top plate. Min 1/2 in. (13 mm) crown of caulk or putty applied around the perimeter of the wrap strip at interface with the gypsum wallboard ceiling or top plate. Min 3/4 in. (19 mm) thickness of caulk or putty applied to completely fill annular space, flush with top surface of floor.

   **3M COMPANY** – CP 25WB+, IC 15WB+ caulk, FB-3000 WT sealant or MP+ Stix putty.

   (Note: CP 25WB+ not suitable for use with CPVC pipes.)

Note: Systems with Nonmetallic Through Penetrant(s) have not been evaluated with a pressure differential of 50 Pa between the exposed and unexposed surfaces as required by the National Building Code of Canada.
1. **Floor-Ceiling Assembly** – The 1 hr fire-rated solid or trussed lumber joist floor-ceiling assembly shall be constructed of the materials and in the manner specified in the individual L500 Series Floor-Ceiling Designs in the UL Fire Resistance Directory, as summarized below:

   A. **Flooring System** – Lumber or plywood subfloor with finish floor of lumber, plywood or **Floor Topping Mixture** as specified in the individual Floor-Ceiling Design. Max diam of floor opening is 4-1/2 in. (114 mm).

   B. **Joists** – Nom 10 in. (254 mm) deep (or deeper) lumber, steel or combination lumber and steel joists, trusses or **Structural Wood Members** with bridging as required and with ends firestopped.

   C. **Gypsum Board** – Nom 4 ft (122 cm) wide by 5/8 in. (16 mm) thick as specified in the individual Floor-Ceiling Design. Gypsum board nailed to wood joists. Max diam of ceiling opening is 4-1/2 in. (114 mm).

1.1 **Chase Wall** – (Optional, not shown) – The through penetrants (Item 2) may be routed through a 1 hr fire-rated single, double or staggered wood stud/gypsum board chase wall constructed of the material and in the manner specified in the individual U300 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Studs** – Nom 2 by 6 in. (51 by 152 mm) or double nom 2 by 4 in. (51 by 102 mm) lumber studs.

   B. **Sole Plate** – Nom 2 by 6 in. (51 by 152 mm) or parallel 2 by 4 in. (51 by 102 mm) lumber plates, tightly butted.

   C. **Top Plate** – The double top plate shall consist of two nom 2 by 6 in. (51 by 152 mm) or two sets of parallel 2 by 4 in. (51 by 102 mm) lumber plates, tightly butted. Max diam of ceiling opening is 4-1/2 in. (114 mm).

   D. **Gypsum Board** – Thickness, type, number of layers and fasteners shall be as specified in individual Wall and Partition Design.

2. **Through Penetrants** – Pipes, conduits, tubing or cables to be bundled within the opening such that the aggregate cross-sectional area of penetrants in opening to be min 42 percent to max 54 percent of the cross-sectional area of the opening in floor-ceiling. A min 1/4 in. (6 mm) annular space shall be maintained around uninsulated metallic pipes. The space between penetrants and periphery of opening shall be min 1/4 in. (6 mm). Penetrants to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of penetrants may be used:

   A. **Metallic Pipes** – The following types and sizes of metallic pipes, conduits or tubing may be used:

      A1. **Steel Pipe** – Nom 3/4 in. (19 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.

      A2. **Conduit** – Nom 3/4 in. (19 mm) diam (or smaller) electrical metallic tubing or steel conduit.

      A3. **Copper Tubing** – Nom 3/4 in. (19 mm) diam (or smaller) Type L or heavier) copper tubing.

      **All Pipes, conduits or tubing larger than nom 1/2 in. (13 mm) diam shall be provided with pipe covering (Item 3).**

   B. **Nonmetallic Pipes** – A max of one nonmetallic pipe or conduit may be used. A min 1/4 in. (6 mm) space must be maintained between uninsulated metallic pipes and nonmetallic pipes or conduits. The following types and sizes of nonmetallic pipes or conduits may be used:

      B1. **Polyvinyl Chloride (PVC) Pipe** – Nom 1-1/4 in. (32 mm) diam (or smaller) Schedule 40 solid core PVC pipe for use in closed (process or supply) or vented (drain, waster or vent) piping system.

      B2. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** – Nom 1-14 in. (32 mm) diam (or smaller) SDR13.5 CPVC pipe for use in closed (process or supply) piping systems.

      B3. **Rigid Nonmetallic Conduit** – Nom 1-1/4 in. (32 mm) diam (or smaller) Schedule 40 PVC conduit installed in accordance with Article 347 of the National Electrical Code (NFPA No. 70).

   C. **Cables** – Max 7/C No. 12 AWG multiconductor power and control cables; XLPE or PVC insulation with XLPE or PVC jacket.
D. **Pipe Covering** – The following types and sizes of pipe coverings may be used with the metallic pipes:

D1. **Tube Insulation** – **Plastics**+ – Nom 1/2 in. (13 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing.

See **Plastics**+ ([QMFZ2](#)) category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5VA may be used.

D2. **Pipe Covering** – Nom 1/2 in. (13 mm) thick hollow cylindrical heavy density (min 3.5 pcf or 56 kg/m³) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product.

See **Pipe and Equipment Covering – Materials** ([BRGU](#)) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

3. **Firestop System** – The details of the firestop system shall be as follows:

A. **Firestop Device** – Firestop device consisting of a steel collar lined with intumescent material and provided with steel clips for attachment to underside of ceiling or top plate when optional chase wall is used in accordance with accompanying installation instructions. The following firestop devices are to be used, dependent on the max opening size:

<table>
<thead>
<tr>
<th>Max Opening Size, In. (mm)</th>
<th>Firestop Device</th>
</tr>
</thead>
<tbody>
<tr>
<td>3-1/2 (89 mm)</td>
<td>PPD 3</td>
</tr>
<tr>
<td>4-1/2 (114 mm)</td>
<td>PPD 4</td>
</tr>
</tbody>
</table>

3M COMPANY

B. **Fill, Void or Cavity Materials** – **Caulk, Sealant or Putty** – Min 5/8 in. (16 mm) thickness of caulk or putty applied within annular space between penetrants and periphery of opening flush with bottom surface of ceiling or top plate. Additionally, when PPD 3 firestop device is used, min 1 in. (25 mm) thickness of caulk or putty applied to completely fill annular space inside of firestop device and between penetrants, flush with the bottom surface of ceiling or top plate and extending downward. When PPD 4 firestop device is used, min 2 in. (51 mm) thickness of caulk or putty applied to completely fill annular space inside of firestop device and between penetrants, flush with the bottom surface of ceiling or top plate and extending downward. Min 3/4 in. (19 mm) thickness of caulk or putty applied to completely fill annular space, flush with top surface of floor.

3M COMPANY – CP 25WB+caulk, MP+putty, IC 15WB caulk, FireDam 150+caulk or FB-3000 WT sealant. (Note: CP 25WB+ and FireDam 150+ not suitable for use with CPVC pipes.)

Note: Systems with Nonmetallic Through Penetrant(s) have not been evaluated with a pressure differential of 50 Pa between the exposed and unexposed surfaces as required by the National Building Code of Canada.
1. **Floor-Ceiling Assembly** – The 1 hr fire-rated solid or trussed lumber joist floor-ceiling assembly shall be constructed of the materials and in the manner specified in the individual L500 series Floor-Ceiling Design in the UL Fire Resistance Directory. The general construction details of floor-ceiling assembly are summarized below:
   A. **Floor System** – Lumber or plywood subfloor with finish floor of lumber, plywood or **Floor Topping Mixture** as specified in the individual floor-ceiling design. Max diam of opening is 4-1/2 in. (114 mm).
   B. **Wood Joists** – Nom 10 in. (254 mm) deep (or deeper) lumber, steel or combination lumber and steel joists, trusses or **Structural Wood Members** with bridging as required and with ends firestopped.
   C. **Gypsum Board** – Nom 5/8 in. (16 mm) thick as specified in the individual floor-ceiling design.

1.1 **Chase Wall** – (Optional, not shown) – The through penetrants (Item 2) may be routed through a fire-rated single, double or staggered wood stud/gypsum wallboard chase wall having a fire rating consistent with that of the floor-ceiling assembly. The chase wall shall be constructed of the materials and in the manner specified in the individual U300 series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Studs** – Nom 2 by 6 in. (51 by 152 mm) or double nom 2 by 4 in. (51 by 102 mm) lumber studs.
   B. **Sole Plate** – Nom 2 by 6 in. (51 by 152 mm) or parallel 2 by 4 in. (51 by 102 mm) lumber plates, tightly butted.
   C. **Top Plate** – The double top plate shall consist of two nom 2 by 6 in. (51 by 152 mm) or two sets of parallel 2 by 4 in. (51 by 102 mm) lumber plates, tightly butted. Max diam of opening is 4-1/2 in. (114 mm).
   D. **Gypsum Board** – Thickness, type, number of layers and fasteners shall be as specified in individual wall and partition design.

2. **Through Penetrants** – Pipes, conduits, tubing and cables to be bundled within the opening such that the aggregate cross-sectional area of penetrants in opening to be min 40 percent to max 54 percent of the cross-sectional area of the opening in floor-ceiling assembly. A min 1/4 in. (6 mm) annular space shall be maintained around uninsulated metallic pipes. The annular space between penetrants and periphery of opening shall be min 1/4 in. (6 mm) to max 1/2 in. (13 mm). Penetrants to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of penetrants may be used:
   A. **Metallic Pipes** – The following type and size of metallic tubing may be used:
      A1. **Copper Tubing** – Nom 3/4 in. (19 mm) diam (or smaller) Type L copper tubing.
      A2. **Copper Pipe** – Nom 3/4 in. (19 mm) diam (or smaller) Regular (or heavier) copper pipe.
   All pipes and tubing greater than nom 1/2 in. (13 mm) diam shall be provided with pipe covering (Item 2D).
   B. **Nonmetallic Pipes** – A max of one nonmetallic pipe may be used. A min 1/4 in. (6 mm) space must be maintained between uninsulated metallic pipes and nonmetallic pipes. The following type and size of nonmetallic pipe may be used:
      A1. **Polyvinyl Chloride (PVC) Pipe** – Nom 1-1/4 in. (32 mm) diam (or smaller) Schedule 40 solid core PVC pipe for use in closed (process or supply or vented (drain, waste or vent) piping system.
      A2. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** – Nom 1-1/4 in. (32 mm) diam (or smaller) SDR 13.5 CPVC pipe for use in closed (process or supply) piping system.
   C. **Cables** – Max 7/C with ground No. 12 AWG (or smaller) multiconductor power or control cable with PVC insulation and jacket materials.
   D. **Pipe Covering – Tube Insulation – Plastics** – Nom 5/8 in. (16 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing.

See **Plastics** (QMFZ2) category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-SVA may be used.
System No. F-C-8020 continued

3. **Firestop System** – The firestop system shall consist of the following:

   A. **Fill, Void or Cavity Materials** – Putty, Sealant or Caulk – Min 5/8 in. (16 mm) thickness of putty or caulk applied to completely fill annular space and interstices between penetrants flush with the bottom surface of the ceiling or top plate. Min 3/4 in. (19 mm) thickness of putty or caulk applied to completely fill annular space and interstices between penetrants flush with the top surface of the floor or sole plate. An additional 1/2 in. (13 mm) diam bead of putty or caulk to be installed around the outside of steel collar (Item 3C) at the collar/gypsum board interface.

   **3M COMPANY** – MP+ putty, CP 25WB+ caulk, IC 15WB+ caulk, FireDam 150+ caulk or FB-3000 WT.

   (Note: CP 25WB+ and FireDam 150+ not suitable for use with CPVC pipes.)

   B. **Fill, Void or Cavity Materials** – Wrap Strip – Min three continuous layers of 2 in. (51 mm) wide wrap strip installed around penetrants and tightly butted against the bottom of the ceiling.

   **3M COMPANY** – Ultra GS

   C. **Steel Collar** – Nom 2 in. (51 mm) deep collar with 1-1/4 in. (32 mm) wide by 2 in. (51 mm) long anchor tabs and min 3/4 in. (19 mm) long tabs to retain wrap strip layers. Coils of precut min 0.016 in. (.41 mm) thick (28 gauge) galv sheet steel are available from wrap strip manufacturer. As an alternate, collar may be field fabricated from min 0.016 in. (.41 mm) thick (28 gauge) galv sheet steel in accordance with instruction sheet supplied by wrap strip manufacturer. Steel collar, with anchor tabs bent outward 90 degrees, wrapped tightly around wrap strip layers with min 1 in. (25 mm) overlap at the seam. A min 1/2 in. (13 mm) wide by min 0.028 in. (.71 mm) thick stainless steel band clamp secured around collar at midheight. As an alternate to the band clamp, collar may be fastened together along the overlapping seam with three No. 6 by 3/8 in. (152 by 10 mm) long self-tapping steel screws. Collar secured to gypsum lboard ceiling using 3/16 in. (5 mm) diam steel toggle bolts in conjunction with 1-1/4 in. (32 mm) diam steel fender washers. Collar secured to top plate when chase wall is used using min 1 in. (25 mm) long No. 12 (or larger) steel wood screws in conjunction with 1-1/4 in. (32 mm) diam steel fender washers. Wrap strip retainer tabs to be bent 90 degrees toward pipe to lock wrap strip layers in position. Min of four symmetrically located anchors required.

1. **Floor-Ceiling Assembly** – The 1 hr fire-rated solid or trussed lumber joist floor-ceiling assembly shall be constructed of the materials and in the manner specified in the individual L500 Series Floor-Ceiling Designs in the UL Fire Resistance Directory. The general construction details of the floor-ceiling assembly are summarized below:

   A. **Flooring System** – Lumber or plywood subfloor with finish floor of lumber, plywood or **Floor Topping Mixture** as specified in the individual Floor-Ceiling Design. Max diam of opening is 5 in. (127 mm).

   B. **Wood Joists** – Nom 10 in. (254 mm) deep (or deeper) lumber, steel or combination lumber and steel joists, trusses or **Structural Wood Members** with bridging as required and with ends firestopped.

   C. **Gypsum Board** – Nom 4 ft (122 mm) wide by 5/8 in. (16 mm) thick as specified in the individual Floor-Ceiling Design. Max diam of opening is 5 in. (127 mm).

1.1 **Chase Wall** (Optional, not shown) – The through penetrants (Item No. 2) may be routed through a fire-rated single, double or staggered wood stud/gypsum board chase wall having a fire rating consistent with that of the floor-ceiling assembly. The chase wall shall be constructed of the materials and in the manner specified in the individual U300 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Studs** – Nom 2 in. by 6 in. (51 mm by 152 mm) or double nom 2 in. by 4 in. (51 mm by 102 mm) lumber studs.

   B. **Sole Plate** – Nom 2 in. by 6 in. (51 mm by 152 mm) or parallel 2 in. by 4 in. (51 mm by 102 mm) lumber plates, tightly butted. Max diam of opening is 5 in. (127 mm).

   C. **Top Plate** – The double top plate shall consist of two nom 2 in. by 6 in. (51 mm by 152 mm) or two sets of parallel 2 in. by 4 in. (51 mm by 102 mm) lumber plates, tightly butted. Max diam of opening is 5 in. (127 mm).

   D. **Gypsum Board** – Thickness, type, number of layers and fasteners shall be as specified in individual Wall and Partition Design.

2. **Through Penetrants** – One or more metallic pipes, conduits or tubing to be installed concentrically or eccentrically within opening. Pipes, conduits or tubing to be spaced min 0 in. (point contact) to max 1 in. (0 mm to max 25 mm) apart. The space between the pipes, conduits or tubing and the periphery of the opening shall be min 0 in. (point contact) to max 1 in. (0 mm to max 25 mm). Penetrants to be rigidly supported on both sides of floor-ceiling assembly. The following types and sizes of metallic pipe, conduits or tubing may be used:

   A. **Steel Pipe** – Nom 3/4 in. (19 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.

   B. **Conduit** – Nom 3/4 in. (19 mm) diam (or smaller) steel electrical metallic tubing or steel conduit.

   C. **Copper Tubing** – Nom 3/4 in. (19 mm) diam (or smaller) Type L (or heavier) copper tubing.

   D. **Copper Pipe** – Nom 3/4 in. (19 mm) diam (or smaller) Regular (or heavier) copper pipe.

3. **Tube Insulation** – **Plastics** – Nom 3/4 in. (19 mm) thick (or less) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. The annular space between the insulated penetrant and the periphery of the opening shall be min 0 in. (point contact) to max 1 in. (0 mm to max 25 mm).

   See **Plastics** (QMFZ2) category in the Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5A may be used.
4. **Nonmetallic Pipes** – One nonmetallic pipe or conduit to be installed within the firestop system. Pipe or conduit to be spaced min 0 in. (point contact) to max 1 in. (0 mm to max 25 mm) from the insulated through penetrants and min 1/2 in. to max 1 in. (13 mm to max 25 mm) from non-insulated through penetrants. The space between the pipe or conduit and the periphery of the opening shall be min 0 in. (point contact) to max 1 in. (0 mm to max 25 mm). Pipe or conduit to be rigidly supported on both sides of floor-ceiling assembly. One of the following types and sizes of nonmetallic through penetrants may be used:

A. **Polyvinyl Chloride (PVC) Pipe** – Nom 1-1/2 in. (38 mm) diam (or smaller) Schedule 40 solid-core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

B. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** – Nom 1-1/2 in. (38 mm) diam (or smaller) SDR13.5 CPVC pipe for use in closed (process or supply) piping systems.

C. **Rigid Nonmetallic Conduit**++ – Nom 1-1/2 in. (38 mm) diam (or smaller) Schedule 40 solid-core PVC conduit installed in accordance with Article 347 of the National Electrical Code (NFPA No. 70).

5. **Cables** – Max two 7/C (or less) No. 12 AWG (or smaller) multiconductor power and control cables with XLPE or PVC insulation with XLPE or PVC jacket. Cables to be spaced min 0 in. (point contact) to max 1 in. (0 mm to max 25 mm) from the insulated through penetrants and min 1/2 in. to max 1 in. (13 mm to max 25 mm) from non-insulated through penetrants. The space between the cables and the periphery of the opening shall be min 0 in. (point contact) to max 1 in. (0 mm to max 25 mm). Cables to be rigidly supported on both sides of the floor-ceiling assembly.

6. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Min 3/4 in. (19 mm) thickness of caulk applied within annulus, flush with top surface of floor or sole plate. Min 5/8 in. (16 mm) thickness of caulk applied within annulus, flush with bottom surface of ceiling or top plate. Min 1/4 in. (6 mm) diam bead of caulk applied at point contact locations at penetrant/floor interface on top surface of floor or sole plate and at penetrant/ceiling or top plate interface.

3M COMPANY – CP 25WB+, IC 15WB+ caulk or FB-3000 WT sealant

**Note:** This system was tested with a pressure differential of 50 Pa between the exposed and unexposed surfaces with the higher pressure on the exposed side.
1. **Floor-Ceiling Assembly** — The 1 hr fire-rated wood joist floor-ceiling assembly shall be constructed of the materials and in the manner specified in the individual L500 Designs in the UL Fire Resistance Directory, as summarized below:

   **A. Flooring System** — Lumber or plywood subfloor with finish floor of lumber, plywood or **Floor Topping Mixture** as specified in the individual Floor-Ceiling Design. Max area of rectangular opening cut in flooring is 43-1/2 sq in. (0.028 m²) with a max width dimension of 3 in. (76 mm) and with a max length dimension of 14-1/2 in. (368 mm). Longer dimension of rectangular opening to be perpendicular to wood joist direction.

   **B. Wood Joists** — Nom 10 in. (254 mm) deep (or deeper) lumber, steel or combination lumber and steel joists, trusses or **Structural Wood Members** with bridging as required and with ends firestopped.

   **C. Gypsum Board** — Thickness, type, number of layers and fasteners as required in the individual Floor-Ceiling Design. Max area of rectangular opening cut in gypsum board ceiling is 43-1/2 sq in. (0.028 m²) with a max width dimension of 3 in. (76 mm) and with a max length dimension of 14-1/2 in. (368 mm).

1A. **Chase Wall** — (Optional, Not Shown) - The through penetrants (Item 2) may be routed through a 1 hr fire rated single, double or staggered wood stud/gypsum board chase wall. Depth of chase wall stud cavity to be min 1/2 in. (13 mm) greater than width of opening cut in sole and top plates to accommodate the through penetrants. The chase wall shall be constructed of the materials and in the manner specified in the individual U300 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   **A. Studs** — Nom 2 by 4 in. (51 by 102 mm), 2 by 6 in. (51 by 152 mm) or double nom 2 by 4 in. (51 by 102 mm) lumber studs.

   **B. Sole Plate** — Nom 2 by 4 in. (51 by 102 mm), 2 by 6 in. (51 by 152 mm) or parallel 2 by 4 in. (51 by 102 mm) lumber plates, tightly butted. Max area of rectangular opening cut in sole plate is 43-1/2 sq in. (0.028 m²) with a max width dimension of 3 in. (76 mm) and with a max length dimension of 14-1/2 in. (368 mm).

   **C. Top Plate** — The double top plate shall consist of two nom 2 by 4 in. (51 by 102 mm), two nom 2 by 6 in. (51 by 152 mm) or two sets of parallel 2 by 4 in. (51 by 102 mm) lumber plates, tightly butted. Max area of rectangular opening cut in top plate is 43-1/2 sq in. (0.028 m²) with a max width dimension of 3 in. (76 mm) and with a max length dimension of 14-1/2 in. (368 mm).

   **D. Gypsum Board** — Thickness, type, number of layers and fasteners shall be as specified in the individual Wall and Partition Design.

2. **Through Penetrants** — One or more metallic or nonmetallic pipes, conduits, tubing or cables to be installed either concentrically or eccentrically within the opening. Min separation between penetrants to be 1 in. (25 mm). Annular space between the penetrants and the periphery of the opening shall be min 0 in. (point contact) to max 1 in. (25 mm). Penetrants to be rigidly supported on both sides of floor-ceiling assembly. The following types and sizes of through penetrants may be used:

   **A. Metallic Penetrants** — The following types and sizes of metallic pipes, conduits or tubes may be used:

      **A1. Steel Pipe** — Nom 2 in. (51 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.

      **A2. Iron Pipe** — Nom 2 in. (51 mm) diam (or smaller) cast or ductile iron pipe.
**System No. F-C-8047 continued**

A3. **Copper Pipe or Tubing** — Nom 2 in. (51 mm) diam (or smaller) Type L (or heavier) copper tube or Regular (or heavier) copper pipe.

A4. **Conduit** — Nom 2 in. (51 mm) diam (or smaller) rigid steel conduit, electrical metallic tubing (EMT) or flexible steel or aluminum conduit.

B. **Nonmetallic Penetrants** — The following types and sizes of nonmetallic pipes, conduits or tubes may be used:

B1. **Polyvinyl Chloride (PVC) Pipe** — Nom 2 in. (51 mm) diam (or smaller) Schedule 40 solid or cellular core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

B2. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** — Nom 2 in. (51 mm) diam (or smaller) SDR11 CPVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

B3. **Rigid Nonmetallic Conduit (RNC)+** — Nom 2 in. (51 mm) diam (or smaller) Schedule 40 PVC conduit installed in accordance with the National Electrical Code (NFPA 70).

B4. **Electrical Nonmetallic Tubing (ENT)+** — Nom 2 in. (51 mm) diam (or smaller) PVC tubing installed in accordance with the National Electrical Code (NFPA 70).

B5. **Cross Linked Polyethylene (PEX) Tubing** — Nom 2 in. (51 mm) diam (or smaller) SDR 9 PEX tubing for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

C. **Cables** — Max 2 in. (52 mm) diam cable bundle installed eccentrically or concentrically within opening. Annular space between cable bundle and periphery of opening to be min 0 in. (point contact) to max 1 in. Cable bundle to be rigidly supported on both sides of wall. The following types and sizes of cables may be used:

C1. Max 200 pair No. 22 AWG (or smaller) copper conductor with polyvinyl chloride (PVC) insulation and jacketing material.

C2. Max 1/C No. 350 kcmil (or smaller) copper conductor cable with cross-linked polyethylene (XLPE) or PVC jacket.

C3. Max 7/C No. 12 AWG (or smaller) copper conductor power and control cables with XLPE or PVC insulation with XLPE or PVC jacket.

C4. Max 3/C No. 4/0 AWG (or smaller) copper or aluminum conductor SER cables with XLPE or PVC insulation and jacket.

C5. Max 4/C No. 2/0 AWG (or smaller) copper conductor, aluminum clad or steel clad TECK 90 cable with or without PVC jacketed.

C6. Max 110/125 fiber optic (F.O.) cable with PVC insulation and jacket.

C7. Max 3/C with ground No. 8 AWG (or smaller) copper conductor NM cable with PVC insulation and jacket.

C8. Max RG/U coaxial cable with fluorinated ethylene insulation and jacket.

C9. Max 4 pair No. 24 AWG (or smaller) copper conductor data cable with Hylar jacket and insulation.

C10. **Through Penetrating Product*** — Any cables, **Armored Cable+ or Metal Clad Cable+** currently Classified under the Through Penetrating Product category.

The T, FT and FTH Ratings are 1 hr unless copper pipe or tube is used. When copper pipe of tube is used, the hourly T, FT and FTH Ratings are 1/2 hr.

3. **Fill, Void or Cavity Material** - Sealant — Min 3/4 in. (19 mm) thickness of fill material applied within the annulus, flush with the top surface of the floor or chase wall sole plate. Min 5/8 in. (16 mm) thickness of fill material applied within the annulus, flush with bottom surface of gypsum board ceiling or chase wall top plate. Min 1/4 in. (6 mm) diam bead of fill material applied at point contact location on the top surface of floor or chase wall sole plate and at the penetrant/ceiling or penetrant/chase wall top plate interface.

**3M COMPANY 3M FIRE PROTECTION PRODUCTS** — CP 25WB+ caulk, IC 15WB+ caulk or FB-3000 WT sealant

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

1. **Floor-Ceiling Assembly** – The 1 hr fire rated concrete and steel joist Floor-Ceiling assembly shall be constructed of the materials and in the manner described in the individual G500 Series Design in the UL Fire Resistance Directory, as summarized below.
   A. **Flooring** – Lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete as specified in the individual G500 Series Design. Max diam of opening is 4-1/2 in. (114 mm).
   B. **Joists** – Steel Joists or **Structural Steel Members** as specified in the individual G500 Series Design.
   C. **Gypsum Board** – Min 5/8 in. (16 mm) thick, screw-attached to furring channels as specified in the individual G500 Series Design. Max diam of opening is 4-1/2 in. (114 mm).

2. **Through Penetrants** – Pipes, conduits, tubing or cables to be bundled within the opening such that the aggregate cross-sectional area of penetrants in opening to be min 42 percent to max 54 percent of the cross-sectional area of the opening in floor-ceiling. A min 1/4 in. (6 mm) annular space shall be maintained around uninsulated metallic pipes. The space between penetrants and periphery of opening shall be min 1/4 in. (6 mm). Penetrants to be rigidly supported on both sides of floor assembly. The following types and sizes of penetrants may be used.
   A. **Metallic Pipes** – The following types and sizes of metallic pipes, conduits or tubing may be used:
      A1. **Steel Pipe** – Nom 3/4 in. (19 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
      A2. **Conduit** – Nom 3/4 in. (19 mm) diam (or smaller) steel electrical metallic tubing or steel conduit.
      A3. **Copper Tubing** – Nom 3/4 in. (19 mm) diam (or smaller) Type L (or heavier) copper tubing.
      A4. **Copper Pipe** – Nom 3/4 in (19 mm) diam (or smaller) Regular (or heavier) copper pipe.
      All pipes, conduits or tubing larger than nom 1/2 in. (13 mm) diam shall be provided with pipe covering (Item 2D).
   B. **Nonmetallic Pipes** – A max of one nonmetallic pipe or conduit may be used. A min 1/4 in. (6 mm) space shall be maintained between uninsulated metallic pipes and nonmetallic pipes or conduits. The following types and sizes of nonmetallic pipes or conduits may be used:
      B1. **Polyvinyl Chloride (PVC) Pipe** – Nom 1-1/4 in (32 mm) diam (or smaller) Schedule 40 solid core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.
      B2. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** – Nom 1-1/4 in. (32 mm) diam (or smaller) SDR13.5 CPVC pipe for use in closed (process or supply) piping systems.
      B3. **Rigid Nonmetallic Conduit** – Nom 1-1/4 in. (32 mm) diam (or smaller) Schedule 40 PVC conduit installed in accordance with the National Electrical Code (NFPA No. 70).
   C. **Cables** – Max 7/C No. 12 AWG multiconductor power and control cables; XLPE or PVC insulation with XLPE or PVC jacket.
   D. **Pipe Covering** – The following types and sizes of pipe coverings may be used with the metallic pipes:
      D1. **Tube Insulation – Plastics** – Nom 1/2 in. (13 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. 
         See **Plastics** category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5VA may be used.
      D2. **Pipe Covering** – Nom 1/2 in. (13 mm) thick hollow cylindrical heavy density (min 3.5 pcf or 56 kg/m³) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product.
      See **Pipe and Equipment Covering – Materials** category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.
3. **Firestop System** – The details of the firestop system shall be as follows:

A. **Fill, Void or Cavity Materials** – **Wrap Strip** – Min 1/4 in. (6 mm) thick intumescent material supplied in 2 in. (51 mm) wide strips. One wrap strip tightly wrapped around perimeter of penetrants (foil side exposed) and held in position using two steel wire ties. Wrap strip recessed into opening such that 3/4 to 1 in. (19 to 51 mm) extends below the bottom surface of the gypsum wallboard ceiling.

   3M COMPANY – FS-195+

B. **Fill, Void or Cavity Materials** – **Caulk, Sealant or Putty** – Min 3/4 in. (19 mm) thickness of caulk or putty applied within annular space inside of wrap strip and between penetrants, flush with the bottom surface of ceiling and extending downward. Min 5/8 in. (16 mm) thickness of caulk or putty applied within annular space between wrap strip and periphery of opening flush with bottom surface of ceiling. Min 1/2 in. (13 mm) diam bead of caulk or putty applied around the perimeter of the wrap strip at interface with the gypsum wallboard ceiling. Min 3/4 in. (19 mm) thickness of caulk or putty applied within annular space, flush with top surface of floor.

   3M COMPANY – CP 25WB+ caulk, MP+ putty, IC 15WB caulk, FireDam 150+ caulk or FB-3000 WT sealant.

   (Note: CP 25WB+ and FireDam 150+ not suitable for use with CPVC pipes.)

**Note:** Systems with Nonmetallic Through Penetrant(s) have not been evaluated with a pressure differential of 50 Pa between the exposed and unexposed surfaces as required by the National Building Code of Canada.
1. **Floor-Ceiling Assembly** – The 1 hr fire rated concrete and steel joist Floor-Ceiling assembly shall be constructed of the materials and in the manner described in the individual G500 Series Design in the UL Fire Resistance Directory, as summarized below:
   
   A. **Flooring** – Lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete as specified in the individual G500 Series Design. Max diam of opening is 4-1/2 in. (114 mm).
   B. **Joists** – Steel Joists or **Structural Steel Members** as specified in the individual G500 Series Design.
   C. **Gypsum Board** – Min 5/8 in. (16 mm) thick, screw-attached to furring channels as specified in the individual G500 Series Design. Max diam of opening is 4-1/2 in. (114 mm).

2. **Through Penetrants** – Pipes, conduits, tubing or cables to be bundled within the opening such that the aggregate cross-sectional area of penetrants in opening to be min 42 percent to max 54 percent of the cross-sectional area of the opening in floor-ceiling. A min 1/4 in. (6 mm) annular space shall be maintained around uninsulated metallic pipes. The space between penetrants and periphery of opening shall be min 1/4 in. (6 mm). Penetrants to be rigidly supported on both sides of floor assembly. The following types and sizes of penetrants may be used.
   
   A. **Metallic Pipes** – The following types and sizes of metallic pipes, conduits or tubing may be used:
      
      A1. **Steel Pipe** – Nom 3/4 in. (19 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
      A2. **Conduit** – Nom 3/4 in. (19 mm) diam (or smaller) steel electrical metallic tubing or steel conduit.
      A3. **Copper Tubing** – Nom 3/4 in. (19 mm) diam (or smaller) Type L (or heavier) copper tubing.

   All pipes, conduits or tubing larger than nom 1/2 in. (13 mm) diam shall be provided with pipe covering (Item 2D).

   B. **Nonmetallic Pipes** – A max of one nonmetallic pipe or conduit may be used. A min 1/4 in. (6 mm) space shall be maintained between uninsulated metallic pipes and nonmetallic pipes or conduits. The following types and sizes of nonmetallic pipes or conduits may be used:
      
      B1. **Polyvinyl Chloride (PVC) Pipe** – Nom 1-1/4 in (32 mm) diam (or smaller) Schedule 40 solid core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.
      B2. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** – Nom 1-1/4 in. (32 mm) diam (or smaller) SDR13.5 CPVC pipe for use in closed (process or supply) piping systems.
      B3. **Rigid Nonmetallic Conduit** – Nom 1-1/4 in. (32 mm) diam (or smaller) Schedule 40 PVC conduit installed in accordance with the National Electrical Code (NFPA No. 70).

   C. **Cables** – Max 7/C No. 12 AWG multiconductor power and control cables; XLPE or PVC insulation with XLPE or PVC jacket.

   D. **Pipe Covering** – The following types and sizes of pipe coverings may be used with the metallic pipes:
      
      D1. **Tube Insulation – Plastics** – Nom 1/2 in. (13 mm) thick acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing.

      See **Plastics** (QMFZ2) category in the Plastics Recognized Component Directory for names of manufacturers. Any Recognized Component tube insulation material meeting the above specifications and having a UL 94 Flammability Classification of 94-5VA may be used.

      D2. **Pipe Covering** – Nom 1/2 in. (13 mm) thick hollow cylindrical heavy density (min 3.5 pcf or 56 kg/m³) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product.

      See **Pipe and Equipment Covering – Materials** (BRGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.
3. **Firestop System** – The details of the firestop system shall be as follows:

   A. **Firestop Device** – Firestop device consisting of a steel collar lined with intumescent material and provided with steel clips for attachment to underside of ceiling in accordance with accompanying installation instructions. The following firestop devices are to be used, dependent on the max opening size.

<table>
<thead>
<tr>
<th>Max Opening Size, In. (mm)</th>

   **3M COMPANY**

   B. **Fill, Void or Cavity Materials** – **Caulk, Sealant or Putty** – Min 5/8 in. (16 mm) thickness of caulk or putty applied within annular space between penetrants and periphery of opening flush with bottom surface of ceiling. Additionally, when PPD 3 firestop device is used, min 1 in. (25 mm) thickness of caulk or putty applied to completely fill annular space inside of firestop device and between penetrants, flush with the bottom surface of ceiling and extending downward. When PPD 4 firestop device is used, min 2 in. (51 mm) thickness of caulk or putty applied to completely fill annular space inside of firestop device and between penetrants, flush with the bottom surface of ceiling and extending downward. Min 3/4 in. (19 mm) thickness of caulk or putty applied within annular space, flush with top surface of floor.

   **3M COMPANY** – CP 25WB+ caulk, MP+ putty, IC 15WB+ caulk, FireDam 150+ caulk or FB-3000 WT sealant.

   (Note: CP 25WB+ and FireDam 150+ not suitable for use with CPVC pipes.)

   **Note:** Systems with Nonmetallic Through Penetrant(s) have not been evaluated with a pressure differential of 50 Pa between the exposed and unexposed surfaces as required by the National Building Code of Canada.
1. **Floor-Ceiling Assembly** – The 1 hr fire rated concrete and steel joist Floor-Ceiling assembly shall be constructed of the materials and in the manner described in the individual G500 Series Design in the UL Fire Resistance Directory, as summarized below:
   A. **Flooring** – Normal or Lightweight concrete as specified in the individual G500 Series Design. Max diam of opening is 5 in. (127 mm).
   B. **Joists** – Steel joists or **Structural Steel Members** as specified in the individual G500 Series Design.
   C. **Gypsum Board** – Min 5/8 in. (16 mm) thick, screw-attached to furring channels as specified in the individual G500 Series Design. Max diam of opening is 5 in. (127 mm).

2. **Through Penetrants** – One or more metallic pipes, conduits or tubing to be installed concentrically or eccentrically within opening. Pipes, conduits or tubing to be spaced min 0 in. (point contact) to max 1 in. (0 mm to max 25 mm) apart. The space between the pipes, conduits or tubing and the periphery of the opening shall be min 0 in. (point contact) to max 1 in. (0 mm to max 25 mm). Penetrants to be rigidly supported on both sides of floor-ceiling assembly. The following types and sizes of metallic pipe, conduits or tubing may be used:
   A. **Steel Pipe** – Nom 3/4 in. (19 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
   B. **Conduit** – Nom 3/4 in. (19 mm) diam (or smaller) electrical metallic tubing or steel conduit.
   C. **Copper Tubing** – Nom 3/4 in. (19 mm) diam (or smaller) Type L (or heavier) copper tubing.
   D. **Copper Pipe** – Nom 3/4 in. (19 mm) diam (or smaller) Regular (or heavier) copper pipe.

3. **Tube Insulation – Plastics** – Nom 3/4 in. (19 mm) thick (or less) acrylonitrile butadiene/polyvinyl chloride (AB/PVC) flexible foam furnished in the form of tubing. The annular space between the insulated penetrant and the periphery of the opening shall be min 0 in. (point contact) to max 1 in. (0 mm to max 25 mm).

4. **Nonmetallic Pipes** – One nonmetallic pipe or conduit to be installed within the firestop system. Pipe or conduit to be spaced min 0 in. (point contact) to max 1 in. (0 mm to max 25 mm) from the insulated through penetrants and min 1/2 in. to max 1 in. (13 mm to max 25 mm) from non-insulated through penetrants. The space between the pipe or conduit and the periphery of the opening shall be min 0 in. (point contact) to max 1 in. (0 mm to max 25 mm). Pipe or conduit to be rigidly supported on both sides of floor-ceiling assembly. One of the following types and sizes of nonmetallic through penetrants may be used:
   A. **Polyvinyl Chloride (PVC) Pipe** – Nom 1-1/2 in. (38 mm) diam (or smaller) Schedule 40 solid-core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.
   B. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** – Nom 1-1/2 in. (32 mm) diam (or smaller) SDR13.5 CPVC pipe for use in closed (process or supply) piping systems.
   C. **Rigid Nonmetallic Conduit** – Nom 1-1/2 in. (38 mm) diam (or smaller) Schedule 40 solid-core PVC conduit installed in accordance with Article 347 of the National Electrical Code (NFPA No. 70).

5. **Cables** – Max two 7/C (or less) No. 12 AWG (or smaller) multiconductor power and control cables with XLPE or PVC insulation with XLPE or PVC jacket. Cables to be spaced min 0 in. (point contact) to max 1 in. (0 mm to max 25 mm) from the insulated through penetrants and min 1/2 in. to max 1 in. (13 mm to max 25 mm) from non-insulated through penetrants. The space between the cables and the periphery of the opening shall be min 0 in. (point contact) to max 1 in. (0 mm to max 25 mm). Cables to be rigidly supported on both sides of the floor-ceiling assembly.
System No. F-E-8005 continued

6. **Fill, Void or Cavity Materials** – **Caulk or Sealant** – Min 3/4 in. (19 mm) thickness of caulk applied within annulus, flush with top surface of floor. Min 5/8 in. (16 mm) thickness of caulk applied within annulus, flush with bottom surface of ceiling. Min 1/4 in. (6 mm) diam bead of caulk applied at point contact locations at penetrant/floor interface on top surface of floor and at penetrant/ceiling interface.

   **3M COMPANY** – CP 25WB+, IC 15WB+ caulk or FB-3000 WT sealant
   (Note: CP 25WB+ not suitable for use with CPVC pipes.)

1. **Floor/Ceiling Assembly** – Code conforming 1 hour rated floor/ceiling assembly, framed with minimum nominal 2" x 10" solid sawn or manufactured wood joists, topping optional (not shown).

2. **Chase Wall** – Rated or non-rated wood or steel stud gypsum wallboard assembly.

3. **Penetrants** – (See table of ratings) Ratings achieved will equal that of floor/ceiling assembly. Cables - May consist of 12 AWG, minimum of one to maximum seven cables, 100 pair 22 AWG, maximum 3 conductor with ground No. 2 AWG aluminum SER cable, Maximum three conductor No. 12 AWG, MC (BX) copper cable or coaxial cable.

4. **Firestop System Components:**
   
   (a) **Forming Material** – If the top or bottom plate has been cut out to prepare a rectangular opening, sheet metal strips shall be nailed to the sides of the plates to form a confined space in which to install 4 pcf mineral wool, compressed 25%.
   
   (b) **3M FireDam 150+ Caulk** – Applied flush with top surface of the sole plate to a depth of 3/4" within the annulus. Minimum 5/8" inch thickness of fill material applied flush with the bottom surface of the ceiling or top plate. Minimum 1/2" diameter bead of caulk applied at the penetrant/floor or sole plate interface at point contact location on the top surface of floor or sole plate and at the penetrant/ceiling or top plate interface at point contact location.

**Note:** Metric conversion factor, inches x 25.4 = mm.

Design No. PH 60-03 continued

2. **Wall Assembly:** Code conforming 1 hour fire-rated or non fire-rated gypsum wallboard assembly with wood framing members.

3. **Penetrants:** (See Table of Ratings above) Schedule 40, ccABS, ABS, PVC pipes for DWV (Drain, Waste and Vent) or Closed (Process and Supply) piping systems and PVC – Thin Wall Vacuum Tubing (nominal 2" diameter). Penetrants must be contained within a wall assembly. Ratings achieved will equal that of floor/ceiling assembly.
   a) Tee’s, Elbows and Couplings: Branch piping and connections are permitted within the assembly.

4. **Forming Material:** Required for notched or cut out openings, mineral wool, 4 pcf, tightly packed, nominal 1" thickness, recessed 1/4" from the top surface of the sole or top plates, not required for circular openings.

5. **Sheet Metal Strip:** Nominal 1-1/2” width, minimum 30 gauge thickness, secured with wallboard screws, applied to notched or cut out openings in sole and top plates, to act as a retainer for the forming material (Item 4).

6. **Sealant:** *3M™ FireDam 150+ Caulk applied as follows:
   a) **Circular Openings:** Apply a 5/8" thickness of caulk within the annular space flush with the floor surface.
   b) **Top Plate:** Apply a 1/4" thickness of caulk, within the annular space, flush with the bottom surface of the top plate.
   c) **Sole Plate:** Apply a 1/4" thickness of caulk, within the annular space, flush with the top surface of the sole plate.
   d) **Top Plate:** Apply a 1/4" thickness of caulk, over mineral wool forming material, within the annular space flush with the top or bottom (not shown) surface of the top plate.
   e) **Sole Plate:** Apply a 1/4" thickness of caulk, over mineral wool forming material, within the annular space flush with the top surface of the top plate.
   f) **Sealant - *3M™ FireDam 150+ Caulk:** Apply within the annular space around the penetrant to the full thickness of the Gypsum Wallboard Patch.

   Sheet Metal Strip: Apply a 1/4" bead of caulk on the outside of the strip at the floor interface for notched or cut out penetrations in the sole plate.

7. ***3M™ FirePlug™:** Install flush within the opening to the bottom surface of the single or double top plate. Pipes with an ID 2" or smaller use *3M™ FirePlug™ 2" and for pipes ID 3" use *3M™ FirePlug™ 3". Alternate: *3M™ Firestrap™: Appropriately sized for the pipe ID may be used in the installation. The *3M™ Firestrap™ 1-1/2" should be used for PVC thin wall Vacuum Tubing nominal 2" diameter.

8. **Gypsum Wallboard Patch:** Two pieces of gypsum wallboard, sized 4” larger than the cutout opening in the flooring, screw-attached to bottom of flooring concentric with cutout. Diameter of opening through both layers of the gypsum wallboard patch is 2-1/2" for 1-1/2” diameter pipes and 3” for 2” diameter pipes.

**Note:** Metric conversion factor, inches x 25.4 = mm.

1. **Floor / Ceiling Assembly**: Code conforming 1 hour fire-rated floor/ceiling assembly, framed with nominal 2" x 10" solid sawn or manufactured wood joists, topping optional (not shown).
   1a) Sole Plate: Nominal 2 x 4 or 2 x 6 solid sawn wood.
   1b) Sub-flooring: Minimum 5/8" wood panel sheathing
   1c) Top Plate: Double Top Plate, nominal 2 x 4, 2 x 6 or double plate system.
   1d) Bathtub Waste/Overflow: Maximum opening in wood flooring (Item 1b) 8" x 12", (see Item 7).

2. **Wall Assembly**: Code conforming 1 hour fire-rated gypsum wallboard assembly with wood framing members.

3. **Penetrants**: (See also table of ratings) Schedule 40, ccABS, ABS and PVC pipes for use in DWV (Drain, Waste and Vent) or Closed (Process and Supply) piping systems, PVC – Thin Wall Vacuum Tubing (nominal 2" Diameter); Kitec® PE-AL-PE Polyethylene/Aluminum/Polyethylene Composite Pressure Pipe and PEX pipes for use in (Process and Supply) piping systems. Penetrants must be contained within a 1 hour fire-rated gypsum wallboard assembly. Ratings achieved will equal that of floor/ceiling assembly.
   3a) Tee's, Elbows and Couplings: Branch piping and connections are permitted within the assembly.

**Firestop System Components:**

4. **Forming Material**: Mineral wool, 4 pcf, tightly packed, nominal 1" thickness, recessed 3/4" from the top surface of the sole plate and bottom surface of the top plates.

5. **Sheet Metal Strip**: Nominal 1-1/2" width, minimum 30 gauge thickness, secured with wallboard screws, applied to notched or cut out openings in sole and top plates, to act as a retainer for the forming material (Item 4). Apply a 1/4" bead of 3M™ Fire Barrier IC 15WB+ Sealant, on the outside of the strip at the floor interface (Item 6f).

6. **Sealant**: *3M™ Fire Barrier IC 15WB+ Sealant – apply as follows:
   - **Sub-Flooring Penetrations**
   - 6a) Circular Openings: Apply a 5/8" thickness of sealant within the annular space flush with the floor surface.
   - 6b) Top Plate: Apply a 3/4" thickness of caulk, within the annular space flush with the bottom surface of the top plate.
   - 6c) Sole Plate: Apply a 3/4" thickness of caulk, within the annular space, flush with the top surface of sole plate.
   - **Notched Penetrations**
   - 6d) Top Plate: Apply a 3/4" thickness of sealant, over mineral wool forming material, within the annular space flush with the bottom surface of the top plate.
   - 6e) Sole Plate: Apply a 3/4" thickness of sealant, over mineral wool forming material, within the annular space flush with the top surface of the sole plate.

7. **Gypsum Wallboard Patch**: Two pieces of gypsum wallboard, sized 4” larger than the cutout opening in the flooring, screw-attached to bottom of flooring concentric with cutout.

**Note**: Metric conversion factor, inches x 25.4 = mm.

*Components bearing the Warnock Hersey Certification Mark.

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products
1. **Floor/Ceiling Assembly** – Wood framed one hour rated assembly with or without concrete topping.

2. **Penetrating Items** – See Table of Ratings.
   
   Maximum 1-1/2 in. I.D. PVC, 1-1/2 in. I.D. ABS, 2 in. I.D. CPVC, 2 in. PVC Vacuum Tubing, 2 in. I.D. Copper, 4 in. I.D. Steel/Cast, 1-1/2 in. I.D. EMT, and 1/2 in. I.D. BX Cable, through-penetrations, process and supply, or DWV applications.

   ** For electrical cable or wire penetrations, maximum eight penetrations including loomex, telephone, COAX and detector cables (#18 AWG FT-14 or smaller) or up to one power cable or smaller NMD 90 4 conductor, aluminum or copper.

3. **Firestop Sealant** – 3M™ Fire Barrier 3000 intumescent silicone sealant. The full depth of the floor and ceiling membranes shall be filled with sealant.

---

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products.
1. **Floor/Ceiling Assembly** – Wood framed one hour rated assembly with or without concrete topping.

2. **Wall Assembly** – Rated or unrated gypsum wallboard faced wall assembly with wood stud or steel stud framing members.

3. **Penetrating Items** – See Table of Ratings. 2 in. PVC vacuum tubing may be used.

** For electrical cable or wire penetrations, maximum eight penetrations including loomex, telephone, COAX and detector cables (#18 AWG FT-14 or smaller) or up to one power cable or smaller NMD 90 4 conductor, aluminum or copper. For piping (metal and plastic), maximum three penetrations, maintaining minimum annular spacing and minimum 1/2 in. spacing between penetrating items.

**For Penetrations of Ceiling Membrane Only:** Maximum 1-1/2 in. I.D. steel, EMT, copper, and CPVC pipe in a maximum 2-1/4 in. diameter hole, or 1/2 in. I.D. PEX in a maximum 1-1/8 in. diameter hole.

4. **Mineral Wood Insulation** – Nominal 4 pcf or greater density mineral wool insulation packed into annular space for full depth of membrane. Mineral wool may be omitted for 1/2 in. PEX or 1/2 in. copper penetrations of the floor surface only when annular space does not exceed 1/4 in.

5. **Firestop Sealant** – 3M™ Fire Barrier 1003 silicone sealant self leveling or 3M™ Fire Barrier 1000 silicone sealant no sag, applied on top of the mineral wool fill on the bottom plate only to a depth of 3/8 in. For 1/2 in. PEX and 1/2 in. copper penetrating the floor surface only, the sealant shall be applied the full depth of the sub-floor (5/8 in. minimum). Where the annular space is less than 1/4 in., a 1/4 in. crown bead of caulk is to be applied above the floor level. For penetrations of ceiling membrane only, caulk to full depth of gypsum wallboard membrane using 3M™ Fire Barrier 1000 silicone sealant no sag or 3M™ Fire Barrier 3000 WT intumescent silicone sealant. For 2 in. vacuum tubing, 3M™ Fire Barrier 3000 WT intumescent silicone sealant is required.

6. **1-1/2” Steel or Copper Tub or Shower Drain** – May be firestopped by sealing a maximum 10 in. by 10 in. floor opening with 5/8 in. Type X gypsum wallboard fastened with at least 4 screws and a perimeter bead of 3M™ Fire Barrier 1000 silicone sealant no sag applied to the full depth of the annular space and to the perimeter of the wallboard.

**Note:** Metric conversion factor, inches x 25.4 = mm.

*Components bearing the Warnock Hersey Certification Mark.*

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products.
1. **Floor Assembly**: Code conforming 2 hour fire-rated assembly, minimum 4-1/2” thickness, normal or low density cast concrete.

2. **Penetrant**: (See table above) Schedule 40, ccABS, ABS, PVC, CPVC, System XFR pipes for DWV (Drain Waste and Vent) or Closed (Process and Supply) piping systems and RNC – PVC (Rigid Non-Metallic Conduit), ratings achieved will equal that of floor assembly. Pipe is inserted from the floor side.

3. **Firestop System Components**: 
   *3M™ Fire Barrier Plastic Cast in Device (PCID): The device is secured to the deck forming membrane, permanently embedded during concrete placement or grouted in concrete assembly in accordance with accompanying installation instructions. The device may be trimmed flush with top surface of the floor or may project up to a maximum of 3-1/2” above the top surface of the floor. Other ancillary products such as 3M™ Tub Box Adapter (TB) and 3M™ Height Adapter (HA) may be attached to the device when required.

*Components bearing the Warnock Hersey Certification Mark.

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products.
1. **Floor/Assembly**: Code conforming 2 hour fire-rated floor or wall assembly, minimum 2-1/2" thick, normal or low density cast concrete, hollow core concrete or Q-Deck.

2. **Penetrant**: (See table of ratings) Schedule 40, PVC, ccPVC, CPVC, ccABS, ABS and FRPP pipes for use in DWV (Drain, Waste and Vent) or Closed (Process and Supply) piping systems and PVC - Thin Wall Vacuum Tubing (2" diameter), ratings achieved equal that of floor assembly.

3. **Firestop System Components**:

   *3M™ RC-1 Collar System – A length of steel collar (Item 3) is applied over the *3M™ Interam™ Ultra GS Wrap (Item 4). The steel collar is secured with self tapping screws or a stainless steel hose clamp (Item 7). Anchoring tabs are extended to the top of the floor and secured to the floor surface with masonry anchors. Anchoring tab extenders may be cut from the 3M™ Fire Barrier RC-1 Restricting Collar by cutting the width of the collar from the anchor tab (large tab) through to the retaining tab (smaller tapered tab), the extender is hooked to the anchor tab as shown.

   Apply 1/4" thickness of *3M™ Fire Barrier CP-25WB+ Caulk, *3M™ Fire Barrier IC 15WB+ Sealant or *3M™ Moldable Putty+ (MPS2) (Item 5) flush with the floor surface over 4 pcf mineral wool (Item 6) forming material. CPVC Pipe - use only *3M™ Fire Barrier IC 15 WB+ Sealant.

   (Alternate Method - Not Shown): *3M™ Interam™ Ultra PPD or 3M™ Fire Barrier RC Pack sized according to pipe ID, secured flush with underside of floor, annular space 1/4".

   For PVC - Thin Wall Vacuum Tubing (2" diameter) use *3M™ Interam™ Ultra PPD-1.5.

1. **Floor/Ceiling Assembly**: Code conforming 1 or 2 hour fire-rated floor/ceiling assembly, framed with minimum nominal 2" x 10" solid sawn or manufactured wood joists, topping optional (not shown).

   Chase Wall (Optional - Not Shown): 1 or 2 hour fire-rated or non fire-rated wood or steel stud gypsum wallboard assembly, when used, install the firestop system as detailed in (Item 3) to the underside of single and double top plates.

   a) Flooring System: Maximum rectangular cutout, 8" x 12", in flooring to accommodate the Bathtub Waste/Overflow Fitting (Item 2a).

2. **Penetrant**: (See also table of ratings) Schedule 40, PVC, cPVC, CPVC, ABS, cABS and FRPP for use in DWV (Drain, Waste and Vent) or Closed (Process and Supply) piping systems and Thin Wall Vacuum Tubing (nominal 2" diameter), branch piping, Tee’s, Couplings and Elbows Optional within assembly. Ratings achieved will equal that of floor/ceiling assembly.

   a) Bathtub Waste/Overflow Fitting: Maximum pipe diameter 2", any of the pipe types detailed above may be used, see Item 3c Gypsum Wallboard Patch.

3. **Firestop System Component**:

   a) *3M™* Interam™ Ultra PPD or *3M™* Fire Barrier RC Pack: Sized appropriately for pipe secured with *3M™* Ultrafast™ Anchors or 1-1/2" toggle bolts over fender washers, use 1-1/4" drywall screws and fender washers for single and double top plates. Use *3M™* Interam™ Ultra PPD-1.5 for nominal 2" diameter Thin Wall PVC Vacuum Tubing.
Design No. PH 120-05 continued

b) Sealant: *3M™ Fire Barrier CP-25WB+ Caulk, *3M™ Fire Barrier IC 15WB+ Sealant or *3M™ FireDam 150+ Caulk or *3M™ Moldable Putty+ (MPS2), to fill the annular space to a minimum depth of 5/8" at the wood floor.

c) Gypsum Wallboard Patch: Two pieces of gypsum wallboard, sized 4" larger than the cutout opening in the flooring, screw-attached to bottom of flooring concentric with cutout. Diameter of opening through both layers of the Gypsum Wallboard Patch is maximum 2-1/2" for 1-1/2" diameter pipes and maximum 3" for 2" diameter pipes.

d) Sealant: *3M™ Fire Barrier CP-25WB+ Caulk, *3M™ Fire Barrier IC 15WB+ Sealant, *3M™ FireDam 150+ Caulk or *3M™ Moldable Putty (MPS2) applied within the annular space around the penetrant to the full thickness of the Gypsum Wallboard Patch.

e) Sealant: *3M™ Fire Barrier CP-25WB+ Caulk, *3M™ Fire Barrier IC 15WB+ Sealant, *3M™ FireDam 150+ Caulk or *3M™ Moldable Putty+ (MP2S), to fill the annular space at the pipe penetration as a smoke seal, however, it is not required to achieve stated ratings.

Note: CPVC Pipe - use only *3M™ Fire Barrier IC 15WB+ Sealant

Note: Metric conversion factor, inches x 25.4 = mm.

*Components bearing the Warnock Hersey Certification Mark.

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products.
1. **Floor/Ceiling Assembly**: Code conforming 2 hour fire-rated floor assembly, nominal 4-1/2” thickness, normal or low density cast concrete.

2. **Penetrant**: (See table above) Schedule 40, FRPP pipes for DWV (Drain, Waste and Vent) or Closed (Process and Supply) piping systems, ratings achieved will equal that of floor assembly. Pipe is inserted from the floor side.

3. **Firestop System Component**: *3M™ Fire Barrier Plastic Cast in Device (PCID):* The device is secured to the deck forming membrane, permanently embedded during concrete placement or grouted in concrete assembly in accordance with accompanying installation instructions. The device may be trimmed flush with top surface of the floor or may project up to a maximum of 3-1/2” above the top surface of floor. Other ancillary products such as 3M™ Tub Box (TB) Adapter and 3M™ Height Adapter (HA) may be attached to the device when required.

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products.
1. **Floor Assembly**: Code conforming 2 hour fire-rated floor assembly, minimum 2-1/2" thickness (Q-Deck or Fluted Deck), normal or low density cast concrete.

2. **Firestop System Components**:  
   - *3M™ Fire Barrier Plastic Cast in Device (PCID)*: The device (2", 3" or 4" diameter) is secured to the deck forming membrane, permanently embedded during concrete placement or grouted in concrete assembly in accordance with accompanying installation instructions. The device may be trimmed flush with top surface of the floor or may project up to a maximum of 3-1/2" above the top surface of floor. H rating of 2 hours is achieved by attaching a Steel Plate, 24 gauge (or heavier), diameter 2" larger than the floor opening, secured with masonry anchors, to the floor surface, over the 3M™ PCID.  
   
   Penetrating Item: Not Required.

*Note*: Metric conversion factor, inches x 25.4 = mm.

Design No. FS 530 F
August 1, 2003
FIRE PENETRATION SEAL (Mechanical)
Penetrating Item Type A
T-Rating - 0 hr
F-Rating - 3 hr

1. FLOOR ASSEMBLY: The three-hour “F-rated” floor/ceiling assembly shall consist of min. 4-1/2 in. thick lightweight or normal-weight (100-150pcf) reinforced concrete. Max. diameter of penetration opening is to be 1/4 in. (min.) to 3-1/4 in. (max.) larger than the penetrating item.

2. PENETRATING ITEM: One metallic pipe, conduit or tubing to be installed either concentrically or eccentrically within the through opening. The penetrating item is to be rigidly supported on both sides of the floor or wall assembly. An annular space of min. 0 in. (point contact) to max. 3-1/4 in. is required within the fire stop system. The following types and sizes of metallic pipes, conduit or tubing may be used:
   A. Steel Pipe: Schedule 10 (or heavier) nom. 24 in. diameter (or smaller) steel pipe.
   B. Conduit: Nom. 4 in. diameter (or smaller) electrical metallic tubing or steel conduit.
   C. Copper Tubing: Type L (or heavier) nom. 6 in. diameter (or smaller) copper tubing.
   D. Copper Pipe: Nom. 6 in. diameter (or smaller) Regular (or heavier) copper pipe.

3. PACKING MATERIAL: Nom. 3 in. depth of 4 pcf mineral wool batt insulation, tightly and permanently packed into the opening. Surface of packing material is to be recessed from the top surface of the floor or both surfaces of the wall assembly, as required to accommodate the necessary depth of caulk fill material (Item 4).

4. FILL, VOID OR CAVITY MATERIAL: Min. 1/2 in. depth of sealant fill material is to be applied to the recess around the top surface of the floor through-penetration opening or both faces of the wall through-penetration. An additional min. 1/2 in. diameter bead of sealant material is to be applied around the outer perimeter of the through opening, at the penetrating item to concrete interface.

FIRE PENETRATION SEAL (Mechanical)
Penetrating Item Type A
T-Rating - 0 hr
F-Rating - 3 hr

1. FLOOR ASSEMBLY: The three-hour "F-rated" floor/ceiling assembly shall consist of min. 4-1/2 in. thick lightweight or normal-weight (100-150 pcf) reinforced concrete. Max. diameter of penetration opening is to be 15 in.

2. PENETRATING ITEM: One metallic pipe, conduit or tubing to be installed either concentrically or eccentrically within the through opening. The penetrating item is to be rigidly supported on both sides of the floor or wall assembly. An annular space of min. 0 in. (point contact) to max. 2-7/8 in. is required within the fire stop system. The following types and sizes of metallic pipes, conduit or tubing may be used:
   A. Steel Pipe: Schedule 10 (or heavier) nom. 12 in. diameter (or smaller) steel pipe.
   B. Conduit: Nom. 6 in. diameter (or smaller) steel conduit.
   C. Conduit: Nom. 4 in. diameter (or smaller) steel electrical tubing.
   D. Copper Tubing: Type L (or heavier) nom. 6 in. diameter (or smaller) copper tubing.
   E. Copper Pipe: Nom. 6 in. diameter (or smaller) regular (or heavier) copper pipe.

3. PACKING MATERIAL: Nom. 3 in. depth of 4 pcf mineral wool batt insulation, tightly and permanently packed into the opening. Surface of packing material is to be recessed from the top surface of the floor or both surfaces of the wall assembly, as required to accommodate the necessary depth of caulk fill material (Item 4).

4. FILL, VOID OR CAVITY MATERIAL: Min. 1/4 in. depth of sealant fill material is to be applied to the recess around the top surface of the floor through-penetration opening or both faces of the wall through-penetration. An additional min. 1/2 in. diameter bead of sealant material is to be applied around the outer perimeter of the through opening, at the penetrating item to concrete interface.

FIRE PENETRATION SEAL (Mechanical)
Penetrating Item Type C
T-Rating - 1 hr
F-Rating - 2 hr

1. FLOOR ASSEMBLY: The fire-rated floor/ceiling assembly shall consist of min. 4-1/2 in. thick lightweight or normal-weight (100-150 pcf) reinforced concrete. Max. diameter of penetration opening is to be 32 in.

2. PENETRATING ITEM: One metallic pipe, conduit or tubing to be installed either concentrically or eccentrically within the through opening. The penetrating item is to be rigidly supported on both sides of the floor or wall assembly. The following types and sizes of metallic pipes, conduit or tubing may be used:
   A. Steel Pipe: Schedule 10 (or heavier) nom. 24 in. diameter (or smaller) steel pipe.
   B. Conduit: Nom. 4 in. diameter (or smaller) steel electrical tubing or steel conduit.
   C. Copper Tubing: Type L (or heavier) nom. 6 in. diameter (or smaller) copper tubing.
   D. Copper Pipe: Nom. 6 in. diameter (or smaller) regular (or heavier) copper pipe.

3. PIPE COVERING MATERIALS: Nom. 1 in. thick hollow cylindrical heavy density (min. 3.5 pcf) glass fiber units, jacketed on the outside with an all service jacket. Longitudinal joints shall be tightly butted and sealed with metal fasteners or factory applied self-sealing lap tape. Transverse joints shall be secured with metal fasteners or with butt tape supplied with the product. An annular space of 1/2 in. (min.) to 1-1/2 in. (max.) is required within the fire stop system. Any listed pipe covering material meeting the above specifications with a flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. PACKING MATERIAL: Nom. 3 in. depth of 4 pcf mineral wool batt insulation, tightly and permanently packed into the opening. Surface of packing material is to be recessed from the top surface of the floor or both surfaces of the wall assembly, as required to accommodate the necessary depth of caulk fill material (Item 5).

5. FILL, VOID OR CAVITY MATERIAL: Min. 1/2 in. depth of sealant fill material is to be applied to the recess around the top surface of the floor through-penetration opening or both faces of the wall through-penetration.

Table 1. Through Penetration Firestop System Installation Details and Ratings

Figure 1. Through Penetration Firestop System

1. **SUPPORTING CONSTRUCTION:** Refer to Figure 1 and Table 1. Create a round opening in a Code-conforming, 2 hour fire-rated floor/ceiling assembly constructed of min. 8 in. thick lightweight or normal weight reinforced concrete having a nominal density of 100–150 pcf. Size the opening to establish the annular space specified in Table 1. Verify compliance of the supporting construction with its corresponding listed design.

2. **PENETRATING ITEM:** Refer to Figure 1 and Table 1. Position the pipe in the opening in the supporting construction (Item 1). Establish the annular space between the Penetrating Item and the Supporting Construction (Item 1) as specified in Table 1.

3. **PACKING MATERIAL:** Tightly pack at min. 50% compression, the annular space with nominal 4 pcf or heavier noncombustible mineral wool insulation to the full depth of the supporting construction (Item 1). Recess the packed insulation a min. of 3/8 in. from the top.

4. **FILL, VOID OR CAVITY MATERIAL** – Refer to Figure 1 and Table 1. Apply the material listed below, filling the min. 3/8 in. recess created with the packing material (Item 3):

   **CERTIFIED MANUFACTURER:** 3M Company
   **CERTIFIED PRODUCT:** Firestop Sealant
   **CERTIFIED MODEL:** 3M™ Fire Barrier™ 1003 Silicone Self Leveling Sealant or 3M™ Fire Barrier™ 1000 No Sag Silicone Sealant

   Apply the material listed above, filling the min. 3/8 in. recess at the top of the supporting construction (Item 1), created with the packing material (Item 3).

5. **CERTIFIED MANUFACTURER:** 3M Company
   **CERTIFIED PRODUCT:** Duct Wrap
   **CERTIFIED MODEL:** Nominal 6 pcf, 3M™ Fire Barrier™ Duct Wrap 615 and nominal 6 pcf, 3M™ Fire Barrier™ Duct Wrap 615+

   Apply the 3M™ Fire Barrier™ Duct Wrap around the penetrating item (Item 2) projecting from the bottom of the supporting construction (Item 1). Apply two layers of the duct wrap over a min. length of 30 in. starting from the bottom of the supporting construction (Item 1). Seal all seams and cut edges with aluminum foil tape. Use butt joints at all transverse and longitudinal joints and offset the joints between the first and second layers. Use fiber reinforced tape to temporarily secure the duct wrap prior to banding. Secure with 1/2 in. wide, 0.015 in.
thick stainless steel banding and 1 in. long stainless steel crimp clamps. Place banding a max. of 1-1/2 in. from any duct wrap edges or outer layer transverse butt joint, and at a max. of 8 in. on center. Tension the banding to hold the duct wrap in place without cutting or damaging the insulation.

6. **RISER CLAMP:** Use a steel riser clamp on any applications that do not involve a wrapped elbow or tee. Secure the riser clamp to the penetrating item (Item 2) at the end point of the duct wrap (Item 5) to retain the duct wrap tight against the underside of the supporting construction (Item 1).

Table 1. Through Penetration Firestop System Installation Details and Ratings

1. **SUPPORTING CONSTRUCTION:** Refer to Figure 1 and Table 1. Create a round opening in a Code conforming 1 or 2 hour fire-rated floor/ceiling or wall assembly. Use min 2-1/2 in. thick low density cast concrete or min 3.6 in thick low density cast concrete for the 1 hour and 2 hour fire-rated floor-ceiling assemblies respectively. Use min 3.2 in. thick or 4.6 in thick normal weight cast concrete for 1 hour and 2 hour fire-rated floor-ceiling assemblies respectively. Verify compliance of the supporting construction with its corresponding listed design.

2. **PENETRATING ITEM:** Refer to Figure 1 and Table 1. Install the penetrating item with either a T or elbow configuration ensuring that the section of penetrating item on the exposed side of the system is parallel and directly adjacent to the fire-rated floor/ceiling or wall assembly (Item 1).

3. **FIRESTOP SYSTEM:** Install an Intertek Certified 3M Fire Protection Product (firestop system) designed and listed to seal the specified penetrating item (Item 2) with an F rating matching the fire resistance of the supporting construction (Item 1). When a specific packing material is referenced in the listed design, as an alternative, use Intertek Certified, min. 4 pcf, mineral wool installed to the full thickness of the floor or wall and tightly packed (min 50% compression). Use an Intertek Certified, 3M sealant, caulk, putty or spray, listed for use with the specified penetrating item (Item 2), and applied as detailed in the corresponding listed design.

4. **CERTIFIED MANUFACTURER:** 3M Company

**CERTIFIED PRODUCT:** Duct Wrap

**CERTIFIED MODEL:** Nominal 6 pcf, 3M™ Fire Barrier™ Duct Wrap 615 and nominal 6 pcf, 3M™ Fire Barrier™ Duct Wrap 615+. Install the nominal 1–1/2 in. thick, nominal 6 pcf duct wrap in a “U” shape around the penetrating item (Item 2) and attach to the supporting construction (Item 1) as described below, meeting the application layers and details described in Table 1. Cut edges are to be sealed with aluminum foil tape. Use additional duct wrap material to fill void spaces created between the penetrating item (Item 2), supporting construction (Item 1), and duct wrap. Fill these void spaces to a min. depth of 3 in. from the uninsulated end of the penetrating item (Item 2).

**Single Layer:** Wrap to be installed in a “U” shape around the penetrating item (Item 2). Ensure that a min. 3 in. flare is present to accommodate securing of the clamping plate (Item 5) on both sides of the penetrating item (Item 2) to the supporting construction (Item 1).

**Double Layer:** Wrap to be installed in a “U” shape around the penetrating item (Item 2). Wrap around the penetrating item (Item 2) such that a min. 3 in. flare is present to accommodate securing of clamping plate (Item 5) to floor-ceiling and/or wall assembly (Item 1).

5. **CLAMPING PLATE:** Install min. 1–1/2 in. by 3/16 in. thick steel plate with pre-drilled nominal 1/4 in. diameter holes. Secure the clamping plate with min. 1/4 in. by 2–3/4 in. long steel masonry anchors or Tapcon Fasteners and 1–1/4 in. washers ensuring the fastener passes through the 3M Fire Barrier Duct Wrap 615, 3M Fire Barrier Duct Wrap 615+ (Item 4) at min. 8 in. on center to clamp the wrap material against the supporting construction (Item 1).

   b) **Caulk (Optional) – *3M™ Fire Barrier CP-25WB+ Caulk, *3M™ Fire Barrier IC 15WB+ Sealant or *3M™ FireDam 150+ Caulk, to fill the annular space at the pipe penetration as a smoke seal.

   **CPVC Pipe – use only *3M™ Fire Barrier IC 15WB+ Sealant**

   **Note:** Metric conversion factor, inches x 25.4 = mm.

   *Components bearing the Warnock Hersey Certification Mark.

   **May be used, however, is not required to achieve stated ratings.

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products.
1. **Wall Assembly:** Code conforming 2 HR fire-rated wall assembly, nominal 4-1/2” thickness, normal or low density cast concrete. Wall may also be constructed of nominal 8” thick concrete blocks (filled or unfilled). Ratings achieved will equal that of wall assembly.

1A **Wall Assembly:** Code conforming 1 or 2 HR fire-rated wall, metal or wood framed gypsum wallboard wall assembly. Ratings achieved will equal that of wall assembly.

2. **Steel Sleeve:** Minimum 28 gauge galvanized steel, positioned within the opening with a 1” overlap, maximum 4-1/2” diameter, sleeve may be flush with wall surface, or extended up to 1/2” beyond either surface of wall. Sleeve is cast or grouted into masonry walls.

3. **Penetrant:** (See also table of ratings) Schedule 40, ccABS, ABS, PVC and XFR pipes used in DWV (Drain, Waste and Vent) or Closed (Process and Supply) pipe systems and PVC -Thin Wall Vacuum Tubing (nominal 2” Diameter), ratings achieved will equal that of the wall assembly.

**Firestop System Components:**

4. * **3M™ FireStrap™** or **3M™ FirePlug™** - Install with 1/4” of the firestop exposed outside the surface of the wall assembly within the steel sleeve, according to the manufacturers instructions.

   **Use** 3M™ FireStrap™ 1-1/2” for PVC -Thin Wall Vacuum Tubing (nominal 2” Diameter)

5. **Sealant** - * 3M™ Fire Barrier CP-25WB+ Caulk, * 3M™ Fire Barrier IC 15WB+ Sealant or * 3M™ FireDam™ 150+ Caulk, apply to seal the space between the device and the steel sleeve and between the steel sleeve and the substrate. Firestop system is applied to both sides of the wall.

**Note:** Metric conversion factor, inches x 25.4 = mm.

*Component bearing the Warnock Hersey Mark.

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products.
1. **Wall Assembly:** Code conforming 1 or 2 HR rated wall, metal or wood framed gypsum wallboard wall assembly. Penetrant to be located on one side of the wall assembly only. Ratings achieved will equal that of wall assembly.

2. **Penetrant:** (See also table of ratings) Maximum 4” ID, Sch. 40, System XFR or PVC Pipe.
   a) Maximum 4” diameter, Sch. 40, System XFR, Fitting
   b) Maximum 4” diameter, Sch. 40, PVC, Fitting

3. **Firestop System Components:**
   a) *3M™ Interam™ Ultra GS Wrap Strip, continuous wrap applied tightly to the fitting. Apply the appropriate number of layers as detailed in the table below. Alternate wrap material: *3M™ Fire Barrier FS-95+ Wrap Strip, applied tightly to the fitting, with butted seams and staggered joints. Apply the appropriate number of layers as detailed in the table below.
   b) *3M™ Fire Barrier RC-1 Collar, anchor tabs bent out at 90°, steel collar wrapped tightly over wrap material (Item 3a) with 1” overlap, secure collar with stainless steel 1/2” Hose Clamp (Item 3c). Secure collar to wall assembly through anchor tabs with 3/16” diameter steel toggle bolts with 1-1/4” diamter washers (Item 3d).

**Caulk (Optional)** - *3M™ Fire Barrier CP-25WB+ Caulk or *3M™ FireDam 150+ Caulk, to fill the annular space at the pipe penetration as a smoke seal.

**Note:** metric conversion factor, inches x 25.4 = mm

*Component bearing the Warnock Hersey Certification Mark

**May be used, however, is not required to achieve stated ratings

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products
1. **Wall Assembly**: Code conforming 2 HR fire-rated wall, metal or wood stud (Item 1a) framed gypsum wallboard (Item 1b), wall assembly. Opening is to be framed to create a nominal 16" square compartment with metal or wood studs (Item 1c). Maximum 7" diameter opening.

2. **Penetrant**: (See also table of ratings) Nominal 6" diameter, Sch. 40, PVC and System XFR pipes used for DWV or Closed (Process and Supply) applications.

3. **Firestop System Components**:
   a. **Galvanized Steel Backing**: Minimum 28 gauge galvanized steel sheet, secured to studs and framed compartment with self-tapping screws. Sheet may be comprised of 2 sections, with a 7" diameter opening for the pipe (Item 2) forming an overlap or butt seam. A 2" wide cover strip is applied over butted seams and secured with self-tapping screws according to the manufacturer's instructions.
   b. **Sealant**: *3M™ Fire Barrier CP-25WB+ Caulk, *3M™ Fire Barrier IC 15WB+ sealant, or *3M™ FireDam 150+ Caulk, applied within the annular space around the pipe, to a 1/4" thickness flush with the wall surface on both sides.
   c. **Aluminum Foil Tape**: Pipe is to be covered with aluminum foil tape from the wall interface for a 4" length.
   d. *3M™ Interam™ Ultra PPD-6 wrapped tightly around the pipe, latched and secured with the steel hose clamp, provided. The mounting tabs are fastened with 1/4" diameter hollow dry wall anchors or toggle bolts in conjunction with 1-1/4" diameter steel fender washers (Item 3d).

**Note**: Metric conversion factor, inches x 25.4 = mm. *Component bearing the Warnock Hersey Mark.

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products.
1. **Wall Assembly**: Code conforming 1 or 2 hour fire-rated wall, nominal 2" x 4" steel/wood framed gypsum wallboard, wall assembly.

2. **Penetrant**: (See table of ratings) Schedule 40, ccABS, ABS, PVC pipes for use in DWV (Drain, Waste and Vent) or Closed (Process and Supply) piping systems and PVC-Thin Wall Vacuum Tubing (nominal 2" diameter), ratings achieved will equal that of the wall assembly.

3. **Firestop System Components**: *3M™ FireStrap™*: Install with 1/4" of the firestop exposed outside the surface of the gypsum wall assembly according to the manufacturers instructions.

   Use *3M™ FireStrap™ 1-1/2" for PVC - Thin Wall Vacuum Tubing (nominal 2" diameter).

4. **Sealant**: *3M™ Fire Barrier CP-25WB+ Caulk, *3M™ Fire Barrier IC 15WB+ Sealant or *3M™ FireDam 150+ Caulk, applied within the annular space between the device (Item 3) and the opening to provide a smoke seal. Firestop system is applied to both sides of the wall.

**Note**: Metric conversion factor, inches x 25.4 = mm.

*Component bearing the Warnock Hersey Mark.

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products.
1. **Wall Assembly**: Code conforming 1 or 2 Hour fire-rated wall, nominal 2" x 4" steel or wood framed gypsum wallboard wall assembly.

2. **Penetrant**: (See also table of ratings) Schedule 40, PVC and System XFR pipes for use in DWV (Drain, Waste and Vent) or Closed (Process and Supply) piping systems, ratings achieved will equal that of the wall assembly.

3. **Firestop System Components**:

   a. *3M™ FireStrap™* or *3M™ FirePlug™*: Install with 1/4" of the firestop exposed outside the surface of the gypsum wall assembly according to the manufacturers instructions.

   b. Sealant: *3M™ Fire Barrier CP-25WB+ Caulk, *3M™ Fire Barrier IC 15WB+ Sealant* or *3M™ FireDam 150+ Caulk*, seal the annular space between the opening and the firestop device, to 1/4" thickness, flush with the wall surface on both sides of the wall.

**Note**: Metric conversion factor, inches x 25.4 = mm.

*Component bearing the Warnock Hersey Mark.

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products.
1. **Wall Assembly:** Code conforming 2 hour fire-rated wall, metal or wood framed gypsum wallboard, wall assembly.
   a) Studs – Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nominal 2x4 lumber, spaced 16 in. on centre. Steel studs to be minimum 3-1/2 in. wide and spaced maximum 24 in. on centre.
   b) Gypsum Wallboard – Thickness, type, number of layers, and fasteners as required in the individual Wall and Partition Design. Diameter of opening is maximum 1/2 in. larger than the outside diameter of metallic sleeve.

2. **Penetrant:** (See table of ratings) Nominal 4" diameter, PVC pipes centred within the firestop system. Pipe to be rigidly supported on both sides of wall assembly. The pipe may be installed at an angle not greater than 45 degrees from perpendicular. Ratings achieved will equal that of the wall assembly.

3. **Firestop System Components:**
   a) **Metallic Sleeve** – cylindrical sleeve fabricated from minimum 0.019 in. thick (26 gauge) galvanized sheet steel, having a minimum 1 in. lap along the longitudinal seam. Sleeve to extend a minimum of 2 in. beyond both sides of the wall. The inside diameter of the sleeve shall be larger than outside diameter of non-metallic pipe or conduit such that an annular space will be present between the steel sleeve and the pipe around the entire circumference of the pipe to accommodate the layer(s) of wrap strips (Item 3b). The annular space between the outside of the wrap strip layer(s) and the inside of the sleeve shall be minimum 0 in. to maximum 1/4 in. The annular space between the outside of the sleeve and the periphery of the opening shall be minimum 0 in. to maximum 1/2 in.
   b) **3M™ Interam™ Ultra GS Wrap Strip** – Nominal 1/2 in. thick intumescent elastomeric material faced on one side with aluminum foil, supplied in 2 in. wide strips. Nominal 2 in. wide strips tightly wrapped around non-metallic pipe (foil side exposed) and slid into sleeve on both sides of wall such that the outer edges of wrap strips are flush with the outer edges of the sleeve. For nominal 4 in. diameter pipes, a minimum of three layers of wrap strip is required. Each layer of wrap strip to be installed with butted seams in successive layers staggered. Wrap strip layers held in position using aluminum foil tape, steel wire tie, or equivalent. A minimum 1/2 in. wide stainless steel hose clamp shall be secured around the outside of the sleeve over the centre of the wrap strips on both ends of the sleeve.
   c) **3M™ FireDam 150+ Caulk** – Minimum thickness of 1-1/4 in., applied within annulus between metallic sleeve and periphery of the opening, flush with both surfaces of the wall assembly. At the point contact location between sleeve and gypsum wallboard, a minimum 1/2 in. diameter bead of caulk shall be applied at the sleeve/wallboard interface on both surfaces of the wall assembly. A minimum 1/4 in. bead of caulk shall also be applied over the outer edges of the wrap strips and within the annular space between the wrap strip and sleeve on both sides of the wall.

**Note:** Metric conversion factor, inches x 25.4 = mm.

---

1. **Wall Assembly** – 1 hour or 2 hour rated wood or steel stud framed gypsum wall assembly. Minimum wall thickness: 115mm (4-1/2”) for 1 hour rated walls, 140mm (5-1/2”) for 2 hour rated walls. The hourly F rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed.

2. **Penetrating Items** – Metallic and non-metallic pipe and conduit as described in the table of ratings.

3. **Firestop Sealant** – 3M™ Fire Barrier 1000 Silicone Sealant No Sag or 3M™ Fire Barrier IC 15 WB+ applied to the full depth of the gypsum wallboard membrane on both sides of the wall. For point contact penetrations, a 12.5mm (1/2”) surface bead is required at point of contact location. For Kitec use only 3M™ Fire Barrier IC 15 WB+ applied the full depth of the gypsum wallboard membrane on both sides of the wall.

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products.
1. **GYPSUM WALL ASSEMBLY:** The framed opening in the wall shall be 4 in. to 6 in. wider and higher than the diameter of the penetrating item such that, when the penetrating item is centered in the opening, a 2 in. to 3 in. clearance is present between the penetrating item and the framing on all four sides. Two-hour fire-rated wall assembly shall include one of the following features:

A. Max. diameter of opening in gypsum wallboard layers is to be 25-1/2 in. for steel stud wall assemblies. When steel studs are used and the diameter of the opening exceeds the width of the stud cavity, the opening shall be framed on all sides using lengths of steel stud installed between the vertical studs and screw-attached to the steel studs at each end. Min. 25 GA galvanized steel studs spaced 24 in. o.c. measuring 3-5/8 in. wide with 1-1/4-in. legs. Studs attached with min. #6 x 3/8-in. long steel stud framing screws to channel shaped floor and ceiling runners, measuring 1/2-in. deep by 3-5/8-in wide, which are secured to floor and ceiling with 1-in. concrete fasteners spaced max. 18-in. o.c. Studs and runners covered with two layers of 5/8 in. thick, Type X gypsum wallboard on each face. The base layer of gypsum wallboard fastened to steel studs with #6 1-1/8 in. bugle head phillips drywall screws 12 in. o.c. The face layer of gypsum wallboard fastened with #6 1-5/8 in. bugle head phillips drywall screws spaced 8 in. o.c. Joint Tape and Compound - vinyl or casein, dry or premixed joint compound applied to face layers of gypsum wallboard in two coats to all exposed screw heads and gypsum wallboard joints. A min. 2-in. wide paper, plastic or fiberglass tape embedded in first layer of compound over joints in gypsum wallboard.

B. Max. diameter of opening in gypsum wallboard layers is to be 14-1/2 in. for wood stud wall assemblies. Wood studs are to consist of min. nom. 2 x 4 lumber max. spaced 16 in. o.c. Studs attached with min. 16d common nails to 2 x 4 lumber floor and ceiling runners measuring, which are secured to floor and ceiling with 3-in. concrete fasteners spaced max. 18-in. o.c. Studs and runners covered with two layers of 5/8 in. thick, Type X gypsum wallboard on each face. The base layer of gypsum wallboard fastened to wood studs with #6 1-1/8 in. bugle head phillips drywall screws spaced 12 in. o.c. The face layer of gypsum wallboard fastened with #6 1-5/8 in. bugle head phillips drywall screws spaced 8 in. o.c. Joint Tape and Compound - vinyl or casein, dry or premixed joint compound applied to face layers of gypsum wallboard in two coats to all exposed screw heads and gypsum wallboard joints. A min. 2-in. wide paper, plastic or fiberglass tape embedded in first layer of compound over joints in gypsum wallboard.
2. **PENETRATING ITEM:** One metallic pipe, conduit or tubing to be installed concentrically within the through opening. The penetrating item is to be rigidly supported on both sides of the wall assembly. A nom. annular space of 3/4 in. is required within the fire stop system. The following types and sizes of metallic pipes, conduit or tubing may be used:

   A. **Steel Pipe:** Schedule 10 (or heavier) nom. 24 in. diameter (or smaller) steel pipe.
   B. **Steel Pipe:** Schedule 5 (or heavier) nom. 4 in. diameter (or smaller) steel pipe.
   C. **Conduit:** Nom. 4 in. diameter (or smaller) electrical metallic tubing or steel conduit.
   D. **Copper Tubing:** Type L (or heavier) nom. 6 in. diameter (or smaller) copper tubing.

3. **FILL, VOID OR CAVITY MATERIAL:** Min. of 1-1/4 in. thickness of sealant fill material is to be applied within the annulus on both faces of the wall through-penetration. Additional material is to be applied around the outer perimeter of the penetrating item, such that a min. 1/4 in. crown is formed.

1. GYPSUM WALL ASSEMBLY: The framed opening in the wall shall be 7-1/2 in. wider and higher than the diameter of the penetrating item such that, when the penetrating item is centered in the opening, a 3-3/4 in. clearance is present between the penetrating item and the framing on all four sides. Two-hour fire-rated wall assembly shall include one of the following features:

A. Max. diameter of opening in gypsum wallboard layers is to be 22-1/2 in. for steel stud wall assemblies. When steel studs are used and the diameter of the opening exceeds the width of the stud cavity, the opening shall be framed on all sides using lengths of steel stud installed between the vertical studs, and screw-attached to the steel studs at each end. Min. 25 GA galvanized steel studs spaced 24 in. o.c. measuring 3-5/8 in. wide with 1-1/4 - in. legs. Studs attached with min. #6 x 3/8-in. steel stud framing screws to channel shaped floor and ceiling runners measuring 1/2-in. deep by 3-5/8-in wide, which are secured to floor and ceiling with 1-in. long concrete fasteners spaced max. 18-in. o.c. Studs and runners covered with two layers of 5/8 in. thick, Type X gypsum wallboard on each face. The base layer of gypsum wallboard fastened to steel studs with #6 1-1/8 in. bugle head phillips drywall screws spaced 12 in. o.c. The face layer of gypsum wallboard fastened with #6, 1-5/8 in. long bugle head phillips drywall screws spaced 8 in. o.c. Joint Tape and Compound -vinyl or casein, dry or premixed joint compound applied to face layers of gypsum wallboard in two coats to all exposed screw heads and gypsum wallboard joints. A min. 2-in. wide paper, plastic or fiberglass tape embedded in first layer of compound over joints in gypsum wallboard.

B. Max. diameter of opening in gypsum wallboard layers is to be 14-1/2 in. for wood stud wall assemblies. Wood studs are to consist of min. nom. 2 x 4 lumber. spaced 16 in. o.c. Studs attached with min. 16d common nails to 2 x 4 lumber floor and ceiling runners, which are secured to floor and ceiling with 3-in. concrete fasteners spaced max. 18-in. o.c. Studs and runners covered with two layers of 5/8 in. thick, Type X gypsum wallboard on each face. The base layer of gypsum wallboard fastened to wood studs with #6 1-1/8 in. bugle head phillips drywall screws spaced 12 in. o.c. The face layer of gypsum wallboard fastened with #6 1-5/8 in. long bugle head phillips drywall screws spaced 8 in. o.c. Joint Tape and Compound -vinyl or casein, dry or premixed joint compound applied to face layers of gypsum wallboard in two coats to all exposed screw heads and gypsum wallboard joints. A min. 2-in. wide paper, plastic or fiberglass tape embedded in first layer of compound over joints in gypsum wallboard.
2. **PENETRATING ITEM:** One metallic pipe, conduit or tubing to be installed either concentrically or eccentrically within the through opening. The penetrating item is to be rigidly supported on both sides of the wall assembly. The following types and sizes of metallic pipes, conduit or tubing may be used:

   A. **Steel Pipe:** Schedule 10 (or heavier) nom. 24 in. diameter (or smaller) steel pipe.
   B. **Conduit:** Nom. 4 in. diameter (or smaller) electrical metallic tubing or steel conduit.
   C. **Copper Tubing:** Type L (or heavier) nom. 6 in. diameter (or smaller) copper tubing.
   D. **Copper Pipe:** Nom. 6 in. diameter (or smaller) Regular (or heavier) copper pipe.

3. **PIPE COVERING MATERIALS:** Nom. 1 in. thick hollow cylindrical heavy density (min. 3.5 pcf) glass fiber units, jacketed on the outside with an all service jacket. Longitudinal joints shall be tightly butted and sealed with metal fasteners or factory applied self-sealing lap tape. Transverse joints shall be secured with metal fasteners or with butt tape supplied with the product. A nom. annular space of 3/4 in. is required within the fire stop system. Any listed pipe covering material meeting the above specifications with a flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **FILL, VOID OR CAVITY MATERIAL:** Min. 1/4-in. depth of sealant fill material is to be applied over the recess of the packing material (4) on both sides of the wall through-penetration opening. The fill material is in direct contact with the steel duct or the insulation. The sealant material overlapped the concrete a nom. 1/4-in.

1. **WALL ASSEMBLY:** The fire-rated wall assembly shall consist of min. 4-1/2 in. thick lightweight or normal-weight (100-150 pcf) reinforced concrete. The wall assembly may also be constructed of any similarly rated concrete masonry units. Max. diameter of penetration opening is to be 32 in.

2. **PENETRATING ITEM:** One metallic pipe, conduit or tubing to be installed either concentrically or eccentrically within the through opening. The penetrating item is to be rigidly supported on both sides of the floor or wall assembly. The following types and sizes of metallic pipes, conduit or tubing may be used:
   
   A. **Steel Pipe:** Schedule 10 (or heavier) nom. 24 in. diameter (or smaller) steel pipe.
   B. **Conduit:** Nom. 4 in. diameter (or smaller) steel electrical tubing or steel conduit.
   C. **Copper Tubing:** Type L (or heavier) nom. 6 in. diameter (or smaller) copper tubing.
   D. **Copper Pipe:** Nom. 6 in. diameter (or smaller) Regular (or heavier) copper pipe

3. **PIPE COVERING MATERIALS:** Nom. 1 in. thick hollow cylindrical heavy density (min. 3.5 pcf) glass fiber units, jacketed on the outside with an all service jacket. Longitudinal joints shall be tightly butted and sealed with metal fasteners or factory applied self-sealing lap tape. Transverse joints shall be secured with metal fasteners or with butt tape supplied with the product. An annular space of 1/2 in. (min.) to 1-1/2 in. (max.) is required within the fire stop system. Any listed pipe covering material meeting the above specifications with a flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

4. **PACKING MATERIAL:** Nom. 3 in. depth of 4 pcf mineral wool batt insulation, tightly and permanently packed into the opening. Surface of packing material is to be recessed from the top surface of the floor or both surfaces of the wall assembly, as required to accommodate the necessary depth of caulk fill material (Item 5).

5. **FILL, VOID OR CAVITY MATERIAL:** Min. 1/2 in. depth of sealant fill material is to be applied to the recess around the top surface of the floor through-penetration opening or both faces of the wall through-penetration.

Penetrating Item Type A
T-Rating - 0 hr
F-Rating - 2 hr

1. **GYPSUM WALL ASSEMBLY:** Max. opening for penetrating item in gypsum wallboard layers is to be 1-1/2 in. larger in diameter than the outside of the penetrating item. Two hour fire-rated wall assembly shall include one of the following features:

   A. Min. 25 GA galvanized steel studs spaced 24 in. o.c. measuring 3-1/2 in. wide with 18-in. o.c. Studs and runners covered with two layers of 5/8 in. thick, Type X gypsum wallboard on each face. The base layer of gypsum wallboard fastened to steel studs with #6 1-1/8 in. bugle head phillips drywall screws 12 in. o.c. The face layer of gypsum wallboard fastened with #6 1-5/8 in. bugle head phillips drywall screws spaced 8 in. o.c. Joint Tape and Compound - Vinyl or casein, dry or premixed joint compound applied to face layers of gypsum wallboard in two coats to all exposed screw heads and gypsum wallboard joints. A min. 2-in. wide paper, plastic or fiberglass tape embedded in first layer of compound over joints in gypsum wallboard.

   B. Wood studs are to consist of min. nom. 2 × 4 lumber max. spaced 16 in. o.c. Studs attached with min. 16d common nails to 2 × 4 lumber floor and ceiling runners measuring, which are secured to floor and ceiling with 3-in. concrete fasteners spaced max. 18-in. o.c. Studs and runners covered with two layers of 5/8 in. thick, Type X gypsum wallboard on each face. The base layer of gypsum wallboard fastened to wood studs with #6 1-1/8 in. bugle head phillips drywall screws spaced 12 in. o.c. The face layer of gypsum wallboard fastened with #6 1-5/8 in. bugle head phillips drywall screws spaced 8 in. o.c. Joint Tape and Compound - vinyl or casein, dry or premixed joint compound applied to face layers of gypsum wallboard in two coats to all exposed screw heads and gypsum wallboard joints. A min. 2-in. wide paper, plastic or fiberglass tape embedded in first layer of compound over joints in gypsum wallboard.

2. **PENETRATING ITEM:** One metallic pipe, conduit or tubing to be installed concentrically within the through opening. The penetrating item is to be rigidly supported on both sides of the wall assembly. An annular space of 3/4 in. is required within the fire stop system. The following types and sizes of metallic pipes, conduit or tubing may be used:

   A. **Steel Pipe:** Schedule 10 (or heavier) nom. 12 in. diameter (or smaller) steel pipe.
   B. **Conduit:** Nom. 6 in. diameter (or smaller) steel conduit.
   C. **Conduit:** Nom. 4 in. diameter (or smaller) electrical metallic tubing.
   D. **Copper Tubing:** Type L (or heavier) nom. 6 in. diameter (or smaller) copper tubing.
   E. **Copper Pipe:** Nom. 6 in. diameter (or smaller) Regular (or heavier) copper pipe
3. FORMING MATERIAL: Nom. 1 in. diameter polyethylene backer rod, tightly and permanently friction fit into opening. The forming material is to be recessed from both surfaces of the wall assembly, as required to accommodate the necessary depth of sealant fill material (Item 4).

3. FILL, VOID OR CAVITY MATERIAL: Min. of 5/8 in. thickness of sealant fill material is to be applied within the annulus on both faces of the wall through-penetration.

FIRE PENETRATION SEAL (Mechanical)
Penetrating Item: Steel Duct
ISO 6944
Integrity, Stability, Insulation – 2 Hr.
T-Rating - 2 hr
F-Rating - 2 hr

1. PENETRATING ITEM: An airtight round or rectangular steel duct system constructed with the limiting specifications in the table below.
Protect duct with two layers of 3M Fire Barrier Duct Wrap 15A or 20A as detailed in systems VAD 529 F, VAD 530 F, or VAD 531 F, VAD 542 F. The insulation abuts the firestop system (3&4) on both sides of the wall.

2. WALL ASSEMBLY: The two-hour fire-rated wall assembly consists of min. 4-1/2 in. thick normal weight (100-150 pcf) reinforced concrete or concrete blocks. Create an opening in the wall assembly in accordance with the applicable specifications in the table below. Position the duct assembly concentrically or eccentrically in the opening so that the annular space ranges from min. 1 in. on one side to max. 2 in. on the other.

3. FILL, VOID OR CAVITY MATERIAL: Min. 1/4-in. depth of sealant fill material is to be applied over the recess of the packing material (4) on both sides of the wall through-penetration opening. The fill material is in direct contact with the steel duct or the insulation. The sealant material overlapped the concrete a nom. 1/4-in.

Listed Manufacturer:
3M
Firestopping
3M Fire Barrier™ 2000+ Silicone Sealant
3M Fire Barrier™ 1000 N/S Silicone Sealant

3. FILL, VOID OR CAVITY MATERIAL: Min. 1/4-in. depth of sealant fill material is to be applied over the recess of the packing material (4) on both sides of the wall through-penetration opening. The fill material is in direct contact with the steel duct or the insulation. The sealant material overlapped the concrete a nom. 1/4-in.

Listed Manufacturer:
3M
Firestopping
3M Fire Barrier™ 2000+ Silicone Sealant
3M Fire Barrier™ 1000 N/S Silicone Sealant
4. **PACKING MATERIAL:** Fill the annular space with scrap 3M Fire Barrier Duct Wrap 15A, 20A, or 4 pcf mineral wool**. Cut the mineral wool into strips. Then compress it approximately 50% and insert it into the opening to fill the entire annular space. Recess the surface of packing material a min. 1/4 in. from both sides of the wall as required to accommodate the necessary depth of caulk fill material. (** Listed with Omega Point Laboratories)

**Listed Manufacturer:**

1. WALL ASSEMBLY: The fire-rated wall assembly shall consist of min. 4-1/2 in. thick lightweight or normal-weight (100-150 pcf) reinforced concrete. The wall assembly may also be constructed of any similarly rated concrete masonry units. Max. diameter of penetration opening is to be 1/4 in. (min.) to 3-1/4 in. (max.) larger than the penetrating item.

2. PENETRATING ITEM: One metallic pipe, conduit or tubing to be installed either concentrically or eccentrically within the through opening. The penetrating item is to be rigidly supported on both sides of the floor or wall assembly. An annular space of min. 0 in. (point contact) to max. 3-1/4 in. is required within the fire stop system. The following types and sizes of metallic pipes, conduit or tubing may be used:
   A. Steel Pipe: Schedule 10 (or heavier) nom. 24 in. diameter (or smaller) steel pipe.
   B. Conduit: Nom. 4 in. diameter (or smaller) steel conduit.
   C. Copper Tubing: Type L (or heavier) nom. 6 in. diameter (or smaller) copper tubing.
   D. Copper Pipe: Nom. 6 in. diameter (or smaller) Regular (or heavier) copper pipe.

4. PACKING MATERIAL: Nom. 3 in. depth of 4 pcf mineral wool batt insulation, tightly and permanently packed into the opening. Surface of packing material is to be recessed from the top surface of the floor or both surfaces of the wall assembly, as required to accommodate the necessary depth of caulk fill material (Item 4).

5. FILL, VOID OR CAVITY MATERIAL: Min. 1/2 in. depth of sealant fill material is to be applied to the recess around the top surface of the floor through-penetration opening or both faces of the wall through-penetration. An additional min. 1/2 in. diameter bead of sealant material is to be applied around the outer perimeter of the through opening, at the penetrating item to concrete interface.

</table>
1. **Floor/Ceiling Assembly:** Code conforming 1 hour fire-rated floor/ceiling assembly, framed with minimum nominal 2” x 10” solid sawn or manufactured wood joists, topping optional (not shown).

2. **Chase Wall:** Code conforming 1 hour fire-rated wood or steel stud gypsum wallboard assembly, install the firestop system as detailed in (Item 4) to the underside of the double top plate.

3. **Penetrant:** (See table of ratings) Nominal 1/2” ID, PEX Pipe, including 90° Metal Turnouts (Item 3a) and Tee’s (Item 3b) for use in Closed (Process and Supply) piping systems, ratings achieved will equal that of floor or wall assembly.

4. **Firestop System Component:** *3M™ Fire Barrier CP-25WB+ Caulk or *3M™ Fire Barrier IC 15WB+ Sealant fill the annular space to a minimum depth of 5.8”

**Note:** Metric conversion factor, inches x 25.4 = mm.

*Components bearing the Warnock Hersey Certification Mark.

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products.
1. **Penetrations**: As per table of ratings; maximum number of penetrants is not limited. Penetrant spacing is limited only by good structural practice for complete mortar penetration except bus ducts or cable trays which shall be spaced a minimum of 4" apart. Steel U-Channel supports may penetrate at angles up to 45° from perpendicular.
   a) Cable trays have a maximum fill of 45% by area, (100% visual fill) of Control, Communication or Power Cables of any type or size, including Mineral Insulated (MI) cable.
   b) Bus ducts may contain Copper conductors (4500 A maximum) or aluminum conductors (3400 A maximum) and be internally firestopped with 3M™ Fire Barrier Mortar 8" in depth, centered in wall or floor. Conductors to be suitably insulated at location of contact with mortar.
   c) No Penetrant (Not Shown): Maximum opening size is 12" x 12" rectangular or 12" diameter.
2. **Filler Material**: *3M™ Fire Barrier Mortar*, minimum depth 4", minimum depth 8" in bus ducts.
   a) Slip Cover: 1/8" thick ceramic paper blankets may be used to wrap moving pipes within 3M™ Fire Barrier Mortar as a bond breaker to prevent mechanical damage. Blankets must be securely held on pipes and/or pipe covering by suitable tapes or wire.
3. **Floor or Wall**: Concrete slab, or concrete block wall with a minimum density of 100 lbs/ft³ density minimum depth as necessary for required fire resistance rating but not less than 4". Maximum size of opening 22.7 sq. ft., maximum length 8 ft.
4. **Pipe Insulation** (Optional): For steel pipe, 1" to 6" pre-molded calcium silicate or rockwool, or 6" perlite based insulation with minimum 0.016" thick aluminum jacket, or minimum 0.010" thick steel or stainless steel jacket. For copper pipe a minimum 1" rockwool pipe wrap insulation with foil scrim craft jacket. All insulation and jacketing must be securely fastened.

Note: Metric conversion factor, inches x 25.4 = mm.
Refer to 3M literature for complete installation information.
*Component bearing the Warnock Hersey Certification Mark.

1. **Floor Assembly:** Code conforming 2 Hour fire-rated floor assembly, nominal 2-1/2" concrete, Q Deck or Fluted Deck, normal or low density cast concrete.

1b. **Floor or Wall Assembly:** Code conforming 2 Hour fire-rated floor or wall assembly, nominal 4-1/2" thickness, normal or low density cast concrete or Hollow Core Concrete (not shown). Wall may also be constructed of nominal 8" thick concrete blocks (filled or unfilled).

2. **Penetrant** – (See also table of ratings) Nominal 2" diameter, Schedule 40, PVC and System XFR pipes for use in DWV (Drain, Waste and Vent) or Closed (Process and Supply) piping systems, ratings achieved will equal that of floor or wall assembly.

3. **Firestop System Components:**
   a. *3M™ FireStrap™ or *3M™ FirePlug™: Install within opening, recessed 1/4" from the floor surface, according to the manufacturers instructions. For Hollow Core Concrete install on the underside flush with the bottom surface, and apply sealant (Item 3b) on floor side, 1/2" thickness over 1" thickness of tightly packed, 4 PCF, mineral wool, recessed 1/2" from the floor surface, according to the manufacturers instructions. For walls install firestop system flush to the surface on both sides. To reduce hole diameter to the size listed, back fill with *3M™ Fire Barrier Mortar or non-shrink grout.

   b. **Sealant:** *3M™ Fire Barrier CP-25WB+ Caulk, *3M™ Fire Barrier IC 15WB+ Sealant, or *3M™ FireDam 150+ Caulk, applied to seal the annular space between the opening and the firestop device (Item 3a), to a 1/4" thickness flush with the floor or wall surface. Firestop system is applied to both sides for wall applications.

**Note:** Metric conversion factor, inches x 25.4 = mm.

*Components bearing the Warnock Hersey Certification Mark.

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products.
1. **Floor or Wall Assembly:** Code conforming 2 hour fire-rated floor or wall assembly, nominal 4-1/2" thickness normal or low density cast concrete, or hollow core concrete. Wall may also be constructed of nominal 8" thick concrete blocks (filled or unfilled). Hollow Core Concrete (Not Shown): Seal the annular space at pipe penetration on the floor side with a 1/4" thickness of *3M™ CP-25WB+ Caulk, *3M™ Fire Barrier IC 15 WB+ Sealant or *3M™ FireDam™ 150+ Caulk, flush with floor surface. Caulk is applied over 1" thickness of mineral wool.

2. **Penetrant:** (See table of ratings) Nominal 4" diameter, Schedule 40, ccABS, ABS, PVC, System XFR, CPVC and FRPP pipes for use in DWV (Drain, Waste and Vent) or Closed (Process and Supply) piping systems, and PVC - Thin Wall Vacuum Tubing (nominal 2" diameter), ratings achieved will equal that of floor or wall assembly.
   b) Nominal 6" diameter, Schedule 40, PVC and System XFR pipe.

3. **Firestop System Component:** *3M™ Interam™ Ultra PPD or *3M™ Fire Barrier Ultra RC Pack: Sized appropriately for pipe diameter, secured with *3M™ Ultrafast™ Anchors or steel masonry anchors 1/4" diameter x 1-1/4" long over fender washers. To reduce opening size backfill annular space with a non-shrink grout. Use *3M™ Interam™ Ultra PPD-1.5 for PVC - Thin Wall Vacuum Tubing (nominal 2" diameter).
   a) *3M™ Interam™ PPD-6: Installed onto the pipe (Item 2b) over aluminum foil tape (Item 3b), secured with steel masonry anchors 1/4" diameter x 1-1/4" long over fender washers.

   **Sealant (Optional):** *3M™ CP-25WB+ Caulk, *3M™ Fire Barrier IC 15 WB+ Sealant or *3M™ FireDam™ 150+ Caulk to fill the annular space at the pipe penetration as a smoke seal.

   *CPVC Pipe - Use only *3M™ Fire Barrier IC 15 WB+ Sealant.

---

**Note:** Metric conversion factor, inches x 25.4 = mm.

*Components bearing the Warnock Hersey Certification Mark.

**May be used, however, is not require to achieve ratings.

---

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products
1. **Design A:** Code conforming 2 HR rated floor or wall assembly, minimum 2-1/2" normal or low density cast concrete, hollow core concrete or Q-Deck. Wall may also be constructed of nominal 8" thick concrete blocks (filled or unfilled).
2. **Penetrant** (See also table of ratings) – PEX Pipes, maximum of three (3) nominal 1" diameter or smaller, ratings will equal that of the floor or wall assembly.
3. **Firestop System Components:**
   a. *3M™ Interam™ Ultra PPD-2 or *3M™ Fire Barrier Ultra RC Pack 2 attach to fire rated substrate, underside for floors and both sides in wall applications.
   b. (Alternate Method - Not Shown) Wrap the pipe bundle continuously to form two layers of *3M™ Interam™ Ultra GS Material Apply a length of *3M™ Fire Barrier RC-1 Collar, with a 1" overlap, secured with a stainless steel hose clamp, fasten to substrate with the appropriate fasteners. Attach the firestop to the fire rated substrate at the underside for floors; both sides in wall applications.
   c. *3M Fire Barrier CP-25WB+ Caulk - Apply to a thickness of 5/8" between the pipes and the interior face of the *3M™ Interam™ Ultra PPD-2 or *3M™ Fire Barrier Ultra RC Pack 2.
4. **Fasteners:** As detailed with 1-1/4" diameter fender washers.
   a. **Design A - Concrete:** 1/4" x 1-1/4" steel masonry fasteners, wedge anchors or Tapcon®.
   b. **Design B - Gypsum:** 1/4" diameter hollow dry wall anchors, length as required for substrate thickness
   c. **Design C - Wood:** 1-1/4" long dry wall screws

**Note:** Design C, apply *3M Fire Barrier CP-25WB+ Caulk, to the annular space in the wood floor membrane or the sole plate.

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products
1. **Floor or Wall Assembly:** Code conforming 1 hour or 2 hour fire-rated floor or wall assembly, nominal 2-1/2" thick, normal or low density cast concrete, or hollow core concrete and block walls. F rating will equal that of floor or wall fire resistance rating.

2. **Penetrant:** (See table of ratings) Nominal 8" diameter or smaller, Steel (Schedule 10 and heavier) and Cast Iron pipes, nominal 4" diameter or smaller EMT, Rigid Steel Conduit and Copper Pipe or Tubing.

3. **Firestop System Component:**
   a) Firestop Design: Installed a listed 3M™ Fire Protection products design to seal the penetrant. Firestop Forming Material: Substitute listed material with 4 pcf mineral wool, installed to the full thickness of the floor or wall. Apply the listed 3M™ sealant, caulk, putty or spray as detailed in the design.
   b) *3M™ FireMaster® Duct Wrap is wrapped around the pipe to meet the application layers as detailed in the table. Seams and cut edges are sealed with aluminum foil tape. Secure with 1/2" wide stainless steel banding at 8" intervals, at the fire separation, within 1-1/2" on both sides of longitudinal butt seams and at the end of the wrapped pipe length.
   c) Point Contact Pipes: *3M™ Firemaster® Duct Wrap must be flared out onto the floor or wall substrate a minimum of 1".
   Wrap Methods:
   - Single Layer: *3M™ FireMaster® Duct Wrap is wrapped around the pipe, transverse seams overlapped 3" longitudinal seams are butted together.
   - Double Layer: *3M™ FireMaster® Duct Wrap is wrapped around the pipe with one layer forming a butt seam for transverse and longitudinal seams, secure with fiber reinforced tape or similar material. Second layer covers the first layer, with transverse and longitudinal butt seams, offset from those of the first layer.
   d) (Not Shown) Floor Applications - install the *3M™ FireMaster® Duct Wrap to the underside of the floor.
   Wall Applications – install the *3M™ FireMaster® Duct Wrap to both sides of the wall

4. **Riser Clamp:** Vertical pipe, floor penetration applications that involve a wrapped (item 3b) pipe length that does not include an elbow or tee. To retain the material (Item 3b) in position against the underside of the floor (to prevent slippage or sag), a steel Riser Clamp is secured to the pipe at the end point of the material (Item 3b) wrapped length of pipe.

**Note:** Metric conversion factor, inches x 25.4 = mm.

*Components bearing the Warnock Hersey Certification Mark.

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products.
1. **Floor or Wall Assembly:** Code conforming 1 or 2 hour fire-rated floor or wall assembly, nominal 2-1/2" thick, normal or low density cast concrete, or hollow core concrete. F rating will equal that of floor or wall fire resistance rating.

2. **Penetrant:** (See table of ratings) Nominal 8" diameter or smaller Steel (Schedule 10 and heavier) or Cast Iron pipe, nominal 4" diameter EMT, Rigid Steel Conduit and Copper Pipe or Tubing.

3. **Firestop System Components:**
   a) Firestop Design: Installed a listed 3M™ Fire Protection Product design to seal the penetrant. Firestop Forming Material: Substitute listed material with 4pcf mineral wool, installed to the full thickness of the floor or wall. Apply the listed 3M™ sealant, caulk, putty or spray as detailed in the design.
   b) *3M™ FireMaster® Duct Wrap is wrapped in a “U” shape around the pipe and attached to the substrate as detailed in Items 5 and 6 to meet the application layers as detailed in the table, seams and cut edges are sealed with aluminum foil tape, secure with 1/2" wide stainless steel banding (Item 8) at “ intervals, at the fire separation and the end of the wrap length of pipe.
   c) (Not Shown) At the wrapped end point, *3M™ FireMaster® Duct Wrap is positioned into the space between the concrete slab and the pipe to fill all void spaces to a depth of 3”.
   d) (Not Shown) Floor Applications - install the *3M™ FireMaster® Duct Wrap to the underside of the floor.
   Wall Applications – install the *3M™ FireMaster® Duct Wrap to both sides of the wall.
4. **Wrap Methods:**
   
   a) **Single Layer (Not shown):** *3M™ FireMaster® Duct Wrap is wrapped in a “U” shape around the pipe, longitudinal seams overlapped 3”.
   
   b) **Double Layer:** *3M™ FireMaster® Duct Wrap is wrapped in a “U” shape around the pipe, butt longitudinal seams on both layers. Exterior layer seams are offset from those of the inner layer seams.

5. **Three-Sided Wrap Method:** *3M™ FireMaster® Duct Wrap is wrapped around the pipe such that a minimum flare of 3” (Item 10) is attached to the substrate, secured with a Clamping Plate (Item 7) to the underside of the floor slab or wall on both sides of the pipe.

6. **Two-Sided Wrap Method:** *3M™ FireMaster® Duct Wrap is wrapped around the pipe such that a minimum overlap of 3” (Item 10) onto the substrate, is secured with a Clamping Plate (Item 7) to the underside of the floor slab and wall.

7. **Clamping Plate:** Minimum 1-1/2” x 3/16” thick steel plate with pre-drilled nominal 1/4” diameter holes at 8” o.c. used to clamp the wrap material against the bottom of the floor slab and surface of the wall. Fasten stainless steel banding (Item 8) to the clamping plates with tails that will permit mating at the mid point of the pipe, prior to securing to substrate. Secure the clamping plate with steel masonry anchors (Item 9) or Tapcon Fasteners (Item 9) passing through the *3M™ FireMaster® Duct Wrap.

**Note:** Metric conversion factor, inches x 25.4 = mm.

*Component bearing the Warnock Hersey Certification Mark.

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products.
**Design A**

1. **Floor or Wall Assembly**: Code conforming 2 hour fire-rated floor or wall assembly, nominal 4-1/2" thick, normal or low density cast concrete or hollow core concrete. Wall may also be constructed of nominal 8" thick concrete blocks (filled or unfilled).

**Design B**

1. **Wall Assembly**: Code conforming 2 Hour fire-rated wall, metal or wood framed gypsum wallboard, wall assembly.
2. **Penetrant**: (See also table of ratings) Nominal 4" diameter, Schedule 40, PVC and System XFR pipes, used for DWV (Drain, Waste and Vent) or Closed (Process and Supply) pipe systems, ratings achieved will equal that of wall assembly.
3. **Firestop System Components**:
   a. Sealant: *3M™ Fire Barrier CP-25WB+ Caulk, *3M™ Fire Barrier IC 15WB+ Sealant or *3M™ FireDam 150+ Caulk, apply a 1/4" thickness of sealant to fill the annular space at the pipe penetration, prior to the installation of the firestop device (Item 3b).
   b. *3M™ Ultra RC Pack or *3M™ Interam™ Ultra PPD, device to be installed on underside of floors and both sides of walls and latched around pipe.

**Anchors**

- Masonry: Secure firestop device with 1/4" diameter by 1-1/4" long steel anchors, Tapcon® or equalivalant fasteners in conjunction with 1-1/4" diameter, steel fender washers.
- Gypsum Wallboard: Secure firestop device with 1/4" diameter, hollow dry wall anchors or steel toggle bolts in conjunction with 1-1/4" diameter, steel fender washers.

**Alternate (not shown)**

- Wrap Strip: *3M™ Interam™ Ultra GS Wrap Strip, nominal 1/8" thick intumescent material supplied in 2" wide strips. Wrap strip is tightly wrapped around pipe with continuous layers and butted tightly against floor or wall surface. Wrap strip layers temporarily held in position using aluminum foil tape, steel wire tie, or equivalent.
- Steel Collar: *3M™ Fire Barrier RC-1 Collar, nominal 2" wide with 1-1/4" by 2" anchor tabs and minimum 1/2" long tabs to retain wrap strip layers. Steel collar, with anchor tabs bent outward 90°, wrapped tightly over wrap strip layers with 1" overlap at seam. Anchor tabs to be pressed tightly against wall surfaces, and collar to be compressed around wrap strip layers, secure with 1/2" wide stainless steel hose clamp at the middle of collar. Collar to be secured to floor or wall surfaces as detailed in (Item 3b).

**Note**: Metric conversion factor, inches x 25.4 = mm.

*Components bearing the Warnock Hersey Certification Mark.

1. **Floor or Wall Assembly:** Code conforming 2 hour fire-rated floor or wall assembly, nominal 4-1/2" thickness, normal or low density cast concrete, or hollow core concrete. Wall may also be constructed of nominal 8" thick concrete blocks (filled or unfilled).

2. **Penetrant:** (See table of ratings) Schedule 40, ccABS, ABS, PVC pipes for use in DWV (Drain, Waste and Vent) or Closed (Process and Supply) piping systems and PVC-Thin Wall Vacuum Tubing (nominal 2" diameter), ratings achieved will equal that of floor or wall assembly.

3. **Firestop System Components:** *3M™ FireStrap™:* Install within opening, recessed 1-1/4" from either surface for solid concrete floor applications, according to the manufacturers instructions. For Hollow Core Concrete install on the underside, flush with the bottom surface, according to the manufacturers instructions. For Walls install firestop system flush to the surface on both sides. To reduce hole size to the size listed, back fill with *3M™ Fire Barrier Mortar. Use 3M™ Firestrap™ 1-1/2" for PVC - Thin Wall Vacuum Tubing (nominal 2" diameter).

4. **Sealant:** *3M™ Fire Barrier CP-25WB+ Caulk, *3M™ Fire Barrier IC 15WB+ Sealant or *3M™ FireDam 150+ Caulk, applied to 1/2" thickness flush with the floor or wall surface. Firestop System is applied to both sides for wall applications.

5. **Forming Material:** Minimum 1" thickness of mineral wool, 4 pcf, tightly packed around the pipe, recessed 1/2" from the floor or wall surface.

**Note:** Metric conversion factor, inches x 25.4 = mm.

*Components bearing the Warnock Hersey Certification Mark.

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products.
1. Floor or Wall Assembly:

1a. Concrete – Floor or wall, minimum depth or thickness as necessary for required rating of fire separation but not less than 4-1/2", normal-density or lightweight concrete. Wall may also be constructed of nominal 8" thick concrete blocks. For openings in concrete block wall, concrete or mortar shall be used to create a solid surround to the opening. The penetrant or penetrants are to be installed a minimum 3/4" to a maximum 18" from the periphery of the opening and 1/2" apart, PVC and ENT Sleeves spaced 1" apart, and cable trays as noted.

Opening Size: Maximum 24 square feet with maximum dimension of 8 ft.

1b. Gypsum – Code conforming 1 or 2 HR rated wall, nominal 2" x 4" steel / wood framed gypsum wallboard wall assembly. Stud framing to create a solid surround to the opening. The penetrant or penetrants are to be installed a minimum 3/4" to a maximum 18" from the periphery of the opening and 1/2" apart, PVC and ENT Sleeves spaced 1" apart, and cable trays as noted.

Opening Size – Maximum 9 sq. ft with maximum dimension of 3 ft.

Penetrants:

Any single or multiple combinations of the detailed penetrants may be installed in the opening. The spacing between penetrants and the opening must be maintained as detailed.

Blank Openings, pack with mineral wool as detailed in (Item 6a), flush with the surface of the floor or wall and apply 3M™ FireDam™ Spray 200 as detailed in (Item 6b)
Design No. PHV 120-09 continued

2. **Cable Trays:**
   Maximum 36" wide steel, aluminum or stainless steel cable tray solid back or ladder type. Maximum fill 40% by area (100% visual fill).
   Control, communication or power cables. Cable trays to be spaced 6" apart.
   T-Rating - 0 HR or 1-1/2 HR with 12 AWG cables.
   **Cables:**
   (Not Shown) Communication or power cables. Armored Cable or Metal Clad Cable, or Mineral Insulated Cable, single or in bundles and installed with rigid support on both sides of opening.

3. **Sleeve:**
   **PVC or ENT Sleeve** – Nominal 4" diameter (or smaller) to contain control, communication or power cables or left blank.
   **Corrugated Wall Sleeve** – Nominal 2" diameter (or smaller) ENT (PVC) or Polyethylene (PE) tubing, to contain control, communication or power cables or left blank. *3M™ Moldable Putty+ installed within the end of the sleeve, around and between the cables or cable bundle, to a 1" thickness, applied over mineral wool packed to a thickness of 3-1/2" for 4-1/2" thick concrete floors, 6" for 8" thick block walls, 2-3/4" for 1 hour rated gypsum wallboard assemblies and 4" for 2 hour rated gypsum wallboard assemblies. Apply *3M™ Moldable Putty+ flush to the surface on both sides of wall applications.
   T-Rating – 0 HR for ENT Sleeve
   T-Rating 1-1/2 HR for PVC Sleeve

4. **Metallic Pipes:**
   **Steel or Iron Pipe** – Nominal 16" diameter (or smaller) Schedule 10 or heavier pipe
   **Copper Pipe or Tubing** – Nominal 4" diameter (or smaller)
   **Conduit** – EMT nominal 4" diameter (or smaller) steel tubing
   **Flexible Metal Conduit** – Nominal 4" diameter (or smaller) jacketed or non-jacketed, steel conduit.
   T-Rating – 0 HR.

5. **a. Insulated Metallic Pipes:**
   **Steel or Iron Pipe** – Nominal 16" diameter (or smaller) schedule 10 or heavier
   **Copper Pipe or Tubing** – Nominal 4" diameter (or smaller).
   Nominal 1-1/2" thick, mineral wool pipe wrap insulation, to be applied to the pipes, extending a minimum 2" on either side of the fire separation thickness, butting up to glass fiber pipe insulation.
   T-Rating is 1 HR or 2 HR dependent upon F-Rating of substrate.

   **b. U-Channel Steel Supports:** May penetrate at angles up to 45 degree from perpendicular.

6. **Firestop Components:**
   **6a. Mineral Wool** – minimum 4pcf density, compressed 33%, minimum 4" depth, applied flush with top of floor or both sides of wall.
   **6b. *3M™ FireDam Spray 200; *3M™ Fire Barrier 1000 Silicone Sealant No Sag and *3M™ 1003 Silicone Sealant Self Leveling** – Spray or brush, or pour or caulk over mineral wool, 1/8" wet thickness (1/16" dry thickness) of spray material overlapping onto the floor, wall, and penetrants 1/2". Apply to both sides of wall assemblies.

Note: metric conversion factor, inches x 25.4 = mm

*Component bearing the Warnock Hersey Certification Mark

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products
1. Floor or Wall Assembly:
   Design A: Code conforming 2 hour fire-rated floor or wall assembly, nominal 2-1/2" thickness, normal or low density cast concrete, hollow core concrete or Q-Deck. Wall may also be constructed of nominal 8" thick concrete blocks (filled or unfilled).
   Design B: Code conforming 1 or 2 hour fire-rated wall, nominal 2" x 4" steel/wood framed gypsum wallboard, wall assembly.
   Design C: Code conforming 1 or 2 hour fire-rated floor/ceiling assembly, framed with nominal 2" x 10" solid sawn or manufactured wood joists, topping optional (not shown).

2. Penetrant: (See table of ratings) Nominal 4" diameter, Schedule 40, ccPVC, PVC, CPVC, ABS, ccABS, and FRPP pipe with couplings for use in DWV (Drain, Waste and Vent) or Closed (Process and Supply) piping systems, ratings achieved will equal that of substrate assembly.

3. Coupling/Fitting: Manufactured of a material similar to that of the pipe.

4. Firestop System Components:
   a) *3M™ Fire Barrier RC-1 Collar, cut to length 1” larger than OD of wrapped pipe and secured in place with a hose clamp. The second collar mounting tabs are placed under the hose clamp (Item 6) of the first collar and bent over to lock in place.
   b) *3M™ Fire Barrier FS-195+ Wrap Strip wrapped around coupling and pipe with butted seams staggered. Stack: Each stack consists of layers of Wrap Strip (Item 4b) covered with a Collar (Item 4a). The first stack is secured to the substrate with an appropriate fastener (Item 5). The second stack, if required is attached to the first stack by placing the mounting tabs under the hose clamp of the first stack and bending over the mounting tab.

5. Fasteners: As detailed with 1-1/4" diameter fender washers.
   Design A – Concrete: 1/3" x 1-1/4" steel masonry fasteners, wedge anchors or Tapcon®.
   Design B – Gypsum: 1/4" diameter hollow dry wall anchors, length as required for substrate thickness

6. Hose Clamp: 1/2" wide stainless steel hose clamp or equivalent, sized appropriately.

7. Sealant: *3M™ Fire Barrier CP-25WB+ Caulk, *3M™ Fire Barrier IC 15WB+ Sealant, fill annular space around pipe to 3/4" thickness through wood floor or sole plate (not shown).

   CPVC Pipe - use only *3M™ Fire Barrier IC 15WB+ Sealant

Note: metric conversion factor, inches x 25.4 = mm
*Component bearing the Warnock Hersey Certification Mark

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products
1. **Floor or Wall Assembly:**
   - **Design A:** Code conforming 2 hour fire-rated floor or wall assembly, minimum 2-1/2" normal or low density cast concrete, hollow core concrete or Q-Deck. Wall may also be constructed of nominal 8" thick concrete blocks (filled or unfilled).
   - **Design B:** Code conforming 1 or 2 hour fire-rated wall, nominal 2" x 4" steel/wood framed gypsum wallboard, wall assembly.
   - **Design C:** Code conforming 1 or 2 hour fire-rated floor/ceiling assembly, framed with nominal 2" x 10" solid sawn or manufactured wood joists, topping optional (not shown).

2. **Penetrant:** (See table of ratings) One nominal 1" diameter (or smaller) PEX Pipe installed within the opening, for use in Closed (Process and Supply) piping systems, ratings achieved will equal that of substrate assembly.

3. **Firestop System Components:**
   a) *3M™ Inte-Ram™ Ultra GS Strip installed within the opening, wrapped tightly around the pipe with butted seam, 1/4" of the wrap strip projects beyond the fire separation plane. A 3" wide adhesive backed aluminum foil tape, cut 1" longer than the wrap strip, is applied to the surface of the wrap strip to secure it to the pipe. System is applied to both sides in wall applications.
   b) **Caulk or Putty (Optional) - *3M™ Fire Barrier CP-25WB+ Caulk or *3M™ Moldable Putty+ (MPS2), to fill the annular space at the pipe penetration as a smoke seal.
   c) Caulk or Putty - *3M™ Fire Barrier CP-25WB+ Caulk or *3M™ MPS2, to fill the annular space at the pipe penetration through the wood floor membrane.

**Note:** Metric conversion factor, inches x 25.4 = mm.

*Components bearing the Warnock Hersey Certification Mark.

**May be used, however, is not require to achieve stated ratings.

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products
1. **Floor or Wall Assembly** – Code conforming 2 Hour fire-rated floor or wall assembly, nominal 4-1/2" thickness, normal or low density cast concrete. Wall may also be constructed of nominal 8" thick concrete blocks (filled or unfilled). Ratings achieved will equal that of floor or wall assembly.

1a **Steel Sleeve** (Optional, not shown) – For use with PVC Pipes only, minimum 0.028 wall thickness (or heavier) galvanized steel sleeve cast or grouted into floor or wall assembly. Sleeve may extend a maximum of 1/2" beyond either surface of floor or wall assembly.

2. **Penetrant** – (See also table of ratings) Schedule 40, PVC pipe for use in DWV (Drain, Waste and Vent) or Closed (Process and Supply) piping systems. PEX and Kitec® – PE-AL-PE, pipes for use in Closed (Process and Supply) piping systems.

**Firestop System Components:**

3. **Forming Material** – Mineral wool, 2" thickness, 4pcf, tightly packed around the penetrant recessed from the floor or wall surface.

4. **Sealant**

   - **PVC Pipes** – *3M™ Fire Barrier IC 15WB+ Sealant apply to 2" thickness, within the annular space around the penetrant, over the forming material, flush with the floor or wall surface.

   - **Kitec® (PE-AL-PE) and PEX Pipes** – *3M™ Fire Barrier IC 15WB+ Sealant apply to 1" thickness, within the annular space around the penetrant, over the forming material, flush with the floor or wall surface.

   For wall applications apply firestop system to both surfaces.

**Note:** metric conversion factor, inches x 25.4 = mm

*Component bearing the Warnock Hersey Certification Mark

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products.
1. **Floor or Wall Assembly:**

   **Design A and B**: Code conforming 2 HR rated floor or wall assembly, nominal 4-1/2" minimum normal or low density cast concrete, or hollow core concrete. Wall may also be constructed of nominal 8" thick concrete blocks (filled or unfilled).

   **Design C**: Code conforming 1 or 2 HR rated wall, nominal 2" x 4" steel/wood framed gypsum wallboard, wall assembly.

2. **Penetrant** – (See also table of ratings) Electrical Nonmetallic Tubing (ENT) - Corline®, PVC corrugated wall tubing, ratings achieved will equal that of floor or wall assembly.

3. **Firestop System Components:**

   **Design A**: apply 1" thickness of *3M™ Fire Barrier CP-25WB+ Caulk over 1" thickness Mineral Wool 4pcf, forming material.

   **Design B**: apply 2 layers of *3M™ Fire Barrier FS-195+ Wrap Strip around tubing, secure with reinforced fiber tape or tie wire, fill remaining annular space to a 2" depth with * 3M™ Fire Barrier CP-25WB+ Caulk.

   **Design C**: apply *3M™ Fire Barrier CP-25WB+ Caulk to seal annular space, for 1 hour assemblies 5/8" thickness and for 2 hour assemblies 1-1/4" thickness.

   Wall Assemblies – apply firestop detail to both sides of wall.

   **Note**: metric conversion factor, inches x 25.4 = mm

   *Component bearing the Warnock Hersey Certification Mark

   This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products.
1. **Floor or Wall Assembly**: Code conforming 2 hour fire-rated floor or wall assembly; minimum 4-1/2" concrete thickness, reinforced lightweight or normal weight concrete for floors, minimum 6-1/2" concrete thickness for walls. Ratings achieved will equal that of floor or wall assembly.

2. **Penetrant**: (See table above) 1-3/16" Kitec process and supply pipe.

3. **Firestop System Components**:
   a) Firestop Forming Material – 4 pcf mineral wool, insulated to a thickness of 2-1/2", spaced to allow for 2" sealant thickness on top of forming for floors, or on each side of forming for walls.
   b) Firestop Sealant – *3M™ Fire Barrier IC 15WB+ Sealant; fill annular space around pipe to a depth of 2". For wall penetrations sealant is required on both sides of wall.

*Note: metric conversion factor, inches x 25.4 = mm
*Component bearing the Warnock Hersey Certification Mark

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products.
1. **Floor or Wall Assembly:** Code conforming 2 hour fire-rated floor or wall assembly, nominal 4-1/2" thick, normal or low density cast concrete, or hollow core concrete. Wall may also be constructed of nominal 8" thick concrete blocks (filled or unfilled).

2. **Penetrant:** (See table of ratings) Schedule 40, nominal 8" diameter PVC pipe for use in DWV (Drain, Waste and Vent) or Closed (Process and Supply) piping systems, ratings achieved will equal that of floor or wall assembly.

**Firestop System Components:**

3. **Non-Shrink Grout:** The annular space between the pipe and the opening shall be filled with a non-shrink grout to the fill thickness of the substrate.

4. **Aluminum Foil Tape:** Cover the pipe for an 8" length beginning at the substrate with an adhesive backed aluminum foil tape.

5. **3M™ Fire Barrier FS-195+ Wrap Strip:** (Not shown) Three stacks formed in a “telescope” fashion of nominal 2” wide wrap strips, wrapped around the pipe with butted seams in successive layers staggered. The first stack is butted to the substrate consisting of five layers, the middle stack four layers and bottom stack three layers of wrap strip. Wrap strips are held in position using aluminum foil tape, filament tape, steel wire tie or equivalent.

6. **3M™ Fire Barrier RC-1 Collar:** Wrap the steel collar around the top stack of wrap strip with a 1” overlap seam. The anchor tabs are bent outward 90° and secured to the substrate with minimum 1/4” diameter by minimum 1-1/2” long steel expansion bolts or equivalent in conjunction steel fender washers, minimum 1-1/4” diameter (Item 7) in each anchor tab. Secure the steel collars in place with a stainless steel band clamp or hose clamp (Item 8). Each successive stack is covered with a steel collar positioned with the anchor tabs extending under the stainless steel band clamp or hose clamp and bent over to lock it in place. The stainless steel band clamps or hose clamps are mechanically interlocked using steel screws. The bottom fingers of the steel collar are bent 90° towards the pipe.

   *3M™ Fire Barrier CP-25WB+ Caulk:** (Not shown) Apply a 1/4” bead of caulk around the pipe at the substrate and wrap strip interface.

**Note:** metric conversion factor, inches x 25.4 = mm

*Component bearing the Warnock Hersey Certification Mark

---

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products
1. **Floor or Wall Assembly**: Code conforming 2 hour fire-rated floor or wall assembly, nominal 4-1/2" thick, normal or low density cast concrete. Wall may be constructed of nominal 8" thick concrete blocks (filled or unfilled).

2. **Penetrant**: (See table of ratings) Steel Pipe nominal 4" diameter (or smaller), or Copper Pipe nominal 2" diameter (or smaller).

3. **Pipe Insulation**: Nominal 1" thick Kookphen® K, rigid phenolic insulation. Ratings achieved will equal that of floor or wall assembly.

4. **Forming Material**: Minimum 4" thickness of 4pcf mineral wool batt insulation, compressed and firmly packed into the opening as a permanent form. Material to be recessed 1/2" from the top surface of floor or from both surfaces of wall.

5. **Firestop System Components**:
   - **Design A**: *3M™ Fire Barrier CP-25WB+ Caulk applied over forming material to a minimum depth of 1/2". For wall applications firestop system is applied to both sides.
   - **Design B**: *3M™ Fire Barrier Ultra GS Intumescent Wrap Strip taped around the entire perimeter of the insulation (Item 3). Floor applications strip to be centered within the floor thickness. For wall applications wrap strip is recessed 1" from the surface on both sides.

*Note: Metric conversion factor, inches x 25.4 = mm.

*Components bearing the Warnock Hersey Certification Mark.

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products.
1. Floor/Wall Assembly:
   - **Design A**: Code conforming 2 hour fire-rated floor or wall assembly, nominal 4-1/2" thick, normal or low density cast concrete, or hollow core concrete. Wall may also be constructed of nominal 8" thick concrete blocks (filled or unfilled).
   - **Design B**: Code conforming 2 hour fire-rated floor assembly, nominal 2-1/2" concrete or Q Deck or Fluted Deck, normal or low density cast concrete.
   - **Design C**: Code conforming 1 or 2 hour fire-rated wall, nominal 2" x 4" steel/wood framed gypsum wallboard, wall assembly.

2. Penetrant (See table above): Schedule 40, FRPP (Fire-Rated Polypropylene Pipe) pipe for use in DWV (Drain, Waste and Vent) or Closed (Process and Supply) piping systems, ratings achieved will equal that of floor/wall assembly.

3. Firestop System Components:
   - **Design A**: *3M™ FireStrap™*: Install within opening, recessed 1-1/4" from either surface, according to the manufacturer’s instructions. For Walls, apply firestop system to both sides. To reduce the opening diameter to the size listed, backfill with *3M™ Fire Barrier Mortar. Firestop is installed on both sides of the wall.
   - **Design B**: *3M™ FireStrap™*: Install within opening 1/2" below the floor surface of the concrete according to the manufacturer’s instructions.
   - **Design C**: *3M™ FireStrap™*: Install with 1/4" of the firestop exposed outside the surface of the gypsum wall assembly according to the manufacturer’s instructions.

4. Sealant: *3M™ Fire Barrier CP-25WB+ Caulk, *3M™ Fire Barrier IC 15WB+ Sealant or *3M™ FireDam 150+ Acrylic Caulk to fill the annular space at the pipe penetration as a smoke seal.

**Note:** Metric conversion factor, inches x 25.4 = mm.
*Components bearing the Warnock Hersey Certification Mark.
Design conforms to NBC 1995, reference clause 3) of 3.1.5.15 “Combustible Piping Material”.

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products.
1. **Floor and Wall Assembly** – 2 Hour rated concrete with minimum 4-1/2 in. thickness. Maximum 12 in. hole size.

2. **Penetrating Items** – Maximum 8 in. steel or cast iron Sch 10 or heavier, centered or offset in hole. Annular space: point contact to 3-3/8 in.

3. **Mineral Wool** – Nominal 4 PCF mineral wool insulation tightly packed around the penetrating item to a depth of 4 in. minimum.

4. **Firestop Sealant** – 3/8 in. depth bead of *3M™ Fire Barrier 1000 Silicone Sealant No Sag or *3M™ 1003 Silicone Silicone Sealant Self Leveling installed on the mineral wool. For wall assemblies, 3/8 in. depth of *3M™ Fire Barrier 1000 Silicone Sealant No Sag sealant shall be installed on both sides of the wall assembly.

5. **Pipe Insulation** – To provide a 2 Hour T Rating, pipe shall be wrapped on both sides of a wall assembly on the underside of a floor/ceiling assembly with 2 layers of mineral wool for pipe insulation, 1 in. thickness, foil jacketed insulation for a length of 24 in. Joints shall be staggered and overlapped 2 in., and sealed with aluminum foil tape. The insulation shall be tightly butted to the underside of the slab and secured with stainless steel bands or screw clamps every 8 in. The integrity of the design is not compromised when the pipe penetration includes fittings or clamps, as long as the insulation thickness remains constant at 2 in.

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products.
1. **Floor/Ceiling Assembly** – Minimum 4-1/2 in. thick concrete slab, two hour rated floor/ceiling assembly.

2. **Wall Assembly** – Minimum 5 in. thick concrete slab, or minimum 8 in. concrete block, two hour rating wall assembly.

3. a) **Penetrating Items** – See Table of Ratings.
   b) **Electrical Penetrations** – Maximum 8 cables spaced 1/8 in. minimum apart.
   c) **Metal Pipes** – Maximum 3 penetrating items spaced 1/8 in. minimum apart.

4. **Mineral Wool Packing** – Nominal 4 PCF or heavier density mineral wool insulation, tightly packed around the penetrating item to a depth of 4 in. minimum.

5. **Firestop Sealant** – *3M™ 1003 Silicone Silicone Sealant Self Leveling for floor/ceiling penetrations or *3M™ Fire Barrier 1000 Silicone Sealant No Sag for floor or wall penetrations, applied to a depth of 3/8 in. for floor penetrations on top of the mineral wool packing, and to a depth of 3/8 in. on both sides of a wall assembly.

This material was extracted and drawn by 3M Fire Protection Products from the 2006 Warnock Hersey Directory of Listed Products
1. Floor or Wall Assembly – Code conforming 2 Hour fire-rated floor or wall assembly, nominal 4-1/2" thickness, normal or low density cast concrete. Wall may also be constructed of nominal 8" thick concrete blocks (filled or unfilled). Ratings achieved will equal that of floor or wall assembly.

1a Steel Sleeve (Optional, not shown) – Minimum 0.028 wall thickness (or heavier) galvanized steel sleeve cast or grouted into floor or wall assembly. Sleeve may extend a maximum of 1/2" beyond either surface of floor or wall assembly.

2. Penetrant – (See also table of ratings) Schedule 40, XFR pipe for use in DWV (Drain, Waste and Vent) or Closed (Process and Supply) piping systems.

Firestop System Components:

3. Forming Material – Mineral wool, 2" thickness, 4pcf, tightly packed around the penetrant recessed from the floor or wall surface.

4. Sealant – *3M™ Fire Barrier IC 15WB+ Sealant applied to a 2" thickness, within the annular space around the penetrant, over the forming material, flush with the floor or wall surface. For wall applications apply firestop system to both surfaces.

Note: metric conversion factor, inches x 25.4 = mm

L Rating At 400° F – 3 CFM/Sq. Ft

System tested with a pressure differential of 50 Pa between the exposed and the unexposed surfaces with the higher pressure on the exposed side.

1. **Floor or Wall Assembly** – Min 114 mm thick reinforced lightweight or normal weight (100-150 pcf) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max diam of opening shall be 25 mm larger than the nom size of through-penetrant (Item 2). See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

1A. **Steel Sleeve** – (optional) – Schedule 40 (or heavier) steel sleeve cast or grouted into floor or wall assembly, flush with both surfaces of floor or wall assembly. The nom size of sleeve shall be 25 mm larger than the nom size of through-penetrant.

The hourly FT and FTH Ratings are 0 Hr when steel sleeve is used, otherwise the hourly FT, FH and FTH Ratings are equal to the hourly F Rating of the assembly.

2. **Through-Penetrant** – One nonmetallic pipe, conduit or tubing to be centered within the firestop system. A nom annular space of 8 mm is required within the firestop system. Pipe, conduit or tubing to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of nonmetallic pipes, conduits or tubing may be used:

   A. **Polyvinyl Chloride (PVC) Pipe** – Nom 50 mm diam (or smaller) Schedule 40 solid core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

   B. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** – Nom 50 mm diam (or smaller) SDR11, SDR13.5 or SDR17 CPVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

   C. **Rigid Nonmetallic Conduit** – Nom 50 mm diam (or smaller) Schedule 40 PVC conduit installed in accordance with the National Electrical Code (NFPA No. 70).

   D. **Electrical Nonmetallic Tubing (ENT)** – Nom 50 mm diam (or smaller) corrugated-wall electrical nonmetallic tubing (ENT) constructed of polyvinyl chloride (PVC) and installed in accordance with the National Electrical Code (NFPA No. 70). See Electrical Nonmetallic Tubing (FKHU) category in the Electrical Construction Materials Directory for names of manufacturers.

   E. **Flexible Nonmetallic Conduit, Liquid-Tight (FNMC)** – Nom 50 mm diam (or smaller) corrugated-wall flexible nonmetallic conduit, liquid-tight (FNMC) constructed of polyvinyl chloride (PVC) and installed in accordance with the National Electrical Code (NFPA No. 70). See Flexible Nonmetallic Conduit, Liquid-Tight (DXOQ) category in the Electrical Construction Materials Directory for names of manufacturers.

3. **Firestop System** – The details of the firestop system shall be as follows:

   A. **Packing Material** – (Optional) – Nom 9.5 mm diam polyethylene backer rod or min 9.5 mm thickness of mineral wool batt insulation firmly packed into opening as a permanent form and recessed from top surface of floor or both surfaces wall as required to accommodate the required thickness of fill material.

   B. **Fill, Void or Cavity Material** – **Sealant** – Min 50 mm thickness of fill material applied within the annulus, flush with top surface of floor or both surfaces wall.

3M COMPANY
3M FIRE PROTECTION PRODUCTS – FB-3000 WT sealant

Note: Systems with Nonmetallic Through Penetrant(s) have not been evaluated with a pressure differential of 50 Pa between the exposed and unexposed surfaces as required by the National Building Code of Canada.
System tested with a pressure differential of 50 Pa between the exposed and the unexposed surfaces with the higher pressure on the exposed side.

1. **Floor or Wall Assembly** – Min 114 mm thick reinforced lightweight or normal weight (1600 - 2400 kg/m³) concrete floor min 152 mm thick reinforced lightweight or normal weight (1600 - 2400 kg/m³) concrete wall. Wall may also be constructed of any UL Classified Concrete Blocks*. Max diam of opening is 102 mm.

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through-Penetrant** – One or more nonmetallic tubes to be installed either concentrically or eccentrically within the firestop system. Aggregate cross-sectional area of tubes in opening to be max 45 percent of the cross-sectional area of the opening. The annular space between the tubes shall be min 0 mm to max 25 mm. The annular space between the tubes and the edge of the opening shall be min 6 mm to max 25 mm. Tubes to be rigidly supported on both sides of the floor or wall assembly. The following types of tubes may be used:

   A. **Crosslinked Polyethylene (PEX) Tubing** – Nom 51 mm diam (or smaller) SDR 9 PEX tubing for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

   B. **Polyethylene/Aluminum/Polyethylene (PE/AL/PE) Tubing** – Nom 19 mm diam (or smaller) PE/AL/PE tubing for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

   C. **Crosslinked Polyethylene/Aluminum/Crosslinked Polyethylene (PEX/AL/PEX) Tubing** – Nom 19 mm diam (or smaller) SDR 9 PEX tubing for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

3. **Fill, Void or Cavity Material** – Sealant – Min 76 mm thickness of fill material applied within the annulus, flush with the top surface of floor or with both sides of wall assembly.

Non-Metallic Pipes

System No. C-AJ-2641
June 23, 2010
F Rating – 2 Hr
FT Ratings – 1-3/4 and 2 Hr (See Item 2)
FH Ratings – 0 and 2 Hr (See Item 2)
FTH Ratings – 0 and 2 Hr (See Item 2)

System tested with a pressure differential of 50 Pa between the exposed and the unexposed surfaces with the higher pressure on the exposed side.

1. **Floor or Wall Assembly** – Min 114 mm (4-1/2 in.) thick reinforced lightweight or normal weight (1600 - 2400 kg/m³ or 100-150 pcf) concrete. Wall may also be constructed of any UL Classified Concrete Blocks. Diam of opening shall be 25 mm (1 in.) larger than nom pipe diam except that for nom 51 mm (2 in.) diam (and smaller) penetrants, diam of opening shall be 19 mm (3/4 in.) larger than nom pipe diam.

See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through Penetrants** – One nonmetallic pipe or conduit to be centered within opening with a nom annular space between penetrant and periphery of opening of 6 mm (1/4 in.). Penetrant to be rigidly supported on both sides of the floor or wall assembly. The following types and sizes of nonmetallic pipes may be used:
   A. **Polyvinyl Chloride (PVC) Pipe** – Nom 102 mm (4 in.) diam (or smaller) Schedule 40 solid core or cellular core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.
   B. **Rigid Nonmetallic Conduit** – Nom 102 mm (4 in.) diam (or smaller) Schedule 40 PVC conduit installed in accordance with National Electrical Code (NFPA No. 70).
   C. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** – Nom 102 mm (4 in.) diam (or smaller) SDR13.5 CPVC pipe for use in closed (process or supply) piping systems.
   D. **Acrylonitrile Butadiene Styrene (ABS) Pipe** – Nom 102 mm (4 in.) diam (or smaller) Schedule 40 solid core or cellular core ABS pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

   The FT, FH and FTH Ratings are 2 hr for the cellular core ABS penetrant type. For all other penetrant types, the FT Rating is 1-3/4 hr and the FH and FTH Ratings are 0 hr.

3. **Firestop System** – The firestop system shall consist of the following:
   A. **Fill, Void or Cavity Materials** – Wrap Strip – Nom 3.2 mm (1/8 in.) thick intumescent material supplied in 51 mm (2 in.) wide strips. For nom 38 and 51 mm (1-1/2 and 2 in.) diam pipes, one layer is required. For nom 2-1/2 and 3 in. (64 and 76 mm) diam pipes, two layers are required. For nom 3-1/2 and 4 in. (89 and 102 mm) diam pipes, three layers are required. Wrap strip tightly wrapped around nonmetallic pipe and butted tightly against the bottom surface of the floor or both surfaces of the wall. Wrap strip layers temporarily held in position using aluminum foil tape, steel wire tie, or equivalent.

3M COMPANY
3M FIRE PROTECTION PRODUCTS – Ultra GS

B. **Steel Collar** – Nom 51 mm (2 in.) deep collar with 32 mm (1-1/4 in.) wide by 51 mm (2 in.) long anchor tabs and min 13 mm (1/2 in.) long tabs to retain wrap strip layers. Coils of precut 0.41 mm (0.016 in.) thick (28 gauge) galv sheet steel available from wrap strip manufacturer. As an alternate, collar may be field-fabricated from min 0.41 mm (0.016 in.) thick (28 gauge) galv sheet steel in accordance with instruction sheet supplied by wrap strip manufacturer. Steel collar, with anchor tabs bent outward 90 degree, wrapped tightly around wrap strip layers with min 25 mm (1 in.) overlap at seam. Anchor tabs to be pressed tightly against floor or wall surface(s), and collar to be compressed around wrap strip layers using a min 13 mm (1/2 in.) wide by 0.71 mm (0.028 in.) thick stainless steel band clamp at the collar midheight. Collar to be secured to floor or wall surface(s) with 6 mm (1/4 in.) diam by min 38 mm (1-1/2 in.) long steel expansion bolts in conjunction with steel nuts and min 32 mm (1-1/4 in.) diam steel fender washers. Min of two, three or four anchor bolts, symmetrically located, for nom 51 mm (2 in.) diam (and smaller), nom 3 in. (76 mm) diam (and smaller) and nom 4 in. (102 mm) diam (and smaller), pipes, respectively.
System No. C-AJ-2641 continued

C. **Firestop Device** – As an alternate to Items 3A and 3B, firestop device sized for nom diam of penetrant (ie, 4.0 device for nom 102 mm (4 in.) pipes, 3.0 device for nom 76 mm (3 in.) diam pipes and 2.0 device for nom 51 mm (2 in.) diam pipes) shall be used. Firestop device to be installed in accordance with the accompanying installation instructions. Firestop device installed and latched around pipe and secured to the underside of the floor or both sides of wall with 6 mm (1/4 in.) diam by min 38 mm (1-1/2 in.) long steel expansion bolts in conjunction with steel nuts and min 32 mm (1-1/4 in.) diam steel fender washers. Min of two, three or four anchor bolts, symmetrically located, for nom 51, 76 and 102 mm (2, 3 and 4 in.) diam pipes, respectively.

**3M COMPANY**
**3M FIRE PROTECTION PRODUCTS** – Ultra RC Pack 2.0, 3.0, 4.0

*Bearing the UL Classification Mark

System No. C-AJ-2642
June 23, 2010
F Rating – 2 Hr
FT Rating – 0 Hr
FH Rating – 2 Hr
FTH Rating – 0 Hr

System tested with a pressure differential of 50 Pa between the exposed and the unexposed surfaces with the higher pressure on the exposed side.

1. **Floor or Wall Assembly** – Min 114 mm (4-1/2 in.) thick lightweight or normal weight (1600 to 2400 kg/m³ or 100 to 150 pcf) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Diam of opening through floor or wall to be 13 to 16 mm (1/2 to 5/8 in.) larger than the outside diam of through-penetrant (Item 2). Max diam of opening is 127 mm (5 in.).

See Concrete Blocks (CAXT) category in the Fire Resistance Directory for names of manufacturers.

2. **Through Penetrants** – One nonmetallic penetrant centered in the through opening. Penetrant to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of nonmetallic penetrants may be used.

   A. **Polyvinyl Chloride (PVC) Pipe** – Nom 102 mm (4 in.) diam (or smaller) Schedule 40 solid core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping system.

   B. **Rigid Nonmetallic Conduit**+ – Nom 102 mm (4 in.) diam (or smaller) Schedule 40 PVC conduit installed in accordance with the National Electrical Code (NFPA No. 70).

   C. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** – Nom 102 mm (4 in.) diam (or smaller) SDR13.5 CPVC pipe for use in closed (process or supply) piping systems.

3. **Nonmetallic Pipe Coupling** – Nom 102 mm (4 in.) diam (or smaller) Schedule 40 PVC pipe coupling or nom 102 mm (4 in.) diam (or smaller) SDR13.5 CPVC pipe coupling installed such that the top of the coupling is flush with the bottom surface of the floor assembly, or flush with either side of the wall assembly, and extending outward.

   A. **Fill, Void or Cavity Materials** – **Wrap Strip** – Nom 6 mm (1/4 in.) thick intumescent elastomeric material faced on one side with aluminum foil, supplied in 51 mm (2 in.) wide strips. Min four layers of wrap strips tightly wrapped around nonmetallic pipe coupling (foil side exposed) with the top edges buttressed against the underside of the floor. In wall assemblies, min four layers of wrap strips tightly wrapped around nonmetallic pipe coupling (foil side exposed) and buttressed tightly against outer surface of wall. For the pipe or conduit on the side of the wall opposite the pipe coupling, the wrap strips shall be wrapped tightly around the pipe or conduit and buttressed tightly against outer surface of wall. For nom 13 mm (1/2 in.) to nom 38 mm (1-1/2 in.) diam pipes or conduits, a min of one layer of wrap strip is required. For nom 51, 64 and 76 mm (2, 2-1/2 and 3 in.) diam pipes or conduits, a min of two layers of wrap strip is required. For nom 89 and 102 mm (3-1/2 and 4 in.) diam pipes or conduits, a min of three layers of wrap strip is required. Each layer of wrap strip to be installed with buttressed seam, with butted seams in successive layers staggered. Wrap strip layers temporarily held in position using aluminum foil tape, steel wire tie or equivalent.

   B. **Steel Collar** – Nom 51 mm (2 in.) deep collar with 32 mm (1-1/4 in.) wide by 51 mm (2 in.) long tabs to retain wrap strip. Coils of precut min 0.41 mm (0.016 in.) thick (28 gauge) galv sheet steel available from wrap strip manufacturer. As an alternate, collar may be field-fabricated from min 0.41 mm (0.016 in.) thick (28 gauge) galv sheet steel in accordance with instruction sheet supplied by wrap strip manufacturer. Collar, with anchor tabs bent outward 90 degrees, wrapped tightly around wrap strip with min 25 mm (1 in.) overlap at seam and compressed around wrap strip(s) using a min 13 mm (1/2 in.) wide by min 0.71 mm (0.028 in.) thick stainless steel band at the collar midheight. Collar anchor tabs pressed tightly against floor or wall surface(s) and secured to floor or wall surface(s) with 6 mm (1/4 in.) diam by min 38 mm (1-1/2 in.) long steel expansion bolts or equivalent in conjunction with steel nuts and min 32 mm (1-1/4 in.) diam steel fender washers. Min of five anchor bolts used for collar installed around pipe coupling. For the collars installed around pipes or conduits in wall assemblies on the side opposite the pipe coupling, a min of two anchor bolts are required for nom 13 to 51 mm (1/2 to 2 in.) pipes or conduits, a min of three anchor bolts for nom 64 and 76 mm (2-1/2 and 3 in.) pipes or conduits and a min of our anchor bolts for nom 89 and 102 mm (3-1/2 and 4 in.) pipes or conduits, symmetrically located. Retainer tabs bent 90 degrees toward pipe to lock wrap strip(s) in position.
C. Fill, Void or Cavity Materials* – Caulk, Sealant or Putty – (Optional, not shown) – Bead of caulk or putty may be applied to outer perimeter of steel collar at its interface with floor or wall surface(s). In floor assemblies, a bead of caulk may be used within the annular space on the top side of the floor.

3M COMPANY

3M FIRE PROTECTION PRODUCTS – CP-25WB+ caulk, FB-3000 WT sealant, MP+ Putty, IC 15WB+ caulk or FireDam 150+ caulk.

(Note: CP 25WB+ and FireDam 150+ not suitable for use with CPVC pipes.)

Non-Metallic Pipes Through Penetrations

System tested with a pressure differential of 50 Pa between the exposed and the unexposed surfaces with the higher pressure on the exposed side.

1. **Floor or Wall Assembly** – Min 95 mm (3-3/4 in.) thick reinforced lightweight or normal weight (1600-2400 kg/m³ or 100-150pcf) concrete for 1 Hr F and FH Ratings. Min 114 mm (4-1/2 in.) thick reinforced lightweight or normal weight (1600-2400 kg/m³ or 100-150pcf) concrete for 2 Hr F and FH Ratings. Wall may also be constructed of any UL Classified **Concrete Blocks***. Floor may also be constructed of min 152 mm (6 in.) thick UL Classified **Precast Concrete Units***. Diam of opening shall be 16 mm (5/8 in.) to 25 mm (1 in.) larger than the outside diam of through-penetrant (Item 2).

   See **Concrete Blocks** (CAZT) and **Precast Concrete Units** (CFTV) categories in Fire Resistance Directory for names of manufacturers.

2. **Steel Sleeve** – (Optional) - Schedule 40 (or heavier) steel sleeve cast or grouted into floor or wall assembly, flush with both surfaces of floor or wall assembly. The nom size of sleeve shall be 25 mm (1 in.) larger than the nom size of through-penetrant.

   The hourly FT and FTH Ratings are 0 Hr when steel sleeve is used. Otherwise, the hourly FT and FTH Ratings are equal to the hourly F and FH Ratings of the assembly.

3. **Through-Penetrant** – One nonmetallic pipe, conduit or tubing to be centered within the firestop system. A min annular space of 8 mm (5/16 in.) is required within the firestop system. Pipe, conduit or tubing to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of nonmetallic pipes, conduits or tubing may be used:

   A. **Polyvinyl Chloride (PVC) Pipe** – Nom 51 mm (2 in.) diam (or smaller) Schedule 40 solid core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

   B. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** – Nom 51 mm (2 in.) diam (or smaller) SDR13.5 or SDR17 CPVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

   C. **Rigid Nonmetallic Conduit**+ – Nom 51 mm (2 in.) diam (or smaller) Schedule 40 PVC conduit installed in accordance with the National Electrical Code (NFPA No. 70).

   D. **Electrical Nonmetallic Tubing (ENT)**+ – Nom 51 mm (2 in.) diam (or smaller) corrugated-wall electrical nonmetallic tubing (ENT) constructed of polyvinyl chloride (PVC) and installed in accordance with the National Electrical Code (NFPA No. 70).

   E. **Flexible Nonmetallic Conduit, Liquid-Tight (FNMC)**+ – Nom 51 mm (2 in.) diam (or smaller) corrugated-wall flexible nonmetallic conduit, liquid-tight (FNMC) constructed of polyvinyl chloride (PVC) and installed in accordance with the National Electrical Code (NFPA No. 70).

4. **Firestop System** – The details of the firestop system shall be as follows:

   A. **Packing Material** – (Optional) - Nom 10 mm (3/8 in.) diam polyethylene backer rod or min 10 mm (3/8 in.) thickness of mineral wool batt insulation firmly packed into opening as a permanent form and recessed from both surfaces of floor or wall as required to accommodate the required thickness of fill material.

   B. **Fill, Void or Cavity Material** – (Optional) - Sealant – Min 16 mm (5/8 in.) thickness of fill material applied within the annulus, flush with both surfaces of the floor or wall, for 1 Hr F and FH Ratings. Min 25 mm (1 in.) thickness of fill material applied within the annulus, flush with both surfaces of the floor or wall, for 2 Hr F and FH Ratings.

   **3M COMPANY**

   3M FIRE PROTECTION PRODUCTS – FB-3000 WT sealant

System tested with a pressure differential of 50 Pa between the exposed and the unexposed surfaces with the higher pressure on the exposed side.

1. **Floor or Wall Assembly** – Min 114 mm (4-1/2 in.) thick reinforced lightweight or normal weight (1600 - 2400 kg/m or 100-150 pcf) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Max diam of opening is 229 mm (9 in.). See Concrete Blocks (CAZT) and Precast Concrete Units (CFTV) category in the Fire Resistance Directory for names of manufacturers.

2. **Through Penetrants** – One nonmetallic pipe or conduit to be installed either concentrically or eccentrically within the firestop system. The annular space between penetrant and periphery of opening shall be min 12.7 mm (1/2 in.) to max 79 mm (3-1/8 in.). Penetrant to be rigidly supported on both sides of floor or wall assembly. The following types and sizes of pipes or conduit may be used:
   A. **Polyvinyl Chloride (PVC) Pipe** – Nom 51 mm (2 in.) diam (or smaller) Schedule 40 solid core or cellular core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.
   B. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** – Nom 51 mm (2 in.) diam (or smaller) SDR-11 CPVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.
   C. **Rigid Nonmetallic Conduit+** – Nom 51 mm (2 in.) diam (or smaller) Schedule 40 PVC conduit installed in accordance with the National Electric Code (NFPA No. 70).

   T Rating is 1-1/2 Hr for Polyvinyl Chloride (PVC) and Rigid Nonmetallic Conduit Pipe. T Rating is 1-1/4 Hr for Chlorinated Polyvinyl Chloride (CPVC) Pipe.

3. **Firestop System** – The details of the firestop system shall be as follows:
   A. **Packing Material** – Min 102 mm (4 in.) thickness of min 64 kg/m³ (4 pcf) mineral wool batt insulation firmly packed within the opening. Packing material to be installed on top surface of cover plate, flush with bottom surface of floor or both surfaces of wall.
   B. **Steel Cover Plate** – Min 18 gauge galv steel cover plate, sized to overlap opening a min of 76 mm (3 in.) on all sides. Opening in plate for penetrant to be sized to the outside diam of penetrant. Plate attached to bottom of floor on both sides of wall with min 5 mm (3/16 in.) by 32 mm (1-1/4 in.) long steel masonry anchors spaced a max of 102 mm (4 in.) OC. Seams in plate covered with min 51 mm (2 in.) wide 28 gauge (or heavier) galv steel and attached to cover plate with No. 10 (or larger) steel screws on each side of seam spaced a max of 76 m (3 in.) OC.
   C. **Firestop Device* – Collar** – Collar to be installed in accordance with the accompanying installation instructions. Collar to be installed and latched around pipe and secured to underside of floor or on both sides of wall with 3M Ultra Fast Anchor Straps or with min No. 10 by 19 mm (3/4 in.) long steel screws and min 32 mm (1-1/4 in.) diam steel fender washers. Min of two anchor straps or anchor bolts, symmetrically located, for nom 51 mm (2 in.) diam (and smaller) pipe.

L Rating At Ambient – Less Than 1 CFM / Sq. Ft
L Rating At 400°F – 3 CFM / Sq. Ft

System tested with a pressure differential of 50 Pa between the exposed and unexposed surfaces with the higher pressure on the exposed side.

1. Floor or Wall Assembly – Min 191 mm thick reinforced lightweight or normal weight (1600-2400 kg/cu meter or 100-150 pcf) concrete. Opening to be 133 mm (5-1/4 in.) by 165 mm (6-1/2 in.) conical opening with 133 mm (5-1/4 in.) opening on top surface of floor or cored opening with max inside diam of 165 mm (6-1/2 in.), or 159 mm (6-1/4 in.) by 191 mm (7-1/2 in.) conical opening with 159 mm (6-1/4 in.) opening on top surface of floor or cored opening with max inside diam of 191 mm (7-1/2 in.).

FT/FTH Rating is 1 3/4 h for 133 mm by 165 mm conical opening or 165 mm cored opening. FT/FTH Rating is 2 h for 159 mm by 191 mm conical opening or 191 mm cored opening.

2. Through Penetrant – One nom 102 mm (4 in.) diam (or smaller) Schedule 40 solid core polyvinyl chloride - XFR (PVC-XFR) pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems. Pipe installed concentrically or eccentrically within the firestop system. A nom annular space for 133 mm opening on top side of slab shall be min 8 mm (0.31 in.) to max 11 mm (0.43 in.). A nom annular space for 159 mm opening on top side of slab shall be min 8 mm (0.31 in.) max 37 mm (1.46 in.). Pipe to be rigidly supported on both sides of floor or wall assembly.

3. Fill, Void or Cavity Material – Sealant – Min 76 mm (3 in.) thickness of fill material applied within the annulus, flush with the top surface of floor or both surfaces of wall.

3M COMPANY 3M FIRE PROTECTION PRODUCTS – FB-3000 WT sealant

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

System No. F-A-2212
June 23, 2010
F Rating – 2 Hr
FT Ratings – 1-3/4 and 2 Hr (See Item 3)
FH Ratings – 0 and 2 Hr (See Item 3)
FTH Ratings – 0 and 2 Hr (See Item 3)

System tested with a pressure differential of 50 Pa between the exposed and the unexposed surfaces with the higher pressure on the exposed side.

1. **Floor Assembly** – Min 114 mm (4-1/2 in.) thick reinforced lightweight or normal weight (1600-2400 kg/m³ or 100-150 pcf) concrete.

2. **Firestop Device** – Cast in place firestop device permanently embedded during concrete placement or grouted in concrete assembly in accordance with accompanying installation instructions. Firestop device shall be sized for nom diam of penetrant (ie, size 4 device for nom 102 mm (4 in.) pipes, size 3 device for nom 76 mm (3 in.) diam pipes and size 2 device for nom 51 mm (2 in.) diam pipes) shall be used. The device may be trimmed flush with top surface of floor or may project up to a max 89 mm (3-1/2 in.) above top surface of floor.

3. **Through Penetrants** – One nonmetallic pipe or conduit installed within the firestop system. Pipe or conduit to be rigidly supported on both sides of floor assembly. The nom penetrant diam shall match the nom size of the firestop device. The following types of nonmetallic pipes or conduits may be used:

   A. **Polyvinyl Chloride (PVC) Pipe** – Nom 102 mm (4 in.) diam (or smaller) Schedule 40 solid core or cellular core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

   B. **Rigid Nonmetallic Conduit** – Nom 102 mm (4 in.) diam (or smaller) Schedule 40 PVC conduit installed in accordance with National Electrical Code (NFPA No. 70).

   C. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** – Nom 102 mm (4 in.) diam (or smaller) SDR13.5 CPVC pipe for use in closed (process or supply) piping systems.

   D. **Acrylonitrile Butadiene Styrene (ABS) Pipe** – Nom 102 mm (4 in.) diam (or smaller) Schedule 40 solid core or cellular core ABS pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

   The FT, FH and FTH Ratings are 2 hr for the cellular core ABS penetrant type. For all other penetrant types, the FT Rating is 1-3/4 hr and the FH and FTH Ratings are 0 hr.

UL System No. F-A-2215
XHEZ7 - Through-penetration Firestop Systems Certified for Canada
May 23, 2011
F Rating — 2 Hr
FH Rating — 2 Hr
FT Rating — 1-1/2 Hr
FTH Rating — 1-1/2 Hr

System not tested with a pressure differential of 50 Pa between the exposed and unexposed surfaces.

1. Floor Assembly — The fire-rated unprotected concrete and steel floor assembly shall be constructed of the materials and in the manner specified in the individual D900 Series designs in the UL Fire Resistance Directory and as summarized below:
   A. Concrete — Min 3 in. (76 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600 - 2400 kg/m²) concrete.
   B. Welded Wire Fabric — 6x6-W1.4xW1.4.
   C. Steel Floor and Form Units* — Composite or noncomposite 1-1/2 in. (38 mm) deep fluted galv units as specified in the individual Floor-Ceiling design. Diam of opening through floor to be 1/2 to 5/8 in. (13 to 16 mm) larger than the outside diam of through-penetrant (Item 2). Max diam of opening is 5 in. (127 mm).

2. Through Penetrants — One nonmetallic pipe or conduit to be centered within the opening. Pipe to be rigidly supported on both sides of floor assembly. The following types and sizes of nonmetallic pipes may be used:
   A. Polyvinyl Chloride (PVC) Pipe — Nom 4 in. (102 mm) diam (or smaller) Schedule 40 solid core or cellular core PVC pipe.
   B. Rigid Nonmetallic Conduit++ — Nom 4 in. (102 mm) diam (or smaller) Schedule 40 PVC conduit installed in accordance with Article 347 of the National Electrical Code (NFPA No. 70).
   C. Acrylonitrile Butadiene Styrene (ABS) Pipe — Nom 4 in. (102 mm) diam (or smaller) Schedule 40 solid core or cellular core ABS pipe.
   D. Fire Retardant Polypropylene (FRPP) Pipe — Nom 4 in. (102 mm) diam (or smaller) Schedule 40 FRPP pipe.
UL System No. F-A-2215 (cont.)

3. Firestop System – The details of the firestop system shall be as follows:

A. Metal Plate Enclosure – Min 16 ga. galv steel. Width of plate to extend a min of 3 in. (76 mm) beyond both sides of opening. Length of plate (transverse to steel floor unit direction) to extend to steel floor unit valley beyond each side of core-drilled hole with a min lap of 1-1/2 in. (38 mm) on the floor unit valley at each end. Circular cutout in plate to be 1/2 in. (13 mm) larger than the outside diam of through-penetrant. Max diam of opening is 5 in. (127 mm). Plate to be cut in half along the length of plate to permit installation around the nonmetallic pipe. Plate secured to valleys of floor unit using min 1/4 in. (6 mm) diam by 1-3/4 in. (44 mm) long steel expansion bolts, or equivalent. Fasteners to be located approx 1 in. (25 mm) from edges of plate at each corner, at each plate/valley intersection and at both sides of cut made to permit installation around nonmetallic pipe. When plate seam is located beneath the crest of the steel deck, a 2 in. (51 mm) wide 16 ga. galv steel plate to be centered over seam and attached to plate with min No. 10 sheet metal screws, max 3 in. (76 mm) O.C. on both sides of seam.

B. Fill, Void or Cavity Material* – Caulk or Sealant – Min 1/2 in. (13 mm) thickness of caulk applied within annular space, flush with the bottom of the upper portion of the flute. Min 1/2 in. (13 mm) thickness of caulk applied into flutes of steel floor units above metal plate enclosure to completely cover packing material (Item 3C).

3M COMPANY – CP 25 WB+ caulk, FB-3000 WT sealant or IC 15 WB+ caulk. (Note: CP 25 WB+ not suitable for use with CPVC pipes.)

B1 Fill, Void or Cavity Materials* – Caulk or Sealant – (Optional, Not Shown) - Min 1/4 in. thickness of caulk or sealant applied within annular space, flush with top of floor.

3M COMPANY – CP 25 WB+ caulk, FB-3000 WT sealant, FB-1000 NS sealant, FB-1003 SL sealant or IC 15 WB+ caulk

C. Packing Material – Min 4pcf (64 kg/m3) mineral wool batt insulation firmly packed into flutes of steel floor units above metal plate enclosure to completely fill cavities. Packing material to be recessed within flutes from both edges of metal plate enclosure to accommodate the required thickness of fill material. Min 1-1/2 in. (38 mm) thickness of min 4pcf (64 kg/m3) mineral wool batt insulation firmly packed into annular space, flush with bottom of floor.

D. Fill, Void or Cavity Materials* – Wrap Strip – Nom 1/8 in. (3.2 mm) thick intumescent material supplied in 2 in. (51 mm) wide strips. Wrap strip tightly wrapped around nonmetallic pipe with continuous layers and butted tightly against bottom of metal plate enclosure. The min number of layers required is dependent upon the nom diam of the pipe. For nom 2 in. (51 mm) diam (and smaller) pipes, one layer is required. For nom 2-1/2 and 3 in. (64 and 76 mm) diam pipes, two layers are required. For nom 3-1/2 and 4 in. (89 and 102 mm) diam pipes, three layers are required. Wrap strip layers temporarily held in position using aluminum foil tape, steel wire tie, or equivalent.

3M COMPANY – Ultra GS

E. Steel Collar – Nom 2 in. (51 mm) deep collar with 1-1/4 in. (32 mm) wide by 2 in. (51 mm) long anchor tabs and min 1/2 in. (13 mm) long tabs to retain wrap strip. Coils of precut min 0.016 in. (0.41 mm) thick (28 gauge) galv sheet steel available from wrap strip manufacturer. As an alternate, collar may be field-fabricated from min 0.016 in. thick (0.41 mm) (28 gauge) galv sheet steel in accordance with instruction sheet supplied by wrap strip manufacturer. Collar, with anchor tabs bent outward 90 deg, wrapped tightly around wrap strip with min 1 in. (25 mm) overlap at seam and compressed around wrap strip(s) using a min 1/2 in. (13 mm) wide by min 0.028 in. (0.71 mm) thick stainless steel band at the collar midheight. Collar anchor tabs pressed tightly against metal plate enclosure. Where the anchor tabs are beneath the valley of the steel floor unit, the anchor tabs are to be secured with 1/4 in. (6 mm) diam by min 1-1/2 in. (38 mm) long steel expansion bolts, or equivalent, in conjunction with min 1-1/4 in. (32 mm) diam steel fender washers with one anchor bolt in each anchor tab. Where the anchor tabs are beneath the crest of the steel deck, the anchor tabs are to be secured to the metal enclosure with No. 10 by min 1/2 in. (13 mm) long self-drilling, self-tapping steel screws and min 1-1/4 in. (32 mm) diam steel fender washers. Retainer tabs bent 90 deg toward pipe to lock wrap strip(s) in position.

F. Firestop Device* – (Not Shown) – As an alternate to Items D and E, a Firestop device consisting of a sheet-steel split collar lined with intumescent material may be used. Firestop device to be installed on underside of floor or on both sides of wall in accordance with the accompanying installation instructions.

3M COMPANY – Ultra PPD 1.5, 2.0, 3.0, 4.0

G. Firestop Device* – As an alternate to Items 3D and 3E, firestop device to be installed in accordance with the accompanying installation instructions. Firestop device to be installed and latched around pipe and secured to the underside of the floor. Collar anchor tabs pressed tightly against metal plate enclosure. Where the anchor tabs are beneath the valley of the steel floor unit, the anchor tabs are to be secured with 1/4 in. (6 mm) diam by min 1-1/4 in. (32 mm) long steel anchor bolts or equivalent in conjunction with 1-1/4 in. (32 mm) diam steel fender washers with one anchor bolt in each anchor tab. Where the anchor tabs are beneath the crest of the metal enclosure with No. 10 by min 1/2 in. (13 mm) long self-drilling, self-tapping steel screws and min 1-1/4 in. (32 mm) diam steel fender washers.

3M COMPANY – Ultra RC Pack 2.0, 3.0, 4.0

June 11, 2012
F Rating – 2 Hr
FT Ratings – 1-3/4 and 2 Hr (See Item 2)
FH Ratings – 0 and 2 Hr (See Item 2)
FTH Ratings – 0 and 2 Hr (See Item 2)

System tested with a pressure differential of 50 Pa between the exposed and the unexposed surfaces with the higher pressure on the exposed side.

1. **Floor Assembly** – The fire rated unprotected concrete and steel floor assembly shall be constructed of the materials and in the manner specified in the individual D900 Series designs in the UL Fire Resistance Directory and as summarized below:
   A. **Concrete** – Min 76 mm (3 in.) thick reinforced lightweight or normal weight (1600-2400 kg/m³ or 100-150 pcf) concrete.
   B. **Welded Wire Fabric** – (Not Shown) – 6x6-W1.4xW1.4.
   C. **Steel Floor and Form Units** – Composite or non-composite 38 mm (1 1/2 in.) deep fluted galv units as specified in the individual Floor-Ceiling design. Diam of opening through floor to be 13 to 16 mm (1/2 to 5/8 in.) larger than the outside diam of through-penetrant (Item 2). Max diam of opening is 127 mm (5 in.).

2. **Through Penetrant** – One nonmetallic pipe or conduit to be centered within opening with a nom annular space between penetrant and periphery of opening of 6 mm (1/4 in.). Penetrant to be rigidly supported on both sides of the floor or wall assembly. The following types and sizes of nonmetallic pipes may be used:
   A. **Polyvinyl Chloride (PVC) Pipe** – Nom 102 mm (4 in.) diam (or smaller) Schedule 40 solid core or cellular core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.
   B. **Rigid Nonmetallic Conduit** – Nom 102 mm (4 in.) diam (or smaller) Schedule 40 PVC conduit installed in accordance with National Electrical Code (NFPA No. 70).
   C. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** – Nom 102 mm (4 in.) diam (or smaller) SDR13.5 CPVC pipe for use in closed (process or supply) piping systems.
   D. **Acrylonitrile Butadiene Styrene (ABS) Pipe** – Nom 102 mm (4 in.) diam (or smaller) Schedule 40 solid core or cellular core ABS pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

The FT, FH and FTH Ratings are 2 hr for the cellular core ABS penetrant type. For all other penetrant types, the FT Rating is 1-3/4 hr and the FH and FTH Ratings are 0 hr.

3. **Firestop System** – The details of the firestop system shall be as follows:
   A. **Metal Plate Enclosure** – Min 1.5 mm (0.060 in.) thick (16 gauge) galv steel. Width of plate to extend a min of 76 mm (3 in.) beyond both sides of opening. Length of plate (transverse to steel floor unit direction) to extend to steel floor unit valley beyond each side of core-drilled hole with a min lap of 38 mm (1-1/2 in.) on the floor unit valley at each end. Circular cutout in plate to be 13 mm (1/2 in.) larger than the outside diam of through-penetrant. Max diam of opening is 127 mm (5 in.). Plate to be cut in half along the length of plate to permit installation around the nonmetallic pipe. Plate secured to valleys of floor unit using min 6 mm (1/4 in.) diam by 44 mm (1-3/4 in.) long steel expansion bolts, or equivalent. Fasteners to be located approx 25 mm (1 in.) from edges of plate at each corner, at each plate/valley intersection and at both sides of cut made to permit installation around nonmetallic pipe. When plate seam is located beneath the crest of the steel deck, a 51 mm (2 in.) wide min 1.5 mm (0.060 in.) thick (16 gauge) galv steel plate to be centered over seam and attached to plate with min No. 10 sheet metal screws, max 76 mm (3 in.) O.C. on both sides of seam.
   B. **Fill, Void or Cavity Material** – Caulk or Sealant – Min 13 mm (1/2 in.) thickness of caulk applied within annular space, flush with the bottom of the upper portion of the flute. Min 13 mm (1/2 in.) thickness of caulk applied into flutes of steel floor units above metal plate enclosure to completely cover packing material (Item 3C).

3M COMPANY
3M FIRE PROTECTION PRODUCTS – CP 25 WB+ caulk, FB-3000 WT sealant or IC 15WB+ caulk. (Note: CP 25WB+ not suitable for use with CPVC pipes.)
### B. Fill, Void or Cavity Materials* – Caulk or Sealant

- (Optional, Not Shown) – Min 6 mm (1/4 in.) thickness of caulk or sealant applied within annular space, flush with top of floor.

#### 3M COMPANY

3M FIRE PROTECTION PRODUCTS – CP 25WB+ caulk, FB-3000 WT sealant, FB-1000 NS sealant, FB-1003 SL sealant or IC 15WB+ caulk

#### C. Packing Material

- Min 64 kg/m³ (4 pcf) mineral wool batt insulation firmly packed into flutes of steel floor units above metal plate enclosure to completely fill cavities. Packing material to be recessed within flutes from both edges of metal plate enclosure to accommodate the required thickness of fill material. Min 38 mm (1-1/2 in.) thickness of min 64 kg/m³ (4 pcf) mineral wool batt insulation firmly packed into annular space, flush with bottom of floor.

#### D. Fill, Void or Cavity Materials* – Wrap Strip

- Nom 3.2 mm (1/8 in.) thick intumescent material supplied in 51 mm (2 in.) wide strips. Wrap strip tightly wrapped around nonmetallic pipe with continuous layers and butted tightly against bottom of metal plate enclosure. The min number of layers required is dependent upon the nom diam of the pipe. For nom 51 mm (2 in.) diam (and smaller) pipes, one layer is required. For nom 64 and 76 mm (2-1/2 and 3 in.) diam pipes, two layers are required. For nom 89 and 102 mm (3-1/2 and 4 in.) diam pipes, three layers are required. Wrap strip layers temporarily held in position using aluminum foil tape, steel wire tie, or equivalent.

#### 3M COMPANY

3M FIRE PROTECTION PRODUCTS – Ultra GS

#### E. Steel Collar

- Nom 51 mm (2 in.) deep collar with 32 mm (1-1/4 in.) wide by 51 mm (2 in.) long anchor tabs and min 13 mm (1/2 in.) long tabs to retain wrap strip. Coils of precut min 0.41 mm (0.016 in.) thick (28 gauge) galv sheet steel available from wrap strip manufacturer. As an alternate, collar may be field-fabricated from min 0.41 mm (0.016 in.) thick (28 gauge) galv sheet steel in accordance with instruction sheet supplied by wrap strip manufacturer. Collar, with anchor tabs bent outward 90 deg, wrapped tightly around wrap strip with min 1 in. (25 mm) overlap at seam and compressed around wrap strip(s) using a min 13 mm (1/2 in.) wide by min 0.71 mm (0.028 in.) thick stainless steel band at the collar midheight. Collar anchor tabs pressed tightly against metal plate enclosure. Where the anchor tabs are beneath the valley of the steel floor unit, the anchor tabs are to be secured with 6 mm (1/4 in.) diam by min 38 mm (1-1/2 in.) long steel expansion bolts, or equivalent, in conjunction with min 32 mm (1-1/4 in.) diam steel fender washers with one anchor bolt in each anchor tab. Where the anchor tabs are beneath the crest of the steel deck, the anchor tabs are to be secured to the metal enclosure with No. 10 by min 13 mm (1/2 in.) long self-drilling, self-tapping steel screws and min 32 mm (1-1/4 in.) diam steel fender washers. Retainer tabs bent 90 deg toward pipe to lock wrap strip(s) in position.

System tested with a pressure differential of 50 Pa between the exposed and the unexposed surfaces with the higher pressure on the exposed side.

1. **Floor-Ceiling Assembly** – The 1 hr fire-rated solid or trussed lumber joist floor-ceiling assembly shall be constructed of the materials and in the manner specified in the individual L500 Series Floor-Ceiling Designs in the UL Fire Resistance Directory. The general construction details of the floor-ceiling assembly are summarized below:

   A. **Flooring System** – Lumber or plywood subfloor with finish floor of lumber, plywood or **Floor Topping Mixture** as specified in the individual Floor-Ceiling Design. Diameter of opening shall be 32 mm (1-1/4 in.) larger than the nom diam of penetrant (Item 2).

   B. **Wood Joists** – Nom 254 mm (10 in.) deep (or deeper) lumber, steel or combination lumber and steel joists, trusses or **Structural Wood Members** with bridging as required and with ends firestopped.

   C. **Gypsum Board** – Nom 1219 mm (4 ft) wide by 16 mm (5/8 in.) thick as specified in the individual Floor-Ceiling Design. Diameter of opening shall be 32 mm (1-1/4 in.) larger than the nom diam of penetrant (Item 2).

1.1. **Chase Wall** – (Optional, not shown) – The penetrant (Item No. 2) may be routed through a fire-rated single, double or staggered wood stud/gypsum board chase wall having a fire rating consistent with that of the floor-ceiling assembly. The chase wall shall be constructed of the materials and in the manner specified in the individual U300 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Studs** – Nom 51 by 152 mm (2 by 6 in.) or double nom 51 by 102 mm (2 by 4 in.) lumber studs.

   B. **Sole Plate** – Nom 51 by 152 mm (2 by 6 in.) or parallel 51 by 102 mm (2 by 4 in.) lumber plates, tightly butted. Diameter of opening shall be 32 mm (1-1/4 in.) larger than the nom diam of penetrant (Item 2).

   C. **Top Plate** – The double top plate shall consist of two nom 51 by 152 mm (2 by 6 in.) or two sets of parallel 51 by 102 mm (2 by 4 in.) lumber plates, tightly butted. Diameter of opening shall be 32 mm (1-1/4 in.) larger than the nom diam of penetrant (Item 2).

   D. **Gypsum Board** – Thickness, type, number of layers and fasteners shall be as specified in individual Wall and Partition Design.

2. **Through Penetrant** – One nonmetallic pipe to be centered within the firestop system. Pipe to be rigidly supported on both sides of floor-ceiling assembly. The annular space between pipe and periphery of opening shall be nom 9.5 mm (3/8 in.). The following types and sizes of nonmetallic pipes may be used:

   A. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** – Nom 51 mm (2 in.) diam (or smaller) SDR13.5 CPVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

   3. **Fill, Void or Cavity Materials** – **Sealant** – Min 19 mm (3/4 in.) thickness of fill material applied within the annulus, flush with top surface of floor. Min 16 mm (5/8 in.) thickness of fill material applied within the annulus, flush with bottom surface of ceiling.

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

F Rating — 1 Hr
FT Rating — 0 Hr
FH Rating — 1 Hr
FTH Rating — 0 Hr
Leakage Rating at Ambient — Less Than 1 CFM/ft²
Leakage Rating at 204° C — 5 CFM/ft²

System tested with a pressure difference of 50 Pa between the exposed and unexposed surfaces with the higher pressure on the exposed surface.

1. **Floor Assembly** — The 1 hr fire rated solid or trussed lumber joist floor-ceiling assembly shall be constructed of the materials and in the manner specified in the individual L500 Series Floor-Ceiling Designs in the UL Fire Resistance Directory. The general construction details of the floor-ceiling assembly are summarized below:
   
   A. **Flooring System** — Lumber or plywood subfloor with finish floor of lumber, plywood or Floor Topping Mixture* as specified in the individual Floor-Ceiling Design. Diam of opening to be 25 mm (1 in.) larger than nom size of penetrant.

   B. **Wood Joists** — Nom 254 mm deep (1 in.) (or deeper) lumber, steel or combination lumber and steel joists, trusses or Structural Wood Members* with bridging as required and with ends firestopped.

   C. **Gypsum Board** — Min 16 mm (5/8 in.) thick, as specified in the individual Floor-Ceiling Design. Diam of opening to be 25 mm larger than nom size of penetrant.

1.1. **Chase Wall** — (Optional) — (Optional, Not Shown) — The through penetrants (Item 2) may be routed through a 1 hr fire-rated single, double or staggered wood stud/gypsum wallboard chase wall constructed of the materials and in the manner specified in the individual U300 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Studs** — Nom 51 by 102 mm (2 by 4 in.) (or larger) or double nom 51 by 102 mm (2 by 4 in.) lumber studs.

   B. **Sole Plate** — Nom 51 by 102 mm (2 by 4 in.) (or larger) or parallel 51 by 102 mm (2 by 4 in.) lumber plates, tightly butted. Diam of opening to be 25 mm (1 in.) larger than nom size of penetrant.

   C. **Top Plate** — The double top plate shall consist of two nom 51 by 102 mm (2 by 4 in.) (or larger) or two sets of parallel nom 51 by 102 mm (2 by 4 in.) (or larger) lumber plates, tightly butted. Diam of opening to be 25 mm larger than nom size of penetrant.

   D. **Gypsum Board** — Thickness, type, number of layers and fasteners shall be as specified in individual Wall and Partition Design.

---

* Figures and diagrams refer to sections labeled 1A, 1B, 1C, 2, and 3.
2. **Through-Penetrant** – One nonmetallic pipe, conduit or tubing to be centered within the firestop system. Annular spaces between pipe and edge of opening to be min 6 mm and max 10 mm. Pipe to be rigidly supported on both sides of floor-ceiling assembly. The following types and sizes of nonmetallic pipes may be used:

   **A. Polyvinyl Chloride (PVC) Pipe** – Nom 51 mm (2 in.) diam (or smaller) Schedule 40 solid or cellular core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping system.

   **B. Chlorinated Polyvinyl Chloride (CPVC) Pipe** – Nom 51 mm (2 in.) diam (or smaller) SDR13.5 CPVC pipe for use in closed (process or supply) piping systems.

   **C. Acrylonitrile Butadiene Styrene (ABS) Pipe** – Nom 51 mm (2 in.) diam (or smaller) Schedule 40 solid or cellular core ABS pipe for use in closed (process or supply) or vented (drain, waste or vent) piping system.

   **D. Rigid Nonmetallic Conduit** – Nom 51 mm (2 in.) diam (or smaller) Schedule 40 PVC conduit installed in accordance with the National Electrical Code (NFPA No. 70).

   **E. Electrical Nonmetallic Tubing (ENT)** – Nom 51 mm (2 in.) diam (or smaller) corrugated-wall electrical nonmetallic tubing (ENT) constructed of polyvinyl chloride (PVC) and installed in accordance with the National Electrical Code (NFPA No. 70).

      See Electrical Nonmetallic Tubing (FKHU) category in the Electrical Construction Materials Directory for names of manufacturers.

   **F. Flexible Nonmetallic Conduit, Liquid-Tight (FNMC)** – Nom 51 mm (2 in.) diam (or smaller) corrugated-wall flexible nonmetallic conduit, liquid-tight (FNMC) constructed of polyvinyl chloride (PVC) and installed in accordance with the National Electrical Code (NFPA No. 70).

   **G. Crosslinked Polyethylene (PEX) Tubing** – Nom 51 mm (2 in.) diam (or smaller) SDR 7.3 or SDR 9 PEX tubing for use in closed (process or supply) piping systems or nom 50 mm diam (or smaller) SDR 9 PEX tubing for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

   **H. Rigid Nonmetallic Conduit** – Nom 51 mm (2 in.) diam (or smaller) Schedule 40 PVC conduit installed in accordance with the National Electrical Code (NFPA No. 70).

3. **Fill, Void or Cavity Materials** – Sealant – Min 19 mm (3/4 in.) thickness of fill material applied within the annulus, flush with top surface of floor or sole plate. Min 16 mm thickness of fill material applied within the annulus, flush with bottom surface of ceiling or lower top plate.

   **3M COMPANY 3M FIRE PROTECTION PRODUCTS** – FB-3000 WT

               |            | 3M™ Fire Barrier Wrap Strips FS-195+ | Min 4-1/2 in. concrete. Max 2 in. steel, max 2 in. iron, max 2 in. conduit, max 2 in. PVC (closed or vented), max 2 in. RNC, max 2 in. CPVC, max 12 in. x 1 in. min 26 gauge steel duct, max 12 in. x 1 in. min 16 ga steel cable tray, max 19% cable fill. |
| F-A-8038      | 2          | 3M™ FireDam™ Spray 200 | Min 4-1/2 in. concrete. Max 2 in. steel, max 2 in. iron, max 2 in. 2 in. conduit, max 12 in. x 1 in. min 26 gauge steel duct, max 12 in. x 1 in. min 16 ga steel cable tray, max 19% cable fill. |

1. **Floor or Wall Assembly** – Min 114 mm (4-1/2 in.) thick reinforced lightweight or normal weight (1600-2400 kg/m³ or 100-150 pcf) concrete. Max area of opening is 7226 cm² (1120 in²) with max dimension of 1016 mm (40 in.)

2. **Through Penetrants** – A combination of the following through penetrants to be installed within the opening. A maximum of one steel duct (Item 2C) and one cable tray (Item 2D) to be installed in the opening. A maximum of two pipes/conduit (Item 2A and/or Item 2B) to be installed within each max 305 by 1016 mm (12 by 40 in.) framed area. Through penetrants to be rigidly supported on both sides of floor assembly. The annular space between metallic penetrants (Items 2A, 2C, 2D) and other nonmetallic penetrating items and cables (Items 2B and 2E) shall be min 242 mm (9-1/2 in.) The annular space between metallic penetrants (Items 2A, 2C, 2D) shall be min 242 mm (9-1/2 in.).

   A. **Metallic Pipe and Conduit** – The following types and sizes of metallic pipes and conduits may be used. The annular space between metallic pipes / conduit and the periphery of the opening shall be min 140 mm (5-1/2 in.)
      2A1. **Steel Pipe** – Nom 51 mm (2 in.) diam (or smaller) Schedule 10 (or heavier) steel pipe.
      2A2. **Iron Pipe** – Nom 51 mm (2 in.) diam (or smaller) cast or ductile iron pipe.
      2A3. **Conduit** – Nom 51 mm (2 in.) diam (or smaller) steel electrical metallic tubing or nom 51 mm (2 in.) diam (or smaller) steel conduit.

   B. **Nonmetallic Pipe and Conduit** – The following types and sizes of nonmetallic pipes and conduits may be used. The annular space between nonmetallic pipes / conduit and the periphery of the opening shall be min 140 mm (5-1/2 in.)
      2B1. **Polyvinyl Chloride (PVC) Pipe** – Nom 51 mm (2 in.) diam (or smaller) Schedule 40 solid core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.
      2B2. **Rigid Nonmetallic Conduit**+ – Nom 51 mm (2 in.) diam (or smaller) Schedule 40 PVC conduit installed in accordance with the Canadian Electrical Code.
      2B3. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** – Nom 51 mm (2 in.) diam (or smaller) SDR 13.5 (or heavier) CPVC pipe for use in closed (process or supply) piping systems.

   C. **Metallic Duct** – Nom 305 by 25 mm (12 by 1 in.) (or smaller) by 26 gauge (or heavier) steel duct. The annular space between duct and the periphery of the opening shall be min 25 mm (1 in.) The long dimension of duct shall be located against a cross brace (Item 4A) and secured to cross brace with steel screws max 51 mm (2 in.) from ends and max 102 mm (4 in.) on center.

   D. **Cable Tray** – Nom 305 mm (12 in.) wide by 25 mm (1 in.) deep (or smaller) by 16 gauge (or heavier) perforated steel cable tray. The annular space between cable tray and the periphery of the opening shall be min 25 mm (1 in.) The long dimension of cable tray shall be located against a cross brace (Item 4A) and secured to cross brace with steel screws max 51 mm (2 in.) from ends and max 203 mm (8 in.) on center.

   E. **Cables** – Aggregate cross-sectional area of cables in cable tray not to exceed 19 percent of the cross-sectional area of the cable tray based on a max 25 mm (1 in.) cable loading depth within the tray. Any combination of the following types and sizes of copper conductor cables may be used:
      2E1. Max 4 pair No. 24 AWG copper conductor Cat 6 telephone cable with PVC insulation and jacket materials.
      2E2. Max RG/6 (or smaller) coaxial cable with fluorinated ethylene (FE) or PVC insulation and jacket materials.
      2E3. Max RG/U (or smaller) coaxial cable with fluorinated ethylene (FE) or PVC insulation and jacket materials.
      2E4. Max 7/C No. 12 AWG copper conductors with PVC insulation and jacket materials.

3. **Firestop System** – The firestop system shall consist of the following:

   A. **Steel Support Grid** – Min 25 by 25 mm (1 by 1 in.) by min 3.2 mm (1/8 in.) thick steel angle installed within opening to frame all four sides and provide edge support for the forming material, 82 mm (3-1/4 in.) below top surface of floor. Angles secured to concrete using min 25 mm (1 in.) long masonry anchors spaced max 305 mm (12 in.) on center and max 51 mm (2 in.) from ends. Additional angle(s) to be installed as cross bracing to provide intermediate support for the forming material along the long dimension of opening. The cross member(s) are to be located max 305 mm (12 in.) from ends of opening and max 305 mm (12 in.) on center along the long dimension of opening. Each end of cross brace angle bears on and is secured to perimeter angle with min one 15 mm (3/4 in.) long No. 8 (or larger) self-tapping steel screw.
System No. F-A-8037C continued

B. **Forming Material** – Min 51 mm (2 in.) thickness of min 64 kg/m³ (4 pcf) density mineral wool batt insulation laid within opening over the steel support grid. Forming material cut to fit contour around all penetrants to provide a tight friction fit and a base for the firestop mortar.
   
   **ROXUL INC** – Type Safe

C. **Fill, Void or Cavity Materials** – **Wrap Strip** – Nom 6 mm (1/4 in.) thick intumescent elastomeric material faced on one side with aluminum foil, supplied in 51 mm (2 in.) wide strips. One nom 51 mm (2 in.) wide strip tightly-wrapped around each nonmetallic pipe (Item 2B) with foil side exposed. Wrap strip located just above the forming material base (Item 4B) such that the bottom edge is flush with the forming material. Wrap strip held in place with pressure-sensitive tape.

   **3M COMPANY**
   **3M FIRE PROTECTION PRODUCTS** – FS-195+

D. **Fill, Void or Cavity Materials** – **Mortar** – Min 30 mm (1.2 in.) thickness of mortar applied to completely fill the opening annulus above the forming material, flush with top surface of floor. Cementitious mortar mixed with water at a rate of 1.0 part dry mixture to 0.3 parts water by weight in accordance with the installation instructions supplied with the product.

1. **Floor or Wall Assembly** – Min 114 mm (4-1/2 in.) thick reinforced lightweight or normal weight (1600-2400 kg/m³ or 100-150 pcf) concrete. Max area of opening is 7226 cm² (1120 in²) with max dimension of 1016 mm (40 in.)

2. **Through Penetrants** – A combination of the following through penetrants to be installed within the opening. A maximum of one steel duct (Item 2B) and one cable tray (Item 2C) to be installed in the opening. A maximum of two metallic pipes/conduit (Item 2A) to be installed within each max 305 by 1016 mm (12 by 40 in.) framed area. Through penetrants to be rigidly supported on both sides of floor assembly. The annular space between penetrants shall be min 242 mm (9-1/2 in.)
   
   A. **Metallic Pipe and Conduit** – The following types and sizes of metallic pipes and conduits may be used. The annular space between metallic pipes/ conduit and the periphery of the opening shall be min 140 mm (5-1/2 in.)
      
      2A1. **Steel Pipe** – Nom 51 mm (2 in.) diam (or smaller) Schedule 10 (or heavier) steel pipe.
      2A2. **Iron Pipe** – Nom 51 mm (2 in.) diam (or smaller) cast or ductile iron pipe.
      2A3. **Conduit** – Nom 51 mm (2 in.) diam (or smaller) steel electrical metallic tubing or nom 51 mm (2 in.) diam (or smaller) steel conduit.
   
   B. **Metallic Duct** – Nom 305 by 25 mm (12 by 1 in.) (or smaller) by 26 gauge (or heavier) steel duct. The annular space between duct and the periphery of the opening shall be min 25 mm (1 in.) The long dimension of duct shall be located against a cross brace (Item 4A) and secured to cross brace with steel screws max 51 mm (2 in.) from ends and max 102 mm (4 in.) on center.
   
   C. **Cable Tray** – Nom 305 mm (12 in.) wide by 25 mm (1 in.) deep (or smaller) by 16 gauge (or heavier) perforated steel cable tray. The annular space between cable tray and the periphery of the opening shall be min 25 mm (1 in.) The long dimension of cable tray shall be located against a cross brace (Item 4A) and secured to cross brace with steel screws max 51 mm (2 in.) from ends and max 203 mm (8 in.) on center.
   
   D. **Cables** – Aggregate cross-sectional area of cables in cable tray not to exceed 19 percent of the cross-sectional area of the cable tray based on a max 25 mm (1 in.) cable loading depth within the tray. Any combination of the following types and sizes of copper conductor cables may be used:
      
      2D1. **Max 4 pair No. 24 AWG copper conductor Cat 6 telephone cable with PVC insulation and jacket materials.**
      2D2. **Max RG/6 (or smaller) coaxial cable with fluorinated ethylene (FE) or PVC insulation and jacket materials.**
      2D3. **Max RG/U (or smaller) coaxial cable with fluorinated ethylene (FE) or PVC insulation and jacket materials.**
      2D4. **Max 7/C No. 12 AWG copper conductors with PVC insulation and jacket materials.**

3. **Firestop System** – The firestop system shall consist of the following:
   
   A. **Steel Support Grid** – Min 25 by 25 mm (1 by 1 in.) by min 3.2 mm (1/8 in.) thick steel angle installed within opening to frame all four sides and provide edge support for the forming material, 102 mm (4 in.) below top surface of floor. Angles secured to concrete using min 25 mm (1 in.) long masonry anchors spaced max 305 mm (12 in.) on center and max 51 mm (2 in.) from ends. Additional angle(s) to be installed as cross bracing to provide intermediate support for the forming material along the long dimension of opening. The cross member(s) are to be located max 305 mm (12 in.) from ends of opening and max 305 mm (12 in.) on center along the long dimension of opening. Each end of cross brace angle bears on and is secured to perimeter angle with min one 15 mm (3/4 in.) long No. 8 (or larger) self-tapping steel screw.
   
   B. **Forming Material** – Min 4 in. (102 mm) thickness, or two layers of min 51 mm (2 in.) thickness, of min 96 kg/m³ (6 pcf) density mineral wool batt insulation laid within opening over the steel support grid. Forming material cut to span the steel supports (Item 3A) and to fit the contour around all penetrants to provide a tight friction fit.

**Roxul Inc** – Type Safe

C. **Fill, Void or Cavity Materials** – Min 2 mm (0.08 in.) wet thickness of coating spray applied or troweled to completely cover the forming material (Item 3B) at both the top and bottom of opening. Coating to lap min 13 mm (1/2 in.) onto penetrants and onto concrete around periphery of opening, at both top and bottom of floor. Coating to be applied in accordance with the installation instructions supplied with the product.

Suggested Installation for 3M™ Fire Barrier Moldable Putty+ on Electrical Outlet Boxes
**WALL OPENING PROTECTIVE MATERIALS (CLIV)**

This category covers proprietary compositions which are used to maintain the hourly ratings of fire resistive walls and partitions containing flush mounted devices such as outlet boxes, electrical cabinets and mechanical cabinets. The individual Classifications indicate the specific applications and the method of installation for which the materials have been evaluated.

The basic standard used to investigate products in this category is ANSI/UL 263, “Fire Tests of Building Construction and Materials”.

**LOOK FOR CLASSIFICATION MARKING ON PRODUCT**

The Classification Marking of Underwriters Laboratories Inc. (shown below) on the product or container is the only method provided by Underwriters Laboratories Inc. to identify Wall Opening Protective Materials produced under its Classification and Follow-Up Service.

**UNDERWRITERS LABORATORIES INC.® CLASSIFIED**

Type MPP+ moldable putty pads for use with max 4-11/16 by 4-11/16 by 2-1/8 in. deep flush device UL Listed Metallic Outlet Boxes installed with steel or wood studs and constructed as specified in the individual U300, U400 or V400 Series Wall and Partition Designs in the Fire Resistance Directory.

Type MPP+ moldable putty pads for use with max 4-11/16 by 4-11/16 by 2-1/8 in. deep flush device UL Listed Metallic Outlet Boxes installed with steel or plastic cover plates for use in 1 hr or 2 hr fire rated gypsum board wall assemblies framed with min 3-1/2 in. wide wood or steel studs and constructed as specified in the individual U300, U400 or V400 Series Wall and Partition Designs in the Fire Resistance Directory. Metallic outlet boxes to be provided with steel attachment brackets which offset box min 1/4 in. from stud. Putty pad to be affixed to the back and all four sides of the box. Boxes may be installed back-to-back within the stud cavity. When back-to-back boxes are interconnected, a ball of putty is to be installed to plug the open end of each electrical metallic tube or conduit within the outlet boxes.

Type MPP+ moldable putty pads for use with max 4 by 4 by 2-1/8 in. deep flush device UL Listed Metallic Outlet Boxes installed with plastic cover plates for use in 1 hr or 2 hr fire rated gypsum board wall assemblies framed with min 3-1/2 in. wide wood or steel studs and constructed as specified in the individual U300, U400 or V400 Series Wall and Partition Designs in the Fire Resistance Directory.

Type MPP+ moldable putty pads for use with max 14 by 4 by 2-1/2 in. deep flush device UL Listed Metallic Outlet Boxes installed with steel or wood studs and constructed as specified in the individual U300, U400 or V400 Series Wall and Partition Designs in the Fire Resistance Directory.

Type MPP+ moldable putty pads for use with max 14 by 4 by 2-1/2 in. deep flush device UL Listed Metallic Outlet Boxes installed with steel or wood studs and constructed as specified in the individual U300, U400 or V400 Series Wall and Partition Designs in the Fire Resistance Directory.

Type MPP+ moldable putty pads for use with max 4 by 4 by 1-1/2 in. deep flush device UL Listed Metallic Outlet Boxes installed with plastic cover plates for use in 1 hr fire rated gypsum board wall assemblies framed with min 3-1/2 in. wide steel studs and constructed as specified in the individual U300, U400 or V400 Series Wall and Partition Designs in the Fire Resistance Directory.

Type MPP+ moldable putty pads for use with max 5 by 5 by 2-7/8 in. deep flush device UL Listed Metallic Outlet Boxes or UL Listed Communications-Circuit Accessories manufactured by Randl Industries Inc for use in 1 hr or 2 hr fire rated gypsum board wall assemblies framed with min 3-5/8 in. wide wood or steel studs and constructed as specified in the individual U300, U400 or V400 Series Wall and Partition Designs in the Fire Resistance Directory. Metallic outlet boxes to be provided with UL Listed Signal Appliance with steel cover plate manufactured by Cooper Wheelock Inc.

Moldable putty pads are to be installed to completely cover the exterior surfaces of the outlet box (except for the side of the outlet box against the stud unless otherwise noted) including nailing tabs and to completely seal against the stud within the stud cavity. Multiple moldable putty pads may be installed on an outlet box to attain the required minimum thickness of putty material. Additional putty material used to seal around each conduit and/or cable fitting on the exterior of each box. A min 1/10 in. thickness of putty material is required on the exterior surfaces of flush device boxes in 1 and 2 hr fire rated Wall and Partition Designs. When the moldable putty pad outlet box protective material is used on boxes on both sides of wall as directed, the horizontal separation between outlet boxes on opposite sides of the wall may be less than 24 in. provided that the outlet boxes are not installed back to back, except as noted.

3M™ Fire Barrier Water Tight Sealant 1000 NS  
3M™ Fire Barrier Water Tight Sealant 3000 WT  
3M™ Fire Barrier Silicone Sealant 2000+  
3M™ Fire Barrier Sealant FD 150+ | Max. 1/2 in. bottom of wall joint between a gypsum shaft wall and a concrete floor. Static joint utilizing Fire Barrier sealants. |
1. **Floor Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete. Floor may also be constructed of any 6 in. (152 mm) thick UL Classified hollow-core **Precast Concrete Units**.

See **Precast Concrete Units** category in the Fire Resistance Directory for names of manufacturers.

2. **Wall Assembly** – The 1 or 2 h fire-rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 or V400 Series Wall or Partition Design in the UL Fire Resistance Directory. In addition, the wall may incorporate a head-of-wall joint system constructed as specified in the HW Series Joint Systems in the UL Fire Resistance Directory. The wall shall include the following construction features:

   A. **Steel Floor Runner** – Floor runners of wall assembly shall consist of min No. 25 gauge galv steel channels sized to accommodate steel studs (Item 2C). Floor runners to be provided with min 1-1/4 in. (32 mm) flanges. Runners secured with steel fasteners spaced 12 in. (305 mm) OC.

   B. **Studs** – Steel studs to be min 3-1/2 in. wide. (89 mm) Studs cut 1/2 to 3/4 in. (13 to 19 mm) less in length than assembly height with bottom nesting in, resting on and fastened to floor runner with sheet metal screws. Stud spacing not to exceed 24 in. (610 mm) OC.

   C. **Gypsum Board** – Gypsum board installed to a min total thickness of 5/8 or 1-1/4 in. (16 or 32 mm) on each side of wall for a 1 or 2 hr rated wall, respectively. Wall to be constructed as specified in the individual U400 or V400 Series Design in the UL Fire Resistance Directory, except that a max 1 in. (25 mm) gap shall be maintained between the bottom of gypsum board and top of concrete floor.

   The hourly fire rating of the joint system is equal to the hourly fire rating of the wall.

3. **Fill, Void or Cavity Material** – **Caulk or Sealant** – Max separation between top of floor and bottom of gypsum board is 1 in. (25 mm). Min 5/8 in. (16 mm) thickness of fill material installed on each side of the wall between the bottom of the gypsum board and the top of the concrete floor, flush with each surface of the wall.

   *Bearing the UL Classification Mark

1. **Floor Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150pcf or 1600-2400 kg/m³) structural concrete. Floor may also be constructed of any 6 in. (152 mm) thick UL Classified hollow-core **Precast Concrete Units**.

   See **Precast Concrete Units** category in the Fire Resistance Directory for names of manufacturers.

2. **Wall Assembly** – The 1 or 2 hr fire-rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 or V400 Series Wall and Partition Design in the UL Fire Resistance Directory. In addition, the wall may incorporate a head-of-wall joint system constructed as specified in the HW Series Joint Systems in the UL Fire Resistance Directory.

   The wall shall include the following construction features:

   A. **Steel Floor Runner** – Floor runners of wall assembly shall consist of min No. 25 gauge galv steel channels sized to accommodate steel studs (Item 2C). Floor runners to be provided with flanges a min of 1/4 in. (6 mm) greater than the joint width. Runners secured with steel fasteners spaced 12 in. (305 mm) OC.

   B. **Studs** – Steel studs to be min 3-1/2 in. (89 mm) wide. Studs cut 1/2 to 3/4 in. (13 to 19 mm) less in length than assembly height with bottom nesting in, resting on and fastened to floor runner with sheet metal screws. Stud spacing not to exceed 24 in. (610 mm) OC.

   C. **Gypsum Board** – Gypsum board installed to a min total thickness of 5/8 or 1-1/4 in. (16 or 32 mm) on each side of wall for a 1 or 2 hr rated wall, respectively. Wall to be constructed as specified in the individual U400 or V400 Series Design in the UL Fire Resistance Directory, except that a max 2 in. (51 mm) gap shall be maintained between the bottom of gypsum board and top of concrete floor.

   The hourly fire rating of the joint system is equal to the hourly fire rating of the wall.

3. **Joint System** – Max separation between top of floor and bottom of gypsum board is 2 in. (51 mm). The joint system consists of forming material and a fill material, as follows:

   A. **Packing Material** – Min 5/8 and 1-1/4 in. (16 and 32 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation for 1 and 2 hr rated assemblies, respectively. Packing material to be firmly packed into gap between the bottom of the gypsum board and the top of the concrete floor on each side of the wall, flush with each surface of the wall.

   B. **Fill, Void or Cavity Material** – Min 1/16 in. (1.6 mm) dry thickness (1/8 in. or 3.2 mm wet thickness) of fill material sprayed or brushed on each side of the wall to completely cover mineral wool between the bottom of the gypsum board and the top of the concrete floor. When 3M Fire Barrier Watertight Spray is used, min wet (and dry) thickness of spray is 1/10 in. (2.5 mm) and spray shall lap min 1/2 in. (13 mm) onto the floor and wall.

   3M COMPANY – FireDam™ Spray 200, 3M Fire Barrier Watertight Spray

   B1. **Fill, Void or Cavity Material** – **Tape** (not shown) – As an alternate to Item 3B, Tape cut to size and press applied along length of joint to completely cover mineral wool between the bottom of the gypsum board and the top of the concrete floor, lapping minimum 1 in. (25 mm) onto wall and floor. Tape shall be applied in minimum 1 ft (305 mm) lengths along the joint at each side of wall and adjoining lengths of Tape shall overlap min 1/2 in. (13 mm).

   3M COMPANY – 3M Fire and Water Barrier Tape

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

FH Ratings — 1 and 2 Hr (See Item 2)
FTH Ratings — 1 and 2 Hr (See Item 2)
Joint Width — 1/2 In. Max
L Rating at Ambient — Less than 1 CFM/Lin Ft
L Rating at 400 F — Less than 1 CFM/Lin Ft

1. Floor Assembly — Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete. Floor may also be constructed of any min 6 in. (152 mm) thick UL Classified hollow-core Precast Concrete Units*.

See Precast Concrete Units (CFTV) category in the Fire Resistance Directory for names of manufactures.

2. Wall Assembly — The 1 or 2 hr fire rated gypsum board/steel stud shaft wall assembly shall be constructed of the materials and in the manner specified in the individual U400, V400 or W400 Series Wall and Partition Design in the UL Fire Resistance Directory. In addition, the wall may incorporate a head-of-wall joint system constructed as specified in the HW Series Joint Systems in the UL Fire Resistance Directory. The wall shall include the following construction features:

A. Steel Floor Runner — "J"-shaped runners, min 2-1/2 in. (64 mm) deep, with unequal legs of 1 in. (25 mm) and 2 in. (51 mm), fabricated from min 24 MSG galv steel. Runners positioned with short leg toward finished side of wall. Runners attached to structural supports with steel fasteners located not greater than 2 in. (51 mm) from ends and not greater than 24 in. (610 mm) OC.

B. Studs — "C-H", "E" (back-to-back) or "C-T"-shaped studs, min 2-1/2 in. (64 mm) deep, fabricated from min 25 MSG galv steel. Cut to lengths 3/8 to 1/2 in. (10 to 13 mm) less than floor-to-ceiling height and spaced 24 in. (610 mm) OC.

C. Gypsum Board* — 1 in. (25 mm) thick gypsum liner panels and 1/2 in., 5/8 in. or 3/4 in. (13, 16 or 19 mm) thick gypsum panels installed as specified in the individual U400 or V400 Series shaft wall designs in the UL Fire Resistance Directory.

The hourly ratings of the joint system are equal to the hourly fire rating of the wall.

3. Fill, Void or Cavity Material* - Sealant — Max separation between top of floor and bottom of gypsum board is 1/2 in. (13 mm). Min 1/2 in. (13 mm) thickness of fill material installed on finish side of the wall between the bottom of the gypsum board and the top of the concrete floor.

L Rating at 400°F – Less than 1 CFM/Lin Ft

CAN/ULC S115
F Rating – 2 Hr
FT Rating – 2 Hr
FH Rating – 2 Hr
FTH Rating – 2 Hr
Nominal Joint Width – 51 mm
Class II Movement Capabilities – 19% or 10% Compression or Extension (See Item 2)
L Rating at Ambient – Less than 1.55 L/s/lin m
L Rating at 204°C – Less than 1.55 L/s/lin m

1. **Floor Assembly** – Min 4-1/2 in. (114 mm) thick steel-reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete.

2. **Joint System** – Max width of joint (at time of installation of joint system) is 2 in. The joint system is designed to accommodate a max 19 percent compression or extension from its installed width except that when the Fire Barrier Watertight Spray (see Item 2B) is used, the movement is limited to max 10 percent compression and extension. The joint system shall consist of the following:

   A. **Forming Material** – Min 4 pcf (64 kg/m³) mineral wool batt insulation installed in joint opening as a permanent form. Batt cut to min width of 4 in. (102 mm) and installed edge-first into joint opening, parallel with joint direction. When 3M Fire Barrier Watertight Spray is used, batts to be cut to min width of 4-1/2 in. (114 mm). The batt sections are compressed min 50 percent in thickness and the compressed batt sections are installed flush with the top surface of floor. Adjoining lengths of batt to be tightly-butted with butted seams spaced min 48 in. (1.2 m) apart along the length of the joint.

      - **INDUSTRIAL INSULATION GROUP LLC** – MinWool-1200 Safing
      - **ROCK WOOL MANUFACTURING CO** – Delta Board
      - **ROCKWOOL MALAYSIA SDN BHD** – Type Safe
      - **ROXUL INC** – Type Safe
      - **THERMAFIBER INC** – Type SAF

   B. **Fill, Void or Cavity Material** – Min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) of fill material sprayed or brushed on top surface of floor to completely cover mineral wool and overlap a min of 1/2 in. (13 mm) onto concrete floor. When 3M Fire Barrier Watertight Spray is used, min wet (and dry) thickness of spray is 1/10 in. (2.5 mm).

      - **3M COMPANY** – FireDam™ Spray 200, 3M Fire Barrier Watertight Spray

   B1. **Fill, Void or Cavity Material** – Tape – As an alternate to Item 2B, Tape cut to size and press applied to top surface of floor to completely cover mineral wool and overlap a min of 1 in. (25 mm) onto the concrete floor at both edges of joint. Tape shall be applied in minimum 1 ft (305 mm) lengths along the joint at top of floor and adjoining lengths of Tape shall overlap min 1/2 in. (13 mm).

      - **3M COMPANY** – 3M Fire and Water Barrier Tape

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

1. **Floor Assembly** – Min 5-1/2 in. thick steel-reinforced lightweight or normal weight (100-150 pcf) structural concrete.

2. **Joint System** – Max width of joint (at time of installation of joint system) is 2 in. The joint system is designed to accommodate a max 10.9 percent compression or extension from its installed width. The joint system shall consist of the following:
   
   A. **Forming Material** – Min 4.0 pcf mineral wool batt insulation installed in joint opening as a permanent form. Batt cut to min width of 5 in. and installed edge-first into joint opening, parallel with joint direction, such that batt sections are compressed min 50 percent in thickness and such that the compressed batt sections are recessed from the top surface of floor to accommodate the required thickness of fill material. Adjoining lengths of batt to be tightly-butted with butted seams spaced min 48 in. apart along the length of the joint.

      - ROCK WOOL MANUFACTURING CO – Delta Safing Board
      - ROCKWOOL MALAYSIA SDN BHD – Type Safe
      - ROXUL INC – Type Safe
      - THERMAFIBER INC – Type SAF
   
   B. **Fill, Void or Cavity Material** – Min 1/2 in. thickness of fill material applied within the joint, flush with top surface of floor.

Assembly Rating – 2 Hr
L Rating At Ambient – Less Than 1 CFM/Lin Ft
L Rating At 400 F – Less than 1 CFM/Lin Ft
Nominal Joint Width – 4"

Class II Movement Capabilities – 15.6% Compression or Extension

1. Floor Assembly – Min 4-1/2 in. thick steel-reinforced lightweight or normal weight (100-150pcf) structural concrete.

2. Joint System – Max width of joint (at time of installation of joint system) is 4 in. The joint system is designed to accommodate a max 15.6 percent compression or extension from its installed width. The joint system shall consist of the following:
   A. Forming Material* – Min 4.0 pcf mineral wool batt insulation installed in joint opening as a permanent form. Batt cut to min width of 4 in. and installed edge-first into joint opening, parallel with joint direction, such that batt sections are compressed min 50 percent in thickness and such that the compressed batt sections are recessed from the top surface of floor to accommodate the required thickness of fill material. Adjoining lengths of batt to be tightly-butted with butted seams spaced min 48 in. apart along the length of the joint. –
      ROCK WOOL MANUFACTURING CO – Delta Safing Board
      ROCKWOOL MALAYSIA SDN BHD – Type Safe
      ROXUL INC – Type Safe
      THERMAFIBER INC – Type SAF
   B. Fill, Void or Cavity Material* – Min 1/4 in. depth of fill material applied within the joint, flush with top surface of floor.
      3M COMPANY – FB 1003 SL

1. **Floor Assembly** — Min 6 in. (152 mm) thick steel-reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete.

2. **Joint System** — Max width of joint (at time of installation of joint system) is 4 in. (102 mm). The joint system is designed to accommodate a max 19 percent compression or extension from its installed width except that when the Fire Barrier Watertight Spray (see Item 2B) is used, the movement is limited to max 10 percent compression and extension. The joint system shall consist of the following:

   A. **Forming Material** — Min 4 pcf (64 kg/m³) mineral wool batt insulation installed in joint opening as a permanent form. Batt cut to min width of 6 in. (152 mm) and installed edge-first into joint opening, parallel with joint direction, such that batt sections are compressed min 50 percent in thickness and such that the compressed batt sections are flush with the top surface of floor. Adjoining lengths of batt to be tightly-butted with butted seams spaced min 36 in. (914 mm) apart along the length of the joint.

      INDUSTRIAL INSULATION GROUP LLC — MinWool-1200 Safing
      JOHNS MANVILLE — Safing
      ROCK WOOL MANUFACTURING CO — Delta Board
      ROCKWOOL MALAYSIA SDN BHD — Type Safe
      ROXUL INC — Type Safe
      THERMAFIBER INC — Type SAF

   B. **Fill, Void or Cavity Material** — Min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) of fill material sprayed or brushed on top surface of floor to completely cover mineral wool and overlap a min of 1/2 in. (13 mm) onto concrete floor and wall. When 3M Fire Barrier Watertight Spray is used, min wet (and dry) thickness of spray is 1/10 in. (2.5 mm).

      3M COMPANY — FireDam™ Spray 200, 3M Fire Barrier Watertight Spray

   B1. **Fill, Void or Cavity Material** — Tape — As an alternate to Item 2B, Tape cut to size and press applied to top surface of floor to completely cover mineral wool and overlap a min of 1 in. (25 mm) onto the concrete floor at both edges of joint. Tape shall be applied in minimum 1 ft (305 mm) lengths along the joint at top of floor and adjoining lengths of Tape shall overlap min 1/2 in. (13 mm).

      3M COMPANY — 3M Fire and Water Barrier Tape

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

1. **Floor Assembly** – Min 5 in. (127 mm) thick reinforced normal weight (150 pcf or 2400 kg/m³) structural concrete.

2. **Joint System** – Max width of joint is 1 in. The joint system shall consist of the following:
   
   A. **Packing Material** – Min 3 in. (76 mm) thickness of min 4.0 pcf (64 kg/m³) mineral wool batt insulation firmly packed into opening as a permanent form, or open cell polyurethane foam backer rod. The open cell polyurethane foam backer rod may be removed after the fill material has cured. Packing material to be recessed from top surface of floor to accommodate the required thickness of fill material.

   B. **Fill, Void or Cavity Material** – The type and thickness of fill material applied within the joint, flush with top surface of floor is dependent on the packing material used, as shown in the table below:

<table>
<thead>
<tr>
<th>Packing Mtl Type</th>
<th>Fill Mtl</th>
<th>Min Fill Thkns In.</th>

1. **Floor Assembly** – Min 4-1/2 in. thick reinforced normal weight (150 pcf) structural concrete.

2. **Joint System** – Max width of joint is 2 in. The joint system shall consist of the following:
   
   A. **Support Hangers** Nom 1 in. wide strips of min 0.019 in. thick (26 gauge) galv steel bent to form a “hat” shape with each “brim” of the “hat” shape bearing min 3/4 in. on the top surface of each floor slab and with the “crown” at a depth of 2-1/4 in. below the top surface of the floor. Support hangers spaced max 8 in. O.C. along length of joint opening with additional support hanger centered below butted end seam of fill material strips (Item 2B).

   B. **Fill, Void or Cavity Material** – Nom 1/4 in. thick intumescent elastomer material faced on one side with aluminum foil, supplied in 2 in. wide strips. Strips friction-fitted in joint opening atop support hangers, with aluminum foil facing down, in two layers. First layer butted end seams to be centered over support hanger and covered with generous bead of caulk (Item 2C). Second layer butted end seams to be offset min 8 in. from first layer end seams and covered with generous bead of caulk (Item 2C).

   C. **Fill, Void or Cavity Material** – **Caulk or Sealant** – Min 1/4 in. diam continuous bead applied to top edges of intumescent strip at its interface with the floor slabs on each side of the joint opening.

   D. **Joint Cover** – Nom 6 in. wide sheet of min 0.034 in. thick (20 gauge) galv steel. Sheet covered over joint opening along its entire length. When installed in more than one piece, adjoining sections of steel sheet to overlap min 2 in. Steel sheet secured to concrete slab on each side of joint opening with steel anchor bolts, or equivalent, spaced max 12 in. O.C.

#### Wall Assembly — Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. 
See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

#### Floor Assembly — Min 4-1/2 in. (114 mm) thick steel-reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete.

#### Joint System — Max width of joint (at time of installation of joint system) is 2 in. (51 mm). The joint system is designed to accommodate a max 19 percent compression or extension from its installed width except that when the Fire Barrier Watertight Spray (see Item 2B) is used, the movement is limited to max 10 percent compression and extension. The joint system shall consist of the following:

**A. Forming Material** — Min 4 pcf (64 kg/m³) mineral wool batt insulation installed in joint opening as a permanent form. Batt cut to min width of 4 in. (102 mm) and installed edge-first into joint opening, parallel with joint direction, such that batt sections are compressed min 50 percent in thickness and such that the compressed batt sections are flush with the top surface of floor. Adjoining lengths of batt to be tightly-butted with butted seams spaced min 48 in. (1.2 m) apart along the length of the joint.

**INDUSTRIAL INSULATION GROUP L L C** — MinWool-1200 Safing  
**JOHNS MANVILLE** — Safing  
**ROCK WOOL MANUFACTURING CO** — Delta Safing Board  
**ROCKWOOL MALAYSIA SDN BHD** — Type Safe  
**ROXUL INC** — Type Safe  
**THERMAFIBER INC** — Type SAF

**B. Fill, Void or Cavity Material** — Min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) of fill material sprayed or brushed on top surface of floor to completely cover mineral wool and overlap a min of 1/2 in. (13 mm) onto concrete floor and wall. When 3M Fire Barrier Watertight Spray is used, min wet (and dry) thickness of spray is 1/10 in. (2.5 mm).

**3M COMPANY** — FireDam™ Spray 200, 3M Fire Barrier Watertight Spray

**B1. Fill, Void or Cavity Material - Tape** — As an alternate to Item 2B, Tape cut to size and press applied to top surface of floor to completely cover mineral wool and overlap a min of 1 in. (25 mm) onto the concrete floor and wall. Tape shall be applied in minimum 1 ft (305 mm) lengths along the joint at top of floor and adjoining lengths of Tape shall overlap min 1/2 in. (13 mm).

**3M COMPANY** — 3M Fire and Water Barrier Tape

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

3. **Joint System** — Max width of joint (at time of installation of joint system) is 1/2 in. The joint system is designed to accommodate a max 31 percent compression or extension from its installed width. — The joint system shall consist of the following:
   - **A. Forming Material** — Min 4.0 pcf mineral wool batt insulation installed in joint opening as a permanent form. Min 3-1/2 in. thickness of batt cut to the appropriate width and installed into joint opening such that batt sections are compressed min 50 percent in width and such that the compressed batt sections are recessed from the top surface of floor to accommodate the required thickness of fill material. Adjoining lengths of batt to be tightly-butted with butted seams spaced min 24 in. apart along the length of the joint.
     - ROCK WOOL MANUFACTURING CO — Delta Safing Board
     - THERMAFIBER INC — Type SAF
   - **B. Fill, Void or Cavity Material** — Min 1/2 in. thickness of fill material applied within the joint, flush with top surface of wall.
     - 3M COMPANY 3M/DYNEON — FB-1003 SL

L Rating at Ambient – Less than 1 CFM/Lin Ft
L Rating at 400°F – Less than 1 CFM/Lin Ft

CAN/ULC S115
F Rating – 3 Hr
FT Rating – 3 Hr
FH Rating – 3 Hr
FTH Rating – 3 Hr
Nominal Joint Width – 102 mm
Class II Movement Capabilities – 19% or 10% Compression or Extension (See Item 2)
L Rating at Ambient – Less than 1.55 L/s/lin m
L Rating at 400°F – Less than 1.55 L/s/lin m

1. Wall Assembly – Min 6 in. (152 mm) thick reinforced lightweight or normal weight (100-150pcf or 1600-2400 kg/m³) structural concrete. Wall may also be constructed of any UL Classified Concrete Blocks*.

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. Floor Assembly – Min 6 in. (152 mm) thick steel-reinforced lightweight or normal weight (100-150pcf or 1600-2400 kg/m³) structural concrete.

3. Joint System – Max width of joint (at time of installation of joint system) is 4 in. (102 mm). The joint system is designed to accommodate a max 19 percent compression or extension from its installed width, except that when the Fire Barrier Watertight Spray (see Item 2B) is used, the movement is limited to max 10 percent compression and extension. The joint system shall consist of the following:

   A. Forming Material* – Min 4 pcf (64 kg/m³) mineral wool batt insulation installed in joint opening as a permanent form. Batt cut to min width of 6 in. (152 mm) and installed edge-first into joint opening, parallel with joint direction, such that batt sections are compressed min 50 percent in thickness and such that the compressed batt sections are flush with the top surface of floor. Adjoining lengths of batt to be tightly-butted with butted seams spaced min 36 in. (914 mm) apart along the length of the joint.

      INDUSTRIAL INSULATION GROUP LLC – MinWool-1200 Safing
      ROCK WOOL MANUFACTURING CO – Delta Board
      ROCKWOOL MALAYSIA SDN BHD – Type Safe
      ROXUL INC – Type Safe
      THERMAFIBER INC – Type SAF

   B. Fill, Void or Cavity Material* – Min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) of fill material sprayed or brushed on top surface of floor to completely cover mineral wool and overlap a min of 1/2 in. (13 mm) onto concrete floor and wall. When 3M Fire Barrier Watertight Spray is used, min wet (and dry) thickness of spray is 1/10 in. (2.5 mm).

      3M COMPANY – FireDam™ Spray 200, 3M Fire Barrier Watertight Spray

   B1. Fill, Void or Cavity Material* – Tape – As an alternate to Item 3B, Tape cut to size and press applied to top surface of floor to completely cover mineral wool and overlap a min of 1 in. (25 mm) onto the concrete floor and wall. Tape shall be applied in minimum 1 ft (305 mm) lengths along the joint at top of floor and adjoining lengths of Tape shall overlap min 1/2 in. (13 mm).

      3M COMPANY – 3M Fire and Water Barrier Tape

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

1. **Floor Assembly** – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual D700 or D900 Series Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Floor And Form Units** – Max 3 in. (76 mm) deep galv steel fluted floor deck.

   B1. **Spray Applied Fire Resistive Material** – (Optional, Not Shown) – Prior to the installation of the Deflective Channel, Forming Material and Fill, Void or Cavity Material (Items 3A, 3B, 3C), the steel floor units may be sprayed with a min 5/16 in. (8 mm) thickness to max 11/16 in. (18 mm) thickness of fire resistive material

   GCP APPLIED TECHNOLOGIES INC – Type MK-6/HY

   B. **Concrete** – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.

1A. **Roof Assembly** – (Not Shown) – As an alternate to the floor assembly, a fire rated fluted steel deck roof assembly may be used. The roof assembly shall be constructed of the materials and in the manner described in the individual P900 Series Roof-Ceiling Design in the UL Fire Resistance Directory. The hourly rating of the roof assembly shall be equal to or greater than the hourly rating of the wall assembly. The roof assembly shall include the following construction features:

   A. **Steel Roof Deck** – Max 3 in. (76 mm) deep galv steel fluted roof deck.

   B. **Roof Insulation** – Max 2-1/4 in. (57 mm) thick poured insulating concrete, as measured from the top plane of the floor units.

2. **Wall Assembly** – The 1 or 2 hr fire rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400, V400 or W400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
A. Steel Floor and Ceiling Runners – Floor and ceiling runners of wall assembly shall consist of galv steel channels sized to accommodate steel studs (Item 2B). When optional deflection channel (Item 3A) is used, ceiling runner to be provided with 3 in. (76 mm) flanges. Ceiling runner installed within the deflection channel with 1 in. (25 mm) gap maintained between the top of ceiling runner and top of deflection channel. When deflection channel is not used, flange height of ceiling runner shall be min 3/4 in. (19 mm) greater than nom joint width.

Ceiling runner is installed perpendicular to direction of fluted steel deck and secured to valleys with steel masonry anchors or by welds spaced max 24 in. (610 mm) OC. When optional spray-applied fire resistive material is used on the steel deck and when deflection channel is not used, ceiling runner secured through spray-applied material to each valley of steel deck with min 3/16 in. (5 mm) diam steel masonry anchors spaced max 12 in. (305 mm) OC.

B. Head of Wall

B1. Light Gauge Framing* – Slotted Studs – Slotted steel stud to be used in conjunction with Light Gauge Framing* – Floor and Ceiling Runners (Item 2A3). Slotted studs to be min 3-1/2 in. (89 mm) wide. Slotted studs cut 1/2 to 3/4 in. (13 to 19 mm) less in length than assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. When slotted ceiling runner (Item 2A1) is used, steel studs secured to slotted ceiling runner with No. 8 by 1/2 in. (13 mm) long wafer head steel screws at midheight of slot on each side of wall. Stud spacing not to exceed 24 in. (610 mm) OC.

B2. Light Gauge Framing* – Slotted Ceiling Runner – Slotted steel stud to be used in conjunction with Light Gauge Framing* – Floor and Ceiling Runners (Item 2A3). Slotted studs to be min 3-1/2 in. (89 mm) wide. Slotted steel studs cut 1 in. (25 mm) less in length than assembly height with bottom nesting in and secured to both ceiling and floor runners. Ceiling runner secured to preformed slot within steel stud by means of No. 10 by 3/4 in. (19 mm) long profile head steel screw. Floor runner attached to bottom of steel stud by means of No. 8 by 1/2 in. (13 mm) long pan head steel screw. Slotted steel stud spacing not to exceed 24 in. (610 mm) OC.

B3. Light Gauge Framing* – Floor and Ceiling Runners – As an alternate to the ceiling and floor runners in Item 2A and 2A1 and 2A2, floor and ceiling runners to consist of galv steel channel sized to accommodate Steel studs (Item 2B). Slotted ceiling runner installed perpendicular to direction of fluted steel deck and secured to valleys with steel masonry anchors spaced max 24 in. (610 mm) OC. When slotted ceiling runner is used, deflection channel (Item 3A) shall not be used. When optional spray-applied fire resistive material is used on the steel deck, ceiling runner is secured through spray-applied material to each valley of steel deck with min 3/16 in. (5 mm) diam steel masonry anchors spaced max 12 in. (305 mm) OC.
B2. Light Gauge Framing* – Slider C-Clip System – As an alternate to the Light Gauge Framing* – Slotted Steel Studs (Item 2B1), a Slider C-Clip System consisting of a C shaped steel clip with a slotted opening and a steel stud to be used in conjunction with Light Gauge Framing* – Floor and Ceiling Runners (Item 2A3). Steel clips and studs to be min 3-1/2 in. (89 mm) wide. Steel clip inserted into inside flange of steel stud without attachment. Total length of steel stud cut 1 in. (25 mm) less than assembly height with bottom of steel stud nesting in and secured to floor runner. Floor runner attached to bottom of steel stud by means of No. 8 by 1/2 in. (13 mm) long pan head steel screw. Ceiling runner secured to steel C-Clip by means of No. 10 by 3/4 in. (19 mm) long pan head steel screw located 3/8 in. (10 mm) below top of ceiling runner. Top row of gypsum board screws shall be centered within the preformed slot of the C-Clip. Steel stud and steel clips spacing not to exceed 24 in. (610 mm) OC.

STEELER INC – Slider C Clip System

B3. Light Gauge Framing* – Steel Studs – Steel Studs to be used in conjunction with Light Gauge Framing* – Floor and Ceiling Runners (Item 2A5). Steel studs to be min 3-5/8 in. (92 mm) wide. Studs cut 1/2 to 3/4 in. (13 to 19 mm) less in length than assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. When slotted ceiling runner (Item 2A1) is used, steel studs secured to slotted ceiling runner with No. 8 by 1/2 in. (13 mm) long wafer head steel screws at midheight of slot on each side of wall. Stud spacing not to exceed 24 in. (610 mm) OC.

CALIFORNIA EXPANDED METAL PRODUCTS CO

C. Gypsum Board* – Gypsum board sheets installed to a min total thickness of 5/8 in. and 1-1/4 in. (16 and 32 mm) on each side of wall for 1 and 2 hr rated assemblies, respectively. Wall to be constructed as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a nom 1 in. (25 mm) gap shall be maintained between the top of the gypsum board and the bottom of the steel floor or roof deck and the top row of screws shall be installed into the studs 3-1/2 in. (89 mm) below the lower surface the floor or roof deck. The hourly fire rating of the joint system is equal to the hourly fire rating of the wall.

The hourly Assembly, F, FH FT and FTH Ratings of the joint system are equal to the hourly fire rating of the wall.

3. Joint System – Max separation between bottom of floor or roof and top of wall is 1 in. (25 mm). The joint system is designed to accommodate a max 25 percent compression or extension from its installed width. The joint system consists of an optional deflection channel, forming material and a fill material, as follows:

A. Deflection Channel – (Optional) – A nom 3-5/8 in. (92 mm) wide by 3 in. (76 mm) deep min 24 ga steel U-shaped channel. Deflection channel installed perpendicular to direction of fluted steel deck and secured to valleys with steel masonry anchors or by welds spaced max 24 in. (610 mm) OC. When optional spray-applied fire resistive material is used on the steel deck, deflection channel secured through spray-applied material to each valley of steel deck with min 1-1/2 in. (38 mm) by min 3/16 in. (5 mm) diam steel masonry anchors spaced max 12 in. (305 mm) OC. The ceiling runner (Item 2A) is installed within the deflection channel to maintain a 1 in. (25 mm) gap between the top of the ceiling runner and the top of the deflection channel. The ceiling runner is not fastened to the deflection channel.

B. Forming Material* – Min 4 in. (102 mm) thickness of min 4 pcf (64 kg/m³) density mineral wool batt insulation cut to the shape of the fluted deck, approx 20 percent larger than the area of the flutes and compressed into flutes of the steel floor or roof deck between the top of the deflection channel or ceiling runner and the steel deck. Additional pieces of min 4 pcf (64 kg/m³) mineral wool batt insulation are to be cut to the contour of the flutes with an additional 1-3/8 in. (35 mm) high section at the bottom of the shapes to fill the 1 in. (25 mm) gap between the top of the gypsum board and bottom of the steel floor or roof deck. The additional pieces of mineral wool are compressed and firmly packed into the flutes and the gap between the top of the gypsum board and bottom of the steel floor units on both sides of the wall and shall be a min 3/4 in. (19 mm) thick for 1 hr Rated Design and a min 1-1/2 in. (38 mm) thick for 2 hr Rated Design.

INDUSTRIAL INSULATION GROUP LLC – MinWool-1200 Safing

ROCK WOOL MANUFACTURING CO – Delta Board or Delta-8

ROCKWOOL MALAYSIA SDN BHD – Type Safe

THERMAFIBER INC – Type SAF

B1. Forming Material* – (Optional, Not Shown) – Preformed mineral wool plugs, formed to the shape of the fluted floor units, friction fit to completely fill the flutes above the ceiling channel. The plugs shall project beyond each side of the ceiling runner and shall be recessed from both wall surfaces to accommodate the required thickness of fill material (Item 3C). Additional forming material, described in Item 3B, to be used in conjunction with the plugs to fill the gap between the top of gypsum board and bottom of steel deck.

THERMAFIBER INC – TopStop mineral wool deck plugs Type SAF batts

C. Fill, Void or Cavity Material* – Min 1/16 in. (1.6 mm) dry (1/8 in. or 3.2 mm wet) thickness of fill material sprayed or brushed on each side of the wall in the flutes of the steel floor or roof deck units and between the top of the gypsum board and the bottom of the steel floor or roof deck units to completely cover mineral wool and overlap a min of 1/2 in. (13 mm) into gypsum board and steel floor deck on both sides of wall. When the steel floor deck is coated with spray-applied material (Item A1), the fill material shall overlap min 2 in. (51 mm) onto the spray-applied material.

3M COMPANY – FireDam™ Spray 200
C1. Fill, Void or Cavity Material* – Tape – As an alternate to Item C, Tape cut to size and press applied within fluted areas of joint to completely cover mineral wool lapping min 1 in. (25 mm) onto the contour of the steel floor units, or min 2 in. (51 mm) onto the spray applied fire resistive material (Item 1A1) on the steel floor units, and extending to lap min 1 in. (25 mm) onto the gypsum board. Additional pieces of Tape are applied along the joint to completely cover the remaining mineral wool between bottom of steel deck and top edge of gypsum board along length of joint, lapping min 1 in. (25 mm) onto the steel floor units, or min 2 in. (51 mm) onto the spray applied fire resistive material (Item 1A1) on the steel floor units, and min 1 in. (25 mm) onto gypsum board. Adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

3M COMPANY – 3M Fire and Water Barrier Tape
1. Floor Assembly — Min 4-1/2 in (114 mm) thick steel-reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete.

2. Wall Assembly — The 1 or 2 hr fire rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400 or V400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

A. Steel Floor And Ceiling Runners — Floor and ceiling runners of wall assembly shall consist of galv steel channels sized to accommodate steel studs (Item 2B). Ceiling runner to be provided with 3 in. (76 mm) flanges. When U-shaped deflection channel (Item 3A) is used, ceiling runner installed within the deflection channel with 1 in. (25 mm) gap maintained between the top of ceiling runner and top of deflection channel. When deflection channel is not used, ceiling runner is secured to concrete floor slab with steel masonry anchors or by welds spaced max 24 in. (610 mm) OC.

A1. Light Gauge Framing* — Slotted Ceiling Runner — As an alternate to the ceiling runner in Item 2A, slotted ceiling runner to consist of galv steel channel with slotted flanges sized to accommodate steel studs (Item 2B). Slotted ceiling runner secured to concrete floor slab with steel masonry anchors spaced max 24 in. (610 mm) OC. When slotted ceiling runner is used, deflection channel (Item 3A) shall not be used.

BRADY CONSTRUCTION INNOVATIONS INC, DBA SLIPTRACK SYSTEMS — SLP-TRK
CALIFORNIA EXPANDED METAL PRODUCTS CO — CST
CLARKDIETRICH BUILDING SYSTEMS — Type SLT, SLT-H
MARINO/WARE, DIV OF WARE INDUSTRIES INC — Type SLT
METAL-LITE INC — The System
RAM SALES LLC — RAM Slotted Track
SCAFCO STEEL STUD MANUFACTURING CO
STEELER INC — Steeler Slotted Ceiling Runner
TELLING INDUSTRIES LLC — True-Action Deflection Track

A2. Light Gauge Framing — Floor and Ceiling Runners — As an alternate to the ceiling and floor runners in Item 2A, 2A1 and 2A2, floor and ceiling runners to consist of galv steel channel sized to accommodate the Light Gauge Framing* Slotted Stud (Item 2B1) or Light Gauge Framing* Slider C-Clip System (Item 2B2). Floor and ceiling runners to be provided with min 1-1/4 in. and 3 in. (32 and 76 mm) flanges, respectively. Ceiling runner secured to concrete floor slab with steel masonry anchors spaced max 12 in. (305 mm) OC. When ceiling runner is used, deflection channel (Item 3A) shall not be used.

STEELER INC — Floor and Ceiling Runners

A3. Light Gauge Framing* — Notched Ceiling Runner — As an alternate to the ceiling runners in Items 2A through 2A3, notched ceiling runners to consist of C-shaped galv steel channel with notched return flanges sized to accommodate steel studs (Item 2B). Notched ceiling runner secured to concrete floor slab with steel masonry anchors spaced max 24 in. (610 mm) OC. When notched ceiling runner is used, deflection channel (Item 3A) shall not be used.

OLMAR SUPPLY INC — Type SCR
B1. Light Gauge Framing* – Slotted Studs – Slotted steel stud to be used in conjunction with Light Gauge Framing* – Floor and Ceiling Runners (Item 2A3). Slotted steel studs cut 1 in. (25 mm) less in length than assembly height with bottom nesting in and secured to ceiling and floor runners. Steel stud secured to preformed slot within double stud by means of No. 8 by 1/2 in. (13 mm) long wafer head steel screws at midheight of slot on each side of wall. Stud spacing not to exceed 24 in. (610 mm) OC.

STEELER INC – Slotted Stud

B2. Light Gauge Framing* – Slider C-Clip System – As an alternate to the Light Gauge Framing* – Slotted Steel Studs (Item 2B1), a Slider C-Clip System consisting of a C shaped steel clip with a slotted opening and a steel stud to be used in conjunction with Light Gauge Framing – Floor and Ceiling Runners (Item 2A3). Steel clips and studs to be min 3-1/2 in. (89 mm) wide. Steel stud cut 1 in. (25 mm) less in length than assembly height with bottom nest in slotted geometry on floor runner and with top nest in ceiling runner, respectively. When slotted steel stud (Item 2A1) is used, steel studs secured to slotted ceiling runner with No. 8 by 1/2 in. (13 mm) long wafer head steel screws at midheight of slot.

STEELER INC – Slider C Clip System

B3. Light Gauge Framing* – Steel Studs – Steel Studs to be used in conjunction with Light Gauge Framing* – Floor and Ceiling Runners (Item 2A5). Steel studs to be min 3-5/8 in. (92 mm) wide. Studs cut 1/2 to 3/4 in. (13 to 19 mm) less in length than assembly height with blank flange in and resting on floor runner and with top nest in ceiling runner without attachment. When slotted steel stud (Item 2A1) is used, steel studs secured to slotted ceiling runner with No. 8 by 1/2 in. (13 mm) long wafer head steel screws at midheight of slot. The joint system consists of a deflection channel, forming material and a fill material, as follows:

A. Deflection Channel (optional) – A nominal 3-5/8 in. (92 mm) wide by 3 in. (76 mm) deep min 24 ga steel U-shaped channel. Deflection channel secured to concrete floor with steel masonry anchors spaced max 24 in. (610 mm) OC. The ceiling runner (Item 2A) is installed within the deflection channel to maintain a 1 in. (25 mm) gap between the top of the ceiling runner and the top of the deflection channel. The ceiling runner is not fastened to the deflection channel.

B. Forming Material* – Min 1-3/8 in. (35 mm) width of 4 pcf (64 kg/m3) mineral wool batt insulation compressed and firmly packed into the gap between the top of the gypsum board and bottom of the floor to completely cover mineral wool and overlap a min of 1/2 in. (13 mm) onto the concrete floor and both sides of wall.

INDUSTRIAL INSULATION GROUP LLC – MinWool-1200 Safing
ROCK WOOL MANUFACTURING CO – Delta Board or Delta -8
ROCKWOOL MALAYSIA SDN BHD – Type Safe
ROXUL INC – Type Safe
THERMAFIBER INC – Type SAF

C. Fill, Void or Cavity Material* – Min 1/16 in. (1.6 mm) dry (1/8 in. or 3.2 mm wet) thickness of fill material sprayed or brushed on each side of the wall between the top of the gypsum board and bottom of the floor to completely cover mineral wool and overlap a min of 1/2 in. (13 mm) onto the concrete floor and both sides of wall.

3M COMPANY – FireDam™ Spray 200

C1. Fill, Void or Cavity Material* – Tape – As an alternate to Item C, Tape cut to size and press applied along length of joint to completely cover mineral wool and lapping min 1 in. (25 mm) onto the concrete floor and the gypsum board. Tape shall be applied in minimum 1 ft (305 mm) lengths and adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

3M COMPANY – 3M Fire and Water Barrier Tape

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.
1. **Floor Assembly** – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the material and in the manner described in the individual Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:

A. **Steel Floor And Form Units** – Max 3 in. (76 mm) deep galv steel floor deck.

   A1. **Spray Applied Fire Resistive Material** – (Optional, not shown) – Prior to the installation of the Forming Material and Fill, Void or Cavity Materials (Items 3A, 3B), the steel floor units may be sprayed with a min 5/16 in. (8 mm) thickness to max 11/16 in (17 mm) thickness of fire resistive material.

   **GCP APPLIED TECHNOLOGIES INC** – Type MK-6/HY

B. **Concrete** – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.

1A. **Roof Assembly** – (Not Shown) – As an alternate to the floor assembly, a fire rated fluted steel deck roof assembly may be used. The roof assembly shall be constructed of the materials and in the manner described in the individual P700 or P900 Series Roof-Ceiling Design in the UL Fire Resistance Directory. The hourly rating of the roof assembly shall be equal to or greater than the hourly rating of the wall assembly. The roof assembly shall include the following construction features:

A. **Steel Roof Deck** – Max 3 in. (76 mm) deep galv steel fluted roof deck.

B. **Roof Insulation** – (P 900 Series) – Min 2-1/4 in. (57 mm) thick poured insulating concrete, as measured from the top plane of the floor units.

C. **Roof Insulation – Mineral and Fiber Board** – (P 700 Series) – Min 3/4 in. (19 mm) thick boards applied in one or more layers directly over steel or over gypsum board sheathing laid atop steel roof deck.
D. **Spray Applied Fire Resistive Material** – (P700 Series, not shown) – Prior to the installation of the Deflective Channel, Forming Material and Fill, Void or Cavity Material (Items 3A, 3B, 3C), the steel floor units may be sprayed with a min 5/16 in. thickness to max 11/16 in. thickness of fire resistive material.

**GCP APPLIED TECHNOLOGIES INC** – Type MK-6/HY

2. **Wall Assembly** – Min 6-1/8 in. (156 mm) thick steel-reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified **Concrete Blocks**.

See **Concrete Blocks** (CAZT) category in the Fire Resistance Directory for names of manufacturers.

3. **Joint System** – Max separation between bottom of floor and top of wall is 1 in. (25 mm). The joint system is designed to accommodate a max 19 percent compression or extension from its installed width. The joint system consists of a forming material and a fill material, as follows:

A. **Forming Material** – Min 6-1/2 in. (165 mm) thickness of min 4 pcf (64 kg/m³) density mineral wool batt insulation cut to the shape of the fluted deck, approx 20 percent larger than the area of the flutes with additional min 6-1/2 in. (165 mm) thick by 1-3/8 in. (35 mm) high sections at the bottom of the shapes to completely fill the 1 in. (25 mm) gap between the top of the wall and bottom of the steel floor or roof deck. Mineral wool to be compressed and firmly packed into the flutes and the gap between the top of the wall and bottom of the steel floor or roof deck.

**INDUSTRIAL INSULATION GROUP L L C** – MinWool-1200 Safing

**ROCK WOOL MANUFACTURING CO** – Delta Board or Delta-8

**ROCKWOOL MALAYSIA SDN BHD** – Type Safe

**ROCKWOOL** – Type Safe

**THERMAFIBER INC** – Type SAF

B. **Fill, Void or Cavity Material** – Min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) of fill material sprayed or brushed on each side of the wall in the flutes of the steel floor or roof deck and between the top of the wall and the bottom of the steel floor units to completely cover mineral wool and overlap a min of 1 in. (25 mm) onto wall and steel deck on both sides of wall. When the steel floor or roof deck is coated with spray applied material, the fill material shall overlap min 2 in. (51 mm) onto the spray applied material.

**3M COMPANY** – FireDam™ Spray 200

B1. **Fill, Void or Cavity Material** – **Tape** – As an alternate to Item B, Tape cut to size and press applied within fluted areas of joint to completely cover mineral wool lapping min 1 in. (25 mm) onto the contour of the steel floor units, or min 2 in. (51 mm) onto the spray applied fire resistive material (Item 1A1) on the steel floor units, and extending to lap min 1 in. (25 mm) onto the concrete wall. Additional pieces of Tape are applied along the joint to completely cover the remaining mineral wool between bottom of steel deck and top edge of wall along length of joint, lapping min 1 in. (25 mm) onto the contour of the steel floor units, or min 2 in. (51 mm) onto the spray applied fire resistive material (Item 1A1) on the steel floor units, and min 1 in. (25 mm) onto concrete wall. Adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

**3M COMPANY** – 3M Fire and Water Barrier Tape

L Ratings apply only when FireDam™ Spray 200 is used.

1. **Floor Assembly** – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual D700 or D900 Series Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Floor And Form Units** – Max 3 in. (76 mm) deep galv steel fluted floor deck.

   A1. **Spray Applied Fire Resistive Material** – (Optional, Not Shown) – Prior to the installation of the Deflective Channel, Forming Material and Fill, Void or Cavity Materials (Items 3A and 3B), the steel floor units may be sprayed with a min 5/16 in. (8 mm) to max 11/16 in. (18 mm) thickness of fire resistive material.

   **GCP APPLIED TECHNOLOGIES INC** – Type MK-6/HY.

   B. **Concrete** – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.

1A. **Roof Assembly** – (Not Shown) – As an alternate to the floor assembly, a fire rated fluted steel deck roof assembly may be used. The roof assembly shall be constructed of the materials and in the manner described in the individual P900 Series Roof-Ceiling Design in the UL Fire Resistance Directory. **The hourly rating of the roof assembly shall be equal to or greater than the hourly rating of the wall assembly.**

   The roof assembly shall include the following construction features:

   A. **Steel Roof Deck** – Max 3 in. (76 mm) deep galv steel fluted roof deck.

   B. **Roof Insulation** – Min 2-1/4 in. (57 mm) thick poured insulating concrete, as measured from the top plane of the floor units.
2. Wall Assembly – The 1 or 2 hr fire rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400 or V400- Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. Steel Floor And Ceiling Runners – Floor and ceiling runners of wall assembly shall consist of galv steel channels sized to accommodate steel studs (Item 2B). When deflection channel (Item 3A) is used, ceiling runner to be provided with 3 in. (76 mm) flanges. Ceiling runner installed within the deflection channel with 1 in. (25 mm) gap maintained between the top of ceiling runner and top of deflection channel. When deflection channel is not used, flange height of ceiling runner shall be min 3/4 in. (19 mm) greater than nom joint width. Ceiling runner installed parallel to direction of fluted steel deck, centered beneath valley, and secured with steel masonry anchors or by welds spaced max 24 in. (610 mm) OC. When optional spray-applied fire resistive material is used on the steel deck and deflection channel is not used, ceiling runner is secured through spray-applied material to valley of floor deck with min 3/16 in. (5 mm) diam steel masonry anchors spaced max 12 in. (305 mm) OC.

   A1. Light Gauge Framing* – Slotted Ceiling Runner – As an alternate to the ceiling runner in Item 2A, slotted ceiling runner to consist of galv steel channel with slotted flanges sized to accommodate steel studs (Item 2B). Slotted ceiling runner installed parallel to direction of fluted steel deck, centered beneath valley, and secured with steel masonry anchors spaced max 24 in. (610 mm) OC. When slotted ceiling runner is used, deflection channel (Item 3A) shall not be used. When optional spray-applied fire resistive material is used on the steel floor slotted ceiling runner secured through spray-applied material to valley of steel deck with min 3/16 in. (5 mm) diam steel masonry anchors spaced max 12 in. (305 mm) OC.

   B. Studs – Steel studs to be min 3-1/2 in. (89 mm) wide. Studs cut 1/2 to 3/4 in. (13 to 19 mm) less in length than assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. When slotted ceiling runner (Item 2A1) is used, steel studs secured to slotted ceiling runner with No. 8 by 1/2 in. (13 mm) long wafer head steel screws at midpoint of slot on each side of wall. Stud spacing not to exceed 24 in. (610 mm) OC.

   B1. Light Gauge Framing* – Slotted Studs – Slotted steel stud to be used in conjunction with Light Gauge Framing* – Floor and Ceiling Runners (Item 2A3). Slotted steel studs to be min 3-1/2 in. (89 mm) wide. Slotted studs cut 1 in. (25 mm) less in length than assembly height with bottom nesting in and secured to both ceiling and floor runners. Ceiling runner secured to preformed slot within steel stud by means of No. 10 by 3/4 in. (19 mm) long low profile head steel screw. Floor runner attached to bottom of steel stud by means of No. 8 by 1/2 in. (13 mm) long pan head steel screw. Slotted stud spacing not to exceed 24 in. (610 mm) OC.

   STEELEER INC – Slotted Stud Runner

   TELLING INDUSTRIES L L C – True-Action Deflection Track

   A2. Light Gauge Framing – Floor and Ceiling Runners – As an alternate to the ceiling and floor runners in Item 2A through 2A2, floor and ceiling runners to consist of galv steel channel sized to accommodate the Light Gauge Framing* Slotted Stud (Item 2B1) or Light Gauge Framing* Slider C-Clip System (Item 2B2). Floor and ceiling runners to be provided with min 1-1/4 in. and 3 in. (32 and 76 mm) flanges, respectively. Ceiling runner installed parallel to direction of steel deck, centered beneath valley, and secured with steel masonry anchors spaced max 12 in. (305 mm) OC. When ceiling runner is used, deflection channel (Item 3A) shall not be used. When optional spray-applied fire resistive material is used on the steel deck, ceiling runner secured through spray-applied material to valley of the steel deck with min 3/16 in. (5 mm) diam steel masonry anchors spaced max 12 in. (305 mm) OC.

   STEELEER INC – Floor and Ceiling Runners

   A3. Light Gauge Framing* – Notched Ceiling Runner – As an alternate to the ceiling runners in Items 2A through 2A3, notched ceiling runners to consist of C-shaped galv steel channel with notched return flanges sized to accommodate steel studs (Item 2B). Notched ceiling runner installed parallel to direction of steel centered on valley, and secured with steel masonry anchors spaced max 24 in. (610 mm) OC. When notched ceiling runner is used, deflection channel (Item 3A) shall not be used. When optional spray-applied fire resistive material is used on the steel deck, notched ceiling runner secured through spray-applied material to valley of deck with min 3/16 in. (5 mm) diam steel masonry anchors spaced max 12 in. (305 mm) OC.

   OLMAR SUPPLY INC – Type SCR

   A4. Light Gauge Framing* – Floor and Ceiling Runners – As an alternate to the ceiling and floor runners in Item 2A through 2A4, floor and ceiling runners to consist of galv steel channel sized to accommodate the Light Gauge Framing* Steel Studs (Item 2B3). Floor and ceiling runners to be provided with min 1-3/4 in. flanges. Ceiling runner installed parallel to direction of steel deck, centered beneath valley, and secured to valleys with steel masonry anchors spaced max 12 in. (305 mm) OC. When ceiling runner is used, deflection channel (Item 3A) shall not be used. When optional spray-applied fire resistive material is used on the steel deck, ceiling runner is secured through spray-applied material to each valley of steel deck with min 3/16 in. (5 mm) diam steel masonry anchors spaced max 12 in. (305 mm) OC.

   CALIFORNIA EXPANDED METAL PRODUCTS CO – ViperTrack™

   B. Construction Joints

   B1. Light Gauge Framing* – Slotted Studs – Slotted steel stud to be used in conjunction with Light Gauge Framing* – Floor and Ceiling Runners (Item 2A3). Slotted steel studs to be min 3-1/2 in. (89 mm) wide. Slotted studs cut 1 in. (25 mm) less in length than assembly height with bottom nesting in and secured to both ceiling and floor runners. Ceiling runner secured to preformed slot within stud by means of No. 10 by 3/4 in. (19 mm) long low profile head steel screw. Floor runner attached to bottom of steel stud by means of No. 8 by 1/2 in. (13 mm) long pan head steel screw. Slotted stud spacing not to exceed 24 in. (610 mm) OC.

   STEELEER INC – Slotted Stud
**Joint System**

Reprinted from the Online Certifications Directory with permission from UL©

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

**3. Joint System**

The joint system consists of an optional deflection channel, forming material and a fill material, as follows:

A. **Deflection Channel**

*(Optional)* – A nominal 3-5/8 in. (92 mm) wide by 3 in. (76 mm) deep min 24 ga steel U-shaped channel. Deflection channel installed parallel to direction of steel deck, centered beneath valley and secured with steel masonry anchors or by welds spaced max 24 in. (610 mm) OC. When optional spray-applied fire resistive material is used on the steel deck, deflection channel secured through spray-applied material to valley of steel deck with min 1-1/2 in. (38 mm) long by min 3/16 in. (5 mm) diam steel masonry anchors spaced a max 24 in. (610 mm) OC. The ceiling runner (Item 2A) is installed within the deflection channel to maintain a 1 in. (25 mm) gap between the top of the ceiling runner and the top of the deflection channel. The ceiling runner is not fastened to the deflection channel.

B. **Forming Material**

Min 4pcf (64 kg/m³) mineral wool batt insulation to be cut a min of 20 percent wider than the gap between the top of the gypsum board and bottom of the steel floor or roof deck. The mineral wool is to be compressed and firmly packed into the gap between the top of the gypsum board and bottom of the steel floor or roof deck on both sides of the wall and shall be min 3/4 in. (19 mm) thick for 1 hr Rated Design and min 1-1/2 in. (38 mm) thick for 2 hr Rated Design.

**C. Fill, Void or Cavity Material**

As an alternate to Item C, Tape cut to size and press applied within fluted areas of joint to completely cover mineral wool lapping min 1 in. (25 mm) onto the contour of the steel floor units, or min 2 in. (51 mm) onto the spray applied fire resistive material (Item 1A1) on the steel floor units, and extending to lap min 1 in. (25 mm) onto the gypsum wall. Additional pieces of Tape are applied along the joint to completely cover the remaining mineral wool between bottom of steel deck and top edge of wall along length of joint, lapping min 1 in. (25 mm) onto the contour of the steel floor units, or min 2 in. (51 mm) onto the spray applied fire resistive material (Item 1A1) on the steel floor units, and min 1 in. (25 mm) onto gypsum wall. Adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

**3M COMPANY**

– Fire Dam® Spray 200

– 3M Fire and Water Barrier Tape

L-Ratings apply only when Fire Dam® Spray 200 is used.

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

1. **Floor Assembly** – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Floor And Form Units*** – Max 3 in. (76 mm) deep galv steel fluted floor deck.

   A1. **Spray Applied Fire Resistive Material*** – (Optional, not shown) – Prior to the installation of the Forming Material and Fill, Void or Cavity Materials (Items 3A and 3B), the steel floor units may be sprayed with a min 5/16 in. (8 mm) to max 11/16 in (17 mm) thickness of fire resistive material.

   GCP APPLIED TECHNOLOGIES INC – Type MK-6/HY.

   B. **Concrete** – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.

1A. **Roof Assembly** – (Not Shown) – As an alternate to the floor assembly, a fire rated fluted steel deck roof assembly may be used. The roof assembly shall be constructed of the materials and in the manner described in the individual P700 or P900 Series Roof-Ceiling Design in the UL Fire Resistance Directory. The hourly rating of the roof assembly shall be equal to or greater than the hourly rating of the wall assembly. The roof assembly shall include the following construction features:

   A. **Steel Roof Deck** – Max 3 in. (76 mm) deep galv steel fluted roof deck.

   B. **Roof Insulation** – (P 900 Series) - Min 2-1/4 in. (57 mm) thick poured insulating concrete, as measured from the top plane of the floor units.

   C. **Roof Insulation** – Mineral and Fiber Board* – (P 700 Series) – Min 3/4 in. (19 mm) thick boards applied in one or more layers directly over steel or over gypsum board sheathing laid atop steel roof deck.
D.  **Spray Applied Fire Resistive Material** – (P700 Series, not shown)– Prior to the installation of the Deflective Channel, Forming Material and Fill; Void or Cavity Material (Items 3A, 3B, 3C), the steel floor units may be sprayed with a min 5/16 in. (8 mm) to max 11/16 in. (17 mm) thickness of fire resistive material.

**GCP APPLIED TECHNOLOGIES INC** – Type MK-6/HY

2. **Wall Assembly** – Min 6-1/8 in. (156 mm) thick steel-reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*.

See **Concrete Blocks** (CAZT) category in Fire Resistance Directory for names of manufacturers.

3. **Joint System** – Max separation between bottom of floor or roof and top of wall is 1 in. (25 mm). The joint system is designed to accommodate a max 19 percent compression or extension from its installed width. The joint system consists of a forming material and a fill material, as follows:

A. **Forming Material** – Min 6-1/2 in. (165 mm) thickness of min 4 pcf (64 kg/m³) density mineral wool batt insulation cut a min of 20 percent wider than the gap between the top of the wall and bottom of the steel floor or roof deck. Mineral wool to be compressed and firmly packed into the gap between the top of the wall and bottom of the steel floor or roof deck.

**INDUSTRIAL INSULATION GROUP LLC** – MinWool-1200 Safing

**ROCK WOOL MANUFACTURING CO** – Delta Board or Delta-8

**ROCKWOOL MALAYSIA SDN BHD** – Type Safe

**ROCKWOOL** – Type Safe

**THERMAFIBER INC** – Type SAF

B. **Fill, Void or Cavity Material** – Min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) of fill material sprayed or brushed on each side of the wall between the top of the wall and the bottom of the steel floor or roof deck to completely cover mineral wool and overlap a min of 1/2 in. (13 mm) onto wall and steel floor or roof deck on both sides of wall. When the steel floor or roof deck is coated with spray applied material, the fill material shall overlap min 2 in. (51 mm) onto the spray applied material.

**3M COMPANY** – FireDam™ Spray 200

B1. **Fill, Void or Cavity Material** – **Tape** – As an alternate to Item B, Tape cut to size and press applied along length of joint to completely cover mineral wool and lap min 1 in. (25 mm) onto the steel floor units, or min 2 in. (51 mm) onto the spray applied fire resistive material (Item 1A1) on the steel floor units, and min 1 in. (25 mm) onto concrete wall. Adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

**3M COMPANY** – 3M Fire and Water Barrier Tape

1. **Floor Assembly** – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual D700 or D900 Series Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Floor And Form Units** – Max 3 in. (76 mm) deep galv steel fluted floor deck.
   
   B. **Concrete** – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.
   
   C. **Spray Applied Fire Resistive Material** – (Optional, Not Shown) – Prior to the installation of the Deflection Channel, Forming Material and Fill, Void or Cavity Materials (Items 3A, 3B, 3C), the steel floor units may be sprayed with a min 5/16 in. (8 mm) to max 11/16 in. (18 mm) thickness of fire resistive material.

   **GCP APPLIED TECHNOLOGIES INC** – Type MK-6/HT.

2. **Wall Assembly** – The 2 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner described in the individual U400- or V400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Roof Deck** – Max 3 in. (76 mm) deep galv steel fluted roof deck.
   
   B. **Roof Insulation** – Min 2-1/4 in. (57 mm) thick poured insulating concrete, as measured from the top plane of the roof deck.

3. **Joint System** – Max separation between bottom of roof or roof and top of wall is 2 in. (51 mm). The joint system is designed to accommodate a max 25 percent compression or extension from its installed width. The joint system consists of an optional deflection channel, forming material and a fill material, as follows:

   A. **Light Gauge Framing** – Slotted Ceiling Runner – As an alternate to the ceiling runner in Item 2A, slotted ceiling runner to consist of galv steel channel with slotted flanges sized to accommodate steel studs (Item 2B). Slotted ceiling runner installed perpendicular to direction of fluted steel deck and secured to valleys with steel masonry anchors spaced max 24 in. (610 mm) OC. When optional spray-applied fire resistive material is used on the steel deck, slotted ceiling channel is not used, ceiling runner secured through spray-applied material to each valley of the steel deck with min 3/16 in. (5 mm) diam steel masonry anchors spaced max 12 in. (305 mm) OC.

   **BRADY CONSTRUCTION INNOVATIONS INC, DBA SLIPTRACK SYSTEMS** – SLP-TRK
   
   **CLARKDIETRICH BUILDING SYSTEMS** – Type SLT, SLT-H
   
   **MARINOWARE, DIV OF WARE INDUSTRIES INC** – Type SLT
   
   **METAL-LITE INC** – The System
   
   **RAM SALES LLC** – RAM Slotted Track
   
   **SCAFCO STEEL STUD MANUFACTURING CO** – True-Action Deflection Track

   A2. **Light Gauge Framing** – Notched Ceiling Runner – As an alternate to the ceiling runners in Items 2A through 2A2, notched ceiling runners to consist of C-shaped galv steel channel with notched return flanges sized to accommodate steel studs (Item 2B). Notched ceiling runner installed perpendicular to direction of fluted steel deck and secured to valleys with steel masonry anchors spaced max 24 in. (610 mm) OC. When notched ceiling runner is used, deflection channel (Item 3A) shall not be used. When optional spray-applied fire resistive material is used on the steel deck, notched ceiling runner secured through spray-applied material to each valley of the steel deck with min 3/16 in. (5 mm) diam steel masonry anchors spaced max 12 in. (305 mm) OC.

   **OLMAR SUPPLY INC** – Type SCR

   B. **Studs** – Steel studs to be min 3-1/2 in. (89 mm) wide. Studs cut 1/2 to 3/4 in. (13 to 19 mm) less in length than assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. When on slot ceiling runner (Item 2AI) is used, steel studs secured to slotted ceiling runner with No. 8 by 1/2 in. (13 mm) long wafer head steel screws at midpoint of slot on each side of wall. Stud spacing not to exceed 24 in. (610 mm) OC.

   C. **Gypsum Board** – Gypsum board sheets installed to a min total thickness of 1-1/4 in. (32 mm) on each side of wall. Wall to be constructed as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a nom 2 in. (51 mm) gap shall be maintained between the top of the gypsum board and the bottom of the steel floor roof deck and the top row of screws shall be installed into the studs 4-1/2 in. (114 mm) below the lower surface of the floor or roof deck.
A. Deflection Channel – (Optional, Not Shown) – A nom 3-5/8 in. (92 mm) wide by 3 in. (76 mm) deep min 24 gauge steel U-shaped channel. Deflection channel installed perpendicular to direction of fluted steel deck and secured to valleys with steel masonry anchors or by welds spaced max 24 in. (610 mm) OC. When optional spray-applied fire resistive material is used on the steel deck, deflection channel secured through spray-applied material to each valley of steel deck with min 1-1/2 in. (38 mm) long by min 3/16 in. (5 mm) diam steel masonry anchors spaced max 12 in. (305 mm) OC. The ceiling runner (Item 2A) is installed within the deflection channel to maintain a 2 in. (51 mm) gap between the top of the ceiling runner and the top of the deflection channel. The ceiling runner is not fastened to the deflection channel.

B. Forming Material* – Min 4 pcf (64 kg/m³) density mineral wool batt insulation cut to the shape of the fluted deck, approximately 20 percent larger than the area of the flutes, with a length equal to the overall thickness of the wall. Insulation compressed into flutes of the steel floor or roof deck above the top of the deflection channel or ceiling runner with the ends flush with the surfaces of the wall. Additional 1-1/4 in. (32 mm) wide sections of mineral wool batt insulation are compressed 50 percent in thickness and installed cut edge first to completely fill the gap above the top of the gypsum board. The forming material shall be installed flush with both surfaces of wall.

C. Fill, Void or Cavity Material* – Tape
- As an alternate to Item C, Tape cut to size and press applied within fluted areas of joint to completely cover mineral wool lapping min 1 in. (25 mm) onto the contour of the steel floor units and extending to lap min 1 in. (25 mm) onto the gypsum wall. Additional pieces of Tape are applied along the joint to completely cover the remaining mineral wool between bottom of steel deck and top edge of wall along length of joint, lapping min 1 in. (25 mm) onto the contour of the steel floor units and gypsum wall. When the steel deck is coated with spray applied material, the Tape shall overlap min 2 in. (51 mm) onto the spray applied material.

D. Isolation Pad – (Optional, Not Shown) – As an option, max 1/2 in. (13 mm) thick molded high density glass fiber isolation pads may be installed between the deflection channel (Item 3A) and the steel floor or roof deck for sound control purposes. The isolation pad shall be cut to the width of the deflection channel and shall be installed along the entire length of the wall. When the isolation pad is used, the deflection channel shall be secured to the steel deck, through the isolation pad, with mechanical fasteners in conjunction with steel fender washers and neoprene isolation grommets supplied by the maker of the isolation pad material.

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

L Rating At Ambient – Less Than 1 CFM/lin ft
L Rating At 400°F – Less Than 1 CFM/lin ft

CAN/ULC S115
F Rating – 2 Hr
FT Rating – 2 Hr
FH Rating – 2 Hr
FTH Rating – 2 Hr
Nominal Joint Width – 51 mm
Class II Movement Capabilities – 19% Compression or Extension
L Rating at Ambient – Less Than 1.55 L/s/lin m
L Rating at 204°C – Less Than 1.55 L/s/lin m

SECTION A-A

1. Floor Assembly – Min 4-1/2 in. (114 mm) thick steel-reinforced lightweight or normal weight (100-150pcf or 1600-2400 kg/m²) structural concrete.

2. Wall Assembly – Min 7-1/2 in. (191 mm) thick lightweight or normal weight (100-150pcf or 1600-2400 kg/m²) concrete. Wall may also be constructed of any UL Classified Concrete Blocks.

See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

3. Joint System – Max separation between bottom of floor and top of wall is 2 in. (51 mm). The joint system is designed to accommodate a max 19 percent compression or extension from its installed width. The joint system consists of a forming material and a fill material, as follows:

A. Forming Material* – Min 3 in. (76 mm) thick, min 4 pcf (64 kg/m²) mineral wool batt insulation compressed and firmly packed into the gap between the top of the wall and bottom of the floor on both sides of the wall. Pieces of batt to be cut to min width of twice the nom joint width and installed vertically, such that the batt sections are compressed min 50 percent and installed flush with both surfaces of wall.

INDUSTRIAL INSULATION GROUP LLC – MinWool-1200 Safing
ROCK WOOL MANUFACTURING CO – Delta Safing Board
ROCKWOOL MALAYSIA SDN BHD – Type Safe
ROXUL INC – Type Safe
THERMAFIBER INC – Type SAF

B. Fill, Void or Cavity Material* – Min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) of fill material sprayed or brushed on each side of the wall between the top of the wall and the bottom of the floor to completely cover mineral wool and overlap a min of 1/2 in. (13 mm) onto wall and floor on both sides of wall.

3M COMPANY – FireDam™ Spray 200

B1. Fill, Void or Cavity Material* – Tape – As an alternate to Item B, Tape cut to size and press applied along length of joint to completely cover mineral wool and lap min 1 in. (25 mm) onto the concrete floor and wall. Tape shall be applied in min 1 ft (305 mm) lengths along joint and adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

3M COMPANY – 3M Fire and Water Barrier Tape

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

1. **Floor Assembly** – The fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Floor and Form Units** – Max 3 in. (76 mm) deep galv fluted units.

   A1. **Spray Applied Fire Resistive Material** – (Optional, not shown) – Prior to the installation of the Forming Material and Fill, Void or Cavity Materials (Items 3A, 3B), the steel floor units may be sprayed with a min 5/16 in. (8 mm) to max 11/16 in. (17 mm) thickness of fire resistive material.

   GCP APPLIED TECHNOLOGIES INC – Type MK-6/HY.

   B. **Concrete** – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.

2. **Wall Assembly** – Min 7-1/2 in. (191 mm) thick lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks.

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

3. **Joint System** – Max separation between bottom of floor and top of wall is 2 in. (51 mm). The joint system is designed to accommodate a max 19 percent compression or extension from its installed width. The joint system consists of a forming material and a fill material, as follows:

   A. **Forming Material** – Min 4 pcf (64 kg/m³) mineral wool batt insulation compressed and firmly packed into the flutes and the gap between the top of the wall and bottom of the floor on both sides of the wall. Pieces of batt to be cut a min thickness of 3 in. (76 mm) to the shape of the deck approximately 25 percent larger than the area of the flutes with additional min 4 in. (102 mm) wide sections of a thickness at least 50 percent larger than gap between the top of the wall and bottom of the steel floor units. Mineral wool to be compressed and firmly packed into the flutes and compressed in thickness and inserted edge first into the gap between the top of the wall and bottom of the steel floor units, flush with both sides of wall.
B. Fill, Void or Cavity Material* – Min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) of fill material sprayed or brushed on each side of the wall in the flutes of the steel floor units and between the top of the wall and the bottom of the floor to completely cover mineral wool and overlap a min of 1/2 in. (13 mm) onto wall and floor on both sides of wall. When the steel deck is coated with spray applied material (Item A1), the fill material shall overlap min 2 in. (51 mm) onto the spray applied material.

3M COMPANY – FireDam Spray 200

B1. Fill, Void or Cavity Material* – Tape – As an alternate to Item B, Tape cut to size and press applied within fluted areas of joint to completely cover mineral wool lapping min 1 in. (25 mm) onto the contour of the steel floor units and extending to lap min 1 in. (25 mm) onto the concrete wall. Additional pieces of Tape are applied along the joint to completely cover the remaining mineral wool between bottom of steel deck and top edge of wall along length of joint, lapping min 1 in. (25 mm) onto the contour of the steel floor units and concrete wall. When the steel deck is coated with spray applied material (Item 1A1), the Tape shall overlap min 2 in. (51 mm) onto the spray applied material. Adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

3M COMPANY – 3M Fire and Water Barrier Tape

L Ratings apply only when FireDam™ Spray 200 is used.

Configuration A

Configuration B

Configuration C
System No. HW-D-0060 continued

1. **Floor Assembly** — The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual Floor-Ceiling Design in the UL Fire Resistance Directory. The hourly fire rating of the floor assembly shall be equal to or greater than the hourly fire rating of the wall assembly. The floor assembly shall include the following construction features:

   A. **Steel Floor and Form Units** — Max 3 in. (76 mm) deep galv fluted floor units.
   B. **Concrete** — Min 2-1/2 in. (64 mm) thick reinforced (100-150 pcf or 1600-2400 kg/m³) concrete, as measured from the top plane of the floor units.

1A. **Roof Assembly** — As an alternate to Item 1, the fire-rated roof assembly shall be constructed of the materials and in the manner described in the individual P700, P800 or P900 series Roof-Ceiling Designs in the UL Fire Resistance Directory and shall contain max 3 in. (76 mm) deep galv steel fluted roof units. The hourly fire rating of the roof assembly shall be equal to or greater than the hourly fire rating of the wall assembly. In the case of spray-applied protection materials on the steel roof units, the joint system shall be installed prior to the spray-applied protection material.

1B. **Floor Assembly** — As an alternate to Item 1, min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete or any min 6 in. (152 mm) thick UL Classified hollow-core **Precast Concrete Units**.

See **Precast Concrete Units** (CFTV) category in the Fire Resistance Directory for names of manufacturers.

2. **Wall Assembly** — The 1, 2 or 3 hr fire-rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400, V400 or W400-Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Light Gauge Framing** — Deflection trak — Deflection trak of wall assembly shall consist of min No. 25 gauge galv steel channels sized to accommodate steel studs (Item 2C) and with offset legs to accommodate wall cladding (Item 3A). Deflection trak installed parallel or perpendicular to the floor units. When installed perpendicular (Configuration A), min No. 25 gauge deflection trak secured on both sides to valley of floor units with 1-1/2 in. (38 mm) long welds spaced max 12 in. (305 mm) OC. Min No. 20 gauge deflection trak may be secured with steel fasteners spaced 12 in. (305 mm) OC. When installed parallel (Configuration B), min No. 25 gauge deflection trak secured on one side to valley of floor units with 1-1/2 in. (38 mm) long welds spaced 12 in. (305 mm) OC. Min No. 20 gauge deflection trak may be secured with steel fasteners spaced max 12 in. (305 mm) OC. The other side of the deflection trak is secured to Z-Furring clips (Item 2B) with two No. 8 by 1-1/2 in. (38 mm) long tec screws. On concrete floor (Configuration C), min No. 20 gauge deflection trak attached to concrete at ceiling with steel fasteners spaced max 12 in. (305 mm) OC.

   B. **Z-Furring** (Parallel Units) — When trak is installed parallel to floor units, Z-Furring clips are attached to the bottom of the floor units within the crests with two steel fasteners. Clip spacing not to exceed 24 in. (610 mm) OC.

   C. **Studs** — Steel studs to be min 2-1/2 in. (64 mm) wide and as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory. Studs cut 1-1/2 in. (38 mm) less in length than the assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. Stud spacing not to exceed 24 in. (610 mm) OC.

   D. **Gypsum Board** — Gypsum board sheets installed and attached to studs and runners as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a nominal 1 in. (25 mm) gap shall be maintained between top of the gypsum board and the bottom flange of the deflection trak. Top row of screws shall be installed into the studs 3 in. (76 mm) below the top edge of the gypsum board sheets.

   The hourly assembly rating of the joint system is equal to the fire rating of the wall.

   **Firestop Configuration A**

3. **Joint System** — Max separation between bottom flange of the deflection trak and top of wallboard (at the time of installation of the joint system) is 1 in. (25 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width. The joint system consists of packing material (Item 3A), wall cladding (Item 3B) and a fill material (Item 3C) as follows:

   A. **Packing Material** — Min 4 pcf (64 kg/m³) density mineral wool batt insulation cut to the shape of the fluted deck, 25 percent larger than the area of the flutes and compressed into the flutes of the steel floor units above the ceiling runner as a permanent form.

   B. **Wall Cladding** — Strips of the gypsum board material cut to the contour of the steel floor units and attached to the deflection trak. The number of layers, board type and thickness and fastener type shall be as specified for the gypsum board in the individual Wall and Partition Design in the UL Fire Resistance Directory. Fasteners shall be max spaced 3 in. (76 mm) OC. The top of the wall cladding shall be recessed min 1/8 in. (3.2 mm) to max 1/2 in. (13 mm) from the steel floor units and overlap the gypsum board 4 in. (102 mm).

   C. **Fill, Void or Cavity Material** — Full depth of fill material installed on each side of the wall between the top of the wall cladding and the surface of the steel floor units, flush with each surface of the cladding.

   **3M COMPANY** — FB 1000NS, FB 2000, FB 2000+, FD-150+, CP 25 WB+

   **Firestop Configuration B**

3. **Joint System** — Max separation between bottom flange of the deflection trak and top of wallboard (at the time of installation of the joint system) is 1 in. (25 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width. The joint system consists of packing material (Item 3A), wall cladding (Item 3B) and a fill material (Item 3C) as follows:

   A. **Wall Cladding** — Strips of the gypsum board material attached to the deflection trak. The number of layers, board type and thickness and fastener type shall be as specified for the gypsum board in the individual Wall and Partition Design in the UL Fire Resistance Directory. Fasteners shall be max spaced 3 in. (76 mm) OC. The top of the wall cladding shall be recessed min 1/8 in. (3.2 mm) to max 1/2 in. (13 mm) from the steel floor units and overlap the gypsum board 4 in. (102 mm).

   B. **Fill, Void or Cavity Material** — Full depth of fill material installed on each side of the wall between the top of the wall cladding and the surface of the steel floor units, flush with each surface of the cladding.

   **3M COMPANY** — FB 1000NS, FB 2000, FB 2000+, FD-150+, CP 25 WB+
System No. HW-D-0060 continued

Firestop Configuration C

3. Joint System — Max separation between bottom flange of the deflection track and top of wallboard (at the time of installation of the joint system) is 1 in. (25 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width. The joint system consists of packing material (Item 3A), wall cladding (Item 3B) and a fill material (Item 3C) as follows:

A. Wall Cladding — Strips of the gypsum board material attached to the deflection track. The number of layers, board type and thickness and fastener type shall be as specified for the gypsum board in the individual Wall and Partition Design in the UL Fire Resistance Directory. Fasteners shall be max spaced 3 in. (76 mm) OC. The top of the wall cladding shall be recessed min 1/8 in. (3.2 mm) to max 1/2 in. (13 mm) from the bottom of the concrete floor and overlap the gypsum board 4 in. (102 mm).

B. Fill, Void or Cavity Material* — Full depth of fill material installed on each side of the wall between the top of the wall cladding and the bottom of the concrete floor, flush with each surface of the cladding.

 CONFIGURATION A

 CONFIGURATION B

 CONFIGURATION C

SECTION A-A
System No. HW-D-0061 continued

1. Floor Assembly — The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual Light Gauge Framing Design in the UL Fire Resistance Directory. The hourly fire rating of the floor assembly shall be equal to or greater than the hourly fire rating of the wall assembly. The floor assembly shall include the following construction features:
   A. **Steel Floor and Form Units** — Max 3 in. (76 mm) deep galv fluted floor units.
   B. **Concrete** — Min 2-1/2 in. (64 mm) thick reinforced (100-150 pcf or 1600-2400 kg/m³) concrete, as measured from the top plane of the floor units.

1A. **Roof Assembly** — As an alternate to Item 1, the fire-rated roof assembly shall be constructed of the materials and in the manner described in the individual P700, P800 or P900 series Roof-Ceiling Designs in the UL Fire Resistance Directory and shall contain max 3 in. (76 mm) deep galv steel fluted roof units. The hourly fire rating of the roof assembly shall be equal to or greater than the hourly fire rating of the wall assembly. In the case of spray-applied protection materials on the steel roof units, the joint system shall be installed prior to the spray-applied protection material.

1B. **Floor Assembly** — As an alternate to Item 1, min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete or any min 6 in. (152 mm) thick UL Classified hollow-core Precast Concrete Units*. See Precast Concrete Units (CFTV) category in the Fire Resistance Directory for names of manufacturers.

2. Wall Assembly — The 1, 2 or 3 hr fire-rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400, V400 or W400-Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Light Gauge Framing** - **Deflection Trak** — Deflection trak of wall assembly consist of min No. 25 gauge galv steel channels sized to accommodate steel studs (Item 2C) and with offset legs to accommodate wall cladding (Item 3A). Deflection trak installed parallel or perpendicular to the steel units. When installed perpendicular (Configuration A), min No. 25 gauge deflection trak secured on both sides to valley of floor units with 1-1/2 in. (38 mm) long welds spaced max 12 in. (305 mm) OC. Min No. 20 gauge deflection trak may be secured with steel fasteners spaced 12 in. (305 mm) OC. When installed parallel (Configuration B), min No. 25 gauge deflection trak secured on one side to valley of floor units with 1-1/2 in. (38 mm) long welds spaced 12 in. (305 mm) OC. Min No. 20 gauge deflection trak may be secured with steel fasteners spaced max 12 in. (305 mm) OC. The other side of the deflection trak is secured to Z-Furring clips (Item 2B) with two No. 8 by 1/2 in. (13 mm) long tec screws. On concrete floor (Configuration C), min No. 20 gauge deflection trak attached to concrete at steel fasteners spaced max 12 in. (305 mm) OC.

   **Fire TRAK CORP** — Shadowline, Cavity Shadowline
   B. **Z-Furring** - **(Parallel Units)** — When trak is installed parallel to floor units, Z-Furring clips are attached to the bottom of the floor units. Clip spacing not to exceed 24 in. (610 mm) OC.
   **Fire TRAK CORP** — Z-Furring Clips
   C. **Studs** — Steel studs to be min 2-1/2 in. (64 mm) wide and as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory. Studs cut 1-1/2 in. (38 mm) less in length than the assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. Stud spacing not to exceed 24 in. OC.
   D. **Gypsum Board*** — Gypsum board sheets installed and attached to studs and runners as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a nominal 1 in. (25 mm) gap shall be maintained between top of the gypsum board and the bottom flange of the deflection trak. Top row of screws shall be installed into the studs 3 in. (76 mm) below the top edge of the gypsum board sheets.
   E. **Bracing** — (Not Shown) - Bracing as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory.

The hourly assembly rating of the joint system is equal to the fire rating of the wall.

**Firestop Configuration A**

3. Joint System — Max separation between bottom flange of the deflection trak and top of wallboard (at the time of installation of the joint system) is 1 in. (25 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width. The joint system consists of packing material (Item 3A), wall cladding (Item 3B) and a fill material (Item 3C) as follows:
   A. **Packing Material** — Min 4 pcf (65 kg/m³) density mineral wool batt insulation cut to the shape of the fluted deck, 25 percent larger than the area of the flutes and compressed into the flutes of the steel floor units above the ceiling runner as a permanent form.
   B. **Wall Cladding** — Strips of the gypsum board material cut to the contour of the steel floor units and attached to the deflection trak. The number of layers, board type and thickness and fastener type shall be as specified for the gypsum board in the individual Wall and Partition Design in the UL Fire Resistance Directory. Fasteners shall be max spaced 1 in. (25 mm) OC. The top of the wall cladding shall be recessed min 1/8 in. (3.2 mm) to max 1/2 in. (13 mm) from the steel floor units and overlap the gypsum board 4 in. (102 mm).
   C. **Fill, Void or Cavity Material*** — Full depth of fill material installed on each side of the wall between the top of the wall cladding and the surface of the steel floor units, flush with each surface of the cladding.

**3M COMPANY** — FB 1000NS, FB 2000, FB 2000+, FD-150+, CP 25 WB+

**Firestop Configuration B**

3. Joint System — Max separation between bottom flange of the deflection trak and top of wallboard (at the time of installation of the joint system) is 1 in. (25 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width. The joint system consists of packing material (Item 3A), wall cladding (Item 3B) and a fill material (Item 3C) as follows:
   A. **Wall Cladding** — Strips of the gypsum board material attached to the deflection trak. The number of layers, board type and thickness and fastener type shall be as specified for the gypsum board in the individual Wall and Partition Design in the UL Fire Resistance Directory. Fasteners shall be max spaced 3 in. (76 mm) OC. The top of the wall cladding shall be recessed min 1/8 in. (3.2 mm) to max 1/2 in. (13 mm) from the steel floor units and overlap the gypsum board 4 in. (102 mm).
   B. **Fill, Void or Cavity Material*** — Full depth of fill material installed on each side of the wall between the top of the wall cladding and the surface of the steel floor units, flush with each surface of the cladding.

**3M COMPANY** — FB 1000NS, FB 2000, FB 2000+, FD-150+, CP 25 WB+
Firestop Configuration C

3. Joint System — Max separation between bottom flange of the deflection trak and top of wallboard (at the time of installation of the joint system) is 1 in. (25 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width. The joint system consists of packing material (Item 3A), wall cladding (Item 3B) and a fill material (Item 3C) as follows:

A. Wall Cladding — Strips of the gypsum board material attached to the deflection trak. The number of layers, board type and thickness and fastener type shall be as specified for the gypsum board in the individual Wall and Partition Design in the UL Fire Resistance Directory. Fasteners shall be max spaced 3 in. (76 mm) OC. The top of the wall cladding shall be recessed min 1/8 in. (3.2 mm) to max 1/2 in. (13 mm) from the bottom of the concrete floor and overlap the gypsum board 4 in. (102 mm).

B. Fill, Void or Cavity Material* — Full depth of fill material installed on each side of the wall between the top of the wall cladding and the surface of the steel floor units, flush with each surface of the cladding.

Assembly Rating – 4 Hr
Nominal Joint Width – 2 In.
Class II Movement Capabilities – 10.9% Compression or Extension

1. **Floor Assembly** – Min 5-1/2 in. thick steel-reinforced lightweight or normal weight (100-150 pcf) structural concrete.

2. **Wall Assembly** – Min 6 in. thick steel-reinforced lightweight or normal weight (100-150 pcf) structural concrete. Wall may also be constructed of any UL Classified **Concrete Blocks**.

3. **Joint System** – Max width of joint (at time of installation of joint system) is 2 in. The joint system is designed to accommodate a max 10.9 percent compression or extension from its installed width. The joint system shall consist of the following:

   A. **Forming Material** – Min 4.0 pcf mineral wool batt insulation installed in joint opening as a permanent form. Batt cut to min width of 5 in. and installed edge-first into joint opening, parallel with joint direction, such that batt sections are compressed min 50 percent in thickness and such that the compressed batt sections are recessed from both surfaces of wall to accommodate the required thickness of fill material. Adjoining lengths of batt to be tightly-butted with butted seams spaced min 48 in. apart along the length of the joint.

      - ROCKWOOL MANUFACTURING CO – Delta Safing Board
      - ROCKWOOL MALAYSIA SDN BHD – Type Safe
      - ROXUL INC – Type Safe
      - THERMACO INC – Type SAF
      - THERMAFIBER INC – Type SAF

   B. **Fill, Void or Cavity Material** – Min 1/2 in. thickness of fill material applied within the joint, flush with both surfaces of wall.

      - 3M COMPANY – FB 2000+

SECTION A-A

1. Floor Assembly – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. Steel Floor and Form Units* – Max 3 in. (76 mm) deep galv steel fluted units.
   B. Concrete – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.

2. Wall Assembly – The 1 hr or 2 fire rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. Steel Floor and Ceiling Runners – Floor and ceiling runners of wall assembly shall consist of galv steel channels sized to accommodate steel studs (Item 2B). When deflection channel (Item 3A) is used, ceiling runner to be installed within the deflection channel with 1 in. (25 mm) gap maintained between the top of ceiling runner and top of deflection channel. When deflection channel is not used, flange height of ceiling runner shall be min 3/4 in. (19 mm) greater than nom joint width. Ceiling runner installed perpendicular to direction of fluted steel deck and secured with steel masonry anchors or by welds spaced max 24 in. (610 mm) OC.
   A1. Light Gauge Framing* – Slotted Ceiling Runner – As an alternate to the ceiling runner in Item 2A, slotted ceiling runner to consist of galv steel channel with slotted flanges sized to accommodate steel studs (Item 2B). Slotted ceiling runner installed perpendicular to direction of fluted steel deck and secured to valleys with steel masonry anchors spaced max 24 in. (610 mm) OC. When slotted ceiling runner is used, deflection channel (Item 3A) shall not be used.
   A2. Light Gauge Framing* – Notched Ceiling Runner – As an alternate to the ceiling runners in Items 2A through 2A2, notched ceiling runners to consist of C-shaped galv steel channel with notched return flanges sized to accommodate steel studs (Item 2B). Notched ceiling runner installed perpendicular to direction of fluted steel deck and secured to valleys with steel masonry anchors spaced max 24 in. (610 mm) OC. When notched ceiling runner is used, deflection channel (Item 3A) shall not be used.
   B. Studs – Steel studs to be min 3-1/2 in. (89 mm) wide. Studs cut 1/2 to 3/4 in. (13 to 19 mm) less in length than assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. When slotted ceiling runner (Item 2A1) is used, steel studs secured to slotted ceiling runner with No. 8 by 1/2 in. (13 mm) long wafer head steel screws at midheight of slot on each side of wall. Stud spacing not to exceed 24 in. (610 mm) OC.
C. **Gypsum Board*** – Gypsum board sheets installed to a min total thickness of 5/8 in. (16 mm) and 1-1/4 in. (32 mm) on each side of wall for 1 and 2 hr rated assemblies, respectively. Wall to be constructed as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a nom 1 in. (25 mm) gap shall be maintained between the top of the gypsum board and the bottom of the steel floor units and the top row of screws shall be installed into the studs 3-1/2 in. (99 mm) below the lower surface of the floor. The hourly fire rating of the joint system is equal to the hourly fire rating of the wall.

3. **Joint System** – Max separation between bottom of floor and top of wall is 1 in. (25 mm). The joint system is designed to accommodate a max 25 percent compression or extension from its installed width. The joint system consists of a deflection channel, forming material and a fill material, as follows:

A. **Deflection Channel** (optional) – A nom 3-5/8 in. (92 mm) wide by 3 in. (76 mm) deep min 24 ga steel U-shaped channel. Flange height of deflection channel shall be min 3/4 in. (19 mm) greater than nom joint width. Deflection channel installed perpendicular to direction of fluted steel deck and secured to valleys with steel masonry anchors or by welds spaced max 24 in. (610 mm) OC. The ceiling runner (Item 2A) is installed within the deflection channel to maintain a 1 in. (25 mm) gap between the top of the ceiling runner and the top of the deflection channel. The ceiling runner is not fastened to the deflection channel.

B. **Forming Material*** – Min 4 in. (102 mm) thickness of min 4 pcf (64 kg/m³) density mineral wool batt insulation cut to the shape of the fluted deck, approx 20 percent larger than the area of the flutes and compressed into flutes of the steel floor units between the top of the deflection channel and the steel deck. Additional pieces of min 4 pcf (64 kg/m³) mineral wool batt insulation are to be cut to the contour of the flutes with an additional 1-3/8 in. (35 mm) high section at the bottom of the shapes to fill the 1 in. (25 mm) gap between the top of the gypsum board and the bottom of the steel floor units. The additional pieces of mineral wool are compressed and firmly packed into the flutes and the gap between the top of the gypsum board and the bottom of the steel floor units on both sides of the wall. The additional pieces shall be a 3/4 in. (19 mm) thick for a 1 hr rated design and a 1-1/2 in. (38 mm) thick for a 2 hr rated design.

**INDUSTRIAL INSULATION GROUP LLC** – MinWool-1200 Safing

**JOHNS MANVILLE** – Safing

**ROCK WOOL MANUFACTURING CO** – Delta Board or Delta-8

**ROCKWOOL MALAYSIA SDN BHD** – Type Safe

**ROXUL INC** – Type Safe

**THERMAFIBER INC** – Type SAF

C. **Fill, Void or Cavity Material*** – Min 1/16 in. dry, (1/8 in. wet) thickness of fill material sprayed or brushed on each side of the wall in the flutes of the steel floor units and between the top of the gypsum board and the bottom of the steel floor units to completely cover mineral wool and overlap a min of 1/2 in. onto gypsum board and steel deck on both sides of wall.

**3M COMPANY** – FireDam™ Spray 200

C1. **Fill, Void or Cavity Material*** – **Tape** – As an alternate to Item C, Tape cut to size and press applied within fluted areas of joint to completely cover mineral wool lapping min 1 in. (25 mm) onto the contour of the steel floor units and extending to lap min 1 in. (25 mm) onto the gypsum board. Additional pieces of Tape are applied along the joint to completely cover the remaining mineral wool between bottom of steel deck and top edge of gypsum board along length of joint, lapping min 1 in. (25 mm) onto the steel floor units and gypsum board. Adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

**3M COMPANY** – 3M Fire and Water Barrier Tape

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

Reprinted from the Online Certifications Directory with permission from UL©
1. **Floor Assembly** – The fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual D700 or D900 Series Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Floor and Form Units** – Max 3 in. (76 mm) deep galv fluted units.

   A1. **Spray Applied Fire Resistive Materials** – (Optional, not shown) – After the installation of ceiling runner or deflection channel (Items 2A, 2A1, 3A) and prior to the installation of the Fill, Void or Cavity Materials (Item 3B), the steel floor units may be sprayed with fire resistive material in accordance with the specifications in the individual D700 Series Design.

   WR GRACE & CO - CONN – Type MK-6/HY

   B. **Concrete** – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.

2. **Wall Assembly** – The 1 or 2 fire rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400 or V400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Floor And Ceiling Runners** – Floor and ceiling runners of wall assembly shall consist of min 1-1/4 in. (32 mm) or 2 in. (51 mm) galv steel channels for D900 and D 700 Series Designs, respectively, sized to accommodate steel studs (Item 2B). When U-shaped deflection channel (Item 3A) is used, ceiling runner installed within the deflection channel with 1 in. (25 mm) gap maintained between the top of ceiling runner and top of deflection plate. When deflection channel is not used, ceiling runner is installed perpendicular to direction of fluted steel deck prior to application of the spray-applied fire resistive material and secured to valleys with steel masonry anchors or by welds spaced max 24 in. (610 mm) OC.

   A1. **Light Gauge Framing** – Slotted Ceiling Runner – As an alternate to the ceiling runner in Item 2A, slotted ceiling runner to consist of galv steel channel with slotted flanges sized to accommodate steel studs (Item 2B). Slotted ceiling runner installed perpendicular to direction of fluted steel deck prior to application of the spray-applied fire resistive material and secured to valleys with steel masonry anchors spaced max 24 in. (610 mm) OC. When slotted ceiling runner is used, deflection channel (Item 3A) shall not be used.

   A2. **Light Gauge Framing** – Notched Ceiling Runner – As an alternate to the ceiling runners in Items 2A through 2A2, notched ceiling runners to consist of C-shaped galv steel channel with notched return flanges sized to accommodate steel studs (Item 2B). Notched ceiling runner installed perpendicular to direction of fluted steel floor deck prior to application of the spray-applied fire resistive material and secured to valleys with steel masonry anchors spaced max 24 in. (610 mm) OC. When notched ceiling runner is used, deflection channel (Item 3A) shall not be used.
System No. HW-D-0111 continued

B. **Studs** – Steel studs to be min 3-1/2 in. (89 mm) wide. Studs cut 1/2 to 3/4 in. (13 to 19 mm) less in length than assembly height. Studs attached to ceiling runner with sheet metal screws a min of 1/2 in. (13 mm) below bottom of deflection channel, when deflection channel is used. When deflection channel is not used, studs shall not be secured to ceiling runner. When slotted ceiling runner (Item 2A1) is used, steel studs secured to slotted ceiling runner with No. 8 by 1/2 in. (13 mm) long wafer head steel screws at midheight of slot on each side of wall. Stud spacing not to exceed 24 in. (610 mm) OC.

C. **Gypsum Board** – Gypsum board sheets to be installed to a min total thickness of 5/8 or 1-1/4 in. (16 or 32 mm) on each side of the wall for a 1 or 2 hr fire rated wall, respectively. Wall to be constructed as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that the gypsum board is cut to fit the contour of the steel floor units or the contour of the spray applied material with a nom 3/4 in. (19 mm) gap. The screws attaching the gypsum board to studs at the top of the wall shall be located 1 in. (25 mm) below the bottom of the deflection channel, when deflection channel is used. When deflection channel is not used, the screws attaching the gypsum board to studs at the top of the wall shall be located 1 in. (25 mm) below the bottom of the ceiling runner (Item 2A) or slotted ceiling runner (Item 2A1). The **hourly fire rating of the joint system is dependant on the hourly fire rating of the wall.**

3. **Joint System** – Max separation between bottom of floor or spray applied material and top of wall is 3/4 in. (19 mm). The joint system is designed to accommodate a max 17 percent compression or extension from its installed width. The joint system consists of a deflection channel and a fill material, as follows:

   A. **Deflection Channel** – (Optional) – A nom 3-1/2 in. (89 mm) wide by min 2 in. (51 mm) deep, min 24 galv steel U-shaped channel. Deflection channel installed perpendicular to direction of fluted steel deck prior to application of the spray-applied fire resistive material and secured to valleys with steel masonry anchors or by welds spaced max 24 in. (610 mm) OC. The ceiling runner (Item 2A) is installed within the deflection channel to maintain a 1 in. (25 mm) gap between the top of the ceiling runner and the top of the deflection channel. The ceiling runner is not fastened to the deflection channel.

   B. **Fill, Void or Cavity Material** – **Caulk** – Min 5/8 in. (16 mm) thickness of fill material installed on each side of the wall between the top of the gypsum board and all surfaces of the steel floor units or spray applied material, flush with each surface of gypsum board.

3M COMPANY – FD-150+

1. **Floor Assembly** – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual Floor-Ceiling Design in the UL Fire Resistance Directory. The hourly fire rating of the floor assembly shall be equal to or greater than the hourly fire rating of the wall assembly. The floor assembly shall include the following construction features:

   A. **Steel Floor and Form Units** – Max 3 in. (76 mm) deep galv fluted floor units.

   B. **Concrete** – Min 2-1/2 in. (64 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m\(^3\)) concrete, as measured from the top plane of the floor units.

      1A. **Roof Assembly** – As an alternate to Item 1, the fire-rated roof assembly shall be constructed of the materials and in the manner described in the individual P900 Series Roof-Ceiling Designs in the UL Fire Resistance Directory and shall contain max 3 in. (76 mm) deep galv steel fluted roof units. The hourly fire rating of the roof assembly shall be equal to or greater than the hourly fire rating of the wall assembly. In the case of spray-applied protection materials on the steel roof units, the joint system shall be installed prior to the spray-applied protection material.

      1B. **Floor Assembly** – As an alternate to Item 1, min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m\(^3\)) structural concrete.

2. **Wall Assembly** – The 1 or 2 hr fire-rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400 and V400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Light Gauge Framing** – Deflection Track – Deflection track of wall assembly shall consist of min No. 25 gauge galv steel channels sized to accommodate steel studs (Item 2C) and with offset legs to accommodate wall cladding (Item 3A). Deflection track installed perpendicular to floor units. Min No. 25 gauge deflection track secured on both sides to valley of floor units with 1-1/2 in. (38 mm) long welds spaced max 12 in. (305 mm) OC. Min No. 20 gauge deflection track may be secured with steel fasteners spaced 12 in. (305 mm) OC.

   B. **Studs** – Steel studs to be min 2-1/2 in. (64 mm) wide and as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory. Studs cut 1-1/2 in. (38 mm) less in length than the assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. Stud spacing not to exceed 24 in. (610 mm) OC.

   C. **Gypsum Board** – Gypsum board sheets installed and attached to studs and runners as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a nominal 1 in. (25 mm) gap shall be maintained between top of the gypsum board and the bottom flange of the deflection track. Top row of screws shall be installed into the studs 3 in. (76 mm) below the top edge of the gypsum board sheets.
D. Bracing (not shown) – Bracing as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory.

The hourly assembly rating of the joint system is equal to the fire rating of the wall.

Firestop Configuration A and A1

3. Joint System – Max separation between bottom flange of the deflection track and top of gypsum board (at the time of installation of the joint system) is 1 in. (25 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width. The joint system consists of wall cladding, packing material and a fill material as follows:

A. Wall Cladding – Strips of the gypsum board material attached to the deflection track. The number of layers, board type and thickness and fastener type shall be as specified for the gypsum board in the individual Wall and Partition Design in the UL Fire Resistance Directory. Fasteners shall be max spaced 3 in. (76 mm) OC. The top of the wall cladding shall be flush with the valleys of the steel floor units and overlap the gypsum board 4 in. (102 mm).

B. Flute Fill – The batt insulation and fill material are to be installed as specified in the Joint Systems in the table below:

Firestop Configuration B and B1

3. Joint System – Max separation between bottom flange of the deflection track and top of wallboard (at the time of installation of the joint system) is 1 in. (25 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width. The joint system consists of wall cladding, packing material and a fill material as follows:

A. Wall Cladding – Strips of the gypsum board material attached to the deflection track. The number of layers, board type and thickness and fastener type shall be as specified for the gypsum wallboard in the individual Wall and Partition Design in the UL Fire Resistance Directory. Fasteners shall be max spaced 3 in. (76 mm) OC. The top of the wall cladding shall be flush with the valleys of the steel floor units and overlap the gypsum board 4 in. (102 mm).

B. Flute Fill – The batt insulation and fill material are to be installed as specified in the systems in the table below:

ANSI/UL 2079
Assembly Ratings — 1, 2 and 3 Hr (See Item 2)
Nominal Joint Width - 1 In.
Class II or III Movement Capabilities —
100% Compression or Extension

CAN/ULC S115
F Ratings — 1, 2 and 3 Hr (See Item 2)
FT Ratings — 1, 2 and 3 Hr (See Item 2)
FH Ratings — 1, 2 and 3 Hr (See Item 2)
FTH Ratings — 1, 2 and 3 Hr (See Item 2)
Nominal Joint Width - 1 In.
Class II or III Movement Capabilities — 100% Compression or Extension
1. **Floor Assembly** — The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual D900 Floor-Ceiling Design in the UL Fire Resistance Directory. The hourly fire rating of the floor assembly shall be equal to or greater than the hourly fire rating of the wall assembly. The floor assembly shall include the following construction features:

   A. **Steel Floor and Form Units** — Max 3 in. (76 mm) deep galv fluted floor units.

   B. **Concrete** — Min 2-1/2 in. (64 mm) thick reinforced (100-150pcf or 1600-2400 kg/m³) concrete, as measured from the top plane of the floor units.

1A. **Roof Assembly** — As an alternate to Item 1, the fire-rated roof assembly shall be constructed of the materials and in the manner described in the individual P900 Series Roof-Ceiling Designs in the UL Fire Resistance Directory and shall contain max 3 in. (76 mm) deep galv steel fluted roof units. The hourly fire rating of the roof assembly shall be equal to or greater than the hourly fire rating of the wall assembly.

1B. **Floor Assembly** — As an alternate to Item 1, min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150pcf or 1600-2400 kg/m³) structural concrete or any min 6 in. (152 mm) thick UL Classified hollow-core Precast Concrete Units.*

See Precast Concrete Units (CFTV) category in the Fire Resistance Directory for names of manufacturers.

2. **Shaft Wall Assembly** — The 1, 2 or 3 hr fire-rated gypsum board/steel stud shaft wall assembly shall be constructed of the materials and in the manner described in the individual U400, V400 or W400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Light Gauge Framing** — **Deflection Trak** — Deflection trak of wall assembly shall consist of min No. 25 ga galv steel channels sized to accommodate steel studs (Item 2C) and with offset legs to accommodate wall cladding (Item 3A). Deflection trak installed parallel or perpendicular to floor units. When installed perpendicular (Configuration A), deflection trak secured on both sides to valley of floor units with 1-1/2 in. (38 mm) long welds spaced max 12 in. (305 mm) OC for 25 ga trak, 20 ga or heavier trak can be secured with steel fasteners spaced 12 in. (305 mm) OC. When installed parallel (Configuration B), deflection trak secured on one side to valley of floor units with 1-1/2 in. (38 mm) long welds (25ga) or steel fasteners (20 ga or heavier) spaced max 12 in. (305 mm) OC. The other side of the deflection trak is secured to Z-Furring clips (Item 2B) with two No. 8 by 1/2 in. (13mm) long steel tec screws. On concrete floor (Configuration C), min No. 20 gauge deflection trak attached to concrete at ceiling with steel fasteners spaced max 12 in. (305 mm) OC.

   FIRE TRAK CORP — Cavity Shadowline

   B. **Z-Furring - (Parallel Units)** — When trak is installed parallel to floor units, Z-Furring clips are attached to the bottom of the floor units within the crests two steel fasteners. Clip spacing not to exceed 24 in. (610) OC.

   FIRE TRAK CORP — Z-Furring Clips

   C. **Studs** — Steel studs to be min 2-1/2 in. (64 mm) wide and as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory. Studs cut 1-1/2 in. (38 mm) less in length than the assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. Stud spacing not to exceed 24 in. (610 mm) OC.

   D. **Gypsum Board** — Gypsum board sheets installed and attached to studs and runners as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a nominal 1 in. (25 mm) gap shall be maintained between top of the gypsum board and the bottom flange of the deflection trak. Top row of screws shall be installed into the studs 3 in. (76 mm) below the top edge of the gypsum board sheets.

   E. **Gypsum Board** — 1 in. (25 mm) thick gypsum board liner panels, supplied in nom 24 in. (610 mm) widths. Panels cut 1 in. (25 mm) less in length than floor to ceiling height. Gypsum board sheets installed and attached to studs and runners as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory.

   The hourly ratings of the joint system are equal to the fire rating of the wall.

3. **Joint System** — Max separation between bottom flange of the deflection trak and top of gypsum board (at the time of installation of the joint system) is 1 in. (25 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width. The joint system consists of packing material (Item 3A), wall cladding (Item 3B) and a fill material (Item 3C) as follows:

   A. **Packing Material** — Min 4 pcf (64 kg/m³) density mineral wool batt insulation cut to the shape of the fluted deck, 25 percent larger than the area of the flutes and compressed into the flutes of the steel floor units above the ceiling runner as a permanent form.

   B. **Wall Cladding** — Strips of the gypsum board material cut to the contour of the steel floor units above the ceiling runner forming a sealing barrier.

   C. **Fill, Void or Cavity Material** — Full depth of fill material installed on each side of the wall between the top of the wall cladding and the surface of the steel floor units, flush with each surface of the cladding.

   **3M COMPANY** — FB 1000NS, FB 2000, FB 2000+, FD-150+, CP 25 WB+

3. **Firestop Configuration A**

   3. **Joint System** — Max separation between bottom flange of the deflection trak and top of gypsum board (at the time of installation of the joint system) is 1 in. (25 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width. The joint system consists of wall cladding (Item 3A) and a fill material (Item 3B) as follows:

   A. **Wall Cladding** — Strips of the gypsum board material attached to the deflection trak on both sides of wall. The number of layers, board type and thickness and fastener type shall be as specified for the gypsum board in the individual Wall and Partition Design in the UL Fire Resistance Directory. Fasteners shall be max spaced 3 in. (76 mm) OC. The top of the wall cladding shall be recessed min 1/8 in. (3.2 mm) to max 1/2 in. (13 mm) from the steel floor units and overlap the gypsum board 4 in. (102 mm) on both sides of wall.

   B. **Fill, Void or Cavity Material** — Full depth of fill material installed on each side of the wall between the top of the wall cladding and the surface of the steel floor units, flush with each surface of the cladding.

   **3M COMPANY** — FB 1000NS, FB 2000, FB 2000+, FD-150+, CP 25 WB+

3. **Firestop Configuration B**

   3. **Joint System** — Max separation between bottom flange of the deflection trak and top of gypsum board (at the time of installation of the joint system) is 1 in. (25 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width. The joint system consists of wall cladding (Item 3A) and a fill material (Item 3B) as follows:

   A. **Wall Cladding** — Strips of the gypsum board material attached to the deflection trak on both sides of wall. The number of layers, board type and thickness and fastener type shall be as specified for the gypsum board in the individual Wall and Partition Design in the UL Fire Resistance Directory. Fasteners shall be max spaced 3 in. (76 mm) OC. The top of the wall cladding shall be recessed min 1/8 in. (3.2 mm) to max 1/2 in. (13 mm) from the steel floor units and overlap the gypsum board 4 in. (102 mm) on both sides of wall.

   B. **Fill, Void or Cavity Material** — Full depth of fill material installed on each side of the wall between the top of the wall cladding and the surface of the steel floor units, flush with each surface of the cladding.

   **3M COMPANY** — FB 1000NS, FB 2000, FB 2000+, FD-150+, CP 25 WB+
3. **Joint System** — Max separation between bottom flange of the deflection trak and top of gypsum board (at the time of installation of the joint system) is 1 in. (25 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width. The joint system consists of wall cladding (Item 3A) and a fill material (Item 3B) as follows:

A. **Wall Cladding** — Strips of the gypsum board material attached to the deflection trak on both sides of wall. The number of layers, board type and thickness and fastener type shall be as specified for the gypsum board in the individual Wall and Partition Design in the UL Fire Resistance Directory. Fasteners shall be max spaced 3 in. (76 mm) OC. The top of the wall cladding shall be recessed min 1/8 in. (3.2 mm) to max 1/2 in. (13 mm) from the bottom of the concrete floor and overlap the gypsum board 4 in. (102 mm) on both sides of wall.

B. **Fill, Void or Cavity Material*** — Full depth of fill material installed on each side of the wall between the top of the wall cladding and the surface of the steel floor units, flush with each surface of the cladding.

SECTION A-A  
CONFIGURATION A

SECTION B-B  
CONFIGURATION B

SECTION C-C  
CONFIGURATION C
System No. HW-D-0120 continued

1. Floor Assembly — The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual D900 Floor-Ceiling Design in the UL Fire Resistance Directory. The hourly fire rating of the floor assembly shall be equal to or greater than the hourly fire rating of the wall assembly. The floor assembly shall include the following construction features:

   A. **Steel Floor and Form Units** — Max 3 in. (76 mm) deep galv fluted floor units.
   B. **Concrete** — Min 2-1/2 in. (64 mm) thick reinforced (100-150 pcf or 1600-2400 kg/m³) concrete, as measured from the top plane of the floor units.

1A. **Roof Assembly** — As an alternate to Item 1, the fire-rated roof assembly shall be constructed of the materials and in the manner described in the individual P900 Series Roof-Ceiling Designs in the UL Fire Resistance Directory and shall contain max 3 in. (76 mm) deep galv steel fluted roof units. The hourly fire rating of the roof assembly shall be equal to or greater than the hourly fire rating of the wall assembly.

1B. **Floor Assembly** — As an alternate to Item 1, min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete or any min 6 in. (152 mm) thick UL Classified hollow-core **Precast Concrete Units**.

   See **Precast Concrete Units** (CFTV) category in the Fire Resistance Directory for names of manufacturers.

2. Shaft Wall Assembly — The 1, 2 hr or 3 fire-rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400, V400 or W400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Light Gauge Framing** — **Deflection Trak** — Deflection trak of wall assembly shall consist of min No. 25 galv steel channels sized to accommodate steel studs (Item 2C) and with offset legs to accommodate wall cladding (Item 3A). Deflection trak installed parallel or perpendicular to floor units. When installed perpendicular (Configuration A), deflection trak secured on both sides to valley of floor units with 1-1/2 in. (38 mm) long welds spaced max 12 in. (305 mm) OC. Min No. 20 gauge deflection trak may be secured with steel fasteners spaced 12 in. (305 mm) OC. When installed parallel (Configuration B), min No. 25 gauge deflection secured on one side to valley of floor units with 1-1/2 in. (38 mm) long welds spaced 12 in. (305 mm) OC. Min No. 25 gauge deflection trak may be secured with steel fasteners spaced max 12 in. (305 mm) OC. The other side of the deflection trak is secured to Z-Furring clips (Item 2B) with two No. 8 by 1/2 in. (13 mm) long steel tec screws. On concrete floor (Configuration C), min No. 20 gauge deflection trak attached to concrete at ceiling with steel fasteners spaced a max 12 in. (305 mm) OC.

   **FIRE TRAK CORP** — Cavity Shadowline

   B. **Z-Furring - (Parallel Units)** — When trak is installed parallel to floor units, Z-Furring clips are attached to the bottom of the floor units within the crests with two steel fasteners. Clip spacing not to exceed 24 in. (610 mm) OC

   **FIRE TRAK CORP** — Z-Furring Clips

   C. **Studs** — Steel studs to be min 2-1/2 in. (64 mm) wide and as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory. Studs cut 1-1/2 in. (38 mm) less in length than the assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. Stud spacing not to exceed 24 in. (610 mm) OC.

   D. **Gypsum Board** — Gypsum board sheets installed and attached to studs and runners as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a nominal 1 in. (25 mm) gap shall be maintained between top of the gypsum board and the bottom flange of the deflection trak. Top row of screws shall be installed into the studs 3 in. (76 mm) below the top edge of the gypsum board sheets.

   E. **Gypsum Board** — 1 in. (25 mm) thick gypsum board liner panels, supplied in nom 24 in. (610 mm) widths. Panels cut 1 in. (25 mm) less in length than floor to ceiling height. Gypsum board sheets installed and attached to studs and runners as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory.

   The hourly ratings of the joint system are equal to the fire rating of the wall.

   **Firestop Configuration A**

   3. Joint System — Max separation between bottom flange of the deflection trak and top of gypsum board (at the time of installation of the joint system) is 1 in. (25 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width. The joint system consists of packing material (Item 3A), wall cladding (Item 3B) and a fill material (Item 3C) as follows:

   A. **Packing Material** — Min 4 pcf (64 kg/m³) density mineral wool batt insulation cut to the shape of the fluted deck, 25 percent larger than the area of the flutes and compressed into the flutes of the steel floor units above the ceiling runner as a permanent form.

   B. **Wall Cladding** — Strips of the gypsum board material cut to the contour of the steel floor units and attached to the deflection trak on both sides of wall. The number of layers, board type and thickness and fastener type shall be as specified for the gypsum board in the individual Wall and Partition Design in the UL Fire Resistance Directory. Fasteners shall be max spaced 3 in. (76 mm) OC. The top of the wall cladding shall be recessed min 1/8 in. (3.2 mm) to max 1/2 in. (13 mm) from the steel floor units and overlap the gypsum board 4 in. (102 mm) on both sides of wall.

   C. **Fill, Void or Cavity Material** — Full thickness of fill material installed on each side of the wall between the top of the wall cladding and the surface of the steel floor units, flush with each surface of the cladding.

   **3M COMPANY** — FB 1000NS, FB 2000, FB 2000+, FD-10+, CP 25 WB+

   **Firestop Configuration B**

   3. Joint System — Max separation between bottom flange of the deflection trak and top of gypsum board (at the time of installation of the joint system) is 1 in. (25 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width. The joint system consists of wall cladding (Item 3A) and a fill material (Item 3B) as follows:

   A. **Wall Cladding** — Strips of the gypsum board material attached to the deflection trak on both sides of wall. The number of layers, board type and thickness and fastener type shall be as specified for the gypsum board in the individual Wall and Partition Design in the UL Fire Resistance Directory. Fasteners shall be max spaced 3 in. (76 mm) OC. The top of the wall cladding shall be recessed min 1/8 in. (3.2 mm) to max 1/2 in. (13 mm) from the steel floor units and overlap the gypsum board 4 in. (102 mm) on both sides of wall.

   B. **Fill, Void or Cavity Material** — Full thickness of fill material installed on each side of the wall between the top of the wall cladding and the bottom of the floor assembly, flush with each surface of the cladding.

   **3M COMPANY** — FB 1000NS, FB 2000, FB 2000+, FD-10+, CP 25 WB+
3. **Joint System** — Max separation between bottom flange of the deflection trak and top of gypsum board (at the time of installation of the joint system) is 1 in. (25 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width. The joint system consists of spray applied fire resistive material (Item 3A), and wall cladding (Item 3B) as follows:

A. **Wall Cladding** — Strips of the gypsum board material attached to the deflection trak on both sides of wall. The number of layers, board type and thickness and fastener type shall be as specified for the gypsum board in the individual Wall and Partition Design in the UL Fire Resistance Directory. Fasteners shall be max spaced 3 in. (76 mm) OC. The top of the wall cladding shall be recessed min 1/8 in. (3.2 mm) to max 1/2 in. (13 mm) from the bottom of the concrete floor and overlap the gypsum board 4 in. (102 mm) on both sides of wall.

B. **Fill, Void or Cavity Material*** — Full depth of fill material installed on each side of the wall between the top of the wall cladding and the surface of the steel floor units, flush with each surface of the cladding.

© 2014 UL LLC
1. **Floor Assembly** – The fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Floor and Form Units** – Max 3 in. (76 mm) deep galv steel fluted units.

   B. **Spray Applied Fire Resistive Material** – The steel floor units shall be sprayed with a min 2 in. (51 mm) thickness of fire resistive material. The spray applied fire resistive material is to be removed from the steel deck for the installation of the ceiling runner (Item 2A) and the joint system (Item 3) such that the steel deck is bare over the ceiling runner and extending 2 in. (51 mm) beyond the surface of the wallboard on both sides of the wall.

      GCP APPLIED TECHNOLOGIES INC – Type MK-6/HY

   C. **Concrete** – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.

2. **Wall Assembly** – The 4 hr fire rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400 or V400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Floor and Ceiling Runners** – Floor and ceiling runners of wall assembly shall consist of min 20 gauge galv steel channels sized to accommodate steel studs (Item 2B). Ceiling runner to be provided with 3 in. (76 mm) flanges. Ceiling runner installed perpendicular to direction of fluted steel floor units and secured to valleys with welds or masonry anchors spaced a max of 24 in. (610 mm) OC.

   B. **Studs** – Steel studs to be min 20 gauge galv steel, min 3-5/8 in. (92 mm) wide. Studs cut 1/2 to 3/4 in. (13 to 19 mm) less in length than assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. Stud spacing not to exceed 24 in. (610 mm) OC.

   C. **Batts and Blankets** – Min 3 in. (76 mm) thickness of min 4 pcf (64 kg/m³) mineral wool batt insulation placed in each stud cavity with a 1 in. (25 mm) gap between top of batt and top of ceiling runner.

   D. **Gypsum Board** – Gypsum board sheets to be installed to a min total thickness of 1-1/2 in. (38 mm) on each side of the wall. Wall to be constructed as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a nom 1 in. (25 mm) gap shall be maintained between the top of the gypsum board and the bottom of the steel floor units and the top row of screws shall be installed into studs 1 in. (25 mm) below the bottom of the ceiling runner.
3. Joint System – Max separation between bottom of floor and top of wall is 1 in. (25 mm). The joint system is designed to accommodate a max 25 percent compression or extension from its installed width. The joint system consists of a forming material and a fill material, as follows:

A. Forming Material* – Min 3-5/8 in. (92 mm) thickness of min 8 pcf (128 kg/m³) density mineral wool batt insulation cut to the shape of the fluted deck, approximately 20 percent larger than the area of the flutes and compressed into flutes of the steel floor units between the top of the ceiling runner and the steel deck. Additional pieces of min 3-1/2 in. (89 mm) thick, min 8 pcf (128 kg/m³) mineral wool batt insulation are to be cut to the contour of the flutes with an additional 1-3/8 in. (35 mm) high section at the bottom of the shapes to fill the 1 in. (25 mm) gap between the top of the wallboard and bottom of the steel floor units. The additional pieces of mineral wool are compressed and firmly packed into the flutes and the gap between the top of the wallboard and bottom of the steel floor units on both sides of the wall and shall extend 2 in. (51 mm) beyond the wall surfaces.

INDUSTRIAL INSULATION GROUP LLC – MinWool-1200 Safing
THERMAFIBER INC – Type SAF
ROCK WOOL MANUFACTURING CO – Delta Safing Board

B. Fill, Void or Cavity Material* – Min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) of fill material sprayed or brushed on each side of the wall in the flutes of the steel floor units and between the top of the gypsum board and the bottom of the steel floor units to completely cover mineral wool and overlap a min of 1 in. (25 mm) onto gypsum board and a min of 3 in. (76 mm) onto the spray applied fire resistive material on both sides of wall.

3M COMPANY – Firedam™ Spray 200

B1. Fill, Void or Cavity Material* – Tape – As an alternate to Item B, Tape cut to size and press applied within fluted areas of joint to completely cover mineral wool lapping min 2 in. (51 mm) onto the contour of the protected steel floor units and extending to lap min 1 in. (25 mm) onto the gypsum wall. Additional pieces of Tape are applied along the joint to completely cover the remaining mineral wool between bottom of protected steel deck and top edge of wall along length of joint, lapping min 2 in. (51 mm) onto the contour of the protected steel floor units and min 1 in. (25 mm) onto the gypsum wall. Adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

3M COMPANY 3M FIRE PROTECTION PRODUCTS – 3M Fire and Water Barrier Tape

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

1. **Floor Assembly** – The fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual D700 or D900 Series Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Floor and Form Units** – Max 2 in. (51 mm) deep galv steel fluted units.

   B. **Spray Applied Fire Resistive Material** – The steel floor units shall be sprayed with a min 2 in. (51 mm) thickness of fire resistive material. The spray applied fire resistive material is to be removed from the steel deck for the installation of the joint system (Item 3) such that the steel deck is bare over the wall and extending 2 in. (51 mm) beyond the surface of the gypsum board on both sides of the wall.

   **GCP APPLIED TECHNOLOGIES INC** – Type MK-6/HY

   C. **Concrete** – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.

   The hourly Assembly, F, FT, FH and FTH Ratings are equal to the 3 or 4 hr Assembly Rating of the D700 or D900 Series Floor-Ceiling design.

2. **Wall Assembly** – Min 6-1/2 in. (165 mm) thick lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of UL Classified Concrete Blocks.

   See **Concrete Blocks** (CAZT) category in the Fire Resistance Directory for names of manufacturers.

3. **Joint System** – Max separation between bottom of floor and top of wall is 1 in. (25 mm). The joint system is designed to accommodate a max 25 percent compression or extension from its installed width. The joint system consists of a forming material and a fill material, as follows:

   A. **Forming Material** – Min 3-5/8 in. (92 mm) thickness of min 8 pcf (128 kg/m³) density mineral wool batt insulation cut to the shape of the fluted deck, approximately 20 percent larger than the area of the flutes and compressed into flutes of the steel floor units between the top of the wall and the steel deck. Additional pieces of min 3-1/2 in. (89 mm) thick, min 8 pcf (128 kg/m³) mineral wool batt insulation are to be cut to the contour of the flutes with an additional 1-3/8 in. (35 mm) high section at the bottom of the shapes to fill the 1 in. (25 mm) gap between the top of the wall and bottom of the steel floor units. The additional pieces of mineral wool are compressed and firmly packed into the flutes and the gap between the top of the wall and bottom of the steel floor units on both sides of the wall and shall extend 2 in. (51 mm) beyond the wall surfaces.
B.  **Fill, Void or Cavity Material** – Min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) of fill material sprayed or brushed on each side of the wall in the flutes of the steel floor units and between the top of the wall and the bottom of the steel floor units to completely cover mineral wool and overlap a min of 1 in. (25 mm) onto wall and a min of 3 in. (76 mm) onto the spray applied fire resistive material on both sides of wall.

3M COMPANY – FireDam™ Spray 200

B1.  **Fill, Void or Cavity Material** – **Tape** – As an alternate to Item B, Tape cut to size and press applied within fluted areas of joint to completely cover mineral wool lapping min 2 in. (51 mm) onto the contour of the protected steel floor units and extending to lap min 1 in. (25 mm) onto the concrete wall. Additional pieces of Tape are applied along the joint to completely cover the remaining mineral wool between bottom of protected steel deck and top edge of wall along length of joint, lapping min 2 in. (51 mm) onto the contour of the protected steel floor units and min 1 in. (25 mm) onto the concrete wall. Adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

3M COMPANY – 3M Fire and Water Barrier Tape

---

System No. HW-D-0134
June 24, 2011
Assembly Rating – 1 and 2 Hr (See Item 2)
L Rating At Ambient – 4 CFM/Lin Ft
L Rating At 400 F – 6 CFM/Lin Ft
Nominal Joint Width – 3/4 In.
Class II Movement Capabilities – 17% Compression or Extension

1. **Floor Assembly** – Min 4-1/2 in. (114 mm) thick lightweight or normal weight (100-150 pcf or 1600-2400 kg/m3) concrete.

2. **Wall Assembly** – The 1 or 2 fire rated gypsum wallboard/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400 or V400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Floor And Ceiling Runners** – Floor and ceiling runners of wall assembly shall consist of galv steel channels sized to accommodate steel studs (Item 2B). When U-shaped deflection channel (Item 3A) is used, ceiling runner installed within the deflection channel with 1 in. (25 mm) gap maintained between the top of ceiling runner and top of deflection channel. When deflection channel is not used, ceiling runner secured to concrete floor slab with steel masonry anchors spaced a max of 24 in. (610 mm) OC.

   A1. **Light Gauge Framing** – Slotted Ceiling Runner – As an alternate to the ceiling runner in Item 2A, slotted ceiling runner to consist of galv steel channel with slotted flanges sized to accommodate steel studs (Item 2B). Slotted ceiling runner secured to concrete floor slab with steel masonry anchors spaced max 24 in. (610 mm) OC. When slotted ceiling runner is used, deflection channel (Item 3A) shall not be used.

   B. **Studs** – Steel studs to be min 3-5/8 in. (92 mm) wide. Studs cut 1/2 to 3/4 in. (13 to 19 mm) less in length than assembly height. Studs attached to ceiling runner with sheet metal screws a min of 1/2 in. (13 mm) below bottom of deflection channel, when deflection channel is used. When deflection channel is not used, steel studs shall not be secured to ceiling runner. When slotted ceiling runner (Item 2A1) is used, steel studs secured to slotted ceiling runner with No. 8 by 1/2 in. (13 mm) long wafer head steel screws at midheight of slot on each side of wall. Stud spacing not to exceed 24 in. (610 mm) OC.

   C. **Gypsum Board** – Gypsum board sheets installed to a min total thickness of 5/8 in. (16 mm) and 1-1/4 in. (32 mm) on each side of wall for a 1 or 2 hr rated assemblies, respectively. Wall to be constructed as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a nom 3/4 in. (19 mm) gap shall be maintained between the top of the gypsum board and the lower surface of the floor. The screws attaching the gypsum board to studs at the top of the wall shall be located 1 in. (25 mm) below the bottom of the U-shaped deflection channel (Item 3A) or slotted ceiling runner (Item 2A1).

The hourly fire rating of the joint system is dependent on the hourly fire rating of the wall.
3. Joint System – Max separation between bottom of floor and top of wall is 3/4 in. (19 mm). The joint system is designed to accommodate a max 17 percent compression or extension from its installed width. The joint system consists of a deflection channel forming material and a fill material, as follows:

A. **Deflection Channel** – (Optional) – A nom 3-3/4 in. (95 mm) wide by min 2 in. (51 mm) deep min 24 ga steel U-shaped channel. Deflection channel secured to concrete floor slab with steel masonry anchors or by welds spaced max 24 in. (610 mm) OC. The ceiling runner (Item 2A) is installed within the deflection channel to maintain a 1 in. (25 mm) gap between the top of the ceiling runner and the top of the deflection channel. The ceiling runner is not fastened to the deflection channel.

B. **Fill, Void or Cavity Material** – **Caulk** – Min 5/8 in. (16 mm) thickness of fill material installed on each side of the wall between the top of the gypsum board and bottom of floor, flush with each surface of gypsum board.

August 21, 2002
Assembly Rating – 1 and 2 Hr (See Items 2 and 3)
L Rating At Ambient – Less Than 1 CFM/Lin Ft
L Rating At 400 F – Less Than 1 CFM/Lin Ft
Nominal Joint Width – 1 In.
Class II Movement Capabilities – 25% Compression or Extension

1. **Floor Assembly** – The fire rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Steel Floor and Form Units** – Max 3 in. deep galv steel fluted units.
   B. **Concrete** – Min 2-1/2 in. thick reinforced concrete, as measured from the top plane of the floor units.

2. **Wall Assembly** – The 1 or 2 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner described in the individual U400 series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Steel Floor and Ceiling Runners** – Floor and ceiling runners of wall assembly shall consist of min No. 25 gauge galv steel channels sized to accommodate steel studs. Ceiling runner to be provided with min 1-1/2 in. flanges. Ceiling runner secured to valleys of steel floor units with steel fasteners or by welds spaced max 12 in. OC.
   A1. **Light Gauge Framing** – **Clipped Ceiling Runner** – As an alternate to the ceiling runner in Item 2A, clipped runner to consist of galv steel channel with clips preformed in track flanges which positively engage the inside flange of the steel studs (Item 2B). Track flanges to be min 2-1/2 in. Clipped ceiling runner installed perpendicular to direction of fluted steel floor units and secured to valleys with steel fasteners spaced max 12 in. OC.
   TOTAL STEEL SOLUTIONS L L C – Snap Trak
   B. **Studs** – Steel studs to be min 3-1/2 in. wide. Studs cut 5/8 in. less in length than assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. Stud spacing not to exceed 24 in.
   C. **Gypsum** Board – Gypsum board sheets installed to a min total thickness of 5/8 in. and 1-1/4 in. on each side of wall for 1 and 2 hr rated assemblies, respectively. Wall to be constructed as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a nom 1 in. gap shall be maintained between the top of the gypsum board and the bottom of the steel floor units and the top row of screws shall be installed into the studs 1 in. below the bottom of the ceiling runner.

The hourly fine rating of the joint system is equal to the hourly fire rating on the wall.

3. **Joint System** – Max width of joint (at time of installation of joint system) is 1 in. The joint system is designed to accommodate a max 25 percent compression or extension from its installed width. The joint system shall consist of the following:
   A. **Forming Material** – Min 4 in. thickness of min 4 pcf mineral wool batt insulation cut to the shape of the fluted deck, approx 20 percent larger than the area of the flutes and compressed into flutes of the steel floor units between the top of the ceiling runner and the steel deck and compressed in thickness to be flush with vertical leg of ceiling runner on both sides. Additional pieces of min 4 pcf mineral wool batt insulation are to be cut to the contour of the flutes with an additional 1-3/8 in. high section at the bottom of the shapes to fill the 1 in. gap between the top of the gypsum board and bottom of the steel floor units. The additional pieces of mineral wool are to be cut to min 3/4 and 1-1/2 in. thick for 1 and 2 hr rated assemblies, respectively, and compressed and firmly packed into the flutes and the gap between the top of the gypsum board and bottom of the steel floor units on both sides of the wall and compressed in thickness to be recessed from each surface of the wall to accommodate the required thickness of fill material.
   IIG MINWOOL L L C – MinWool-1200 Safing
   ROCKWOOL MANUFACTURING CO – Delta Safing Board
   THERMAFIBER INC – Type SAF
   B. **Fill, Void or Cavity Material** – **Sealant** – Min 1/4 in. thickness of sealant installed on each side of the wall in the flutes of the steel floor units and between the top of the wall and the bottom of the steel floor units, flush with each surface of the gypsum board. An additional min 1/8 in. thickness of sealant to overlap onto gypsum board a min 1/2 in.
   3M COMPANY – FB-1000 NS

1. **Floor Assembly** – Min 4-1/2 in. thick lightweight or normal weight (100-150 pcf) concrete.

2. **Wall Assembly** – Min 7-1/2 in. thick UL Classified Concrete Blocks* or min 7-1/2 in. thick reinforced lightweight or normal weight (100-150 pcf) structural concrete.

   See **Concrete Blocks** (CAZT) category in the Fire Resistance Directory for names of manufacturers.

3. **Joint System** – Max separation between bottom of floor and top of wall is 3/4 in. The joint system is designed to accommodate a max 16.6 percent compression or extension from its installed width. Max width of joint 3/4 in. The joint system consists of the following:

   A. **Packing Material** – Nom 1 in. diam polyethylene backer rod compressed and installed into joint. Packing material to be recessed from each surface of wall as required to accommodate the required thickness of fill material.

   B. **Fill, Void or Cavity Material** – **Caulk** – Min 1/2 in. thickness of fill material installed within joints on each side of the wall, flush with each surface of the wall.

   BRADY CONSTRUCTION INNOVATIONS INC.
   DBA SLIPTRACK SYSTEMS – SLP-TRK
   MARINO/WARE, DIV OF WARE INDUSTRIES INC – Type SLT
   TELLING INDUSTRIES LLC – True-Action Deflection Track

   A2. **Light Gauge Framing** – Notched Ceiling Runner – As an alternate to the ceiling runners in Items 2A and 2A1, notched ceiling runners to consist of C-shaped galv steel channel with notched return flanges sized to accommodate steel studs (Item 2B). Notched ceiling runner secured to concrete floor slab with steel masonry anchors spaced max 24 in. (610 mm) OC.

   OLMAR SUPPLY INC – Type SCR

   B. **Studs** – Steel studs to be min 3-1/2 in. (89 mm) wide. Studs cut 1/2 to 3/4 in. (13 to 19 mm) less in length than assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. When slotted ceiling runner is used, steel studs secured to runner with No. 8 by 1/2 in. (13 mm) long wafer head steel screws at midheight of slot on each side of wall. Stud spacing not to exceed 24 in. (610 mm) OC.

   C. **Gypsum Board** – Gypsum board sheets installed to a min total thickness of 5/8 in. (16 mm) and 1-1/4 in. (32 mm) on each side of wall for 1 and 2 hr rated assemblies, respectively. Wall to be constructed as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a nom 1 in. (25 mm) gap shall be maintained between the top of the gypsum board and the lower surface of the floor and the top row of screws shall be installed into the studs 1 in. (25 mm) below the bottom of the ceiling runner.

   The hourly fire rating of the joint system is equal to the hourly fire rating of the wall.

3. **Joint System** – Max separation between bottom of floor and top of wall is 1 in. (25 mm). The joint system is designed to accommodate a max 25 percent compression or extension of its installed width. The joint system consists of the following:

   A. **Forming Material** – Min 3/8 and 1 in. (10 and 25 mm) wide strips of min 4 pcf (64 kg/m³) mineral wool batt insulation for 1 and 2 hr rated assemblies, respectively. Mineral wool strips to be compressed approximately 33 percent in thickness to fill the max 1 in. (25 mm)
gap between top of gypsum board and bottom of floor on both sides of the wall and recessed from each surface of wall to accommodate the required thickness of fill material.

**IIIG MINWOOL LLC** – MinWool-1200 Safing
**ROCK WOOL MANUFACTURING CO** – Delta Board or Delta-8
**ROCKWOOL MALAYSIA SDN BHD** – Type Safe
**ROXUL INC** – Type Safe
**THERMAFIBER INC** – Type SAF

B. **Fill, Void or Cavity Material** – **Sealant** – Min 1/4 in. (6 mm) thickness of sealant installed on each side of the wall between the top of the wallboard and the bottom of the floor to completely cover mineral wool. An additional min 1/8 in. (3 mm) thickness of sealant to overlap onto gypsum board a min of 1/2 in. (13 mm).

1. **Floor Assembly** – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Steel Floor And Form Units** – Max 3 in. deep galv steel fluted roof deck.
   B. **Concrete** – Min 2-1/2 in. thick reinforced concrete, as measured from the top plane of the floor units.
1A. **Roof Assembly** – (Not Shown) - As an alternate to the floor assembly, a fire rated fluted steel deck roof assembly may be used. The roof assembly shall be constructed of the materials and in the manner described in the individual P900 Series Roof-Ceiling Design in the UL Fire Resistance Directory. The hourly rating of the roof assembly shall be equal to or greater than the hourly rating of the wall assembly and shall include the following construction features:
   A. **Steel Roof Deck** – Max 3 in. deep galv steel fluted roof deck.
   B. **Roof Insulation** – Min 2-1/4 in. thick poured insulating concrete, as measured from the top plane of the deck.
2. **Wall Assembly** – Min 6-1/8 in. thick steel-reinforced lightweight or normal weight (100-150 pcf) concrete. Wall may also be constructed of any UL Classified **Concrete Blocks**.*
   See Concrete Blocks (CAZT) category in Fire Resistance Directory for names of manufacturers
3. **Joint System** – Max separation between bottom of floor or roof and top of wall is 1 in. The joint system is designed to accommodate a max 25% compression or extension from its installed width. The joint system consists of the following:
   A. **Forming Material** – Min 4 pcfs mineral wool batt insulation cut into min 5-5/8 in. wide strips, compressed approximately 33 percent in thickness to fill the max 1 in. gap between top of wall and bottom of steel floor or roof deck and recessed from both surfaces of wall to accommodate the required thickness of fill material.
      IIIG MINWOOL L L C – MinWool-1200 Safing
      ROCKWOOL MANUFACTURING CO – Delta Board or Delta -8
      ROCKWOOL MALAYSIA SDN BHD – Type Safe
      ROXUL INC – Type Safe
      THERMAFIBER INC – Type SAF
   B. **Fill, Void or Cavity Material** – Sealant – Min 1/4 in. thickness of sealant installed on each side of wall between top of wall and bottom of floor or roof, flush with each surface of wall.
      3M COMPANY – FireBarrier 1000 NS

Assembly Rating – 1 and 2 Hr (See Items 2 and 3)
L Rating At Ambient – 4 CFM/Lin Ft
L Rating At 400 F – 6 CFM/Lin Ft
Nominal Joint Width – 1 In.
Class II Movement Capabilities – 18.75% Compression or Extension

1. Floor Assembly – The fire rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. Steel Floor and Form Units* – Max 3 in. deep galv steel fluted units.
   B. Concrete – Min 2-1/2 in. thick reinforced concrete, as measured from the top plane of the floor units.

2. Wall Assembly – The 1 or 2 hr fire rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner described in the individual U400 series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. Steel Floor and Ceiling Runners – Floor and ceiling runners of wall assembly shall consist of min No. 25 gauge galv steel channels sized to accommodate steel studs. Ceiling runner to be provided with min 1-1/4 in. flanges. Ceiling runner secured to valleys of steel floor units with steel fasteners or by welds spaced max 12 in. OC.
      A1. Light Gauge Framing* – Clipped Ceiling Runner – As an alternate to the ceiling runner in Item 2A, clipped runner to consist of galv steel channel with clips preformed in track flanges which positively engage the inside flange of the steel studs (Item 2B). Track sized to accommodate steel studs (Item 2B). Track flanges to be min 2-1/2 in. Clipped ceiling runner installed perpendicular to direction of fluted steel floor units and secured to valleys with steel fasteners spaced max 12 in. OC.
   B. Studs – Steel studs to be min 3-1/2 in. wide. Studs cut 5/8 in. less in length than assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. Stud spacing not to exceed 24 in.
   C. Gypsum Board* – Gypsum board sheets installed to a min total thickness of 5/8 in. and 1-1/4 in. on each side of wall for 1 and 2 hr rated assemblies, respectively. Wall to be constructed as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a nom 1 in. gap shall be maintained between the top of the gypsum board and the bottom of the steel floor units and the top row of screws shall be installed into the studs 1 in. below the bottom of the ceiling runner.

The hourly fire rating of the joint system is equal to the hourly fire rating of the wall.

3. Joint System – Max width of joint (at time of installation of joint system) is 1 in. The joint system is designed to accommodate a max 18.75 percent compression or extension from its installed width. The joint system shall consist of the following:
   A. Forming Material* – Min 4 in. thickness of min 4pcf mineral wool batt insulation cut to the shape of the fluted deck, approx 20 percent larger than the area of the flutes and compressed into flutes of the steel floor units between the top of the ceiling runner and the steel deck and compressed in thickness to be flush with vertical leg of ceiling runner on both sides. Additional pieces of min 4pcf mineral wool batt insulation are to be cut to the contour of the flutes with an additional 1-3/8 in. high section at the bottom of the shapes to fill the 1 in. gap between the top of the wallboard and bottom of the steel floor units. The additional pieces of mineral wool are to be cut to min 3/4 and 1-1/2 in. thick for 1 and 2 hr rated assemblies, respectively and compressed and firmly packed into the flutes and the gap between the top of the gypsum board and bottom of the steel floor units on both sides of the wall and compressed in thickness to be recessed from each surface of the wall to accommodate the required thickness of fill material.
      IIG MINWOOL L L C – MinWool-1200 Safing
      ROCK WOOL MANUFACTURING CO – Delta Safing Board
      THERMAFIBER INC – Type SAF
   B. Fill, Void or Cavity Material* – Caulk – Min 1/4 in. thickness of caulk installed on each side of the wall in the flutes of the steel floor units and between the top of the wall and the bottom of the steel floor units, flush with each surface of the gypsum board. An additional min 1/8 in. thickness of caulk to overlap onto gypsum board a min 1/2 in.
       3M COMPANY – FireDam 150+

1. **Floor Assembly** – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual D700 or D900 Series Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Floor and Floor Units** – Max 3 in. (76 mm) deep galv steel fluted floor units

   B. **Concrete** – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.

   C. **Structural Steel Support** – (Optional) – Steel beam or open-web steel joist, as specified in the individual D700 or D900 Series Floor-Ceiling Design, used to support steel floor units. Structural steel support oriented perpendicular to wall assembly. Where open-web steel joists pass through the fire rated wall, 3/8 in. (10 mm) diamond mesh expanded steel lath having a nom weight of 1.7 to 3.4 lb per sq yd (0.9-1.8 kg/m²) shall be secured to one side of each joist with steel tie wire and the lath shall be fully covered with spray applied fire resistive material with no min thickness requirement.

   D. **Spray-Applied Fire Resistive Material** – After installation of the ceiling runner (Item 2A) or deflection track (Item 3A, if used), steel floor units and structural steel supports to be sprayed in accordance with the specifications in the individual D700 Series Design or the structural steel supports to be sprayed in accordance with the specifications in the individual D900 Series Design.

   **GCP APPLIED TECHNOLOGIES INC** – Type MK-6/HY

2. **Wall Assembly** – The 1 or 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner described in the individual U400, V400 or W400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Floor and Ceiling Runners** – Floor and ceiling runners of wall assembly shall consist of galv steel channels sized to accommodate steel studs (Item 2B). Ceiling runner to be provided with min 1-1/4 in. (32 mm) to max 3 in. (76 mm) flanges. When deflection channel (Item 3A) is used, the ceiling runner is to nest within the deflection channel with a 1/2 in. to 1 in. (13 to 25 mm) gap maintained between the top of the ceiling runner and the top of the deflection channel. When deflection channel is not used, ceiling runner to be provided with min 3 in. (76 mm) flanges and secured to steel floor units (Item 1A) with steel fasteners or welds spaced max 24 in. (610 mm) OC. Ceiling runner to be centered beneath and parallel with valley of steel floor unit. A clearance of 1 to 1-1/4 in. (25 to 32 mm) shall be maintained between the end of the ceiling runner or deflection channel and the spray applied fire resistive material on the structural steel support members.

3. Joint System – Max separation between bottom of the spray applied fire resistive material on the steel floor units and top of gypsum board (at time of installation of joint system) is 2 in. (51 mm) when D700 series assembly is used. Max separation between bottom of the steel floor units and top of gypsum board (at time of installation of joint system) is 2 in. (51 mm) when D900 series assembly is used.

A. Deflection Channel – (Optional, Not Shown) - Min 24 gauge galv steel channel, 3 in. (76 mm) deep, sized to accommodate ceiling runner (Item 2A). Deflection channel to be centered beneath and parallel with valley of steel floor unit and secured to steel floor unit with steel fasteners or welds spaced max 24 in. (610 mm) OC. The ceiling runner (Item 2A) is installed within the deflection channel to maintain a 1/2 to 1 in. (13 to 25 mm) gap between the top of the ceiling runner and the top of the deflection channel. A clearance of 1 to 1-1/4 in. (25 to 32 mm) shall be maintained between the end of the deflection channel and the spray applied fire resistive material on the structural steel support member. The screws attaching the gypsum board to the studs along the top of the wall shall be located 1 in. (25 mm) below the bottom of the ceiling runner or the optional deflection channel. The hourly fire rating of the joint system is equal to the hourly fire rating of the wall.

B. Forming Material – Nom 4pcf (64 kg/m³) mineral wool batt insulation cut to a length approx the same as the overall thickness of wall.

C. Fill, Void or Cavity Material – Tape

Nominal Joint Width – 1 in.
Class II Movement Capabilities – 18.75% Compression & Extension

1. **Floor Assembly** – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Steel Floor And Form Units*** – Max 2 in. deep galv steel fluted roof deck.
   B. **Concrete** – Min 2-1/2 in. thick reinforced concrete, as measured from the top plane of the floor units.

1A. **Roof Assembly** – (Not Shown) - As an alternate to the floor assembly, a fire rated fluted steel deck roof assembly may be used. The roof assembly shall be constructed of the materials and in the manner described in the individual P900 Series Roof-Ceiling Design in the UL Fire Resistance Directory. The hourly rating of the roof assembly shall be equal to or greater than the hourly rating of the wall assembly and shall include the following construction features:
   A. **Steel Roof Deck** – Max 2 in. deep galv steel fluted roof deck.
   B. **Roof Insulation** – Min 2-1/4 in. thick poured insulating concrete, as measured from the top plane of the deck.

2. **Wall Assembly** – Min 6-1/8 in. thick steel-reinforced lightweight or normal weight (100-150 pcf) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*.
   See Concrete Blocks (CAZT) category in Fire Resistance Directory for names of manufacturers.

3. **Joint System** – Max separation between bottom of floor or roof and top of wall is 1 in. The joint system is designed to accommodate a max 18.75 percent compression or extension from its installed width. The joint system consists of the following:
   A. **Forming Material*** – Min 4 pcf mineral wool batt insulation cut into min 5-5/8 in. wide strips, compressed approximately 33 percent in thickness to fill the max 1 in. gap between top of wall and bottom of steel floor or roof deck. Min 5-5/8 in. width of min 4 pcf mineral wool batt insulation cut to the shape of the fluted deck, approximately 20 percent larger than the area of the flutes, firmly packed into the flutes. Mineral wool to be recessed from both surfaces of wall to accommodate the required thickness of fill material.

1. **Floor Assembly** – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Floor And Form Units** – Max 3 in. (76 mm) deep galv steel fluted floor deck.

   B. **Concrete** – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.

1A. **Roof Assembly** – (Not Shown) - As an alternate to the floor assembly, a fire rated fluted steel deck roof assembly may be used. The roof assembly shall be constructed of the materials and in the manner described in the individual P900 Series Roof-Ceiling Design in the UL Fire Resistance Directory. The hourly rating of the roof assembly shall be equal to or greater than the hourly rating of the wall assembly and shall include the following construction features:

   A. **Steel Roof Deck** – Max 3 in. (76 mm) deep galv steel fluted roof deck.

   B. **Roof Insulation** – Min 2-1/4 in. (57 mm) thick poured insulating concrete, as measured from the top plane of the deck.

2. **Wall Assembly** – The 1 or 2 hr fire rated gypsum wallboard/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400 or V400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Floor And Ceiling Runners** – Floor and ceiling runners of wall assembly shall consist of min No. 25 gauge galv steel channels sized to accommodate steel studs (Item 2B). Ceiling runner to be provided with min 1-1/2 in. (38 mm) flanges. Ceiling runner installed parallel to direction of fluted steel deck, centered beneath valley, and secured with steel masonry anchors or welds spaced max 24 in. (610 mm) OC.

   A1. **Light Gauge Framing** – Slotted Ceiling Runner – As an alternate to the ceiling runner in Item 2A, ceiling runner to consist of galv steel channel with slotted flanges sized to accommodate steel studs (Item 2B). Ceiling runner installed parallel to direction of fluted steel deck, centered beneath valley, and secured with steel masonry anchors spaced max 24 in. (610 mm) OC.

   A2. **Light Gauge Framing** – Notched Ceiling Runner – As an alternate to the ceiling runners in Items 2A and 2A1, notched ceiling runners to consist of C-shaped galv steel channel with notched return flanges sized to accommodate steel studs (Item 2B). Notched ceiling runner installed parallel to direction of fluted steel deck, centered beneath valley, and secured with steel masonry anchors spaced max 24 in. (610 mm) OC.

   **SCAFCO STEEL STUD MANUFACTURING CO**
   **BRADY CONSTRUCTION INNOVATIONS INC**
   **DBA SLIPTRACK SYSTEMS – SLP-TRK**
   **MARINO/WARE, DIV OF WARE INDUSTRIES INC** – Type SLT
   **TELLING INDUSTRIES LLC** – True-Action Deflection Track

   A2. **Light Gauge Framing** – Notched Ceiling Runner – As an alternate to the ceiling runners in Items 2A and 2A1, notched ceiling runners to consist of C-shaped galv steel channel with notched return flanges sized to accommodate steel studs (Item 2B). Notched ceiling runner installed parallel to direction of fluted steel deck, centered beneath valley, and secured with steel masonry anchors spaced max 24 in. (610 mm) OC.

   **OLMAR SUPPLY INC** – Type SCR

   B. **Studs** – Steel studs to be min 3-1/2 in. (89 mm) wide. Studs cut 1/2 to 3/4 in. (13 to 19 mm) less in length than assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. When slotted ceiling runner is used, steel studs secured to runner with No. 8 by 1/2 in. (13 mm) long wafer head steel screws at midheight of slot on each side of wall. Stud spacing not to exceed 24 in (610 mm) OC.

   C. **Gypsum Board** – Gypsum board sheets installed to a min total thickness of 5/8 in. (16 mm) and 1-1/4 in. (32 mm) on each side of wall for 1 and 2 hr rated assemblies, respectively. Wall to be constructed as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a max 1 in. (25 mm) gap shall be maintained between the top of the gypsum board and the lower surface of the floor or roof and the top row of screws shall be installed into the studs 1 in. (25 mm) below the bottom of the ceiling runner.

The hourly fire rating of the joint system is equal to the hourly fire rating of the wall.
System No. HW-D-0205 continued

3. Joint System – Max separation between bottom of floor or roof and top of wall is 1 in. (25 mm). The joint system is designed to accommodate a max 19 percent compression or extension from its installed width. The joint system consists of the following:

A. **Forming Material** – Min 3/8 and 1 in. (10 and 25 mm) wide strips of min 4 pcf (64 kg/m³) mineral wool batt insulation for 1 and 2 hr rated assemblies, respectively. Mineral wool strips to be compressed approximately 33 percent in thickness to fill the max 1 in. (25 mm) gap between the top of gypsum board and bottom of steel floor or roof deck on both sides of the wall and recessed from each surface of wall to accommodate the required thickness of fill material.

- IIG MINWOOL L L C – MinWool-1200 Safing
- ROCKWOOL MANUFACTURING CO – Delta Board or Delta -8
- ROCKWOOL MALAYSIA SDN BHD – Type Safe
- ROXUL INC – Type Safe
- THERMAFIBER INC – Type SAF

B. **Fill, Void or Cavity Material** – **Sealant** – Min 1/4 in. (6 mm) thickness of sealant installed on each side of wall in the flutes of steel floor or roof deck and between top of wall and bottom of steel floor or roof deck to completely cover mineral wool, flush with each surface of wall. An additional min 1/8 in. (3.2 mm) thickness of sealant to overlap onto gypsum board a min of 1/2 in. (13 mm).

1. **Floor Assembly** – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual D700 or D900 Series Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Floor and Floor Units** – Max 3 in. (76 mm) deep galv steel fluted floor units.

   B. **Concrete** – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.

   C. **Structural Steel Support** – (Optional) – Steel beam or open-web steel joist, as specified in the individual D700 or D900 Series Floor-Ceiling Design, used to support steel floor units. Structural steel support oriented perpendicular to wall assembly. Where open-web steel joists pass through the fire rated wall, 3/8 in. (10 mm) diamond mesh expanded steel lath having a nom weight of 1.7 to 3.4 lb per sq yd (0.9 to 1.8 kg/m²) shall be secured to one side of each joist with steel tie wire and the lath shall be fully covered with spray applied fire resistive material with no min thickness requirement.

   D. **Spray-Applied Fire Resistive Material** – Steel floor units and structural steel supports to be sprayed in accordance with the specifications in the individual D700 Series Design or the structural steel supports to be sprayed in accordance with the specifications in the individual D900 Series Design.

2. **Wall Assembly** – Min 6-1/8 in. (156 mm) thick steel-reinforced lightweight or normal weight (100-150pcf or 1600-2400 kg/m³) concrete. Wall shall be installed parallel to the flutes of the steel floor and form units. A min clearance of 1 in. (25 mm) to a max clearance of 3 in. (76 mm) shall be maintained between the wall and the spray applied fire resistive material on the two sides of the structural support member. Wall may also be constructed of any UL Classified Concrete Blocks.

   See **Concrete Blocks** (CAZT) category in Fire Resistance Directory for names of manufacturers.
3. Joint System – Max separation between bottom of the spray applied fire resistive material on the lowest portion of steel floor units and top of wall (at time of installation of joint system) is 1 in. (25 mm) when D700 series assembly is used. Max separation between bottom of the steel floor units and top of gypsum board (at time of installation of joint system) is 1 in. (25 mm) when D900 series assembly is used. Max separation between spray applied fire resistive material on bottom of structural support member and top of wall is 1 in. (25 mm). The joint system is designed to accommodate a max 13 percent compression or extension from it’s installed width as measured between the spray applied fire resistive material on the steel floor units and the top of wall. The joint system shall consist of forming and fill materials, as follows:

A. Forming Material* – Nom 4 pcf (64 kg/m³) mineral wool batt insulation cut to a min 6-1/8 in. (156 mm) length, compressed a min of 25 percent in thickness and installed cut edge first to completely fill the gap above the wall, flush with both surfaces of wall. Additional nom 4 pcf (64 kg/m³) mineral wool batt insulation compressed a min of 25 percent in thickness to be installed to completely fill the flutes of the steel floor and form units located above wall. Nom 4 pcf (64 kg/m³) mineral wool batt insulation cut to a min 6-1/8 in. (156 mm) length, compressed a min of 25 percent in thickness and installed cut edge first to completely fill the gap between the spray applied fire resistive material on the structural steel member and the wall.

INDUSTRIAL INSULATION GROUP LLC – MinWool-1200 Safing
JOHNS MANVILLE – Safing
ROCK WOOL MANUFACTURING CO – Delta Board
ROCKWOOL MALAYSIA SDN BHD – Type Safe
ROCKWOOL – Type Safe
THERMAFIBER INC – Type SAF

B. Fill, Void or Cavity Material* – Min 1/16 in. dry thickness (min 1/8 in. or 3.2 mm wet thickness) of fill material spray applied over the forming material on each side of the wall. Fill material to overlap a min of 1/2 in. (13 mm) onto the wall and a min 2 in. (51 mm) onto the deck or the spray applied material (Item 1C) on the steel floor unit and on the structural steel support member on both sides of wall.

3M COMPANY – FireDam ™ Spray 200

B1. Fill, Void or Cavity Material* – Tape – As an alternate to Item B, Tape cut to size and press applied to completely cover mineral wool between bottom of floor and top of wall. Tape to overlap a min of 1 in. (25 mm) onto the wall and a min 2 in. (51 mm) onto the deck or the spray applied material (Item 1C) on the steel floor unit and on the structural steel support member on both sides of wall. All adjoining lengths of Tape shall overlap min 1/2 in. (13 mm).

3M COMPANY – 3M Fire and Water Barrier Tape

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

Reprinted from the Online Certifications Directory with permission from UL©
1. **Floor Assembly** – Min 4-1/2 in. (114 mm) thick steel reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m²) structural concrete. Floor may also be constructed of any min 6 in. thick UL Classified hollow-core Precast Concrete Units*. See Precast Concrete Units (CFTV) category in the Fire Resistance Directory for names of manufacturers.

2. **Wall Assembly** – The 2 hr fire rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400 or V400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Floor And Ceiling Runners** – Floor and ceiling runners of wall assembly shall consist of galv steel channels sized to accommodate steel studs (Item 2B). When deflection channel (Item 3A) is used, ceiling runner to be provided with 3 in. (76 mm) flanges. Ceiling runner is installed within the deflection channel with 2 in. (51 mm) gap maintained between the top of ceiling runner and top of deflection channel. When deflection channel is not used, flange height of ceiling runner shall be min 3/4 in. (19 mm) greater than nom joint width. Ceiling Runner secured to floor assembly with steel fasteners spaced max 24 in. (610 mm) OC.

   A1. **Light Gauge Framing* – Slotted Ceiling Runner** – As an alternate to the ceiling runner in Item 2A, slotted ceiling runner to consist of galv steel channel with slotted flanges sized to accommodate steel studs (Item 2B). Slotted ceiling runner secured to floor assembly with steel fasteners spaced max 24 in. (610 mm) OC. When slotted ceiling runner is used, deflection channel (Item 3A) shall not be used.

   METAL-LITE INC – The System

   SCAFCO STEEL STUD MANUFACTURING CO

   BRADY CONSTRUCTION INNOVATIONS INC, DBA SLIPTRACK SYSTEMS – SLP-TRK

   MARINO/WARE, DIV OF WARE INDUSTRIES INC – Type SLT

   TELLING INDUSTRIES LLC – True-Action Deflection Track

   B. **Studs** – Steel studs to be min 3-1/2 in. (89 mm) wide. Studs cut 1/2 to 3/4 in. (13 to 19 mm) less in length than assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. When slotted ceiling runner (Item 2A1) is used, steel studs secured to slotted ceiling runner with No. 8 by 1/2 in. (13 mm) long wafer head steel screws at midheight of slot on each side of wall. Stud spacing not to exceed 24 in. (610 mm) OC.

   C. **Gypsum Board* – Gypsum board installed to a min total thickness of 1-1/4 in. (32 mm) on each side of wall. Wall to be constructed as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a max 2 in. (51 mm) gap shall be maintained between the top of the gypsum board and the bottom of the floor assembly and the top row of screws shall be installed into the studs 4-1/2 in. (114 mm) below the lower surface of the floor.
3. Joint System – Max separation between bottom of floor and top of wall is 2 in. (51 mm). The joint system is designed to accommodate a max 25 percent compression or extension from its installed width. The joint system consists of a deflection channel, forming material and a fill material, as follows:

A. **Deflection Channel** (optional) – A nom 3-5/8 in. (92 mm) wide by 3 in. (76 mm) deep min 24 gauge steel U-shaped channel. Deflection channel secured to floor assembly with steel fasteners spaced max 24 in. (610 mm) OC. The ceiling runner (Item 2A) is installed within the deflection channel to maintain a 2 in. (51 mm) gap between the top of the ceiling runner and the top of the deflection channel. The ceiling runner is not fastened to the deflection channel.

B. **Forming Material*** – Min 1-1/4 in. (32 mm) thickness of min 4 pcf (64 kg/m³) mineral wool insulation cut a min 33 percent wider than the max 2 in. (51 mm) wide gap above the top of the gypsum board, compressed in width, and firmly packed into the gap between the top of the gypsum board and the bottom of the floor assembly, flush with both surfaces of the wall.

INDUSTRIAL INSULATION GROUP LLC – MinWool-1200 Safing
JOHNS MANVILLE – Safing
ROCK WOOL MANUFACTURING CO – Delta Board or Delta-8
ROCKWOOL MALAYSIA SDN BHD – Type Safe
ROXUL INC – Type Safe
THERMAFIBER INC – Type SAF

C. **Fill, Void or Cavity Material*** – Min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) of fill material sprayed or brushed on each side of the wall between the top of the gypsum board and the bottom of the floor to completely cover mineral wool and overlap a min of 1/2 in. (13 mm) onto gypsum board and floor on both sides of wall.

3M COMPANY – FireDam™ Spray 200

Cl. **Fill, Void or Cavity Material** – Tape – As an alternate to Item C, Tape cut to size and press applied along length of joint to completely cover mineral wool and lap min 1 in. (25 mm) onto the concrete floor and gypsum wall. Tape shall be applied in min 1 ft (305 mm) lengths along joint and adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

3M COMPANY – 3M Fire and Water Barrier Tape

HWD Head of Wall
Construction Joints

1. Floor Assembly – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual D900 Series Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. Steel Floor and Form Units* – Max 3 in. (76 mm) deep galv steel fluted units.
   B. Concrete – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.

2. Wall Assembly – The 1 or 2 hr fire rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. Steel Floor and Ceiling Runners – Floor and ceiling runners of wall assembly shall consist of galv steel channels sized to accommodate steel studs (Item 2B). Flange height of ceiling runner shall be min 3/4 in. (19 mm) greater than nom joint width. Ceiling runner installed perpendicular to direction of fluted steel floor units and secured with steel fasteners or by welds spaced max 24 in. (610 mm) OC.
   A1. Light Gauge Framing* – Slotted Ceiling Runner – As an alternate to the ceiling runner in Item 2A, slotted ceiling runner to consist of galv steel channel with slotted flanges sized to accommodate steel studs (Item 2B). Flange height of ceiling runner shall be min 3/4 in. (19 mm) greater than nom joint width. Slotted ceiling runner installed perpendicular to direction of fluted steel floor units and secured to valleys with steel fasteners spaced max 24 in. (610 mm) OC.
   B. Studs – Steel studs to be min 3-1/2 in. (89 mm) wide. Studs cut 1/2 to 3/4 in. (13 to 19 mm) less in length than assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. When slotted ceiling runner (Item 2A) is used, steel studs secured to slotted ceiling runner with No. 8 by 1/2 in. (13 mm) long wafer head steel screws at midheight of slot on each side of wall. Stud spacing not to exceed 24 in. (610 mm) OC.
   C. Gypsum Board* – Gypsum board sheets installed to a min total thickness of 5/8 in. (16 mm) and 1-1/4 in. (32 mm) on each side of wall for 1 and 2 hr rated assemblies, respectively. Wall to be constructed as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a max 2 in. (51 mm) gap shall be maintained between the top of the gypsum board and the bottom of the steel floor units and the top row of screws shall be installed into the studs 3-1/2 in. (89 mm) below the lower surface of the floor.

   The hourly fire rating of the joint system is equal to the hourly fire rating of the wall.

3. Through Penetrants (Not applicable when Item 4B1 is used) – A max of one nonmetallic or metallic pipe or conduit or a max of three cables may be installed within the individual areas of the flutes of the steel deck above the ceiling runner. Annular space between the penetrants and the steel deck or top of ceiling runner shall be min 1/2 in. (13 mm). Penetrants to be rigidly supported on both sides of wall assembly. The following types and sizes of nonmetallic or metallic pipe or conduit or cables may be used:
   A. Metallic Pipes – The following types and sizes may be used:
      1. Steel Pipe – Nom 1-1/2 in. (38 mm) diam (or smaller) Schedule 5 (or heavier) steel pipe.
      2. Conduit – Nom 1-1/2 in. (38 mm) diam (or smaller) electrical metallic tubing or rigid steel conduit.
B. Nonmetallic Pipes – The following types and sizes may be used:

1. Polyvinyl Chloride (PVC) Pipe – Nom 1-1/2 in. (38 mm) diam (or smaller) Schedule 40 solid core PVC pipe for use in closed (process or supply) piping systems.

2. Chlorinated Polyvinyl Chloride (CPVC) Pipe – Nom 1-1/2 in. (38 mm) diam (or smaller) SDR13.5 CPVC pipe for use in closed (process or supply) piping systems.

3. Rigid Nonmetallic Conduit++ – Nom 1-1/2 in. (38 mm) diam (or smaller) Schedule 40 PVC conduit installed in accordance with Article 347 of the National Electrical Code (NFPA No. 70).

C. Cables – A max of three cables may be used. A min 1/2 in. (13 mm) annular space must be maintained between cables. Max 3C with ground No. 12 AWG (or smaller) MC (BX) copper cables with polyvinyl chloride insulation.

4. Joint System – Max separation between bottom of floor and top of wall is 2 in. The joint system is designed to accommodate a max 25 percent compression or extension from its installed width. The joint system consists of a forming material and a fill material, as follows:

A. Forming Material* – Min 4 in. (102 mm) thickness of min 4 pcf (64 kg/m³) density mineral wool batt insulation cut to the shape of the fluted deck, approx 20 percent larger than the area of the flutes and compressed into flutes of the steel floor units between the top of the ceiling runner and the steel deck and tightly packed around the individual penetrants. Additional pieces of min 4 pcf (64 kg/m³) mineral wool batt insulation are to be cut to the contour of the flutes with an additional 1-3/4 in. (44 mm) high section at the bottom of the shapes to fill the 2 in. (51 mm) gap between the top of the gypsum board and the bottom of the steel floor units. The additional pieces of mineral wool are compressed and firmly packed into the flutes and around the penetrants and into the gap between the top of the gypsum board and the bottom of the steel floor units on both sides of the wall. The additional pieces shall be a 3/4 in. (19 mm) thick for a 1 hr rated design and a 1-1/2 in. (38 mm) thick for a 2 hr rated design.

INDUSTRIAL INSULATION GROUP LLC – MinWool-1200 Safing
ROCK WOOL MANUFACTURING CO – Delta Board or Delta-8
ROCKWOOL MALAYSIA SDN BHD – Type Safe
ROXUL INC – Type Safe

B. Fill, Void or Cavity Material* – Min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) of fill material sprayed or brushed on each side of the wall in the flutes of the steel floor units and between the top of the gypsum board and the bottom of the steel floor units to completely cover mineral wool and overlap a min of 1/2 in. (13 mm) onto gypsum board and a min 1 in. (25 mm) onto steel deck and penetrants on both sides of wall.

3M COMPANY – FireDam™ Spray 200

B1. Fill, Void or Cavity Material* – Tape (Not applicable when Item 3 is used) – As an alternate to Item 4B, Tape cut to size and press applied within fluted areas of joint to completely cover mineral wool lapping min 1 in. (25 mm) onto the contour of the steel floor units and extending to lap min 1 in. (25 mm) onto the gypsum wall. Additional pieces of Tape are applied along the joint to completely cover the remaining mineral wool between bottom of steel deck and top edge of wall along length of joint, lapping min 1 in. (25 mm) onto the contour of the steel floor units and min 1 in. (25 mm) onto the gypsum wall. Adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

3M COMPANY – 3M Fire and Water Barrier Tape

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.
1. Floor Assembly – The fire rated fluted steel floor unit/concrete floor assembly shall be constructed of the materials and in a manner described in the individual D900 Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. Steel Floor And Form Units* – Max 3 in. (76 mm) deep galv steel fluted floor units.

   B. Concrete – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.

2. Wall Assembly – Min 7-1/2 in. (191 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete. Wall may also be constructed of any UL Classified Concrete Blocks*.

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

3. Joint System – Max width of joint (at time of installation of joint system) is 2 in. (51 mm). The joint system is designed to be installed from only one side of the wall due to the opposite side of the wall being inaccessible. The joint system is designed to accommodate a max 12.5 percent compression or extension from its installed width. The joint system shall consist of the following:

   A. Forming Material* – Min 4 pcf (64 kg/m³) mineral wool batt insulation cut into strips, compressed approximately 25 percent in thickness, and installed to fill the max 2 in. (51 mm) gap between the top of the wall and the bottom of the fluted steel floor units. Additional pieces of min 4 pcf (64 kg/m³) mineral wool batt insulation cut to the shape of the fluted deck, approximately 20 percent larger than the area of the flutes, firmly packed into the flutes. The strips and shaped pieces of mineral wool batt insulation installed on the inaccessible side of the wall are to be 1 in. to 2 in. (25 to 51 mm) wide and are to be installed flush with the inaccessible surface of the wall. After application of the sealant (Item 3B) on the surface of the mineral wool batt packing material above the top plane of the wall, additional strips and shaped pieces of the mineral wool batt insulation are to be installed to fill the remainder of the joint opening above the wall, flush with the accessible surface of the wall.

   ROCK WOOL MANUFACTURING CO – Delta Board or Delta-8
   ROCKWOOL MALAYSIA SDN BHD – SAFE
   ROXUL INC – SAFE

   B. Fill, Void or Cavity Material* – Sealant – Min 1/8 in. (3.2 mm) wet thickness or 1/16 in. (1.6 mm) dry thickness of fill material spray applied over the forming material. The fill material sprayed on the nom 1 in. to 2 in. (25 to 51 mm) thickness of forming material located on the inaccessible side of the wall is to lap a min of 1 in. (25 mm) onto the steel deck and onto the top surface of the wall. The fill material sprayed on the forming material on the accessible side of the wall is to overlap a min of 1/2 in. (13 mm) onto the wall and a min of 1 in. (25 mm) onto the steel floor unit on either side of the wall.

   3M COMPANY – FireDam™ Spray 200

   B1. Fill, Void or Cavity Material* – Tape – As an alternate to Item B, Tape cut to size and press applied within fluted areas of joint to completely cover mineral wool lapping min 1 in. (25 mm) onto the contour of the steel floor units and extending to lap min 1 in. (25 mm) onto the concrete wall. Additional pieces of Tape are applied along the joint to completely cover the remaining mineral wool between bottom of steel deck and top edge of wall along length of joint, lapping min 1 in. (25 mm) onto the contour of the steel floor units and min 1 in. (25 mm) onto the concrete wall. Adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

   3M COMPANY – 3M Fire and Water Barrier Tape

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

1. **Floor Assembly** – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual D700 or D800 Series Floor-Ceiling Design in the UL Fire Resistance Directory. The hourly fire rating of the floor assembly shall be equal to or greater than the hourly fire rating of the wall assembly. The floor assembly shall include the following construction features:

   A. **Steel Floor and Floor Units** – Max 3 in. (76 mm) deep galv steel fluted floor units.

   B. **Concrete** – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.

   C. **Structural Steel Support** – Steel beam or open-web steel joist, as specified in the individual D700 or D800 Series Floor-Ceiling Design, used to support steel floor units. Structural steel support oriented parallel to and 2 to 6 in. (51 to 152 mm) from wall assembly.

   D. **Steel Lath** – When structural steel support (Item 1C) consists of open-web steel joists, 3/8 in. (10 mm) diamond mesh expanded steel lath having a nom weight of 1.7 to 3.4 lb per sq yd (0.9 to 1.8 kg/m²) shall be installed to completely cover one side of each joist which is located within 6 in. (152 mm) of wall assembly. The lath shall be secured with steel tie wire and shall be fully covered with spray applied fire resistive material.

   E. **Spray-Applied Fire Resistive Material** – After installation of the ceiling runner (Item 2A) or deflection track (Item 3A, if used), steel floor units and structural steel supports to be sprayed with the thickness of material specified in the individual D700 or D800 Series Design. The flutes of the steel floor units above the structural steel supports and above the ceiling runner (Item 2A) or deflection channel (Item 3A) shall be filled with spray-applied fire resistive material. As an alternate, the spray-applied fire resistive material in the flutes above the ceiling runner may be applied to follow the contour of the steel floor units. Excess material shall be removed from the flanges of the ceiling runner or deflection track beyond the required thickness of spray-applied fire resistive material on the steel floor units.

   **GCP APPLIED TECHNOLOGIES INC** – Type MK-6/HY

1A. **Roof Assembly** – (Not Shown) – As an alternate to the floor assembly (Item 1), a fire rated fluted steel deck roof assembly may be used. The roof assembly shall be constructed of the materials and in the manner described in the individual P7000 or P8000 Series Roof-Ceiling Design in the UL Fire Resistance Directory. The hourly fire rating of the roof assembly shall be equal to or greater than the hourly fire rating of the wall assembly. The roof assembly shall include the following construction features:
2. Wall Assembly – The 1, 2, 3 or 4 hr fire-rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400 or V400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

A. Steel Floor and Ceiling Runners – Floor and ceiling runners of wall assembly shall consist of galv steel channels sized to accommodate steel studs (Item 2B). Ceiling runner flange height to be min 1/2 in. (13 mm) greater than joint width at max anticipated extension. When deflection channel (Item 3A) is used, flange height of ceiling runner is to be equal to or greater than flange height of deflection channel and the ceiling runner is to rest within the deflection channel with a max 1-1/4 in. (32 mm) gap maintained between the top of the ceiling runner and the top of the deflection channel. When deflection channel is not used, ceiling runner is secured to steel floor units (Item 1A) with steel fasteners or welds spaced max 24 in. (610 mm) OC. Ceiling runner or deflection track to be installed parallel with structural steel support and located such that a max clearance of 4 in. (102 mm) is present between the finished wall and the spray-applied fire resistive material at the lowest elevation of the structural steel support.

A1. Light Gauge Framing* – Slotted Ceiling Runner – As an alternate to the ceiling runner in Item 2A, ceiling runner to consist of galv steel channel with slotted flanges sized to accommodate steel studs (Item 2B). Ceiling runner secured to valleys with steel fasteners spaced max 24 in. (610 mm) OC. When slotted ceiling runner is used, deflection channel (Item 3A) shall not be used.

B. Studs – Steel studs to be min 3-5/8 in. (92 mm) wide. Studs cut max 1-1/4 in. (32 mm) less in length than assembly height to accommodate max anticipated compression of joint width with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. Stud spacing not to exceed 24 in. (610 mm) OC. When slotted ceiling runner (Item 2A1) is used, steel studs secured to slotted ceiling runner with No. 8 by 1/2 (13 mm) long wafer head steel screws at midheight of slot on each side of wall. When deflection channel (Item 3A) is used, steel studs attached to ceiling runner (Item 2A) with sheet metal screws located 3/4 in. (19 mm) below the bottom of the deflection channel. When deflection channel is not used, studs to nest in ceiling runner without attachment.

C. Gypsum Board* – After installation of the ceiling runner (Item 2A) or deflection track (Item 3A, if used), steel roof deck and structural steel supports to be sprayed with a thickness of spray applied fire resistive material as specified in the individual P700 or P800 Series Roof-Ceiling design. The flutes of the steel deck above the structural steel supports and above the ceiling runner (Item 2A) or deflection channel (Item 3A) shall be filled with spray-applied fire resistive material. As an alternate, the spray-applied fire resistive material in the flutes above the ceiling runner may be applied to follow the contour of the steel roof deck. Excess material shall be removed from the flanges of the ceiling runner or deflection track beyond the required thickness of spray-applied fire resistive material on the steel roof deck.

GCP APPLIED TECHNOLOGIES INC – Type MK-6/HY

3. Joint System – Max separation between bottom plane of steel roof unit and top of gypsum board (at time of installation of joint system) is 2 in. (51 mm). Max separation between spray applied fire resistive material on structural support member and surface of wall is min 1 in. (25 mm) to max 4 in. (102 mm). The joint system is designed to accommodate a max 50 percent compression or extension from its installed width as measured between the bottom plane of the spray-applied fire resistive material on the steel floor unit and the top of the gypsum board. The joint system shall consist of forming and fill materials, with or without a deflection channel (Item 3A), as follows:

A. Steel Roof Deck – Max 3 in. (76 mm) deep galv steel fluted roof deck.

B. Roof Insulation – Mineral and Fiber Board* – Min 3/4 in. (19 mm) thick boards applied in one or more layers directly over steel roof deck or over gypsum board sheathing laid atop steel roof deck.

C. Roof Covering* – Hot-mopped or cold-application materials compatible with mineral and fiber board insulation.

D. Structural Steel Support – Steel beam or open-web steel joist, as specified in the individual P700 or P800 Series Roof-Ceiling Design, used to support steel floor units. Structural steel support oriented parallel to and min 2 in. (51 mm) to max 6 in. (152 mm) from wall assembly.

E. Steel Lath – When structural steel support (Item 1D) consists of open-web steel joists, 3/8 in. (10 mm) diamond mesh expanded steel lath having a nom weight of 1.7 to 3.4 lb per sq yd (0.9 to 1.8 kg/m²) shall be installed to completely cover one side of each joist which is located within 6 in. (152 mm) of wall assembly. The lath shall be secured with steel tie wire and shall be fully covered with spray applied fire resistive material.

F. Spray-Applied Fire Resistive Material* – After installation of the ceiling runner (Item 2A) or deflection track (Item 3A, if used), steel roof deck and structural steel supports to be sprayed with a thickness of spray applied fire resistive material as specified in the individual P700 or P800 Series Roof-Ceiling design. The flutes of the steel deck above the structural steel supports and above the ceiling runner (Item 2A) or deflection channel (Item 3A) shall be filled with spray-applied fire resistive material. As an alternate, the spray-applied fire resistive material in the flutes above the ceiling runner may be applied to follow the contour of the steel roof deck. Excess material shall be removed from the flanges of the ceiling runner or deflection track beyond the required thickness of spray-applied fire resistive material on the steel roof deck.

TOTAL STEEL SOLUTIONS LLC – Snap Trak

BRADY CONSTRUCTION INNOVATIONS INC, DBA SLIPTRACK SYSTEMS – SLP-TRK

A2. Light Gauge Framing* – Clipped Ceiling Runner – As an alternate to the ceiling runner in Items 2A and 2A1, clipped runner to consist of galv steel channel with clips preformed in track flanges which positively engage the inside flange of the steel studs (Item 2B). Track sized to accommodate steel studs (Item 2B). Track flanges to be min 2-1/2 in. (64 mm). Clipped runner secured with steel fasteners spaced max 24 in. (610 mm) OC. When clipped ceiling runner is used, deflection channel (Item 3A) shall not be used.

The hourly fire rating of the joint system is equal to the hourly fire rating of the wall.
UL System No. HW-D-0384 (cont.)

A. **Deflection Channel** – (Optional, Not Shown) – Max 2 in. (51 mm) deep min 24 gauge galv steel channel sized to accommodate ceiling runner (Item 2A). Deflection channel to be installed parallel with structural steel support and located such that a max clearance of 4 in. (102 mm) is present between the finished wall and the spray-applied fire resistive material at the lowest elevation of the structural steel support. Deflection channel secured to steel floor units with steel fasteners or welds spaced max 24 in. (610 mm) OC. The ceiling runner (Item 2A) is installed within the deflection channel to maintain a max 1-1/4 in. (32 mm) gap between the top of the ceiling runner and the top of the deflection channel. The ceiling runner nests inside the deflection channel without attachment.

B. **Forming Material** – Nom 4 pcf (64 kg/m³) density mineral wool batt insulation. Sections of mineral wool batt cut to a width of 4 in. (102 mm) and stacked to attain a thickness which is 50 percent greater than the width of the linear gap between the spray applied fire resistive material on the structural steel member and the surface of the wall assembly. Stacked sections of mineral wool compressed 33 percent in thickness and installed cut edge first into linear gap until the bottom edge is flush with the bottom surface of the spray applied fire resistive material on the structural steel member. When the spray-applied fire resistive material in the flutes above the wall follows the contour of the steel deck, sections of mineral wool batt cut to the shape of the fluted deck and stacked to a min 6 in. (152 mm) thickness shall be installed in the flutes of the steel floor or roof deck between the top of the deflection channel and the spray-applied fire resistive material. The mineral wool batt insulation is to be installed flush with the gypsum board surface on the side of the wall opposite the structural steel support. Additional sections of mineral wool batt insulation are compressed 50 percent in thickness and are installed cut edge first to completely fill the gap above the top of the gypsum board.

ROCK WOOL MANUFACTURING CO – Delta Board

ROCKWOOL MALAYSIA SDN BHD – SAFE

ROCKWOOL – SAFE

THERMABRICK INC – SAF Mineral Wool

C. **Fill, Void or Cavity Material** – Sealant – Min 1/8 in. (3.2 mm) wet thickness or 1/16 in. (1.6 mm) dry thickness of fill material spray applied over the forming material on each side of the wall. Fill material to overlap a min of 1/2 in. (13 mm) onto the gypsum board and a min 2 in. (51 mm) onto the spray applied material (Item 1C) on the steel floor unit or on the structural steel support member on each side of the wall.

3M COMPANY – FireDam™ Spray 200

C1. **Fill, Void or Cavity Material** – Tape – As an alternate to Item C, Tape cut to size and press applied within fluted areas of joint to completely cover mineral wool lapping min 2 in. (51 mm) onto the contour of the protected steel floor units and extending to lap min 1 in. (25 mm) onto the gypsum wall. Additional pieces of Tape are applied along the joint to completely cover the remaining mineral wool between bottom of protected steel deck and top edge of wall along length of joint, lapping min 2 in. (51 mm) onto the contour of the protected steel floor units and min 1 in. (25 mm) onto the gypsum wall. Additional pieces of Tape to be applied to completely cover the mineral wool between structural support beam and face of wall, lapping min 2 in. (51 mm) onto sprayed structural beam and min 1 in. onto gypsum wall. Adjoining lengths of Tape shall overlap min 1/2 in. (13 mm).

3M COMPANY – 3M Fire and Water Barrier Tape

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

1. **Floor Assembly** – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual D700 or D800 Series Floor-Ceiling Design in the UL Fire Resistance Directory. The hourly fire rating of the floor assembly shall be equal to or greater than the hourly fire rating of the wall assembly. The floor assembly shall include the following construction features:

   A. **Steel Floor and Floor Units** – Max 3 in. (76 mm) deep galv steel fluted floor units.

   B. **Concrete** – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.

   C. **Structural Steel Support** – Steel beam or open-web steel joist, as specified in the individual D700 or D800 Series Floor-Ceiling Design, used to support steel floor units. Structural steel support oriented parallel to and min 2 in. (51 mm) to max 6 in. (152 mm) from wall assembly.

   D. **Steel Lath** – When structural steel support (Item 1C) consists of open-web steel joists, 3/8 in. (10 mm) diamond mesh expanded steel lath having a nom weight of 1.7 to 3.4 lb per sq yd (0.9 to 1.8 kg/m²) shall be installed to completely cover one side of each joist which is located within 6 in. (152 mm) of wall assembly. The lath shall be secured with steel tie wire and shall be fully covered with spray applied fire resistive material.

   E. **Spray-Applied Fire Resistive Material** – Steel floor units and structural steel supports to be sprayed with the thickness of material specified in the individual D700 or D800 Series Design. The flutes of the steel floor units above the structural steel supports shall be filled with spray-applied fire resistive material. The spray-applied fire resistive material in the flutes above the wall shall be applied to follow the contour of the steel floor units.

   **GCP APPLIED TECHNOLOGIES INC** – Type MK-6/HY

1A. **Roof Assembly** – (Not Shown) – As an alternate to the floor assembly (Item 1), a fire rated fluted steel deck roof assembly may be used. The roof assembly shall be constructed of the materials and in the manner described in the individual P700 or P800 Series Roof-Ceiling Design in the UL Fire Resistance Directory. The hourly fire rating of the roof assembly shall be equal to or greater than the hourly fire rating of the wall assembly. The roof assembly shall include the following construction features:

   A. **Steel Roof Deck** – Max 3 in. (76 mm) deep galv steel fluted roof deck.

   B. **Roof Insulation** – Mineral and Fiber Board** – Min 3/4 in. (19 mm) thick boards applied in one or more layers directly over steel roof deck or over gypsum board sheathing laid atop steel roof deck.

   C. **Roof Covering** – Hot-mopped or cold-application materials compatible with mineral and fiber board insulation.
2. Wall Assembly – Min 6 in. (152 mm) thick steel-reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete. Wall may also be constructed of any UL Classified Concrete Blocks*

See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

The hourly fire rating of the joint system is equal to the hourly fire rating of the wall assembly.

3. Joint System – Max separation between bottom plane of spray-applied fire resistive material on the steel floor unit and the top of the wall. The joint system shall consist of forming and fill materials, accommodate a max 50 percent compression or extension from its installed width as measured between the bottom plane of the spray-applied fire resistive material on the steel floor unit and the top of the wall. The joint system shall consist of forming and fill materials, as follows:

A. Forming Material* – Nom 4 pcf (64 kg/m³) density mineral wool batt insulation. Sections of mineral wool batt cut to a width of 4 in. (102 mm) and stacked to attain a thickness which is 50 percent greater than the width of the linear gap between the spray applied fire resistive material on the structural steel member and the surface of the wall assembly. Stacked sections of mineral wool compressed 33 percent in thickness and installed cut edge first into linear gap until the bottom edge is flush with the bottom surface of the spray applied fire resistive material on the structural steel member. On the opposite side of the wall, sections of mineral wool batt insulation cut to the width of the wall inserted edge-first between the top of the wall and the spray-applied fire resistive material on the valleys of the steel deck, compressed approx 50 percent in thickness beneath each valley and flush with the wall surface. Additional pieces of mineral wool batt cut to the shape of the steel deck flute, stacked to a min 6 in. (152 mm) thickness and installed in the flutes above the wall flush with the wall surface.

ROCK WOOL MANUFACTURING CO – Delta Board

ROCKWOOL MALAYSIA SDN BHD – SAFE

THERMABRANE INC – SAF Mineral Wool

B. Fill, Void or Cavity Material* – Sealant – Min 1/8 in. (3.2 mm) wet thickness or 1/16 in. (1.6 mm) dry thickness of fill material spray applied over the forming material on each side of the wall. Fill material to overlap a min of 1/2 in. (13 mm) onto the wall surface and a min of 2 in. (51 mm) onto the spray-applied fire resistive material on each side of the wall.

3M COMPANY – FireDam™ Spray 200

B1. Fill, Void or Cavity Material* – Tape – As an alternate to Item B, Tape cut to size and press applied within fluted areas of joint to completely cover mineral wool lapping min 2 in. (51 mm) onto the contour of the protected steel floor units and extending to lap min 1 in. (25 mm) onto the concrete wall. Additional pieces of Tape are applied along the joint to completely cover the remaining mineral wool between bottom of protected steel deck and top edge of wall along length of joint, lapping min 2 in. (51 mm) onto the contour of the protected steel floor units and min 1 in. (25 mm) onto the concrete wall. Additional pieces of Tape to be applied to completely cover the mineral wool between structural support beam and face of wall, lapping min 2 in. (51 mm) onto sprayed structural beam and min 1 in. onto face of concrete wall. Adjoining lengths of Tape shall overlap min 1/2 in. (13 mm).

3M COMPANY – 3M Fire and Water Barrier Tape

**System No. HW-D-0441**  
March 14, 2006  
Assembly Rating – 3 Hr  
Nominal Joint Width – 2 In.  
Class II Movement Capability – 13% Compression and Extension

1. **Floor Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete.

2. **Wall Assembly** – Min 5-1/4 in. (133 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete. Wall may also be constructed of any UL Classified Concrete Blocks*.  
See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

3. **Joint System** – Max separation between bottom of floor and top of wall (at time of installation of joint system) is 2 in. The joint system is designed to accommodate a max 13 percent compression or extension from its installed width. The joint system shall consist of the following:
   
   A. **Forming Material** – Min 4.0 pcf (64 kg/m³) mineral wool batt insulation installed in joint opening as a permanent form. Pieces of batt cut to min width of 4-1/4 in. (108 mm) and installed edge-first into joint opening, parallel with joint direction, such that batt sections are compressed min 50 percent in thickness and such that the compressed batt sections are recessed from both surfaces of wall to accommodate the required thickness of fill material.

1. **Floor Assembly** – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual D900 Series Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. **Steel Floor And Form Units** – Max 3 in. (76 mm) deep galv steel fluted floor deck.
   
   B. **Concrete** – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor deck.
   
   2. **Steel Straps** – Nom 2 in. (51 mm) wide min No. 20 gauge galv steel straps, spaced max 24 in. (610 mm) OC. Steel straps cut to overlap a min of 1-1/2 in. (38 mm) onto two adjacent valleys of floor deck and secured using min 1-1/4 in. (32 mm) long steel fasteners with steel fender washers at each end. When optional isolation pads (Item 4D) are used, continuous min No. 20 gauge galv steel backing plate(s) may be substituted for the steel straps. Backing plate(s) to overlap a min of 1-1/2 in. (38 mm) onto valleys of floor deck and secured using min 1-1/4 in. (32 mm) long steel fasteners with steel fender washers spaced max 24 in. (610 mm) OC.
   
   3. **Wall Assembly** – The 2 hr fire rated double steel stud/gypsum board wall assembly shall be constructed of the materials and in the manner described in the individual U400 or V400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. **Steel Floor And Ceiling Runners** – Floor and ceiling runners of wall assembly shall consist of galv steel channels sized to accommodate steel studs (Item 3B). When deflection channels (Item 4A) are used, ceiling runners to be provided with 3 in. (76 mm) flanges. Ceiling runners installed within the deflection channels with 2 in. (51 mm) gap maintained between the top of ceiling runner and top of deflection channel. When deflection channels are not used, flange height of ceiling runners shall be min 3/4 in. (19 mm) greater than nom joint width. Ceiling runners installed parallel with direction of fluted steel floor units and secured to steel straps (Item 2) with two No. 8 self-drilling, self-tapping steel screws per strap.
   
   B. **Studs** – Steel studs to be min 3-1/2 in. (89 mm) wide. Studs cut 1/2 to 2 in. (13 to 51 mm) less in length than assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. Opposing studs to align. Stud spacing not to exceed 24 in. (610 mm) OC.
   
   C. **Bracing** – Cut from pieces of steel channel or gypsum board and screw-attached to opposing studs as specified in the individual Wall and Partition Design.
   
   D. **Gypsum Board** – Gypsum board sheets installed to a min total thickness of 1-1/4 in. (32 mm) on each side of wall. Wall to be constructed as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a max 2 in. (51 mm) gap shall be maintained between the top of the gypsum board and the bottom of the steel floor roof deck and the top row of screws shall be installed into the studs 4-1/2 in. (114 mm) below the lower surface of the floor or roof deck.
4. **Joint System** – Max separation between bottom of floor and top of wall is 2 in. (51 mm). The joint system is designed to accommodate a max 25 percent compression or extension from its installed width. The joint system consists of optional deflection channels, forming material and a fill material, as follows:

**A. Deflection Channel** (optional, not shown) – Nom 3-5/8 in. (92 mm) wide by 3 in. (76 mm) deep min 24 gauge steel U-shaped channels. Deflection channels installed parallel with direction of fluted steel floor units and secured to steel straps (Item 2) with two No. 8 self-drilling, self-tapping steel screws per strap. The ceiling runner (Item 3A) is installed within the deflection channel to maintain a max 2 in. (51 mm) gap between the top of the ceiling runner and the top of the deflection channel. The ceiling runner is not fastened to the deflection channel.

**B. Forming Material** – Min 4 pcf (64 kg/m³) density mineral wool batt insulation installed to entirely fill the flutes of the steel floor units above the steel straps or steel backing plates. Mineral wool cut into strips having an approximate width equal to that of the flute, stacked as needed and then compressed 50 percent in thickness into the flute. Butted end seams of mineral wool strips to be centered over steel straps. Additional 1-1/4 in. (32 mm) wide sections of mineral wool batt insulation are compressed 50 percent in thickness and installed cut edge first to completely fill the gap above the top of the gypsum board. The forming material shall be installed flush with both surfaces of wall.

**INDUSTRIAL INSULATION GROUP LLC** – MinWool-1200 Safing

**JOHNS MANVILLE** – Safing

**ROCK WOOL MANUFACTURING CO** – Delta Board or Delta-8

**ROCKWOOL MALAYSIA SDN BHD** – Type Safe

**ROXUL INC** – Type Safe

**THERMAFIBER INC** – Type SAF

**C. Fill, Void or Cavity Material** – Min 1/16 in. (1.6 mm) dry thickness (1/8 in. or 3.2 mm wet thickness) of fill material sprayed or brushed on each side of the wall to completely cover mineral wool and steel straps or steel backing plates and to overlap a min of 1/2 in. (13 mm) onto gypsum board and steel deck on both sides of wall.

**3M COMPANY** – FireDam™ Spray 200

**Cl. Fill, Void or Cavity Material** – Tape – As an alternate to Item C, Tape cut to size and press applied to completely cover mineral wool between bottom of steel floor units and top of wall, lapping min 1 in. (25 mm) onto the gypsum wall and extending to cover the exposed mineral wool within the flutes and lapping min 1 in. (25 mm) onto the contour of the steel floor units min. Tape shall be applied in min 1 ft (305 mm) lengths along the joint and adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

**3M COMPANY** – 3M Fire and Water Barrier Tape

**D. Isolation Pads** (optional, not shown) – As an option, max 1/2 in. (13 mm) thick molded high density glass fiber isolation pads may be installed between the deflection channels (Item 3A) and the steel straps (Item 2) for sound control purposes. The isolation pads shall be cut to the width of each deflection channel and shall be installed along the entire length of the wall. When the isolation pads are used, the deflection channels shall be secured to the steel deck, through the isolation pads and steel straps or steel backing plates, with mechanical fasteners in conjunction with steel fender washers and neoprene isolation grommets supplied by the maker of the isolation pad material.

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

**CONFIGURATION A**

**CONFIGURATION B**
1. Floor Assembly – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual D700 Series Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:

A. Steel Floor And Floor Units* – Max 3 in. (76 mm) deep galv steel fluted floor units.

B. Concrete – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.

C. Structural Steel Support – Steel beam, as specified in the individual D700 Series Floor-Ceiling Design, used to support steel floor units. Steel beam centered over and parallel with wall assembly.

D. Spray-Applied Fire Resistive Material* – After installation of the steel attachment clips (Item 2B), steel floor units and structural steel support to be sprayed with the min thickness of material specified in the individual D700 Series Design. The flutes of the steel floor units are to be filled with material across the entire top flange of the steel beam. Additional material shall be applied to the web of the steel beam on each side of the wall. For a 1 hr Assembly, F, FT, FH and FTH Rating, the thickness of material applied to each side of the steel beam web shall be 13/16 in. (21 mm). For a 2 hr Assembly, F, FT, FH and FTH Rating, the thickness of material applied to each side of the steel beam web shall be 1-3/8 in. (35 mm). For a 3 hr Assembly, F, FT, FH and FTH Rating, the thickness of material applied to each side of the steel beam web shall be 3-1/16 in. (78 mm). For a 4 hr Assembly, F, FT, FH and FTH Rating, the thickness of material applied to each side of the steel beam web shall be 4-7/16 in. (113 mm).

GCP APPLIED TECHNOLOGIES INC – Type MK-6/HY

Joint Configuration A

2. Wall Assembly – The 1, 2, 3 or 4 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner described in the individual U400 or V400 Series Wall or Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

A. Steel Floor and Ceiling Runners – Floor runners of wall assembly shall consist of galv steel channels sized to accommodate steel studs (Item 2B). Ceiling runner flange height to be min 1/2 in. (13 mm) greater than joint width at max anticipated extension. When deflection channel (Item 3A) is used, flange height of ceiling runner is to be equal to or greater than flange height of deflection channel and the ceiling runner is to nest within the deflection channel with a max 1-1/4 (32 mm) gap maintained between the top of the ceiling runner and the top of the deflection channel. When deflection channel is not used, ceiling runner is secured to steel beam (Item 1A) with steel attachment clips (Item 2B) spaced max 24 in. (610 mm) OC. Ceiling runner or deflection channel to be centered beneath and parallel with bottom flange of steel beam. A clearance equal to the required thickness of spray-applied fire resistive material (Item 1D) shall be maintained between the top of the ceiling runner or deflection channel and the bottom flange of the steel beam.

B. Steel Attachment Clips – Z-shaped clips formed from min 1 in. (25 mm) wide strips of min 16 ga galv steel. Clips to be sized to extend through the thickness of the spray-applied fire resistive material on the bottom flange of the steel beam with 2 in. (51 mm) long upper and lower legs. Clips to be installed perpendicular to steel beam direction. Legs of clips fastened to center of the steel beam bottom flange and to top center of ceiling runner (or deflection channel) prior to application of spray-applied fire resistive materials using steel fasteners or welds. Clips spaced max 16 in. (406 mm) OC.

C. Studs – Steel studs to be min 3-5/8 in. (92 mm) wide. Studs cut max 1-1/4 in. (32 mm) less in length than assembly height to accommodate max anticipated compression of joint width with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. Stud spacing not to exceed 24 in. (610 mm) OC. When deflection channel (Item 3A) is used, stud spacing not to exceed 24 in. (610 mm) OC. When deflection channel (Item 3A) is used, steel studs attached to ceiling runner (Item 2A) with sheet metal screws located 1/2 in. (13 mm) below the bottom of the deflection channel. When deflection channel is not used, studs to nest in ceiling runner without attachment.

D. Gypsum Board* – Gypsum board sheets installed to a min total 5/8 in. (16 mm), 1-1/4 in. (32 mm), 1-7/8 in. (48 mm) or 2-1/2 in. (64 mm) thickness on each side of wall for 1, 2, 3 and 4 hr fire rated assemblies, respectively. Wall to be constructed in accordance with the individual U400 or V400 Series Wall and Partition Design in the UL Fire Resistance Directory except that a max 2 in. (51 mm) high gap shall be maintained between the top of the gypsum board and the bottom plane of the spray applied fire resistive material on the bottom flange of the steel beam. The screws attaching the gypsum board to the studs along the top of the wall shall be located 1 in. (25 mm) below the bottom of the ceiling runner. No gypsum board attachment screws shall be driven into the ceiling runner or into the optional deflection channel.

The hourly Assembly, F, FT, FH and FTH R ratings of the joint system are equal to the hourly fire rating of the wall.

3. Joint System – Max separation between spray applied fire resistive material on bottom of steel beam and top of gypsum board (at time of installation of joint system) is 2 in. (51 mm). The joint system is designed to accommodate a max 50 percent compression or extension from its installed width as measured between the bottom plane of the protective material on the steel beam and the top of the gypsum board. The joint system shall consist of forming and fill materials, with or without a deflection channel (Item 3A), as follows:

A. Deflection Channel – (Optional, Not Shown) - Max 2 in. (51 mm) deep min 24 gauge galv steel channel sized to accommodate ceiling runner (Item 2A). Deflection channel installed parallel with and centered beneath bottom flange of steel beam (Item 1C) and secured to steel beam with steel attachment clips (Item 2B) spaced max 16 in. (406 mm) OC. The ceiling runner (Item 2A) is installed within the deflection channel to maintain a max 1-1/4 (32 mm) gap between the top of the ceiling runner and the top of the deflection channel. A clearance equal to the required thickness of spray-applied fire resistive material (Item 1D) shall be maintained between the top of the ceiling runner or deflection channel and the bottom flange of the steel beam. The ceiling runner nests inside the deflection channel without attachment.
B. Forming Material* – Sections of min 4 pcf (64 kg/m²) mineral wool batt insulation to be compressed 33 percent in thickness and installed cut-edge first to completely fill the gap between the spray-applied fire resistive material and the top of the gypsum board. The forming material shall be installed flush with both surfaces of wall.

INDUSTRIAL INSULATION GROUP L L C – MinWool-1200 Safing
JOHNS MANVILLE – Safing
ROCK WOOL MANUFACTURING CO – Delta Board
ROCKWOOL MALAYSIA SDN BHD – SAFE
ROCKWOOL – SAFE
THERMAFIBER INC – SAF

C. Fill, Void or Cavity Material* - Sealant – Min 1/8 in. (3.2 mm) wet thickness or 1/16 in. (1.6 mm) dry thickness of fill material spray applied over the forming material on each side of the wall. Fill material to overlap min 1 in. (25 mm) onto the gypsum board and onto the spray applied fire resistive material on both sides of wall.

3M COMPANY – FireDam Spray 200

C1. Fill, Void or Cavity Material* – Tape – As an alternate to Item C, Tape cut to size and press applied to completely cover mineral wool forming material, lapping min 1 in. (25 mm) onto the gypsum wall and min 2 in. (51 mm) onto the sprayed structural support beam. Tape shall be applied in min 1 ft (305 mm) lengths along the joint and adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

3M COMPANY – 3M Fire and Water Barrier Tape
1. **Floor Assembly** – The fire rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Floor And Form Units** – Max 3 in. (76 mm) deep fluted galv steel deck.
   
   B. **Concrete** – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.

2. **Wall Assembly** – The 2 hr fire rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400 or V400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Floor And Ceiling Runners** – Floor and ceiling runners of wall assembly shall consist of min 25 ga galv steel channels sized to accommodate steel studs (Item 2B). Ceiling runner to be provided with min 3 in. (76 mm) flanges. Ceiling runner installed parallel with direction of fluted steel deck with one side in contact with deck valley and with opposite side cantilevered minimum 1-1/2 in. (38 mm) beyond deck valley. Ceiling runner secured to valley of deck with steel anchors or welds spaced max 24 in. (610 mm) OC. Ceiling runner additionally secured to crest of deck in conjunction with steel attachment clips (Item 2B).
   
   B. **Steel Attachment Clips** – Z-shaped clips formed from min 1 in. (25 mm) wide strips of min 16 ga galv steel. Height of clip to be equal to depth of steel deck. Legs of clip to be sized to lap min 1 in. (25 mm) on crest of steel deck and min 1 in. (25 mm) on top of steel ceiling runner. Web of clip to be parallel and flush with side edge of ceiling runner. Legs of clips fastened to crest of the steel deck and to the top of the ceiling runner (or deflection channel) prior to application of spray-applied fire resistive materials using steel fasteners or welds. Clips spaced max 6 in. (152 mm) OC.
   
   C. **Studs** – Steel studs to be min 3-1/2 in. (89 mm) wide. Studs cut 1/2 to 3/4 in. (13 to 19 mm) less in length than assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. Stud spacing not to exceed 24 in. (610 mm) OC.
   
   D. **Gypsum Board** – Gypsum board sheets installed to a min total thickness of 1-1/4 in. (32 mm) on each side of wall. Wall to be constructed as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a max 2 in. (51 mm) gap shall be maintained between the top of the gypsum board and the bottom plane of the steel floor deck and the top row of screws shall be installed into the studs 1 in. (25 mm) below the bottom of the ceiling runner.

3. **Joint System** – Max separation between bottom plane of steel deck floor and top of gypsum board is 2 in. (51 mm). The joint system is designed to accommodate a max 25 percent compression or extension from its installed width. The joint system consists of the following:

   A. **Forming Material** – The flute area of the steel deck above the cantilevered ceiling runner is to be tightly packed with min 4 pcf (64 kg/m³) mineral wool batt insulation inserted cut-edge first and compressed min 33 percent in thickness. Nom 1-1/4 in. (32 mm) thick strips of min 4 pcf (64 kg/m³) mineral wool batt insulation to be cut to a width which is 1 in. (25 mm) greater than the vertical distance between the top of the gypsum board and the steel deck on each side of the wall. Mineral wool strips to be compressed in width and installed to fill the gap between the top of the gypsum board and the bottom of the steel floor deck flush with the wall surface on each side of the wall.

**INDUSTRIAL INSULATION GROUP LLC** – MinWool-1200 Safing

**JOHNS MANVILLE** – Safing
ROCK WOOL MANUFACTURING CO – Delta Board or Delta -8
ROCKWOOL MALAYSIA SDN BHD – Type Safe

1. **Floor Assembly** – The fire rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Floor And Form Units** – Max 3 in. (76 mm) deep fluted galv steel deck.

   B. **Concrete** – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.

2. **Wall Assembly** – Min 6-1/8 in. (156 mm) thick steel-reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. Wall assembly to be installed parallel with fluted steel floor deck with a min of 2 in. (51 mm) of the wall thickness beneath valley of deck.

   See **Concrete Blocks** (CAZT) category in the Fire Resistance Directory for names of manufacturers

3. **Joint System** – Max separation between bottom plane of steel deck floor and top of wall is 2 in. (51 mm). The joint system is designed to accommodate a max 25 percent compression or extension from its installed width. The joint system consists of the following:

   A. **Forming Material** – The area between the top of the wall and the steel deck is to be tightly packed with min 4 pcf (64 kg/m³) mineral wool batt insulation inserted cut-edge first and compressed min 33 percent in thickness. The forming material is to be recessed 1-1/4 in. (32 mm) from each surface of the wall to accommodate vertically-oriented strips of forming material. Nom 1-1/4 in. (32 mm) thick strips of min 4 pcf (64 kg/m³) mineral wool batt insulation to be cut to a width which is 1 in. (25 mm) greater than the vertical distance between the top of the wall and the steel deck on each side of the wall. Mineral wool strips to be compressed in width and installed to fill the gap between the top of the wall and the bottom of the steel floor deck flush with the wall surface on each side of the wall.

   **INDUSTRIAL INSULATION GROUP LLC** – MinWool-1200 Safing

   **JOHNS MANVILLE** – Safing

   **ROCK WOOL MANUFACTURING CO** – Delta Board or Delta -8

   **ROCKWOOL MALAYSIA SDN BHD** – Type Safe

   **ROXUL INC** – Type Safe

   **THERMAFIBER INC** – Type SAF

   B. **Fill, Void or Cavity Material** – Sealant – Min 1/8 in. (3.2 mm) wet thickness or 1/16 in. (1.6 mm) dry thickness of fill material spray applied over the forming material on each side of the wall. Fill material to overlap min 2 in. (51 mm) onto steel deck and min 1 in. (25 mm) onto the wall surface on both sides of the wall.

   **3M COMPANY**

   **3M FIRE PROTECTION PRODUCTS** – FireDam 200 Spray

   B1. **Fill, Void or Cavity Material** – Tape – As an alternate to Item B, Tape cut to size and press applied over the mineral wool forming material and lapping min 1 in. (25 mm) onto the steel floor units and concrete wall. Tape applied in minimum 1 ft (305 mm) lengths along joint and adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

   **3M COMPANY** – 3M Fire and Water Barrier Tape

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

Reprinted from the Online Certifications Directory with permission from UL©
1. **Roof-Ceiling Assembly** – The fire rated roof-ceiling assembly shall be constructed of the materials and in the manner described in the individual P200 or P500 Series Roof-Ceiling Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Purlin** – Min 16 ga coated steel. Max spacing as specified in the individual **Roof-Ceiling Design**.

   B. **Lateral Bracing** – (Not Shown) – As required.

   C. **Batts and Blankets** – Insulation – Any faced compressible glass-fiber blanket insulation having a min 6 in. (152 mm) thickness before compression and a min density of 0.6 pcf (9.6 kg/m³). Insulation draped over purlins prior to installation of panel clips (Item 1F) and/or metal roof deck panels (Item 1D). Side edges of the batts shall be butted or overlapped a max of 3 in. (76 mm).

      See **Batts and Blankets** (BZJZ) category in the UL Fire Resistance Directory or **Batts and Blankets** (BKNV) category in the UL Building Materials Directory for names of manufacturers.

   D. **Metal Roof Deck Panels** – Min 26 ga coated steel. Panels continuous over two or more spans. Roof panel end laps, if required, centered over purlins with min 3 in. (76 mm) panel overlap as specified in the individual **Roof-Ceiling Design**. A line of tube sealant or tape sealant may be used at panel end and side laps.

      See **Metal Roof Deck Panels** (TJPV) category in the UL Roofing Materials and Systems Directory for names of manufacturers.

   E. **Fasteners** – Fasteners used for panel-to-purlin and panel-to-panel connections to be self-tapping, hex-head, plated steel or stainless steel screws with either an integral or a separate steel washer fitted with a compressible sealing washer. Fastener type, length, pilot hole diam and spacing to be as specified in the individual **Roof-Ceiling Design**.

   F. **Roof Deck Fasteners** – Panel Clips – (Not Shown) – Panel clips used for panel-to-purlin connections to be secured to purlin through insulation as specified in the individual **Roof-Ceiling Design**.

      See **Roof Deck Fasteners** (TLSX) category in the UL Roofing Materials and Systems Directory for names of manufacturers.

   G. **Thermal Spacer Blocks** – (Not Shown) – Expanded polystyrene strips cut to fit between panel clips (Item 1F) as specified in the individual **Roof-Ceiling Design**. Thermal spacer blocks, when used, are to be installed between insulation (Item 1C) and metal roof deck panels (Item 1D) over purlins.

   H. **Ceiling Membrane** – The Steel Framing Members*, Acoustical Material*, Gypsum Board* and other ceiling membrane components shall be as specified in the individual **Roof-Ceiling Design**.

2. **Wall Assembly** – The 1 h fire-rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 or V400 Series **Wall and Partition Design** in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Ceiling Deflection Channel** – U-shaped channel formed from min 16 ga steel sized to accommodate steel studs (Item 2C) and provided with 5 in. (127 mm) flanges. Deflection channel installed parallel with and aligned with web of purlin and secured to bottom flange of purlin with min No. 14 self-tapping, hex-head, plated steel or stainless steel screws spaced max 24 in. (610 mm) OC.

   B. **Steel Floor and Ceiling Runners** – Floor runner of the wall assembly and the floor and ceiling runners of the cripple wall above the wall assembly shall consist of min 1-1/4 in. (32 mm) deep min 25 ga galv steel channels sized to accommodate steel studs (Item 2C). Floor runner of cripple wall aligned with and resting atop flange of purlin. Ceiling runner of cripple wall installed to compress insulation (Item 1C) to min thickness of 3/8 in. (10 mm) by wedging lengths of stud (Item 2C) between the runners. Steel studs of cripple wall attached to web of purlin with steel screws driven through opposite side of purlin web.

   C. **Studs** – Steel studs to be min 3-1/2 in. (89 mm) wide. Studs cut max 2 in. (51 mm) less in length than assembly height with bottom nesting in and resting on the floor runner and with top nesting in ceiling deflection channel without attachment. Width of stud to be equal to or greater than width of purlin flange. Stud spacing not to exceed 24 in. (610 mm) O.C. Studs of cripple wall cut to length as required to compress insulation (Item 1C) to min thickness of 3/8 in. (10 mm) and spaced max 24 in. (610 mm) OC.
System No. HW-D-0488 continued

D. **Gypsum Board** – Min 5/8 in. (16 mm) thick gypsum board sheets installed on each side of wall. Wall to be constructed as specified in the individual U400 or V400 Series Design in the UL Fire Resistance Directory except that a max 2 in. wide gap shall be maintained between the gypsum board of the wall assembly below the purlin and the gypsum board of the cripple wall. Top edge of gypsum board of wall assembly to be max 2 in. (51 mm) below top of ceiling deflection channel. Bottom edge of gypsum board of cripple wall to be flush with top of ceiling deflection channel. Screws securing gypsum board to steel studs of wall assembly to be located 2-1/4 in. to 2-1/2 in. (57 to 64 mm) below flange of ceiling deflection channel. Screws securing gypsum board of cripple wall to be driven into web of purlin and into studs and runners of cripple wall. No screws are to be driven into flanges of ceiling deflection channel.

E. **Gypsum Board** – Min 5/8 in. (16 mm) thick “rip strip” of gypsum board installed to cover first layer of gypsum board on cripple wall and to lap min 3 in. (76 mm) onto gypsum board of wall assembly on each side of wall. The “rip strip” of gypsum board is to be the same material used for the wall assembly and is to be secured to the web of purlin and into studs and runners of the cripple wall. No screws are to be driven into flanges of ceiling deflection channel. Joints of “rip strip” to be offset from joints of gypsum board on wall assembly.

Max separation between top of wall assembly gypsum board and bottom of cripple wall gypsum board (at time of installation of joint system) is 2 in. (51 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width.

3. **Fill, Void or Cavity Material** – Caulk – Min 5/8 in. (16 mm) thickness of fill material installed to fill any gap between top of cripple wall gypsum board and insulation (Item 1C) or purlin flange on each side of the wall.

   E. **Fasteners** – Fasteners used for panel-to-purlin and panel-to-panel connections to be self-tapping, hex-head, plated steel or stainless steel screws with either an integral or a separate steel washer fitted with a compressible sealing washer. Fastener type, length, pilot hole diam and spacing to be as specified in the individual Roof-Ceiling Design.

   F. **Roof Deck Fasteners** – Panel Clips – (Not Shown) – Panel clips used for panel-to-purlin connections to be secured to purlin through insulation as specified in the individual Roof-Ceiling Design.

      See **Roof Deck Fasteners (TLSX)** category in the UL Roofing Materials and Systems Directory for names of manufacturers.

   G. **Thermal Spacer Blocks** – (Not Shown) – Expanded polystyrene strips cut to fit between panel clips (Item 1F) as specified in the individual Roof-Ceiling Design. Thermal spacer blocks, when used, are to be installed between insulation (Item 1C) and metal roof deck panels (Item 1D) over purlins.

   H. **Ceiling Membrane** – The Steel Framing Members, Acoustical Material, Gypsum Board and other ceiling membrane components shall be as specified in the individual Roof-Ceiling Design.

2. **Wall Assembly** – The 1 h fire-rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 or V400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Ceiling Deflection Channel** – U-shaped channel formed from min 16 ga steel sized to accommodate steel studs (Item 2D) and provided with 5 in. (127 mm) flanges. Deflection channel installed perpendicular to purlins and secured to bottom flange of purlins with min No. 14 self-tapping, hex-head, plated steel or stainless steel screws.

   B. **Steel Floor and Ceiling Runners** – Floor runner of the wall assembly and the floor and ceiling runners of the cripple wall above the wall assembly shall consist of min 1-1/4 in. (32 mm) deep min 25 ga galv steel channels sized to accommodate steel studs (Item 2D). Floor runner of cripple wall aligned with and screw-attached to top of ceiling deflection channel. Ceiling runner of cripple wall installed to compress insulation (Item 1C) to min thickness of 3/8 in. (10 mm) by wedging lengths of stud (Item 2D) between the runners. Steel studs of cripple wall attached to each side of purlin web and to floor and ceiling runners with steel screws.

   C. **Batts and Blankets** – Packing Material – Unfaced compressible mineral wool batt insulation having a nom 2 in. (51 mm) thickness before compression and a nom density of 4 pcf (64 kg/m³). Strips of nom 2 in. (51 mm) thick batt cut to width of cripple wall ceiling runner and compressed min 50 percent in thickness between cripple wall ceiling runner and insulation (Item 1C). Compression of mineral wool batt packing material to result in compression of insulation (Item 1C) to nominal 3/8 in. (10 mm) thickness.

      See **Batts and Blankets (BZJZ)** category in the UL Fire Resistance Directory or **Batts and Blankets (BKNV)** category in the UL Building Materials Directory for names of manufacturers.
D. **Studs** – Steel studs to be min 3-1/2 in. (89 mm) wide. Studs cut max 2 in. (51 mm) less in length than assembly height beneath purlins with bottom nesting in and resting on the floor runner and with top nesting in ceiling deflection channel without attachment. Stud spacing not to exceed 24 in. (610 mm) O.C. Studs of cripple wall cut to length as required to compress packing material (Item 2C) and insulation (Item 1C) to min thicknesses of 1 in. (25 mm) and 3/8 in. (10 mm), respectively. Studs spaced max 24 in. (610 mm) O.C.

E. **Gypsum Board** – Min 5/8 in. (16 mm) thick gypsum board sheets installed on each side of wall. Wall to be constructed as specified in the individual U400 or V400 Series Design in the UL Fire Resistance Directory except that a max 2 in. wide gap shall be maintained between the gypsum board of the wall assembly below the purlin and the gypsum board of the cripple wall. Top edge of gypsum board of wall assembly to be max 2 in. (51 mm) below top of ceiling deflection channel. Bottom edge of gypsum board of cripple wall to be flush with top of ceiling deflection channel. Screws securing gypsum board to steel studs of wall assembly to be located 2-1/4 in. to 2-1/2 in. (57 to 64 mm) below flange of ceiling deflection channel. Screws securing gypsum board of cripple wall to be driven into studs and runners of cripple wall. No screws are to be driven into flanges of ceiling deflection channel.

F. **Gypsum Board** – Min 5/8 in. (16 mm) thick “rip strip” of gypsum board installed to cover first layer of gypsum board on cripple wall and to lap min 3 in. (76 mm) onto gypsum board of wall assembly on each side of wall. The “rip strip” of gypsum board is to be the same material used for the wall assembly and is to be secured to the studs and runners of the cripple wall. No screws are to be driven into flanges of ceiling deflection channel. Joints of “rip strip” to be offset from joints of gypsum board on wall assembly. Max separation between top of wall assembly gypsum board and bottom of cripple wall gypsum board (at time of installation of joint system) is 2 in. (51 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width.

3. **Fill, Void or Cavity Material** – **Caulk** – Min 5/8 in. (16 mm) thickness of fill material installed to fill any gap between top of cripple wall gypsum board and insulation (Item 1C) on each side of the wall. Additional caulking installed to fill annular space between purlin and gypsum board “rip strip” (Item 2F) on both sides of wall. Additional nom 1/2 in. (13 mm) diam bead of caulk to be applied around perimeter of purlin at its interface with the “rip strip” on each side of the wall.

1. **Roof-Ceiling Assembly** – The fire rated roof-ceiling assembly shall be constructed of the materials and in the manner described in the individual P200 or P500 Series Roof-Ceiling Designs in the UL Roofing Materials and Systems Directory and shall include the following construction features:

   A. **Purlin** – (Not Shown) – Min 16 ga coated steel. Max spacing as specified in the individual Roof-Ceiling Design.

   B. **Lateral Bracing** – Min 16 ga coated steel strap, channel, angle or other structural shape installed where required for lateral support of studs. Attached to steel purlins on each side of wall assembly with welds or with min No. 14 self-tapping, hex-head, plated steel or stainless steel screws.

   C. **Batts and Blankets** – Insulation – Any faced compressible glass-fiber blanket insulation having a min 6 in. (152 mm) thickness before compression and a min density of 0.6 pcf (9.6 kg/m³). Insulation draped over purlins prior to installation of panel clips (Item 1F) and/or metal roof deck panels (Item 1D). Side edges of the batts shall be butted or overlapped a max of 3 in. (76 mm).

   See **Batts and Blankets (BZJZ)** category in the UL Fire Resistance Directory or **Batts and Blankets (BKNV)** category in the UL Building Materials Directory for names of manufacturers.

   D. **Metal Roof Deck Panels** – Min 26 ga coated steel. Panels continuous over two or more spans. Roof panel end laps, if required, centered over purlins with min 3 in. (76 mm) panel overlap as specified in the individual Roof-Ceiling Design. A line of tube sealant or tape sealant may be used at panel end and side laps.

   See **Metal Roof Deck Panels (TJPV)** category in the UL Roofing Materials and Systems Directory for names of manufacturers.

   E. **Fasteners** – Fasteners used for panel-to-purlin and panel-to-panel connections to be self-tapping, hex-head, plated steel or stainless steel screws with either an integral or a separate steel washer fitted with a compressible sealing washer. Fastener type, length, pilot hole diam and spacing to be as specified in the individual Roof-Ceiling Design.

   F. **Roof Deck Fasteners** – Panel Clips – (Not Shown) - Panel clips used for panel-to-purlin connections to be secured to purlin through insulation as specified in the individual Roof-Ceiling Design.

   See **Roof Deck Fasteners (TLSX)** category in the UL Roofing Materials and Systems Directory for names of manufacturers.

   G. **Thermal Spacer Blocks** – (Not Shown) – Expanded polystyrene strips cut to fit between panel clips (Item 1F) as specified in the individual Roof-Ceiling Design. Thermal spacer blocks, when used, are to be installed between insulation (Item 1C) and metal roof deck panels (Item 1D) over purlins.

   H. **Ceiling Membrane** – The Steel Framing Members*, Acoustical Material*, Gypsum Board* and other ceiling membrane components shall be as specified in the individual Roof-Ceiling Design.

2. **Wall Assembly** – The 1 h fire-rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 or V400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Ceiling Deflection Channel** – U-shaped channel formed from min 16 ga steel sized to accommodate steel studs (Item 2D) and provided with 5 in. (127 mm) flanges. Deflection channel installed parallel with and between purlins and secured to lateral bracing (Item 1B) with min No. 14 self-tapping, hex-head, plated steel or stainless steel screws.

   B. **Steel Floor and Ceiling Runners** – Floor runner of the wall assembly and the floor and ceiling runners of the cripple wall above the wall assembly shall consist of min 1-1/4 in. (32 mm) deep min 25 ga galv steel channels sized to accommodate steel studs (Item 2D). Floor runner of cripple wall aligned with and screw-attached to top of ceiling deflection channel. Ceiling runner of cripple wall installed to compress insulation (Item 1C) and packing material (Item 2C) to min thickness of 3/8 in. (10 mm) and 1 in. (25 mm), respectively, by wedging lengths of steel (Item 2D) between the runners. Steel studs of cripple wall attached to floor and ceiling runners with steel screws.
System No. HW-D-0490 continued

C. **Batts and Blankets** – Packing Material – Unfaced compressible mineral wool batt insulation having a nom 2 in. (51 mm) thickness before compression and a nom density of 4 pcf (64 kg/m³). Strips of nom 2 in. (51 mm) thick batt cut to width of cripple wall ceiling runner and compressed min 50 percent in thickness between cripple wall ceiling runner and insulation (Item 1C). Compression of mineral wool batt packing material to result in compression of insulation (Item 1C) to nominal 3/8 in. (10 mm) thickness. When width of metal roof deck panels (Item 1D) rib exceeds 2 in. (51 mm).

See **Batts and Blankets** (BZIZ) category in the UL Fire Resistance Directory or **Batts and Blankets** (BKNV) category in the UL Building Materials Directory for names of manufacturers.

D. **Studs** – Steel studs to be min 3-1/2 in. (89 mm) wide. Studs cut max 2 in. (51 mm) less in length than assembly height beneath purlins with bottom nesting in and resting on the floor runner and with top nesting in ceiling deflection channel without attachment. Stud spacing not to exceed 24 in. (610 mm) O.C. Studs of cripple wall cut to length as required to compress packing material (Item 2C) and insulation (Item 1C) to min thicknesses of 1 in. (25 mm) and 3/8 in. (10 mm), respectively. Studs spaced max 24 in. (610 mm) O.C.

E. **Gypsum Board** – Min 5/8 in. (16 mm) thick gypsum board sheets installed on each side of wall. Wall to be constructed as specified in the individual U400 or V400 Series Design in the UL Fire Resistance Directory except that a max 2 in. wide gap shall be maintained between the gypsum board of the wall assembly and the gypsum board of the cripple wall. Top edge of gypsum board of wall assembly to be max 2 in. (51 mm) below top of ceiling deflection channel. Bottom edge of cripple wall gypsum board to be flush with top of ceiling deflection channel. Screws securing gypsum board to steel studs of wall assembly to be located 2-1/4 in. to 2-1/2 in. (57 to 64 mm) below flange of ceiling deflection channel. Screws securing gypsum board of cripple wall to be driven into studs and runners of cripple wall. No screws are to be driven into flanges of ceiling deflection channel.

F. **Gypsum Board** – Min 5/8 in. (16 mm) thick “rip strip” of gypsum board installed to cover first layer of gypsum board on cripple wall and to lap min 3 in. (76 mm) onto gypsum board of wall assembly on each side of wall. The “rip strip” of gypsum board is to be the same material used for the wall assembly and is to be secured to the studs and runners of the cripple wall. No screws are to be driven into flanges of ceiling deflection channel. Joints of “rip strip” to be offset from joints of gypsum board on wall assembly.

Max separation between top of wall assembly gypsum board and bottom of cripple wall gypsum board (at time of installation of joint system) is 2 in. (51 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width.

3. **Fill, Void or Cavity Material** – **Caulk** – Min 5/8 in. (16 mm) thickness of fill material installed to fill any gap between top of cripple wall gypsum board and insulation (Item 1C) on each side of wall. Additional caulk installed to fill annular space between lateral bracing and gypsum board “rip strip” (Item 2F) on both sides of wall. Additional nom 1/2 in. (13 mm) diam bead of caulk to be applied around perimeter of lateral brace at its interface with the “rip strip” on each side of the wall.

1. **Floor Assembly** – Min 4-1/2 in. (114 mm) thick lightweight or normal weight (100-150pcf or 1600-2400 kg/m³) concrete.

2. **Wall Assembly** – The 1 or 2 hr fire rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400 or V400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Floor And Ceiling Runners** – Floor and ceiling runners of wall assembly shall consist of galv steel channels sized to accommodate steel studs (Item 2B). When U-shaped deflection channel (Item 3A) is used, ceiling runner installed within the deflection channel with 1 in. (25 mm) gap maintained between the top of ceiling runner and top of deflection channel. When deflection channel is not used, ceiling runner secured to concrete floor slab with steel masonry anchors spaced a max of 24 in. (610 mm) OC.

   A1. **Light Gauge Framing** – Slotted Ceiling Runner – As an alternate to the ceiling runner in Item 2A, slotted ceiling runner to consist of galv steel channel with slotted flanges sized to accommodate steel studs (Item 2B). Slotted ceiling runner secured to concrete floor slab with steel masonry anchors spaced max 24 in. (610 mm) OC. When slotted ceiling runner is used, deflection channel (Item 3A) shall not be used.

   A2. **Light Gauge Framing** – Clipped Ceiling Runner – As an alternate to the ceiling runner in Items 2A and 2A1, clipped runner to consist of galv steel channel with clips preformed in track flanges which positively engage the inside flange of the steel studs (Item 2B). Track flanges to be min 2-1/2 in. (64 mm). Clipped ceiling runner secured to concrete floor slab with steel masonry anchors spaced max 24 in. (610 mm) OC. When clipped ceiling runner is used, deflection channel (Item 3A) shall not be used.

   A3. **Light Gauge Framing** – Notched Ceiling Runner – As an alternate to the ceiling runners in Items 2A through 2A2, notched ceiling runners to consist of C-shaped galv steel channel with notched return flanges sized to accommodate steel studs (Item 2B). Notched ceiling runner secured to concrete floor slab with steel masonry anchors spaced max 24 in. (610 mm) OC. When noted ceiling runner is used, deflection channel (Item 3A) shall not be used.

   B. **Studs** – Steel studs to be min 3-5/8 in. (92 mm) wide. Studs cut 1/2 to 3/4 in. (13 to 19 mm) less in length than assembly height. Studs attached to ceiling runner with sheet metal screws a min of 1/2 in. (13 mm) below bottom of deflection channel, when deflection channel is used. When deflection channel is not used, steel studs shall not be secured to ceiling runner. When slotted ceiling runner (Item 2A1) is used, steel studs secured to slotted ceiling runner with No. 8 by 1/2 in. (13 mm) long wafer head steel screws at midheight of slot on each side of wall. Stud spacing not to exceed 24 in. (610 mm) OC.
System No. HW-D-0517 continued

C. **Gypsum Board** – Gypsum board sheets installed to a min total thickness of 5/8 in. (16 mm) and 1-1/4 in. (32 mm) on each side of wall for 1 and 2 hr rated assemblies, respectively. Wall to be constructed as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a nom 3/4 in. (19 mm) gap shall be maintained between the top of the gypsum board and the lower surface of the floor. The screws attaching the gypsum board to studs at the top of the wall shall be located 1 in. (25 mm) below the bottom of the U-shaped deflection channel (Item 3A) or slotted ceiling runner (Item 2A1).

**The hourly fire rating of the joint system is equal to the hourly fire rating of the wall.**

3. Joint System – Max separation between bottom of floor and top of wall is 3/4 in. (19 mm). The joint system is designed to accommodate a max 34 percent compression from its installed width. The joint system consists of a deflection channel forming material and a fill material, as follows:

   A. **Deflection Channel** – (Optional, Not Shown) – Nom 3-3/4 in. (95 mm) wide by min 2 in. (51 mm) deep min 24 ga steel U-shaped channel. Deflection channel secured to concrete floor slab with steel masonry anchors or by welds spaced max 24 in. (610 mm) OC. The ceiling runner (Item 2A) is installed within the deflection channel to maintain a 1 in. (25 mm) gap between the top of the ceiling runner and the top of the deflection channel. The ceiling runner is not fastened to the deflection channel.

   B. **Fill, Void or Cavity Material** – **Caulk** – Min 5/8 in. (16 mm) thickness of fill material installed on each side of the wall between the top of the gypsum board and bottom of floor, flush with each surface of gypsum board.

1. **Floor Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete. Floor may also be constructed of any UL Classified hollow-core Precast Concrete Units*. See Precast Concrete Units (CFTV) in Fire Resistance Directory for names of manufacturers.

1A. **Floor Assembly** – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual D900 Series Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:

A. **Steel Floor And Form Units** – Max 3 in. (76 mm) deep galv steel fluted floor units.

B. **Concrete** – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.

2. **Shaft Wall Assembly** – The 2 hr fire rated shaft wall assembly shall be constructed of the materials and in the manner described in the individual U400 or V400-Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

A. **Steel Floor And Ceiling Runners** – Floor and ceiling runners of wall assembly shall consist of galv steel channels sized to accommodate steel “C-H” studs. Flange height of ceiling runner shall be min 1/2 in. (13 mm) greater than nom joint width. Ceiling runner secured with steel masonry anchors spaced max 24 in. (610 mm) OC.

B. **Steel Studs** – “C-H”-shaped steel studs to be min 2-1/2 in. (64 mm) wide and formed of min 24 MSG galv steel. Studs cut 1/2 to 3/4 in. (13 to 19 mm) less in length than assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner or slotted ceiling track. Studs spaced 24 in. (610 mm) OC. After installation of gypsum board liner panels (Item 2D), studs secured to flange of floor runner on finished side of wall only with No. 6 by 1/2 in. (13 mm) long self-drilling, self-tapping steel screws. Studs secured to flange of slotted ceiling track on finished side of wall only with No. 8 by 1/2 in. (13 mm) long self-drilling, self-tapping wafer head steel screws at slot mid height.

C. **Gypsum Board** – 1 in. (25 mm) thick by 24 in. (610 mm) wide gypsum board liner panels. Panels cut 1 in. (25mm) less in length than floor to ceiling height. Vertical edges inserted in “H”-shaped section of “C-H” studs. Free edge of end panels attached to long leg of “J” runner (Item 2A) with 1-5/8 in. (41 mm) long Type S steel screws spaced max 12 in. (305 mm) OC.

D. **Gypsum Board** – Gypsum board sheets, 1/2 or 5/8 in. (13 or 16 mm) thick, applied vertically or horizontally in two layers on finished side of wall as specified in the individual U400 or V400-Series Wall and Partition Design. A max 1 in. (25 mm) gap shall be maintained between the top of the gypsum board and the bottom surface of the concrete floor. The screws attaching the gypsum board layers to the C-H studs shall be located 1 in. (25 mm) below the bottom of the slotted ceiling track (Item 2C). No gypsum board attachment screws are to penetrate the slotted ceiling track.
3. **Joint System** – Max separation between bottom of floor and top of liner panel (Item 2D) and between bottom of floor and top of gypsum board sheets (Item 2E) at time of installation of joint system is 3/4 in. (19 mm). The joint system is designed to accommodate a maximum 19 percent compression or extension from its installed width. The joint system consists of the following:

**Configuration A, B, and C**

**A. Forming Material** – Min 4 pcf (64 kg/m³) density mineral wool batt insulation cut to a thickness equal to the overall thickness of the gypsum board and shaft liner and compressed 50 percent in height and inserted between the top of the gypsum board and bottom of floor on both sides of the wall.

**B. Fill, Void or Cavity Material** – Sealant – Prior to the installation of the gypsum board (Item 2D), a min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) of fill material sprayed or brushed on inside of ceiling runner to completely cover mineral wool and overlap a min of 1/2 in. (13 mm) onto shaft liner (Item 2C) and runner (Item 2A). After installation of gypsum board (Item 2D) min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) of fill material sprayed or brushed on gypsum board on the wall to completely cover mineral wool and overlap a min of 1/2 in. (13 mm) onto wall and floor.

**3M COMPANY**
3M FIRE PROTECTION PRODUCTS – FireDam Spray 200

**B1. Fill, Void or Cavity Material ** – Tape – Alternate to Item B. Prior to the installation of the gypsum board (Item 2D), Tape cut to size and press applied on inside of ceiling runner to completely cover mineral wool and overlap a min of 1 in. (25 mm) onto shaft liner (Item 2C) and runner (Item 2A). After installation of gypsum board (Item 2D), Tape cut to size and press applied over the mineral wool forming material and lapping min 1 in. (25 mm) onto the steel floor units and gypsum wall. Tape applied in minimum 1 ft (305 mm) lengths along joint and adjoining lengths of Tape shall overlap min 1/2 in. (13 mm).

**3M COMPANY – 3M Fire and Water Barrier Tape**

**Configuration C Only**

**C. Forming Material** – Min 4 in. (102 mm) thickness of min 4 pcf (64 kg/m³) density mineral wool batt insulation cut to the shape of the fluted deck, approx 20 percent larger than the area of the flutes and compressed into flutes of the steel floor deck between the top of the ceiling runner and the steel deck.

**D. Fill, Void or Cavity Material** – Min 1/16 in. (1.6 mm) dry (1/8 in. or 3.2 mm wet) thickness of fill material sprayed or brushed on each side of the wall in the flutes of the steel floor units and between the bottom edge of the ceiling runner or top of the gypsum board, and the bottom of the steel floor to completely cover mineral wool and overlap a min of 1/2 in. (13 mm) on to gypsum board, ceiling runner and steel floor deck on both sides of wall.

**3M COMPANY**
3M FIRE PROTECTION PRODUCTS – FireDam™ Spray 200

**D1. Fill, Void or Cavity Material** – Tape – As an alternate to Item D, Tape cut to size and press applied within fluted areas of joint to completely cover mineral wool lapping min 1 in. (25 mm) onto the contour of the steel floor units and extending to lap min 1 in. (25 mm) onto the gypsum wall (finished side of wall) and ceiling runner (shaft side of wall). Adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

**3M COMPANY – 3M Fire and Water Barrier Tape**

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

Reprinted from the Online Certifications Directory with permission from UL©
1. **Floor Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete.

2. **Wall Assembly** – Nom 8 in. (203 mm) thick 2, 3 or 4 hr rated UL Classified Concrete Blocks*. Wall may also be constructed of min 8 in. thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete. See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers. The assembly rating is equal to the lesser of the hourly rating of the wall or floor.

3. **Joint System** – Max separation between bottom of floor and top of wall (at time of installation of joint system) is 1 in. (25 mm). The joint system is designed to accommodate a max 12.5 percent compression or extension from its installed width. The joint system shall consist of the following:
   
   A. **Packing Material** – Open or closed cell polyethylene or polyurethane foam backer rod used as a permanent form. Packing material to be recessed from both surfaces of the wall to accommodate the required thickness of fill material.
   
   B. **Fill, Void or Cavity Material** – **Caulk** – Min 5/8 in. (16 mm) thickness of fill material applied within the joint, flush with both surfaces of wall. An additional thin film of caulk is to be applied to overlap a min 1/2 in. (13 mm) onto the bottom of the floor and top of wall surface on both sides of the wall.

   *Bearing the UL Classification Mark

1. Floor Assembly – The fire rated fluted steel floor unit/concrete floor assembly shall be constructed of the materials and in a manner described in the individual D900 Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. Steel Floor And Form Units* – Max 3 in. (76 mm) deep galv steel fluted floor units.

   B. Concrete – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.

2. Wall Assembly – Min 7-1/2 in. (191 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m^3) structural concrete. Wall may also be constructed of any UL Classified Concrete Blocks*.

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

3. Joint System – Max width of joint (at time of installation of joint system) is 2 in. (51 mm). The joint system is designed to be installed from only one side of the wall due to the opposite side of the wall being inaccessible. The joint system is designed to accommodate a max 13 percent compression or extension from its installed width. The joint system shall consist of the following:

   A. Forming Material* – Min 4 pcf (64 kg/m^3) mineral wool batt insulation cut into strips, compressed approximately 25 percent in thickness, and installed to fill the max 2 in. (51 mm) gap between the top of the wall and the bottom of the fluted steel floor units. Additional pieces of min 4 pcf (64 kg/m^3) mineral wool batt insulation cut to the shape of the fluted deck, approximately 20 percent larger than the area of the flutes, firmly packed into the flutes.

   B. Fill, Void or Cavity Material* – Sealant – Min 1/8 in. (3.2 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) of fill material sprayed or brushed on each side of the wall between the top of the wall and the bottom of the floor to completely cover mineral wool and overlap a min of 1/2 in. (13 mm) onto wall, and min of 1 in. (25 mm) onto the steel floor unit, on both sides of wall.

   3M COMPANY – FireDam™ Spray 200

   B1. Fill, Void or Cavity Material* – Tape – As an alternate to Item B, Tape cut to size and press applied within fluted areas of joint to completely cover mineral wool lapping min 1 in. (25 mm) onto the contour of the steel floor units and extending to lap min 1 in. (25 mm) onto the concrete block wall. Additional pieces of Tape are applied along the joint to completely cover the remaining mineral wool between bottom of steel deck and top edge of wall along length of joint, lapping min 1 in. (25 mm) onto the contour of the steel floor units and min 1 in. (25 mm) onto the concrete block wall. Adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

   3M COMPANY – 3M Fire and Water Barrier Tape

4. Steel Angles (optional) – Nom 5 x 3 in. (127 x 76 mm) (or larger) by 12 MSG (or heavier) steel angles. Nom 3 in. (76 mm) leg secured to ceiling, on both sides of wall, with steel fasteners. Angles can consist of intermittent or continuous lengths. Intermittent lengths can be random or evenly spaced.

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

3M Fire Protection Products
Applicators and Specifiers Guide

1. Floor Assembly – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete. Floor may also be constructed of any UL Classified hollow-core Precast Concrete Units.* See Precast Concrete Units (CFTV) in Fire Resistance Directory for names of manufacturers.

1A. Floor Assembly – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual D900 Series Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:

A. Steel Floor And Form Units* – Max 3 in. (76 mm) deep galv steel fluted floor units.
B. Concrete – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.

2. Wall Assembly – The 1, 2, 3 or 4 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner described in the individual U400 or V400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

A. Steel Floor and Ceiling Runners – Floor and ceiling runners of wall assembly shall consist of min No. 25 gauge galv steel channels sized to accommodate steel studs (Item 2B). Ceiling runner flange height to be min 1/2 in. (13 mm) greater than joint width at max anticipated extension. Ceiling runner secured with steel masonry anchors or welds spaced max 24 in. (610 mm) OC. Ceiling runner secured directly to bottom of floor for Configuration A. Ceiling runner secured parallel to and centered with flute as shown in Configuration B. For Configuration C, ceiling runner secured perpendicular to steel deck flutes.

B. Studs – Steel studs to be min 3-5/8 in. (92 mm) wide. Studs cut max 1-1/4 in. (32 mm) less in length than assembly height to accommodate max anticipated compression of joint width with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. Stud spacing not to exceed 24 in. (610 mm) OC.

C. Gypsum Board* – Gypsum board sheets installed to a min total thickness of 5/8 in., 1-1/4 in., 1-7/8 in., or 2-1/2 in. (16, 32, 48 or 64 mm) on each side of wall for 1, 2, 3 and 4 hr fire rated wall assemblies, respectively. Wall to be constructed as specified in the individual U400 Series Design in the UL Fire Resistance Directory, except that a max 2 in. (51 mm) gap shall be maintained between the top of the gypsum board and the bottom surface of the floor. The screws securing successive layers of gypsum board shall be staggered min 1 in. (25 mm) from screws in preceding layer(s). Top row of screws in face layer of gypsum board shall be installed into the studs 1-1/2 in. (38 mm) below flange of ceiling runner.

The hourly fire rating of the joint system is equal to the hourly fire rating of the wall.
3. **Joint System** – Max separation between bottom of floor and top of gypsum board sheets at time of installation of joint system is 2 in. (51 mm). The joint system is designed to accommodate a maximum 50 percent compression or extension from its installed width. The joint system consists of the following:

**Configurations A and B**

A. **Forming Material** – Min 4 pcf (64 kg/m³) density mineral wool batt insulation cut to a width equal to the overall thickness of the gypsum board and with a thickness equal to twice the height of the gap between the top of the gypsum board and the bottom of the floor. Insulation compressed 50 percent in thickness and inserted between the top of the gypsum board and the bottom of the floor on both sides of the wall.

INDUSTRIAL INSULATION GROUP LLC – MinWool-1200 Safing
JOHNS MANVILLE – Safing
ROCK WOOL MANUFACTURING CO – Delta Board
ROCKWOOL MALAYSIA SDN BHD – Type Safe
ROXUL INC – Type Safe

B. **Fill, Void or Cavity Material** – Min 1/16 in. (1.6 mm) dry thickness (1/8 in. or 3.2 mm wet thickness) of fill material sprayed or brushed to completely cover forming material and to overlap a min of 1/2 in. (13 mm) on to gypsum board and concrete or steel floor deck on both sides of wall.

3M COMPANY
3M FIRE PROTECTION PRODUCTS – FireDam™ Spray 200

B1. **Fill, Void or Cavity Material** – Tape – As an alternate to Item B, Tape cut to size and press applied over the mineral wool forming material and lapping min 1 in. (25 mm) onto the steel floor units or concrete floor and concrete wall. Tape applied in minimum 1 ft (305 mm) lengths along joint and adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

3M COMPANY – 3M Fire and Water Barrier Tape

**Configuration C**

A. **Forming Material** – Nom 4 pcf (64 kg/m³) mineral wool batt cut to the shape of the steel deck flute with a height 1 in. (25 mm) greater than the height of flutes and with a length equal to the overall thickness of the wall assembly. Mineral wool batt compressed and installed into each flute above the ceiling runner with its projecting ends flush with the wall surfaces. Additional pieces of min 4 pcf (64 kg/m³) density mineral wool batt cut to a width equal to the overall thickness of the gypsum board and with a thickness equal to twice the height of the gap between the top of the gypsum board and the valleys of the steel deck floor. Insulation compressed 50 percent in thickness and inserted between the top of the gypsum board and the bottom of the floor on both sides of the wall.

INDUSTRIAL INSULATION GROUP LLC – MinWool-1200 Safing
JOHNS MANVILLE – Safing
ROCK WOOL MANUFACTURING CO – Delta Board
ROCKWOOL MALAYSIA SDN BHD – Type Safe
ROXUL INC – Type Safe

B. **Fill, Void or Cavity Material** – Min 1/16 in. (1.6 mm) dry thickness (1/8 in. or 3.2 mm wet thickness) of fill material sprayed or brushed to completely cover forming material and to overlap a min of 1/2 in. (13 mm) on to gypsum board and steel deck on both sides of wall.

3M COMPANY
3M FIRE PROTECTION PRODUCTS – FireDam™ Spray 200

B1. **Fill, Void or Cavity Material** – Tape – As an alternate to Item B, Tape cut to size and press applied within fluted areas of joint to completely cover mineral wool lapping min 1 in. (25 mm) onto the contour of the steel floor units or concrete floor and extending to lap min 1 in. (25 mm) onto the gypsum wall. Adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

3M COMPANY – 3M Fire and Water Barrier Tape

1. **Floor Assembly** – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual D900 Floor-Ceiling Design in the UL Fire Resistance Directory. The hourly fire rating of the floor assembly shall be equal to or greater than the hourly fire rating of the wall assembly. The floor assembly shall include the following construction features:

   A. **Steel Floor and Form Units** – Max 3 in. (76 mm) deep galv fluted floor units.
   B. **Concrete** – Min 2-1/2 in. (64 mm) thick reinforced (100-150pcf or 1600-2400 kg/m³) concrete, as measured from the top plane of the floor units.

1A. **Roof Assembly** – As an alternate to Item 1, the fire-rated roof assembly shall be constructed of the materials and in the manner described in the individual P900 Series Roof-Ceiling Designs in the UL Fire Resistance Directory and shall contain max 3 in. (76 mm) deep galv steel fluted roof units. The hourly fire rating of the roof assembly shall be equal to or greater than the hourly fire rating of the wall assembly.

2. **Wall Assembly** – The 1 hr or 2 fire rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400, V400 or W400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Floor Runners** – Floor runners of wall assembly shall consist of galv steel channels sized to accommodate steel studs (Item 2C).
   B. **Light Gauge Framing** – Slotted Ceiling Runner – Slotted ceiling runner to consist of galv steel channel with slotted flanges sized to accommodate steel studs (Item 2C). Slotted ceiling runner installed perpendicular to direction of fluted steel deck secured to valleys (Configuration A) or parallel to direction of fluted deck secured to valleys or corrugated steel straps (Configuration B and C) with typical steel fasteners or welds spaced max 24 in. (610 mm).

   **SAFTI SEAL INC** – STW or STX
   **MRI STEEL FRAMING LLC** – Smart Slotted Track
   **SUPER STUD BUILDING PRODUCTS** – Slotted Track
UL System No. HW-D-0633 (cont.)

C. **Studs** – Steel studs to be min 3-1/2 in. (89 mm) wide. Studs cut 1/2 to 3/4 in. (13 to 19 mm) less in length than assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner (Item 2B) steel studs secured to slotted ceiling runner with No. 8 by 1/2 in. (13 mm) long wafer head steel screws at mid-height of slot on min. one side of wall. Stud spacing not to exceed 24 in. (610 mm) OC.

D. **Gypsum Board** – Gypsum board sheets installed to a min total thickness of 5/8 in. (16 mm) and 1-1/4 in. (32 mm) on each side of wall for 1 and 2 hr rated assemblies, respectively. Wall to be constructed as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a nom 1 in. (25 mm) gap shall be maintained between the top of the gypsum board and the bottom of the steel floor units and the top row of screws shall be installed into the studs a min. 4 in. (102 mm) below the lower surface of the floor. The hourly fire rating of the joint system is equal to the hourly fire rating of the wall.

3. **Joint System** – Max separation between bottom flange of the deflection track and top of wallboard (at the time of installation of the joint system) is 1 in. (25 mm). The joint system is designed to accommodate a max 25 percent compression or extension from its installed width. The joint system consists of:

A. **Forming Material** – Min 4 pcf (64 kg/m³) density mineral wool batt insulation cut approx 33 percent wider than the flutes, approx 33 percent thicker than the depth of the steel deck, and with a length equal to the overall width of the wall. Mineral wool compressed and inserted into flutes of the steel floor units between top of ceiling runner and the steel deck.

   INDUSTRIAL INSULATION GROUP L L C – MinWool-1200 Safing
   JOHNS MANVILLE – Safing
   ROCK WOOL MANUFACTURING CO – Delta Board or Delta-8
   ROCKWOOL – Type Safe
   THERMAFIBER INC – Type SAF

A1. **Forming Material** – Plugs – As an alternate to Item 3A, preformed mineral wool plugs, formed to the shape of the fluted floor units, friction fit to completely fill the flutes above the ceiling runner. The plugs shall project beyond the finished side of the ceiling runner, flush with wall surface.

   ROCK WOOL MANUFACTURING CO – Delta Deck Plugs

B. **Forming Material** – Min 4 pcf (64 kg/m³) density mineral wool batt insulation cut to a thickness twice larger than the distance between the top of the gypsum board and the bottom of the steel floor unit. Material compressed 50 percent and installed within ceiling runner above top of liner panel flush with the inside surface of the panel. Material compressed and installed on finished side of the wall between the top of the gypsum board and the bottom of the steel floor units, flush with the surface of the wall.

   INDUSTRIAL INSULATION GROUP L L C – MinWool-1200 Safing
   JOHNS MANVILLE – Safing
   ROCK WOOL MANUFACTURING CO – Delta Board
   ROCKWOOL – SAFE
   THERMAFIBER INC – Type SAF

C. **Fill, Void or Cavity Material** – Min 1/16 in. (0.16 mm) dry, (1/8 in. or 3.2 mm wet) thickness of fill material sprayed or brushed on each side of the wall in the flutes of the steel floor units and between the top of the gypsum board and the bottom of the steel floor units to completely cover mineral wool and overlap a min of 1/2 in. (13 mm) onto gypsum board and steel deck on both sides of wall.

   3M COMPANY – Firedam Spray 200

C1. **Fill, Void or Cavity Material** – Tape – As an alternate to the 3M Firedam Spray 200 (see Item C), Tape cut to size and press applied within fluted areas of joint to completely cover mineral wool lapping min 1 in. (25 mm) onto the contour of the steel floor units and extending to lap min 1 in. (25 mm) onto the gypsum wall. Additional pieces of Tape are applied along the joint to completely cover the remaining mineral wool between bottom of steel deck and top edge of wall along length of joint, lapping min 1 in. (25 mm) onto the contour of the steel floor units and min 1 in. (25 mm) onto the gypsum wall. Adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

   3M COMPANY – 3M Fire and Water Barrier Tape

1. **Floor Assembly** — The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual D900 Series Floor-Ceiling Design in the UL Fire Resistance Directory. The floor assembly shall have a fire rating equal to or greater than the joint system and shall include the following construction features:
   
   **A. Steel Floor And Form Units** – Max 3 in. (76 mm) deep galv steel fluted floor units.
   
   **B. Concrete** – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.

2. **Wall Assembly** — The 4 hr fire-rated cementitious and mineral fiber panels/steel stud wall assembly shall be constructed of the materials and in the manner described in Wall and Partition Design No. V460 in the UL Fire Resistance Directory and shall include the following construction features:
   
   **A. Steel Floor And Ceiling Runners** – Nom, 4-1/4 in. (108 mm) wide by 1-3/8 in. (35 mm) deep steel channels fabricated by from min No. 14 MSG galv steel. Prior to the installation of the Mineral and Fiber Panels and Partition Panels (Items 2B and 2E), No. 8 by 2-1/2 in. (64 mm) long steel screws drilled through the ceiling runner and into the fluted deck area.
   
   **B. Studs** – Steel studs to be channel shaped min 4 in. (102 mm) deep, 2-1/2 in. (64 mm) flanges and 1/2 in. (13 mm) return, fabricated from 14 MSG, spaced a max of 24 in. (610 mm) OC. Studs to be cut 1 in. (25 mm) less than assembly height. Studs secured to floor runners with self-drilling screws and friction fit into ceiling runners.
   
   **C. Mineral and Fiber Boards** – Min 1 in. (25 mm) thick calcium silicate board, 48 in. (1219 mm) wide. Boards attached to studs with No. #8 self-drilling screws, 2-3/8 in. (60 mm) long, spaced 10 in. (254 mm) OC. Joints centered over studs and staggered on opposite sides of wall.

   **DURASYSTEMS BARRIERS INC** – PROMATECT@250

   **D. Caulking and Sealants** – (Not Shown) - Min 1/4 in. (6.4 mm) bead of sealant, installed on all vertical and horizontal joint surfaces between adjacent panels of calcium silicate board (Item 3).

   **DURASYSTEMS BARRIERS INC** – PROMASEAL
E. Units Partition Panel* – Nom 3/8 in. (9.5 mm) thick, steel skin cementitious panels, installed over calcium silicate board (Item 3) with vertical and horizontal joints offset. Panels installed to steel studs using No. 12 flat or hex washer head self-drilling screws, 2-1/2 in. (64 mm) long, at 10 in. (25 mm) OC. At all, horizontal joints, a 14 MSG sheet of steel, 4 in. (102 mm) wide by the length of the joint is installed between the calcium silicate board (Item 3) and the DuraSteel panel (Item 5) such that it overlaps equally the ends of adjacent DuraSteel panels.

DURASYSTEMS BARRIERS INC – DURASTEEL

3. Joint System – Max separation between bottom of floor deck and top of wall is 1 in. (25 mm). The joint system is designed to accommodate a max 50 percent compression and extension from its installed width. The joint system consists of the following:

A. Fill, Void or Cavity Material - Mortar – Min 6-3/4 in. (171 mm) thickness of mortar installed in accordance with manufacturer’s installation instructions to completely fill the gap within the flutes of the steel deck, installed flush with both surfaces of the wall. As an option, foam sheets may be installed within the gap between the wall and the floor to prevent the leakage of the fill material during the installation.

DURASYSTEMS BARRIERS INC – DURA S.T.O.P Firestop Mortar

B. Fill, Void or Cavity Material - Foam Strips – Nom 1 11/16 in. (42 mm) wide tapered foam strips cut to size and compressed 68 percent in height in accordance with manufacturer’s installation instructions. Strips compressed and inserted into the gap between the top of the wall and the bottom of the steel deck, flush with both surfaces of the wall.

DURASYSTEMS BARRIERS INC – FGC

C. Fill, Void or Cavity Material* – Sealant – (Not Shown) - Prior to the installation of the foam strips (Item 3B), a min 1/4 in. (6.4 mm) thickness of fill material applied at the bottom of the mortar (Item 3A) and the steel deck along the length of the joint in accordance with manufacturer’s installation instructions.

TREMCO INC – Tremstop Fyre Sil

C1. Fill, Void or Cavity Material* – Sealant – (Not Shown) - Prior to the installation of the cover plate, (Item 3D), a min 1/4 in. (6.4 mm) diam bead of fill material applied on the Unit Partition Panel (Item 2E) along the length of the joint approximately 1-1/2 in. (38 mm) below the top of the panel.

3M COMPANY 3M FIRE PROTECTION PRODUCTS – CP 25WB+ Caulk

D. Cover Plate* – Nom 3 in. (76 mm) wide by No. 22 gauge thick steel cover plate with a return flange provided by the foam strip manufacturer. The cover plate extends a nom 1/2 in (13 mm) on to foam strips (Item No. 3B) on both sides of the wall. The cover plate secured to wall by No. 10 by 1 in. (25 mm) long steel screws spaced a max 8 in. (203mm) OC.

DURASYSTEMS BARRIERS INC — OFP

SECTION A-A

1. **Floor Assembly** — Min 2-1/2 in. (64 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete.

2. **Wall Assembly** — Min 7-1/2 in. (191 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete. Wall may also be constructed of any min 7-5/8 in. (194 mm) thick UL Classified Concrete Blocks*.

3. **Joint System** — Max width of joint (at time of installation of joint system) is 1 in. (25 mm). The joint system is designed to accommodate a max 12.5 percent compression or extension from its installed width. The joint system shall consist of the following:

   A. **Forming Material** — Min 4 pcf (64 kg/m³) mineral wool batt insulation cut into strips that are min 5/8 in. (16 mm) wide with a thickness of min 25 percent larger than the joint width. The strips of mineral wool are compressed and firmly packed into the joint at both sides of wall, recessed 1/4 in. (6 mm) from face of wall.

   - **ROCK WOOL MANUFACTURING CO** — Delta Board or Delta-8
   - **ROCKWOOL MALAYSIA SDN BHD** — SAFE
   - **ROXUL INC** — SAFE

   B. **Fill, Void or Cavity Material** — **Caulk** — Min 1/4 in. (6 mm) thickness of fill material installed within the joint on each side of the wall between the top of the wall and bottom of floor, flush with each surface of wall.

   **3M COMPANY 3M FIRE PROTECTION PRODUCTS** — FireDam 150+

#### Floor Assembly

1. **Floor Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete. Floor may also be constructed of any UL Classified hollow-core Precast Concrete Units*. See **Precast Concrete Units (CFTV)** in Fire Resistance Directory for names of manufacturers.

1A. **Floor Assembly** – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual D700 or D900 Series Floor-Ceiling Design in the UL Fire Resistance Directory. The hourly fire rating of the floor assembly shall be equal to or greater than the hourly fire rating of the wall assembly. The floor assembly shall include the following construction features:

   A. **Steel Floor And Form Units*** – Max 3 in. (76 mm) deep galv steel fluted floor units.

   B. **Concrete** – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.
C. **Spray Applied Fire Resistive Material** *(Optional, Not Shown)* – The steel floor units may be sprayed with fire resistive material in accordance with the applicable Floor-Ceiling Design. The spray applied fire resistive material is to be removed from the steel deck for the installation of the joint system (Item 3) such that the steel deck is bare over the wall.

**GCP APPLIED TECHNOLOGIES INC** – Type MK-6/HY

1B. **Roof Assembly** – *(Not Shown)* - As an alternate to the floor assembly (Item 1), a fire rated fluted steel deck roof assembly may be used. The roof assembly shall be constructed of the materials and in the manner described in the individual P700 or P900 Series Roof-Ceiling Design in the UL Fire Resistance Directory. The hourly fire rating of the roof assembly shall be equal to or greater than the hourly fire rating of the wall assembly. The roof assembly shall include the following construction features:

A. **Steel Roof Deck** – Max 3 in. (76 mm) deep galv steel fluted roof deck.

B. **Roof Insulation** – Min 2-1/2 in. (64 mm) thick poured insulating concrete, as measured from the top plane of the steel roof deck.

C. **Spray Applied Fire Resistive Material** *(Optional, Not Shown)* – The steel roof units may be sprayed with fire resistive material in accordance with the applicable Roof-Ceiling Design. The spray applied fire resistive material is to be removed from the steel deck for the installation of the joint system (Item 3) such that the steel deck is bare over the wall.

**GCP APPLIED TECHNOLOGIES INC** – Type MK-6/HY

2. **Wall Assembly** – Min 6-1/8 in. (156 mm), 7-3/8 in. (187 mm) or 8-5/8 in. (219 mm) thick lightweight or normal weight (100-150 pcf or 1600-2400 kg/m²) concrete for 2, 3 and 4 hr Assembly (F, FT, FH and FTH) Ratings, respectively. Wall may also be constructed of UL Classified Concrete Blocks. The hourly Assembly, F, FT, FH and FTH rating of the joint system is equal to the hourly rating of the wall. See *Concrete Blocks* (CAZT) category in the Fire Resistance Directory for names of manufacturers.

3. **Joint System** – Max separation between bottom of floor and top of wall at time of installation of joint system is 2 in. (51 mm). The joint system is designed to accommodate a maximum 10 percent compression or extension from its installed width. The joint system consists of the following:

**Configurations A and B**

A. **Forming Material** – Min 4 pcf (64 kg/m³) density mineral wool batt insulation cut to a thickness equal to twice the height of the gap between the top of the wall and the bottom of the floor. Insulation compressed 50 percent in thickness and inserted within joint to completely fill the space between the top of the wall and the bottom of the floor, over the full thickness of the wall.

**INDUSTRIAL INSULATION GROUP LLC** – MinWool-1200 Safing

**JOHNS MANVILLE** – Safing

**ROCK WOOL MANUFACTURING CO** – Delta Board

**ROCKWOOL MALAYSIA SDN BHD** – Type Safe

**ROCKWOOL** – Type Safe

B. **Fill, Void or Cavity Material** – Min 1/16 in. (1.6 mm) dry thickness (1/8 in. or 3.2 mm wet thickness) of fill material sprayed or brushed to completely cover forming material and to overlap a min of 1/2 in. (13 mm) on to wall and steel deck or spray applied fire resistive material on both sides of wall.

**3M COMPANY 3M FIRE PROTECTION PRODUCTS** – FireDam™ Spray 200

3B. **Fill, Void or Cavity Material** – Tape – As an alternate to Item B, Tape cut to size and press applied to completely cover mineral wool forming material and overlap a min of 1 in. (25 mm) onto wall and steel deck, or min 2 in. (51 mm) onto spray applied fire resistive material, on both sides of wall. Adjoining lengths of Tape shall overlap min 1/2 in. (13 mm).

**3M COMPANY** – 3M Fire and Water Barrier Tape

**Configuration C**

A. **Forming Material** – Nom 4 pcf (64 kg/m³) mineral wool batt cut to the shape of the steel deck flute with a height 1 in. (25 mm) greater than the height of flutes and with a length equal to the overall thickness of the wall assembly. Mineral wool batt compressed and installed into each flute above the wall with its ends projecting flush with the wall surfaces. Additional pieces of nom 4 pcf (64 kg/m³) density mineral wool batt cut to a width equal to twice the height of the wall and with a thickness equal to twice the height of the gap between the top of the wall and the valleys of the steel deck floor. Insulation compressed 50 percent in thickness and inserted between the top of the wall and the bottom of the floor, flush with both sides of the wall.

**INDUSTRIAL INSULATION GROUP LLC** – MinWool-1200 Safing

**JOHNS MANVILLE** – Safing

**ROCK WOOL MANUFACTURING CO** – Delta Board

**ROCKWOOL MALAYSIA SDN BHD** – Type Safe

**ROCKWOOL** – Type Safe

B. **Fill, Void or Cavity Material** – Min 1/16 in. (1.6 mm) dry thickness (1/8 in. or 3.2 mm wet thickness) of fill material sprayed or brushed to completely cover forming material and to overlap a min of 1/2 in. (13 mm) on to wall and steel deck or spray applied fire resistive material on both sides of wall.

**3M COMPANY 3M FIRE PROTECTION PRODUCTS** – FireDam™ Spray 200
B1. Fill, Void or Cavity Material* – Tape – As an alternate to Item B, Tape cut to size and press applied within fluted areas of joint to completely cover mineral wool lapping min 1 in. (25 mm) onto the contour of the steel floor units and extending to lap min 1 in. (25 mm) onto the gypsum wall. Additional pieces of Tape are applied along the joint to completely cover the remaining mineral wool between bottom of steel deck and top edge of wall along length of joint, lapping min 1 in. (25 mm) onto the contour of the steel floor units and min 1 in. (25 mm) onto the gypsum wall. When the steel deck is coated with spray applied material, the Tape shall overlap min 2 in. (51 mm) onto the spray applied material. Adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

1. **Floor Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete.

2. **Wall Assembly** – Min 5-1/4 in. (133 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete. Wall may also be constructed of any UL Classified Concrete Blocks*.

   See [Concrete Blocks](CAZT) category in the Fire Resistance Directory for names of manufacturers.

3. **Joint System** – Max separation between bottom of floor and top of wall (at time of installation of joint system) is 2 in. The joint system is designed to accommodate a max 13 percent compression or extension from its installed width. The joint system shall consist of the following:

   A. **Forming Material*** — Min 4 pcf (64 kg/m³) mineral wool batt insulation compressed and firmly packed into the gap between the top of the wall and bottom of the floor. The strips of mineral wool batt insulation installed on the inaccessible side of the wall are to be 1 in. to 2 in. (25 to 51 mm) wide and are to be installed edge-first such that the batt sections are compressed min 50 percent, flush with the inaccessible surface of the wall. After application of the fill material (Item 3B) on the surface of the mineral wool batt packing material above the top plane of the wall, additional strips of the mineral wool batt insulation are to be installed to fill the remainder of the joint opening above the wall and recessed from the surface of the wall to accommodate the fill material on the accessible surface of the wall. Sections of strips of batts to be stacked on top of each other to form an overall thickness two times the thickness of the nominal joint width and installed edge-first such that the batt sections are compressed min 50 percent.

   INDUSTRIAL INSULATION GROUP LLC — MinWool-1200 Safing
   JOHNS MANVILLE — Safing
   ROCK WOOL MANUFACTURING CO — Delta Safing Board
   ROCKWOOL MALAYSIA SDN BHD — Type Safe
   ROCKWOOL — Type Safe
   THERMAFIBER INC — Type SAF

   B. **Fill, Void or Cavity Material*** — Caulk or Sealant — Min 1/2 in. (13 mm) thickness of fill material applied within the joint over the first 1 to 2 in. (25 to 51 mm) wide strips of forming material. Min 1/2 in. (13 mm) of fill material applied within the joint, flush with the accessible surface of wall.

Reprinted from the Online Certifications Directory with permission from UL©.
1. **Floor Assembly** — The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual Floor-Ceiling Design in the UL Fire Resistance Directory. The hourly fire rating of the floor assembly shall be equal to or greater than the hourly fire rating of the wall assembly. The floor assembly shall include the following construction features:
   
   A. **Steel Floor and Form Units** — Max 3 in. (76 mm) deep galv fluted floor units.
   
   B. **Concrete** — Min 2-1/2 in. (64 mm) thick reinforced (100-150 pcf or 1600-2400 kg/m³) concrete, as measured from the top plane of the floor units.

1A. **Roof Assembly** — As an alternate to Item 1, the fire-rated roof assembly shall be constructed of the materials and in the manner described in the individual P700, P800 or P900 Series Roof-Ceiling Designs in the UL Fire Resistance Directory and shall contain max 3 in. deep galv steel fluted roof units. The hourly fire rating of the roof assembly shall be equal to or greater than the hourly fire rating of the wall assembly. In the case of spray-applied protection materials on the steel roof units, the joint system shall be installed prior to the spray-applied protection material.

1B. **Floor Assembly** — As an alternate to Item 1, min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete or any min 6 in. (152 mm) thick UL Classified hollow-core **Precast Concrete Units**.

See **Precast Concrete Units** (CFTV) category in the Fire Resistance Directory for names of manufactures.

2. **Wall Assembly** — The 1, 2 or 3 hr fire-rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400, V400 or W400-Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Light Gauge Framing** — **Deflection Trak** — Deflection trak of wall assembly shall consist of min No. 25 gauge galv steel channels sized to accommodate steel studs (Items 2C) and with offset legs to accommodate wall cladding (Item 3A). Deflection trak installed parallel or perpendicular to the floor units. When installed perpendicular (Configuration A), min No. 25 gauge deflection trak secured on both sides to valley of floor units with 1-1/2 in. (38 mm) long welds spaced max 12 in. (305 mm) OC. Min No. 20 gauge deflection trak
System No. HW-D-1011 continued

may be secured with No. 8 by 1/2 in. (13 mm) long steel tec screws spaced 12 in. (305 mm) OC. When installed parallel (Configuration B), min No. 25 gauge deflection trak secured on one side to valley of floor units with 1-1/2 in. (38 mm) long welds spaced 12 in. (305 mm) OC. Min No. 25 gauge deflection trak may be secured with No. 8 by 1/2 in. (13 mm) steel tec screws spaced max 12 in. (305 mm) OC. The other side of the deflection trak is secured to Z-Furring clips (Item 2B) with two No. 8 by 1/2 in. (13 mm) long steel tec screws. On concrete floor (Configuration C), min No. 20 gauge deflection trak attached to concrete at ceiling with 1/4 in. (6 mm) diam by 1-1/4 in. (32 mm) long steel expansion anchors spaced max 12 in. (305 mm) OC.

**FIRE TRAK CORP** — Shadowline

**B. Light Gauge Framing**

— Clips are attached to the inside bottom leg of the ceiling runner (Item 2A) with 2 — No.8 by 1/2 in. (13 mm) long steel self-drilling framing screws and engage the short flange of the studs.

**FIRE TRAK CORP** — Slip Clips or Redi Klips

**C. Studs**

— Steel studs to be min 2-1/2 in. (64 mm) wide and specified in the individual Wall and Partition Design in the UL Fire Resistance Directory. Studs cut 4 in. (102 mm) less in length than the assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. Stud spacing not to exceed 24 in. (610 mm) OC.

**D. Gypsum Board**

— Gypsum board sheets installed and attached to studs and runners as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a nominal 3-1/2 in. (89 mm) gap shall be maintained between top of the gypsum board and the bottom flange of the deflection trak. Top row of screws shall be installed into the studs 13-1/2 in. (343 mm) below the top edge of the gypsum board sheets.

**E. Z-Furring — (Parallel Units)**

— When trak is installed parallel to floor units, Z-Furring clips are attached to the bottom of the floor units within the crests and top of the deflection trak with two No. 8 by 1/2 in. (13 mm) long steel tec screws. Clip spacing not to exceed 24 in. (610 mm) OC.

**FIRE TRAK CORP** — Z-Furring Clips

The hourly ratings of the joint system are equal to the fire rating of the wall.

**Firestop Configuration A**

3. **Joint System** — Max separation between bottom flange of the deflection trak and top of wallboard (at the time of installation of the joint system) is 3 in. (76 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width. The joint system consists of packing material (Item 3A), wall cladding (Item 3B) and a fill material (Item 3C) as follows:

**A. Packing Material**

— Min 4 pcf (64 kg/m³) density mineral wool batt insulation cut to the shape of the fluted deck, 25 percent larger than the area of the flutes and compressed into the flutes of the steel floor units above the ceiling runner as a permanent form.

**B. Wall Cladding**

— Strips of the gypsum board material cut to the contour of the steel floor units and attached to the deflection trak. The number of layers, board type and thickness and fastener type shall be specified for the gypsum board in the individual Wall and Partition Design in the UL Fire Resistance Directory. Fasteners shall be max spaced 3 in. (76 mm) OC. The top of the wall cladding shall be recessed min 1/8 in. (3.2 mm) to max 1/2 in. (13 mm) from the steel floor units and overlap the gypsum board 7 in. (178 mm).

**C. Fill, Void or Cavity Material**

— Full depth of fill material installed on each side of the wall between the top of the wall cladding and the surface of the steel floor units, flush with each surface of the cladding.

**3M COMPANY** — FB 1000NS, FB 2000, FB 2000+, FD-150+, CP 25 WB+

**Firestop Configuration B**

3. **Joint System** — Max separation between bottom flange of the deflection trak and top of wallboard (at the time of installation of the joint system) is 3 in. (76 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width. The joint system consists of wall cladding (Item 3A) and a fill material (Item 3B) as follows:

**A. Wall Cladding**

— Strips of the gypsum board material attached to the deflection trak. The number of layers, board type and thickness and fastener type shall be as specified for the gypsum board in the individual Wall and Partition Design in the UL Fire Resistance Directory. Fasteners shall be max spaced 3 in. (76 mm) OC. The top of the wall cladding shall be recessed min 1/8 in. (3.2 mm) to max 1/2 in. (13 mm) from the steel floor units and overlap the gypsum board 7 in. (178 mm).

**B. Fill, Void or Cavity Material**

— Full depth of fill material installed on each side of the wall between the top of the wall cladding and the surface of the steel floor units, flush with each surface of the cladding.

**3M COMPANY** — FB 1000NS, FB 2000, FB 2000+, FD-150+, CP 25 WB+

**Firestop Configuration C**

3. **Joint System** — Max separation between bottom flange of the deflection trak and top of wallboard (at the time of installation of the joint system) is 3 in. (76 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width. The joint system consists of wall cladding (Item 3A) and a fill material (Item 3B) as follows:

**A. Wall Cladding**

— Strips of the gypsum board material attached to the deflection trak. The number of layers, board type and thickness and fastener type shall be as specified for the gypsum board in the individual Wall and Partition Design in the UL Fire Resistance Directory. Fasteners shall be max spaced 3 in. (76 mm) OC. The top of the wall cladding shall be recessed min 1/8 in. (3.2 mm) to max 1/2 in. (13 mm) from the bottom of the concrete floor and overlap the gypsum board 7 in. (178 mm).

**B. Fill, Void or Cavity Material**

— Full depth of fill material installed on each side of the wall between the top of the wall cladding and the bottom of the floor assembly, flush with each surface of the cladding.

**3M COMPANY** — FB 1000NS, FB 2000, FB 2000+, FD-150+, CP 25 WB+

**System No. HW-D-1012**
February 19, 2014

**ANSI/UL2079**
Assembly Ratings — 1, 2 and 3 Hr (See Item 2)
Nominal Joint Width - 3 In.
Class II or III Movement Capabilities — 100% Compression or Extension

**CAN/ULC S115**
F Ratings — 1, 2 and 3 Hr (See Item 2)
FT Ratings — 1, 2 and 3 Hr (See Item 2)
FH Ratings — 1, 2 and 3 Hr (See Item 2)
FTH Ratings — 1, 2 and 3 Hr (See Item 2)
Nominal Joint Width - 3 In.
Class II or III Movement Capabilities — 100% Compression or Extension
1. **Floor Assembly** — The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual Floor-Ceiling Design in the UL Fire Resistance Directory. The hourly fire rating of the floor assembly shall be equal to or greater than the hourly fire rating of the wall assembly. The floor assembly shall include the following construction features:
   
   **A. Steel Floor and Form Units** — Max 3 in. (76 mm) deep galv fluted floor units.
   
   **B. Concrete** — Min 2-1/2 in. (64 mm) thick reinforced (100-150 pcf or 1600-2400 kg/m³) concrete, as measured from the top plane of the floor units.
   
1A. **Roof Assembly** — As an alternate to Item 1, the fire-rated roof assembly shall be constructed of the materials and in the manner described in the individual P700, P800 or P900 series Roof-Ceiling Designs in the UL Fire Resistance Directory and shall contain max 3 in. (76 mm) deep galv steel fluted roof units. The hourly fire rating of the roof assembly shall be equal to or greater than the hourly fire rating of the wall assembly. In the case of spray-applied protection materials on the steel roof units, the joint system shall be installed prior to the spray-applied protection material.

1B. **Floor Assembly** — As an alternate to Item 1, min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete or any min 6 in. (152 mm) thick UL Classified hollow-core **Precast Concrete Units**.

See **Precast Concrete Units** (CFTV) category in the Fire Resistance Directory for names of manufacturers.

2. **Wall Assembly** — The 1, 2 or 3 hr fire-rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400, V400 or W400-Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   **A. Light Gauge Framing** — **Deflection Trak** — Deflection trak of wall assembly shall consist of min No. 25 gauge galv steel channels sized to accommodate steel studs (Item 2C) and with offset legs to accommodate wall cladding (Item 3A). Deflection trak installed parallel or perpendicular to the floor units. When installed perpendicular (Configuration A), min No. 25 gauge deflection trak secured on both sides to valley of floor units with 1-1/2 in. (38 mm) long welds spaced max 12 in. (305 mm) OC. Min No. 20 gauge deflection trak may be secured with No. 8 by 1/2 in. (13 mm) long steel tec screws spaced 12 in. (305 mm) OC. When installed parallel (Configuration B), min No. 25 gauge deflection trak secured on one side to valley of floor units with 1-1/2 in. (38 mm) long welds spaced 12 in. (305 mm) OC. Min No. 25 gauge deflection trak may be secured with No. 8 by 1/2 in. (13 mm) steel tec screws spaced max 12 in. (305 mm) OC. The other side of the deflection trak is secured to Z-Furring clips (Item 2B) with two No. 8 by 1/2 in. (13 mm) long tec screws. On concrete floor (Configuration C), min No. 20 gauge deflection trak attached to concrete at ceiling with 1/4 in. (6 mm) diam by 1-1/4 in. (32 mm) long steel expansion anchor spaced max 12 in. OC.

   **FIRE TRAK CORP** — Shadowline, Cove Shadowline

   **B. Light Gauge Framing** — Clips are attached to the inside bottom leg of the ceiling runner (Item 2A) with 2 - No. 8 by 1/2 in. (13 mm) long steel-drilling framing screws and engage the short flange of the studs.

   **FIRE TRAK CORP** — Slip Clips or Redi Klips

   **C. Studs** — Steel studs to be min 2-1/2 in. (64 mm) wide and as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory. Studs cut 4 in. (102 mm) less in length than the assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. Stud spacing not to exceed 24 in. (610 mm) OC.

   **D. Gypsum Board** — Gypsum board sheets installed and attached to studs and runners as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a nominal 3-1/2 in. (89 mm) gap shall be maintained between top of the gypsum board and the bottom flange of the deflection trak. Top row of screws shall be installed into the studs 13-1/2 in. (343 mm) below the top edge of the gypsum board sheets.

   **E. Z-Furring** — **(Parallel Units)** — When trak in installed parallel to floor units, Z-Furring clips are attached to the bottom of the floor units within the crests and top of the deflection trak with two No. 8 by 1/2 in. (13 mm) long tec screws or steel fasteners. Clip spacing not to exceed 24 in. (610 mm) OC.

   **FIRE TRAK CORP** — Z-Furring Clips

   **F. Bracing** — (Not Shown) - Bracing as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory.

The hourly ratings of the joint system are equal to the fire rating of the wall.

**Firestop Configuration A**

3. **Joint System** — Max separation between bottom flange of the deflection trak and top of wallboard (at the time of installation of the joint system) is 1 in. (25 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width. The joint system consists of packing material (Item 3A), wall cladding (Item 3B) and a fill material (Item 3C) as follows:

   **A. Packing Material** — Min 4 pcf (64 kg/m³) density mineral wool batt insulation cut to the shape of the fluted deck, 25 percent larger than the area of the flutes and compressed into the flutes of the steel floor units above the ceiling runner as a permanent form.

   **B. Wall Cladding** — Strips of the gypsum board material cut to the contour of the steel floor units and attached to the deflection trak.

   The number of layers, board type and thickness and fastener type shall be as specified for the gypsum board in the individual Wall and Partition Design in the UL Fire Resistance Directory. Fasteners shall be max spaced 3 in. (76 mm) OC. The top of the wall cladding shall be recessed min 1/8 in. (3.2 mm) to max 1/2 in. (13 mm) from the steel floor units and overlap the gypsum board 7 in. (178 mm).

   **C. Fill, Void or Cavity Material** — Full depth of fill material installed on each side of the wall between the top of the wall cladding and the surface of the steel floor units, flush with each surface of the cladding.

**3M COMPANY** — FB 1000NS, FB 2000, FB 2000+, FD-150+, CP 25 WB+
System No. HW-D-1012 continued

Firestop Configuration B

3. Joint System — Max separation between bottom flange of the deflection trak and top of wallboard (at the time of installation of the joint system) is 1 in. (25 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width. The joint system consists of packing material (Item 3A), wall cladding (Item 3B) and a fill material (Item 3C) as follows:

A. Wall Cladding — Strips of the gypsum board material attached to the deflection trak. The number of layers, board type and thickness and fastener type shall be as specified for the gypsum board in the individual Wall and Partition Design in the UL Fire Resistance Directory. Fasteners shall be max spaced 3 in. (76 mm) OC. The top of the wall cladding shall be recessed min 1/8 in. (3.2 mm) to max 1/2 in. (13 mm) from the steel floor units and overlap the gypsum board 7 in. (178 mm).

B. Fill, Void or Cavity Material* — Full depth of fill material installed on each side of the wall between the top of the wall cladding and the surface of the steel floor units, flush with each surface of the cladding.

Firestop Configuration C

3. Joint System — Max separation between bottom flange of the deflection trak and top of wallboard (at the time of installation of the joint system) is 1 in. (25 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width. The joint system consists of packing material (Item 3A), wall cladding (Item 3B) and a fill material (Item 3C) as follows:

A. Wall Cladding — Strips of the gypsum board material attached to the deflection trak. The number of layers, board type and thickness and fastener type shall be as specified for the gypsum board in the individual Wall and Partition Design in the UL Fire Resistance Directory. Fasteners shall be max spaced 3 in. (76 mm) OC. The top of the wall cladding shall be recessed min 1/8 in. (3.2 mm) to max 1/2 in. (13 mm) from the bottom of the concrete floor and overlap the gypsum board 7 in. (178 mm).

B. Fill, Void or Cavity Material* — Full depth of fill material installed on each side of the wall between the top of the wall cladding and the surface of the steel floor units, flush with each surface of the cladding.

Assembly Rating – 2 Hr
L Rating At Ambient – Less Than 1 CFM/Lin Ft
L Rating At 400 F – Less Than 1 CFM/Lin Ft
Nominal Joint Width – 4 In.
Class II Movement Capabilities – 15.6% Compression or Extension

1. **Floor Assembly** – Min 4-1/2 in. thick steel-reinforced lightweight or normal weight (100-150 pcf) structural concrete.

2. **Wall Assembly** – Min 5 in. thick steel-reinforced lightweight or normal weight (100-150 pcf) structural concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. 

3. **Joint System** – Max width of joint (at time of installation of joint system) is 4 in. The joint system is designed to accommodate a max 15.6 percent compression or extension from its installed width. The joint system shall consist of the following:
   A. **Forming Material** – Min 4.0 pcf mineral wool batt insulation installed in joint opening as a permanent form. Batt cut to min width of 4 in. and installed edge-first into joint opening, parallel with joint direction, such that batt sections are compressed min 50 percent in thickness and such that the compressed batt sections are recessed from both surfaces of wall to accommodate the required thickness of fill material. Adjoining lengths of batt to be tightly-buttoed with butted seams spaced min 48 in. apart along the length of the joint. – ROYCO MANUFACTURING CO – Delta Safing Board
      ROCKWOOL MALAYSIA SDN BHD – Type Safe
      ROXUL INC – Type Safe
      THERMAFIBER INC – Type SAF
   B. **Fill, Void or Cavity Material** – Min 1/2 in. thickness of fill material applied within the joint, flush with both surfaces of wall.
      3M COMPANY – FB 1000 NS

1. **Floor Assembly** — The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual Floor-Ceiling Design in the UL Fire Resistance Directory. The hourly fire rating of the floor assembly shall be equal to or greater than the hourly fire rating of the wall assembly. The floor assembly shall include the following construction features:

A. **Steel Floor and Form Units** — Max 3 in. (76 mm) deep galv fluted floor units.

B. **Concrete** — Min 2-1/2 in. (64 mm) thick reinforced (100-150 pcf or 1600-2400 kg/m³) concrete, as measured from the top plane of the floor units.

1A. **Roof Assembly** — As an alternate to Item 1, the fire-rated roof assembly shall be constructed of the materials and in the manner described in the individual P900 Series Roof-Ceiling Designs in the UL Fire Resistance Directory and shall contain max 3 in. (76 mm) deep galv steel fluted roof units. The hourly fire rating of the assembly shall be equal or greater than the hourly fire rating of the wall assembly. In the case of spray-applied protection materials in the steel roof units, the joint system shall be installed prior to the spray-applied protection material.

1B. **Floor Assembly** — As an alternate to Item 1, min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete.

2. **Wall Assembly** — The 1 or 2 hr fire-rated gypsum board /steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400 and V400-Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

A. **Light Gauge Framing** — **Deflection Track** — Deflection track of wall assembly shall consist of min No. 25 gauge galv steel channels sized to accommodate steel studs (Item 2C) and with offset legs to accommodate wall cladding (Item 3A). Deflection track installed perpendicular to floor units. Min No. 25 gauge deflection track secured on both sides to valley of floor units with 1-1/2 in. (38 mm) long welds spaced max 12 in. (305 mm) OC. Min No. 20 gauge deflection track may be secured with steel fasteners spaced 12 in. (305 mm) OC.

**FIRE TRAK CORP** — Shadowline and Cavity Shadowline

B. **Light Gauge Framing** — Clips are attached to the inside bottom leg of the ceiling runner (Item 2A) with 2 - No. 8 by 1/2 in. (13 mm)
long steel self-drilling framing screws and engage the short flange of the studs.

**FIRE TRAK CORP** — Slip Clips or Redi Klips

C. **Studs** — Steel studs to be min 2-1/2 in. (64 mm) wide and as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory. Studs cut 4 in. (102 mm) less in length than the assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. Stud spacing not to exceed 24 in. (610 mm) OC.

D. **Gypsum Board** — Gypsum board sheets installed and attached to studs and runners as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a nominal 3-1/2 in. (89 mm) gap shall be maintained between top of the gypsum board and the bottom flange of the deflection track. Top row of screws shall be installed into the studs 13-1/2 in. (343 mm) below the top edge of the gypsum board sheets.

E. **Bracing** — (Not shown) Bracing as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory. The hourly assembly rating of the joint is equal to the fire rating of the wall.

**Firestop Configuration A and A1**

3. Joint System — Max separation between bottom flange of the deflection track and top of gypsum board (at the time of installation of the joint system) is 1 in. (25 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width. The joint system consists of spray applied fire resistive material (Item 3A), and wall cladding (Item 3B), as follows:

A. **Wall Cladding** — Strips of the gypsum board material attached to the deflection track. The number of layers, board type and thickness and fastener type shall be as specified for the gypsum board in the individual Wall and Partition Design in the UL Fire Resistance Directory. Fasteners shall be max spaced 3 in. (76 mm) OC. The top of the wall cladding shall be flush with the valleys of the steel floor units and overlapped the gypsum board 7 in. (178 mm) OC. Fasteners shall be max spaced 3 in. (76 mm) OC. The top of the wall cladding shall be flush with the valleys of the steel floor units and overlapped the gypsum board 7 in. (178 mm).

B. **Flute Fill** — The batt insulation and fill material are to be installed as specified in the Joint Systems in the table below:

<table>
<thead>
<tr>
<th>Manufacturer</th>

B1 **Fill, Void or Cavity Material** — Tape — As an alternate to the 3M FireDam Spray 200 (see Item B), Tape cut to size and press applied over the mineral wool forming material in the flutes and lapping min 1 in. (25 mm) onto the contour of the steel floor units and gypsum wall. Tape applied in minimum 1 ft (305 mm) lengths along joint and adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

**Firestop Configuration B and B1**

3. Joint System — Max separation between bottom flange of the deflection track and top of gypsum board (at the time of installation of the joint system) is 1 in. (25 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width. The joint system consists of spray applied fire resistive material (Item 3A), and wall cladding (Item 3B) as follows:

A. **Wall Cladding** — Strips of the gypsum board material attached to the deflection track. The number of layers, board type and thickness and fastener type shall be as specified for the gypsum board in the individual Wall and Partition Design in the UL Fire Resistance Directory. Fasteners shall be max spaced 3 in. (76 mm) OC. The top of the wall cladding shall be flush with the valleys of the steel floor units and overlapped the gypsum board 7 in. (178 mm).

B. **Flute Fill** — The batt insulation and fill material are to be installed as specified in the Joint Systems in the table below:

3M COMPANY — FB 1000NS, FB 2000, FB 2000+

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.
1. **Floor Assembly** – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the UL Fire Resistance Directory. The hourly fire rating of the floor assembly shall be equal to or greater than the hourly fire rating of the wall assembly. The floor assembly shall include the following construction features:
   
   A. **Steel Floor and Floor Units** – Max 3 in. (76 mm) deep galv steel fluted floor units.
   
   B. **Concrete** – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.

2. **Wall Assembly** – The 1 or 2 hr fire-rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400 or V400 Series Wall or Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. **Steel Floor and Ceiling Runners** – Floor and ceiling runners of wall assembly shall consist of min 24 gauge galv steel channels sized to accommodate steel studs (Item 2B). Ceiling runner to be provided with flanges sized a min of 1-1/2 in. (38 mm) longer than the nom joint width. The ceiling runner is secured to steel floor units with steel fasteners or welds spaced max 24 in. (610 mm) OC.
   
   B. **Studs** – Steel studs to be min 3-1/2 in. (89 mm) wide. Studs cut 1-1/4 in. (32 mm) to 1-1/2 in. (38 mm) less in length than assembly height with bottom nesting in and secured to floor runner. Studs to nest in ceiling runner without attachment.
   
   C. **Gypsum Board** – Gypsum board sheets installed to a min total 5/8 in. (16 mm) or 1-1/4 in. (32 mm) thickness on each side of wall for 1 and 2 hr fire rated assemblies, respectively. Wall to be constructed as specified in the individual U400 or V400 Series Design in the UL Fire Resistance Directory except that a max 4 in. (102 mm) gap shall be maintained between the top of the gypsum board and the bottom plane of the steel deck on both sides of wall assembly. For 1 hr fire rated walls, a min 4 in. wide strip of 5/8 in. thick gypsum board shall be installed flush with the top edge of the gypsum board along its entire length on both sides of the wall to create a nominal 1-1/4 in. wide ledge to support the bottom edge of the forming material (Item 3A). The screws attaching the gypsum board to the studs along the top of the wall shall be located 1-1/2 in. (38 mm) below the bottom of the ceiling runner. No gypsum board attachment screws shall be driven into the ceiling runner.
   
   **The hourly fire rating of the joint system is equal to the hourly fire rating of the wall.**

3. **Joint System** – Max separation between bottom plane of steel floor unit and top of gypsum board (at time of installation of joint system) is 4 in. (102 mm). The joint system is designed to accommodate a max 25 percent compression or extension from its installed width as measured between the bottom plane of the steel floor unit and the top of the gypsum board. The joint system shall consist of forming and fill materials, as follows:
   
   A. **Forming Material** – Nom 8 pcf (128 kg/m^3) mineral wool batt insulation. Sections of mineral wool batt cut to a width equal to the thickness of the wall assembly at its top edge and tightly packed into the areas of the fluted deck above the ceiling runner, flush with both surfaces of wall. Additional 1-1/2 in. wide by 2 in. (51 mm) thick sections of nom 8 pcf (128 kg/m^3) mineral wool batt insulation are compressed 37 percent in the thickness direction and installed to completely fill the gap above the top of the gypsum board on both sides of the wall. As an option for the 1 hr assembly rating, nom 4 pcf (64 kg/m^3) density mineral wool batt insulation may be used in the gap above the top of the gypsum board.

   **ROCK WOOL MANUFACTURING CO** – Delta 8
   
   **ROCKWOOL MALAYSIA SDN BHD** – SAFE
   
   **ROXUL INC** – SAFE
B. Fill, Void or Cavity Material* – Sealant – Min 1/8 in. (3.2 mm) wet thickness or 1/16 in. (1.6 mm) dry thickness of fill material spray applied over the forming material on each side of the wall. Fill material to overlap a min of 1/2 in. (13 mm) onto the gypsum board and a min 1 in. (25 mm) onto the steel floor unit on each side of the wall.

3M COMPANY – FireDam™ Spray 200

B1. Fill, Void or Cavity Material* – Tape – As an alternate to Item B, Tape cut to size and press applied within fluted areas of joint to completely cover mineral wool lapping min 1 in. (25 mm) onto the contour of the steel floor units and extending to lap min 1 in. (25 mm) onto the gypsum wall. Additional pieces of Tape are applied along the joint to completely cover the remaining mineral wool between bottom of steel deck and top edge of wall along length of joint, lapping min 1 in. (25 mm) onto the contour of the steel floor units and min 1 in. (25 mm) onto the gypsum wall. Adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

3M COMPANY – 3M Fire and Water Barrier Tape

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

**ANSI/UL2079**
Assembly Rating – 2 Hr
Nominal Joint Width – 4 in.
Class II Movement Capabilities – 19% Compression or Extension

**CAN/ULC S115**
F Rating – 2 Hr
FT Rating – 2 Hr
FH Rating – 2 Hr
FTH Rating – 2 Hr
Nominal Joint Width – 102 mm
Class II Movement Capabilities – 19% Compression or Extension

---

1. **Floor Assembly** – Min 4-1/2 in. (114 mm) thick steel-reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete.

2. **Wall Assembly** – Min 7-1/2 in. (191 mm) thick lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Wall may also be constructed of any UL Classified Concrete Blocks.

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

3. **Joint System** – Max separation between bottom of floor and top of wall is 4 in. (102 mm). The joint system is designed to accommodate a max 19 percent compression or extension from its installed width. The joint system consists of a forming material and a fill material, as follows:

   A. **Forming Material** – Min 4 pcf (64 kg/m³) mineral wool batt insulation compressed and firmly packed into the gap between the top of the wall and bottom of the floor on both sides of the wall. Sections of min 3 in. (76 mm) wide strips of batts to be stacked on top of each other to form an overall thickness two times the thickness of the nominal joint width and installed edge-first such that the batt sections are compressed min 50 percent and installed flush with both surfaces of wall.

   INDUSTRIAL INSULATION GROUP LLC – MinWool-1200 Safing
   JOHNS MANVILLE – Safing
   ROCK WOOL MANUFACTURING CO – Delta Safing Board
   ROCKWOOL MALAYSIA SDN BHD – Type Safe
   ROXUL INC – Type Safe
   THERMAFIBER INC – Type SAF

   B. **Fill, Void or Cavity Material** – Min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) of fill material sprayed or brushed on each side of the wall between the top of the wall and the bottom of the floor to completely cover mineral wool and overlap a min of 1/2 in. (13 mm) onto wall and floor on both sides of wall.

   3M COMPANY – FireDam ™ Spray 200

   B1. **Fill, Void or Cavity Material** – Tape – As an alternate to Item B, Tape cut to size and press applied to completely cover mineral wool forming material and lapping min 1 in. (25 mm) onto the contour of the steel floor units and extending to lap min 1 in. (25 mm) onto the concrete block wall. Tape to be applied in minimum 1 ft (305 mm) lengths along the joint and adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

   3M COMPANY – 3M Fire and Water Barrier Tape

4. **Steel Angles** (optional) – Nom 5 x 3 in. (127x 76mm) (or larger) by 12 MSG (or heavier) steel angles. Nom 3 in. (76 mm) leg secured to ceiling, on both sides of wall, with steel fasteners. Angles can consist of intermittent or continuous lengths. Intermittent lengths can be random or evenly spaced.

   *Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

1. **Floor Assembly** — The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual D900 Series Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:
   
   **A. Steel Floor and Form Units** — Max 3 in. (76 mm) deep galv steel fluted floor units.
   
   **B. Concrete** — Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.
   
   1A. **Roof Assembly** (not shown) — As an alternate to the floor assembly, a fire rated fluted steel deck roof assembly may be used. The roof assembly shall be constructed of the materials and in the manner described in the individual P900 Series Roof-Ceiling Design in the UL Fire Resistance Directory. The hourly rating of the roof assembly shall be equal to or greater than the hourly rating of the wall assembly. The roof assembly shall include the following construction features:
   
   **A. Steel Roof Deck** — Max 3 in. (76 mm) deep galv steel fluted roof deck.
   
   **B. Roof Insulation** — Min 2-1/4 in. (57 mm) thick poured insulating concrete, as measured from the top plane of the steel roof deck.
   
2. **Wall Assembly** — Min 7-1/2 in. (191 mm) thick lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete, running parallel to the deck fluts. Wall may also be constructed of any UL Classified Concrete Blocks. See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.
   
3. **Joint System** — Max separation between bottom of floor and top of wall is 4 in. (102 mm). The joint system is designed to accommodate a max 19 percent compression or extension from its installed width. The joint system consists of a forming material and a fill material, as follows:
   
   **A. Forming Material** — Min 4 pcf (64 kg/m³) mineral wool batt insulation compressed and firmly packed into the gap between the top of the wall and bottom of the floor on both sides of the wall, and filling the crest of the deck. Sections of min 3 in. (76 mm) wide strips of batts to be stacked on top of each other to form an overall thickness two times the thickness of the nominal joint width and installed edge-first such that the batt sections are compressed min 50 percent and installed flush with both surfaces of wall.

   INDUSTRIAL INSULATION GROUP LLC — MinWool-1200 Safing

   JOHNS MANVILLE — Safing

   ROCK WOOL MANUFACTURING CO — Delta Safing Board

   ROCKWOOL MALAYSIA SDN BHD — Type Safe

   ROXUL INC — Type Safe

   THERMAFIBER INC — Type SAF

   **B. Fill, Void or Cavity Material** — Min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) of fill material sprayed or brushed on each side of the wall between the top of the wall and the bottom of the floor to completely cover mineral wool and overlap a min of 1/2 in. (13 mm) onto wall and floor on both sides of wall.

   3M COMPANY

   3M FIRE PROTECTION PRODUCTS — FireDam™ Spray 200

   **B1. Fill, Void or Cavity Material** — Tape — As an alternate to Item B, Tape cut to size and press applied to completely cover mineral wool forming material and lapping min 1 in. (25 mm) onto the contour of the steel floor units and the concrete wall. Tape to be applied in minimum 1 ft (305 mm) lengths along the joint and adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

   3M COMPANY

   3M COLUMBIA PLANT — 3M Fire and Water Barrier Tape

4. **Steel Angles** (optional) — Nom 5 x 3 in. (127 x 76 mm) (or larger) by 12 MSG (or heavier) steel angles. Nom 3 in. (76 mm) leg secured to ceiling, on both sides of wall, with steel fasteners. Angles can consist of intermittent or continuous lengths. Intermittent lengths can be random or evenly spaced.

1. **Floor Assembly** – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual D900 Series Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. **Steel Floor and Form Units** – Max 3 in. (76 mm) deep galv steel fluted floor units.
   
   B. **Concrete** – Min 2-1/2 in. (64 mm) thick reinforced concrete, as measured from the top plane of the floor units.

1A. **Roof Assembly** – (Not Shown) – As an alternate to the floor assembly, a fire rated fluted steel deck roof assembly may be used. The roof assembly shall be constructed of the materials and in the manner described in the individual P900 Series Roof-Ceiling Design in the UL Fire Resistance Directory. The hourly rating of the roof assembly shall be equal to or greater than the hourly rating of the wall assembly. The roof assembly shall include the following construction features:

   A. **Steel Roof Deck** – Max 3 in. (76 mm) deep galv steel fluted roof deck.
   
   B. **Roof Insulation** – Min 2-1/4 in. (57 mm) thick poured insulating concrete, as measured from the top plane of the steel roof deck.

2. **Wall Assembly** – Min 7-1/2 in. (191 mm) thick lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete, running perpendicular to the deck flutes. Wall may also be constructed of any UL Classified Concrete Blocks. See **Concrete Blocks** (CAZT) category in the Fire Resistance Directory for names of manufacturers.

3. **Joint System** – Max separation between bottom of floor and top of wall is 4 in. (102 mm). The joint system is designed to accommodate a max 19 percent compression or extension from its installed width. The joint system consists of a forming material and a fill material, as follows:

   A. **Forming Material** – Nom 4 pcf (64 kg/m³) mineral wool batt cut to the shape of the steel deck flute with a height 1 in. (25 mm) greater than the height of flutes and with a length equal to the overall thickness of the wall assembly. Mineral wool batt compressed and installed into each flute above the wall with its ends projecting flush with the wall surfaces. Additional pieces of min 4 pcf (64 kg/m³) density mineral wool batt cut to a width equal to the overall thickness of the wall and with a thickness equal to twice the height of the gap between the top of the wall and the valleys of the steel deck floor. Insulation compressed 50 percent in thickness and inserted between the top of the wall and the bottom of the floor, flush with both sides of the wall.
INDUSTRIAL INSULATION GROUP LLC – MinWool-1200 Safing
JOHNS MANVILLE – Safing
ROCK WOOL MANUFACTURING CO – Delta Board
ROCKWOOL MALAYSIA SDN BHD – Type Safe
ROCKWOOL – Type Safe
THERMAFIBER INC – Type SAF

B. Fill, Void or Cavity Material* – Min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) of fill material sprayed or
brushed on each side of the wall between the top of the wall and the bottom of the floor to completely cover mineral wool and overlap a
min of 1/2 in. (13 mm) onto wall and floor on both sides of wall.

3M COMPANY 3M FIRE PROTECTION PRODUCTS – FireDam™ Spray 200

B1. Fill, Void or Cavity Material* – Tape – As an alternate to Item B, Tape cut to size and press applied to completely cover mineral wool
forming material and lapping min 1 in. (25 mm) onto the contour of the steel floor units and the concrete wall. Tape to be applied in
minimum 1 ft (305 mm) lengths along the joint and adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at
both sides of wall.

3M COMPANY 3M FIRE PROTECTION PRODUCTS – 3M Fire and Water Barrier Tape

4. Steel Angles – (Optional, not shown) – Nom 5 in. by 3 in. (127 mm by 76 mm) (or larger) by 12 MSG (or heavier) steel angles. Nom 3 in.
(76 mm) leg secured to ceiling, on both sides of wall, with steel fasteners. Angles can consist of intermittent or continuous lengths.
Intermittent lengths can be random or evenly spaced.

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

1. **Floor Assembly** — Min 4-1/2 in. (114 mm) thick steel-reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m3) structural concrete.

2. **Wall Assembly** — Min 7-1/2 in. (191 mm) thick lightweight or normal weight (100-150 pcf or 1600-2400 kg/m3) concrete. Wall may also be constructed of any UL Classified Concrete Blocks.

3. **Joint System** — Max separation between bottom of floor and top of wall is 4 in. (102 mm). The joint system is designed to accommodate a max 19 percent compression or extension from its installed width. The joint system consists of a forming material and a fill material, as follows:

   A. **Forming Material** — Min 4 pcf (64 kg/m3) mineral wool batt insulation compressed and firmly packed into the gap between the top of the wall and bottom of the floor. The strips and shaped pieces of mineral wool batt insulation installed on the inaccessible side of the wall are to be 1 in. to 2 in. (25 to 51 mm) wide and are to be installed edge-first such that the batt sections are compressed min 50 percent, flush with the inaccessible surface of the wall. After application of the sealant (item 3B) on the surface of the mineral wool batt packing material above the top plane of the wall, additional strips of the mineral wool batt insulation are to be installed to fill the remainder of the joint opening above the wall, flush with the accessible surface of the wall. Sections of strips of batts to be stacked on top of each other to form an overall thickness two times the thickness of the nominal joint width and installed edge-first such that the batt sections are compressed min 50 percent.

   JOHNS MANVILLE — Safing

   ROCK WOOL MANUFACTURING CO — Delta Safing Board

   ROCKWOOL MALAYSIA SDN BHD — Type Safe

   ROCKWOOL — Type Safe

   THERMAFIBER INC — Type SAF
B. Fill, Void or Cavity Material* — Sealant — Min 1/8 in. (3.2 mm) wet thickness or 1/16 in. (1.6 mm) dry thickness of fill material spray applied over the forming material. The fill material sprayed on the nom 1 in. to 2 in. (25 to 51 mm) thickness of forming material located on the inaccessible side of the wall is to lap a min of 1 in. (25 mm) onto the floor and onto the top surface of the wall. The fill material sprayed on the forming material on the accessible side of the wall is to overlap a min of 1/2 in. (13 mm) onto the floor and wall.

3M COMPANY 3M FIRE PROTECTION PRODUCTS — FireDam™ Spray 200

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.
1. **Floor Assembly** – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:
   
   **A. Steel Floor And Form Units** – Max 3 in. deep galv or phos/painted fluted units.
   
   **B. Concrete** – Min 3 in. thick reinforced concrete, as measured from the top plane of the fluted units.

2. **Wall Assembly** – The 1 or 2 hr fire rated gypsum wallboard/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400-Series Wall or Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   **A. Steel Floor And Ceiling Runners** – Floor and ceiling runners of wall assembly shall consist of min 25 gauge galv steel channels sized to accommodate steel studs (Item 2B). Ceiling runner to be provided with min 1-1/4 in. flanges. Ceiling runner secured to valleys of steel floor units (Item 1A) with steel fasteners or by welds spaced max 24 in. OC.

   **B. Studs** – Steel studs to be min 3-5/8 in. wide. Studs cut 1 in. less in length than assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. Stud spacing not to exceed 24 in. OC.

   **C. Gypsum Board** – Wallboard sheets installed to a min total thickness of 1/2 or 1 in. on each side of wall for a 1 or 2 hr fire rated wall, respectively. Wall to be constructed as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a nom 1 in. gap shall be maintained between the top of the wallboard and the bottom of the steel floor units and the top row of screws shall be installed into the studs 1-3/4 in. below the valleys of the steel floor units. The hourly fire rating of the joint system is equal to the hourly fire rating of the wall.

3. **Joint System** – Max separation between bottom of floor and top of wall is 1 in. The joint system consists of a forming material and a fill material in the flutes of the steel floor units and between the top of the wallboard and bottom of the steel floor units, as follows:

   **A. Packing Material** – For 1 or 2 Hr Rated Designs, a 3-1/2 in. or 4-1/2 in. thickness, respectively, of min 4 pcf density mineral wool batt insulation is firmly packed into flutes of the steel floor units and between the top of the wallboard and bottom of the steel floor units, and recessed from each surface of wall to accommodate the required thickness of fill material.

   **B. Fill, Void or Cavity Material** – Min 1/2 in. thickness of fill material installed on each side of the wall in the flutes of the steel floor units and between the top of the wallboard and bottom of the steel floor units (concrete floor), flush with each surface of wallboard.

   **3M COMPANY** – FB-2000 or FB-2000+. (Note: L Ratings apply only when FB-2000+ is used)

*Bearing the UL Classification Marking

1. **Floor Assembly** – Min 4-1/2 in. thick steel-reinforced lightweight or normal weight (100-150 pcf) structural concrete.

2. **Wall Assembly** – The 1 or 2 hr fire rated gypsum wallboard/stud wall assembly shall be constructed of the materials and in the manner described in the individual U400-Series Wall or Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Steel Floor And Ceiling Runners** – Top and bottom runners of wall assembly shall consist of min 3-5/8 in. wide by 3 in. deep corrosion protected min 25 MSG steel channels. Floor runner secured with steel fasteners spaced max 24 in. O.C. The ceiling runner is installed within the u-shaped deflection plate (item 3A) with a nom 1 in. gap is maintained between the top of the ceiling runner and the top of the deflection plate.
   B. **Studs** – Min 3-5/8 in. wide by 1-1/4 in. deep corrosion protected min 25 MSG steel channels. Steel stud spacing not to exceed 24 in. O.C.
   C. **Gypsum Board** – 5/8 in. thick, 4 ft wide with square or tapered edges. Wallboard sheets installed vertically on both sides of stud framing with joints centered over studs. A max 1 in. gap is maintained between the top of the wallboard and the bottom of the concrete floor. The gypsum wallboard type, thickness, number of layers and fastener types shall be as specified in the individual U400-Series Design in the UL Fire Resistance Directory.

3. **Joint System** – Max separation between bottom of floor and top of wall is 1 in. The joint system consists of a deflection plate, packing material and caulk, as follows:
   A. **Deflection Plate** – A nom 4 in. wide by 3 in. deep, min 24 gauge steel u-shaped channel. The deflection plate is attached to the concrete floor with masonry anchors at a max 24 in. O.C. The steel ceiling runner (item 2A) is installed within the deflection plate to maintain a nom 1 in. gap between the top of the ceiling runner and the top of the deflection plate. The ceiling runner is not fastened to the deflection plate.
   B. **Packing Material** – The following packing materials are used:
      - **Mineral Wool** – A 1 in. thickness by 4 in. wide section of min 4 pcf density mineral wool batt insulation is fitted into the 1 in. gap within the deflection plate between the top of the ceiling runner and the deflection plate.
      - **Polyethylene Backer Rod** (2 hr rated system only) – A nom 1-1/4 in. diam polyethylene backer rod friction-fitted into the gap between the top of the gypsum wallboard and the bottom of the concrete deck on both sides of the wall and recessed from each surface of wall to accommodate the required thickness of fill material.
   C. **Fill, Void or Cavity Material** – **Caulk or Sealant** – A min 5/8 in. thickness of fill material for 1 hr rated systems and a min 1/2 in. thickness of fill material for 2 hr rated systems installed on each side of the wall between the top of the wallboard and bottom of the concrete floor.

ANSI/UL2079
Assembly Ratings – 1 and 2 Hr (See Items 2, 3B and 3C)
Nominal Joint Width – 1 In.

CAN/ULC S115
F Ratings– 1 and 2 Hr (See Items 2, 3B and 3C)
FT Ratings – 1 and 2 Hr (See Items 2, 3B and 3C)
FH Ratings – 1 and 2 Hr (See Items 2, 3B and 3C)
FTH Ratings – 1 and 2 Hr (See Items 2, 3B and 3C)
Nominal Joint Width – 1 In.

1. **Floor Assembly** – Min 4-1/2 in. (114 mm) thick steel-reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete.

2. **Wall Assembly** – The 1 or 2 hr fire rated gypsum wallboard/stud wall assembly shall be constructed of the materials and in the manner described in the individual U400-Series Wall or Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. **Steel Floor And Ceiling Runners** – Top and bottom runners of wall assembly shall consist of min 3-5/8 in. (92 mm) wide by 3 in. (76 mm) deep corrosion protected min 25 MSG steel channels. Floor runners secured with steel fasteners spaced max 24 in. (610 mm) O.C. The ceiling runners are installed within the U-shaped deflection plate (Item 3A) with a nom 1 in. (25 mm) gap is maintained between the top of the ceiling runners and the top of the deflection plate.
   
   B. **Studs** – 3-5/8 in. (92 mm) wide by 1-1/4 in. (32 mm) deep corrosion protected min 25 MSG steel channels. Steel stud spacing not to exceed 24 in. (610 mm) O.C.
   
   C. **Gypsum Board* – 5/8 in. (16 mm) thick, 4 ft (1219 mm) wide with square or tapered edges. Wallboard sheets installed vertically on both sides of stud framing with joints centered over studs. A max 1 in. (25 mm) gap is maintained between the top of the wallboard and the bottom of the concrete floor. The gypsum wallboard type, thickness, number of layers and fastener types shall be as specified in the individual U400-Series Design in the UL Fire Resistance Directory.

3. **Joint System** – Max separation between bottom of floor and top of wall is 1 in. (25 mm). The joint system consists of a deflection plate, packing material and caulk, as follows:
   
   A. **Deflection Plate** – A nom 4 in. (102 mm) wide by 3 in. (76 mm) deep, min 24 ga steel U-shaped channel. The deflection plate is attached to the concrete floor with masonry anchors at a max 24 in. (610 mm) O.C. The steel ceiling runner (Item 2A) is installed within the deflection plate to maintain a nom 1 in. (25 mm) gap between the top of the ceiling runner and the top of the deflection plate. The ceiling runner is not fastened to the deflection plate.
   
   B. **Packing Material** – The following packing materials are used:
      
      - **Mineral Wool** – A 1 in. (25 mm) thickness by 4 in. (102 mm) wide section of min 4 pcf density mineral wool batt insulation is fitted into the 1 in. (25 mm) gap within the deflection plate between the top of the ceiling runner and the deflection plate.
      
      - **Polyethylene Backer Rod** (2 hr rated system only) – A nom 1-1/4 in. (32 mm) diam polyethylene backer rod friction-fitted into the gap between the top of the gypsum wallboard and the bottom of the concrete deck on both sides of the wall and recessed from each surface of wall to accommodate the required thickness of fill material.
   
   C. **Fill, Void or Cavity Material* – A min 5/8 in. (16 mm) thickness of fill material for 1 hr rated systems and a min 1/2 in. (13 mm) thickness of fill material for 2 hr rated systems installed on each side of the wall between the top of the wallboard and bottom of the concrete floor.

1. **Floor Assembly** – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Floor And Form Units* –** Composite or noncomposite max 3 in. (76 mm) deep min 22 ga galv or phos/painted fluted units. Adjacent units button-punched or welded together max 36 in. (914 mm) OC along side joints.

   B. **Normal Weight or Light Weight Concrete** – Min 3 in. (76 mm) thick concrete of the type, density, and compressive strength detailed for the specific Floor-Ceiling Design described in the UL Fire Resistance Directory.

2. **Wall Assembly** – Min 5-1/2 in. (140 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete. Wall may also be constructed of any UL Classified Concrete Blocks*.

   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

3. **Joint System** – Max separation between bottom of floor and top of wall is 1 in. (25 mm). The joint system consists of a forming material and a fill material in the flutes of the steel floor units and between the top of the wall and bottom of the steel floor units, as follows:

   A. **Packing Material** – Min 4-1/2 in. (114 mm) thickness of min 4.0 pcf (64 kg/m³) mineral wool batt insulation firmly packed into flutes of the steel floor units and between the top of the wallboard and bottom of the steel floor units as a permanent form. Packing material to be recessed from each surface of wall to accommodate the required thickness of fill material.

   B. **Fill, Void or Cavity Material* –** Min 1/2 in. (13 mm) thickness of fill material installed on each side of the wall in the flutes of the steel floor units and between the top of the wall and the bottom of the steel floor units, flush with each surface of wall.

1. **Floor Assembly** – The fire rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Floor and Form Units** – Composite or noncomposite max 3 in. deep min 22 ga galv or phos/painted fluted units. Adjacent units button-punched or welded together max 36 in. OC along side joints.

   B. **Normal Weight or Light Weight Concrete** – Min 2-1/2 in. thick concrete of the type, density and compressive strength detailed for the specific Floor-Ceiling Design described in the UL Fire Resistance Directory.

2. **Wall Assembly** – The 1 or 2 Hr fire-rated gypsum wallboard/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Steel Floor and Ceiling Runners** – Floor and ceiling runners of wall assembly shall consist of min 25 ga galv steel channels sized to accommodate steel studs (Item 2B). Ceiling runner to be provided with min 1-1/4 in. flanges. Ceiling runner secured to valleys of steel floor units (Item 1A) with steel fasteners or by welds spaced max 24 in. OC.

   B. **Studs** – Min 3-1/2 in. wide by 1-1/4 in. deep corrosion protected min 25 MSG steel channels. Steel stud spacing not to exceed 24 in. OC.

   C. **Gypsum Board** – 5/8 in. thick, 4 ft wide with square or tapered edges. Wallboard sheets installed vertically on both sides of stud framing with joints centered over studs. Wallboard to be butted tight to bottom of the steel deck. The gypsum wallboard type, thickness, number of layers and fastener types shall be as specified in the individual U400 Series Design in the UL Fire Resistance Directory.

3. **Joint System** – The joint system consists of a forming material and a fill material in the flutes of the steel floor units, as follows:

   A. **Packing Material** – Min 3-3/4 in. thickness of min 4.0 pcf mineral wool batt insulation, compressed a min of 25 percent into flutes of the steel floor units between the top of the ceiling runner and bottom of the steel floor units, and recessed from each surface of wall to accommodate the required thickness of fill material.

   B. **Fill, Void or Cavity Material** – Min 3/8 in. thickness of fill material installed on each side of the wall in the flutes of the steel floor units. An additional min 3/8 in. bead of fill material to be installed at the wallboard/steel deck interface.

Assembly Rating – 1 & 2 Hr (See Item 2)
Joint Width – 3/4 In. Max

1. **Floor Assembly** – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Steel Floor and Form Units** – Max 3 in. deep galv steel fluted units.
   B. **Concrete** – Min 2-1/2 in. thick reinforced concrete, as measured from the top plane of the floor units.

2. **Wall Assembly** – The 1 or 2 hr fire-rated gypsum wallboard/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400 Series Wall or Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Steel Floor and Ceiling Runners** – Floor and ceiling runners of wall assembly shall consist of galv steel channels sized to accommodate steel studs (Item 2B). Ceiling runner to be secured to valleys of steel floor units (Item A) with steel fasteners or by welds spaced max 24 in. OC.
   B. **Studs** – Steel studs to be min 3-1/2 in. wide. Studs cut 1/2 to 3/4 in. less in length than assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner with or without attachment. Stud spacing not to exceed 24 in. OC.
   C. **Gypsum Board** – Wallboard sheets installed to a min total thickness of 5/8 in. and 1-1/4 in. on each side of wall for 1 and 2 hr rated assemblies, respectively. Wall to be constructed as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that wallboard is cut to the contour of the steel floor units with a max 3/4 in. gap between the top of the wallboard and the bottom of the floor units.

   The hourly fire rating of the joint system is dependent on the hourly fire rating of the wall.

3. **Fill, Void or Cavity Material** – **Caulk or Sealant** – Min 5/8 in. and 1-1/4 in. thickness of fill material for 1 and 2 hr rated assemblies, respectively, installed on each side of the wall between the top of the wallboard and all surfaces of the steel floor units, flush with each surface of the wall.

   **3M COMPANY** – CP 25WB+ caulk or FB-3000 WT sealant

1. **Floor Assembly** – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Steel Floor And Form Units** – Max 1-1/2 to 3 (38 to 76 mm) in. deep min 22 ga galv or phos/painted steel fluted units.
   B. **Concrete** – Min 3 in. (76 mm) thick reinforced concrete, as measured from the top plane of the floor units.

2. **Wall Assembly** – The 1 or 2 hr fire rated gypsum wallboard/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400 - Series Wall or Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Steel Floor And Ceiling Runners** – Floor and ceiling runners of wall assembly shall consist of min 25 ga galv steel channels sized to accommodate steel studs (Item 2B). Ceiling runner to be provided with 1-1/4 in. (32 mm) flanges. Ceiling runner secured to valleys of steel floor units (Item 1A) with steel fasteners or by welds spaced max 24 in. (610 mm) OC.
   B. **Studs** – Steel studs to be min 3-1/2 in. (89 mm) wide. Studs cut 1/2 to 3/4 in. (13 to 19 mm) less in length than assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. Stud spacing not to exceed 24 in. (610 mm) OC.
   C. **Gypsum Board** – Wallboard sheets installed to a min total thickness of 5/8 in. (16 mm) and 1-1/4 in. (32 mm) on each side of wall for 1 and 2 hr rated assemblies, respectively. Wall to be constructed as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a nom 1 in. (25 mm) gap shall be maintained between the top of the wallboard and the bottom of the steel floor units and the top row of screws shall be installed into the studs 1-3/4 in. (44 mm) below the valleys of the steel floor units.

3. **Joint System** – Max separation between bottom of floor and top of wall is 1 in. (25 mm). The joint system consists of a packing material and a fill material in the flutes of the steel floor units and between the top of the wallboard and bottom of the steel floor units, as follows:
   A. **Packing Material** – Min 3-1/2 in. (89 mm) thickness of min 4 pcf (64 kg/m3) density mineral wool batt insulation for 1 hr Rated Design, min 4-1/2 in. (114 mm) thickness for 2 hr Rated Design, firmly packed into flutes of the steel floor units and between the top of the wallboard and bottom of the steel floor units, and recessed from each surface of wall to accommodate the required thickness of fill material.
   B. **Fill, Void or Cavity Material** – Min 1/2 in. (13 mm) thickness of fill material installed on each side of the wall in the flutes of the steel floor units and between the top of the wallboard and bottom of the steel floor units (concrete floor), flush with each surface of wallboard.

3M COMPANY – FB-1000 NS or FB-2000

1. **Floor Assembly** – Min 4-1/2 in. (114 mm) thick steel-reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete.

2. **Wall Assembly** – The 1 or 2 hr fire rated gypsum wallboard/steel stud wall assembly shall be constructed of the materials and in the manner described in the individual U400- Series Wall or Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. **Steel Floor And Ceiling Runners** – Floor and ceiling runners of wall assembly shall consist of min 25 ga galv steel channels sized to accommodate steel studs (Item 2B). Ceiling runner to be provided with 3 in. (76 mm) flanges. Ceiling runner installed within the U-shaped deflection plate (Item 3A) with 1 in. (25 mm) gap maintained between the top of ceiling runner and top of deflection plate.
   
   B. **Studs** – Steel studs to be min 3-1/2 in. (89 mm) wide. Studs cut 1/2 to 3/4 in. (13 to 19 mm) less in length than assembly height with bottom nesting in and resting on floor runner and with top nesting in ceiling runner without attachment. Stud spacing not to exceed 24 in. (610 mm) OC.
   
   C. **Gypsum Board** – Wallboard sheets installed to a min total thickness of 5/8 in. (16 mm) and 1-1/4 in. (32 mm) on each side of wall for 1 and 2 hr rated assemblies, respectively. Wall to be constructed as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a nom 1 in. (25 mm) gap shall be maintained between the top of the wallboard and the lower surface of the floor and the top row of screws shall be installed into the studs 3-1/2 in. (89 mm) below the valleys of the steel floor units.

3. **Joint System** – Max separation between bottom of floor and top of wall is 1 in. (25 mm). The joint system consists of a deflection plate, packing material and caulking, as follows:
   
   A. **Deflection Channel** – A nom 4 in. (102 mm) wide by 3 in. (76 mm) deep min 24 ga steel U-shaped channel. Deflection channel secured to lower surface of floor with steel fasteners spaced max 24 in. (610 mm) OC. The ceiling runner (Item 2A) is installed within the deflection channel to maintain a 1 in. (25 mm) gap between the top of the ceiling runner and the top of the deflection channel. The ceiling runner is not fastened to the deflection channel.
   
   B. **Packing Material** – The following packing materials are used:
      
      - **Mineral Wool** – A 1 in. (25 mm) thickness by 4 in. (102 mm) wide section of min 4 pcf (64 kg/m³) density mineral wool batt insulation is fitted into the 1 in. (25 mm) gap within the deflection plate between the top of the ceiling runner and the deflection plate.
      
      - **Polyethylene Baker Rod** – (2 hr rated system only) – A nom 3/4 in. (19 mm) thick by 1 in. (25 mm) wide polyethylene backer rod friction-fitted into the gap between the top of the gypsum wallboard and the bottom of the concrete deck on both sides of the wall and recessed from each surface of wall to accommodate the required thickness of fill material.
   
   C. **Fill, Void or Cavity Material** – A min 5/8 in. (16 mm) thickness of fill material installed on each side of the wall between the top of the wallboard and bottom of the concrete floor.
   
   **3M COMPANY** – FB-1000 NS or FB-2000

1. **Floor Assembly** – The fire-rated fluted steel deck/concrete floor assembly shall be constructed of the materials and in the manner described in the individual Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Steel Floor And Form Units** – Max 3 in. (76 mm) deep min 22 ga galv or phos/painted steel fluted units.
   B. **Concrete** – Min 3 in. (76 mm) thick reinforced concrete, as measured from the top plane of the floor units.

2. **Wall Assembly** – Min 5-1/2 in. (140 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete. Wall may also be constructed of any UL Classified Concrete Blocks.
   See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

3. **Joint System** – Max separation between bottom of floor and top of wall is 1 in. (25 mm). The joint system consists of a packing material and a fill material in the flutes of the steel floor units and between the top of the wall and bottom of the steel floor units, as follows:
   A. **Packing Material** – Min 3-1/2 in. (89 mm) thickness of min 4 pcf (64 kg/m³) density mineral wool batt insulation for 1 hr Rated Design, min 4-1/2 in. (114 mm) thickness for 2 hr Rated Design, firmly packed into flutes of the steel floor units and between the top of the wall and bottom of the steel floor units, and recessed from each surface of wall to accommodate the required thickness of fill material. Mineral wool batts packed into opening horizontally with a min 25 percent compression.
   B. **Fill, Void or Cavity Material** – Min 1/2 in. (13 mm) thickness of fill material installed on each side of the wall in the flutes of the steel floor units and between the top of the wall and bottom of the steel floor units, flush with each surface of wall.

3M COMPANY – FB-1000 NS or FB-2000

1. **Floor Assembly** – The 1 hr fire-rated wood joist, wood truss or combination wood and steel truss Floor-Ceiling assembly shall be constructed of the materials and in the manner described in the individual L500-Series Floor-Ceiling Design in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. **Flooring System** – Lumber or plywood subfloor with finish floor of lumber, plywood or **Floor Topping Mixture** as specified in the individual Floor-Ceiling Design.
   
   B. **Wood Joists** – Nom 10 in. (254 mm) deep (or deeper) lumber, steel or combination lumber and steel joists, trusses or **Structural Wood Members** with bridging as required and with ends firestopped.
   
   C. **Gypsum Board** – Nom 4 ft. (122 cm) wide by 5/8 in. (16 mm) thick as specified in the individual Floor-Ceiling Design.

2. **Wall Assembly** – The 1 hr fire rated gypsum board/lumber stud wall assembly shall be constructed of the materials and in the manner described in the individual U300-Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Studs** – Wall framing to consist of nom 2 by 4 in. (51 by 102 mm) lumber spaced 16 in. (406 mm) OC. Top plate installed parallel or perpendicular to direction of wood joists and secured to bottom of joists with steel fasteners spaced max 24 in. (610 mm) OC.

   B. **Gypsum Board** – Gypsum board sheets installed to a min total thickness of 5/8 in. (16 mm) on each side of wall. Wall to be constructed as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a max 1/2 in. (13 mm) gap shall be maintained between the top of the gypsum board and the ceiling of the floor-ceiling assembly.

3. **Fill, Void or Cavity Material** – **Caulk** – Min 5/8 in. (16 mm) thickness of fill material installed to fill the max 1/2 in. (13 mm) gap at the wall/ceiling intersection flush with each surface of the wall.

   **3M COMPANY** – FireDam 150+ Caulk

System No. WW-D-0013
April 22, 2011
Assembly Rating – 4 Hr
Nominal Joint Width – 2 In.
Class II Movement Capabilities – 10.9% Compression or Extension

1. **Wall Assembly** – Min 6 in. thick steel-reinforced lightweight or normal weight (100-150 pcf) structural concrete. Wall may also be constructed of any UL Classified Concrete Blocks*.

2. **Joint System** – Max width of joint (at time of installation of joint system) is 2 in. The joint system is designed to accommodate a max 10.9 percent compression or extension from its installed width. The joint system shall consist of the following:
   A. **Forming Material** – Min 4.0 pcf mineral wool batt insulation installed in joint opening as a permanent form. Batt cut to min width of 5 in. and installed edge-first into joint opening, parallel with joint direction, such that batt sections are compressed min 50 percent in thickness and such that the compressed batt sections are recessed from both surfaces of wall to accommodate the required thickness of fill material. Adjoining lengths of batt to be tightly-butted with butted seams spaced min 48 in. apart along the length of the joint.
      - IIG MINWOOL L L C – MinWool-1200 Safing
      - ROCKWOOL MANUFACTURING CO – Delta Safing Board
      - ROCKWOOL MALAYSIA SDN BHD – Type Safe
      - ROXUL INC – Type Safe
      - THERMAFIBER INC – Type SAF
   B. **Fill, Void or Cavity Material** – Min 1/2 in. thickness of fill material applied within the joint, flush with both surfaces of wall.
      - 3M COMPANY – FB 2000+
      *Bearing the UL Classification Mark

1. **Wall Assembly** – Min 7-1/2 in. thick reinforced lightweight or normal weight (100-150 pcf) structural concrete. Wall may also be constructed of any UL Classified Concrete Blocks*. See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Joint System** – Max width of joint (at time of installation of joint system) is 1 in. The joint system is designed to accommodate a max 18.75 percent compression or extension from its installed width. The joint system shall consist of the following:
   A. **Packing Material** – Nom 1-1/4 in. diameter polyethylene backer rod compressed and installed into joint. Packing material to be recessed from each surface of wall as required to accommodate the required thickness of fill material.
   B. **Fill, Void or Cavity Material*** – Min 1/2 in. thickness of fill material applied within the joint, flush with both surfaces of wall.

   *Bearing the UL Classification Mark

Reprinted from the Online Certifications Directory with permission from Underwriters Laboratories Inc. Copyright © 2010 Underwriters Laboratories Inc.
1. **Wall Assembly** – Nonbearing 1, 2 or 3 hr fire rated gypsum board/steel stud assembly constructed of the materials and in the manner described in the individual U400-Series Wall or Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. **Studs** – Min 1-1/2 in. (38 mm) wide steel studs spaced max 24 in. (610 mm) OC.
   B. **Gypsum Board*** – The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual U400 Series Design in the UL Fire Resistance Directory.

   The hourly assembly rating of the joint system is equal to the hourly fire rating of the wall assembly in which it is installed.

2. **Joint System** – Max width of joint (at time of installation of joint system) is 2 in. (51 mm) The joint system is designed to accommodate a max 12.5 percent compression or extension from its installed width. The joint system shall consist of the following:
   
   A. **Forming Material*** – Min 4.0 pcf (64 kg/m3) mineral wool batt insulation installed in joint opening as a permanent form. Pieces of batt cut to min width of 1-3/4, 3, or 4-1/4 in. (44, 76 or 108 mm) for 1, 2 and 3 hr rated assemblies, respectively. Pieces of batt installed edge-first into joint opening, parallel with joint direction, such that batt sections are compressed min 50 percent in thickness and such that the compressed batt sections are recessed from both surfaces of wall to accommodate the required thickness of fill material.
      
      ROCK WOOL MANUFACTURING CO – Delta Board
      ROCKWOOL MALAYSIA SDN BHD – SAFE
      ROXUL INC – SAFE
   B. **Fill, Void or Cavity Material*** – Min 1/2 in. (13 mm) thickness of fill material applied within the joint, flush with both surfaces of wall.
      
      3M COMPANY – FD-150+

UL System No. WW-D-0074
XHBN - Joint Systems

September 01, 2017

Assembly Rating – 1 and 2 Hr (See Item 2)
L Rating At Ambient – 4 CFM/Lin Ft
L Rating At 400 F – 6 CFM/Lin Ft
Nominal Joint Width – 3/4 In.
Class II Movement Capabilities – 17% Compression or Extension

1. Concrete Wall Assembly – Min 4-1/2 in. thick reinforced lightweight or normal weight (100-150 PCF) structural concrete. Wall may also be constructed of any UL Classified Concrete Blocks*.

See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. Gypsum Wall Assembly – The 1 or 2 h fire-rated gypsum wallboard/steel stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 Series Wall or Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

A. Steel Runners – Runners of wall assembly shall consist of min No. 25 gauge galv steel channels sized to accommodate steel studs (Item 2B). Runner to be provided with 1-1/4 in. flanges. Runner secured to concrete wall assembly with steel concrete fasteners spaced 12 in. OC.

B. Studs – Steel studs to be min 3-5/8 in. (92 mm) wide. Studs cut 1/2 to 3/4 in. (13 to 19 mm) less in length than assembly height. Stud spacing not to exceed 24 in. (610 mm) OC.

C. Gypsum Board* – Gypsum board sheets installed to a min total thickness of 5/8 in. (16 mm) and 1-1/4 in. (32 mm) on each side of wall for a 1 or 2 hr rated assemblies, respectively. Wall to be constructed as specified in the individual Wall and Partition Design in the UL Fire Resistance Directory, except that a nom 3/4 in. (19 mm) gap shall be maintained between the side of the gypsum board and the face of the concrete wall assembly.

3. Fill, Void or Cavity Material* – Caulk – Max separation between side of gypsum board and face of concrete wall assembly is 3/4 in. (19 mm). The joint system is designed to accommodate a max 17 percent compression or extension from its installed width. Min 5/8 in. (16 mm) thickness of fill material installed on each side of the wall between the side of the gypsum board and the face of the concrete wall assembly, flush with each surface of gypsum board.

3M COMPANY 3M FIRE PROTECTION PRODUCTS – FD-150+

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

1. **Wall Assembly** — Nonbearing 1 or 2 hr fire rated gypsum board/steel stud assembly constructed of the materials and in the manner described in the individual U400, V400 or W400 Series Wall or Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   A. **Studs** — Min 3-1/2 (89 mm) wide steel studs spaced max 24 in. (610 mm) OC. Additional studs lining opening.
   B. **Gypsum Board** — The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the individual U400, V400 or W400 Series Design in the UL Fire Resistance Directory.

   The hourly assembly rating of the joint system is equal to the hourly fire rating of the wall assembly in which it is installed.

2. **Joint System** — Max width of joint (at time of installation of joint system) is 2 in. (51 mm) The joint system is designed to accommodate a max 19 percent compression or extension from its installed width. The joint system shall consist of the following:
   A. **Forming Material** — Min 4.0 pcf (64 kg/m³) mineral wool batt insulation installed in joint opening as a permanent form. Pieces of batt cut to min width of twice the width of the joint and 1 in. wide, compressed 50% and inserted cut edge first into the joint flush with inaccessible side of wall. A 1 in. (25 mm) depth of sealant (Item 2B) is then applied. Additional pieces of batt are cut to a width of twice the width of the joint and a width of 3-7/8 in., compressed 50% and inserted cut edge first into the joint. Pieces of batt are inserted such that the compressed batt sections are recessed from the accessible surfaces of gypsum board wall to accommodate the required thickness of fill material. (Item 2B)

   **ROCK WOOL MANUFACTURING CO** — Delta Board
   **ROCKWOOL MALAYSIA SDN BHD** — SAFE
   **ROXUL INC** — SAFE

   B. **Fill, Void or Cavity Material** — Min 5/8 in. (16 mm) thickness of fill material applied within the joint from the accessible side of wall to the installed 1 in. (25 mm) depth of forming material (Item 2A). Additional 5/8 in. (16 mm) thickness installed to the forming materials (Item 2A) flush with the accessible side of wall.

   **3M COMPANY** — FD-150+

1. Wall Assembly – The 1 or 2 hr fire rated gypsum board/steel stud assembly constructed of the materials and in the manner described in the individual U400, V400 or W400 Series Wall or Partition Design in the UL Fire Resistance Directory and shall include the following construction features:
   
   A. Studs – Min 3-1/2 in. (89 mm) wide steel studs spaced max 24 in. (610 mm) OC.
   
   B. Gypsum Board* – Gypsum board sheets installed to a min total thickness of 5/8 in. (16 mm) or 1-1/4 in. (32 mm) on each side of wall for 1 and 2 hr fire rated assemblies, respectively. The gypsum board type, number of layers, fastener type and sheet orientation shall be as specified in the individual U400, V400 or W400 Series Design in the UL Fire Resistance Directory.

   The hourly assembly rating of the joint system is equal to the hourly fire rating of the wall assembly in which it is installed.

2. Joint System – Max width of joint (at time of installation of joint system) is 4 in. (102 mm). The joint system is designed to accommodate a max 25 percent compression or extension from its installed width. The joint system shall consist of the following:

   A. Forming Material* – Min 4.0 pcf (64 kg/m³) mineral wool batt insulation installed in joint opening as a permanent form. Pieces of batt cut to min width of 4-3/4 or 6 in. (121 or 152 mm) for 1 and 2 hr rated assemblies, respectively. Pieces of batt installed edge-first into joint opening, parallel with joint direction, such that batt sections are compressed min 50 percent in thickness and flush with both surfaces of wall.

   INDUSTRIAL INSULATION GROUP L L C – MinWool-1200 Safing
   ROCK WOOL MANUFACTURING CO – Delta Safing Insulation
   ROCKWOOL MALAYSIA SDN BHD – SAFE Mineral Wool
   ROCKWOOL – SAFE Mineral Wool
   JOHNS MANVILLE – Safing
   THERMAFIBER INC – Type SAF
B. Fill, Void or Cavity Material* – Tape – Tape cut to size and press applied to completely cover mineral wool forming material along length of joint, lapping min 1 in. (25 mm) onto the gypsum board at each side of joint. Tape to be applied in 1 ft (305 mm) (or greater) lengths and adjoining lengths of Tape shall overlap min 1/2 in. (13 mm). Tape shall be applied at both sides of wall.

3M COMPANY 3M FIRE PROTECTION PRODUCTS – 3M Fire and Water Barrier Tape

B1. Fill, Void or Cavity Material* – As an alternate to Item B, min 1/16 in. (1.6 mm) dry thickness (min 1/8 in. or 3.2 mm wet thickness) of fill material sprayed or brushed to both surfaces of wall to completely cover mineral wool and overlap a min of 1/2 in. (13 mm) onto the concrete at both sides of joint.

3M COMPANY 3M FIRE PROTECTION PRODUCTS – FireDam™ Spray 200

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

Joint Width – 4 In. Max

1. **Wall Assembly** – Min 4-1/2 in. thick lightweight or normal weight (100-150 pcf) concrete wall or min 7-5/8 in. thick masonry wall. Wall may also be constructed of any UL Classified *Concrete Blocks*. See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Joint System** – Max width of joint is 4 in. The joint system shall consist of the following:
   A. **Packing Material** – Min 1-3/4 in. thickness of min 4.0 pcf mineral wool batt insulation packed into opening as a permanent form on both sides of wall such that the width of the wool is compressed at least 25 percent. Packing material to be recessed from both surfaces of wall to accommodate the required thickness of fill material.
   B. **Fill, Void or Cavity Material** – Min 3/8 in. thickness of fill material applied within the joint, flush with each surface of wall.

I. Wall Assembly – The minimum 1 hr fire rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400, V400 or W400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

A. Ceiling Deflection Channel – U-shaped channel formed from min 16 ga steel sized to accommodate steel studs (Item 1C) and provided with nom 5 in. (127 mm) flanges. Deflection channel installed parallel with and aligned with web of purlin and secured to bottom flange of purlin with min No. 14 self-tapping, hex-head, plated steel or stainless steel screws spaced max 24 in. (610 mm) OC.

B. Steel Floor and Ceiling Runners – Floor runner of the wall assembly and the floor and ceiling runners of the cripple wall above the wall assembly shall consist of min 1-1/4 in. (32 mm) deep min 25 ga galv steel channels sized to accommodate steel studs (Item 1C). Floor runner of cripple wall aligned with and resting atop flange of purlin. Ceiling runner of cripple wall installed to compress insulation (Item 2C) to min thickness of 3/8 in. (10 mm) by wedging lengths of stud (Item 1C) between the runners. Steel studs of cripple wall attached to web of purlin with steel screws driven through opposite side of purlin web.

C. Studs – Steel studs to be min 3-1/2 in. (89 mm) wide. Studs cut max 2 in. (51 mm) less in length than the wall assembly height with bottom nesting in and resting on the floor runner and with top nesting in ceiling deflection channel without attachment. Width of stud to be equal to or greater than width of purlin flange. Stud spacing not to exceed 24 in. (610 mm) O.C. Studs of cripple wall cut to length as required to compress insulation (Item 2C) to min thickness of 3/8 in. (10 mm) and spaced max 24 in. (610 mm) OC.

D. Gypsum Board* – (CKNX) – Min 5/8 in. (16 mm) thick gypsum board sheets installed on each side of wall. Wall to be constructed as specified in the individual U400, V400 or W400 Series Design in the UL Fire Resistance Directory except that a max 2 in. (51 mm) wide gap shall be maintained between the gypsum board of the wall assembly below the purlin and the gypsum board of the cripple wall.

E. Gypsum Board*– (CKNX) – Min 5/8 in. (16 mm) thick “rip strip” of gypsum board installed to cover first layer of gypsum board on cripple wall and to lap min 3 in. (76 mm) onto gypsum board of wall assembly on each side of wall. The “rip strip” of gypsum board is to be the same material used for the wall assembly and is to be secured to the web of purlin and into studs and runners of cripple wall. No screws are to be driven into flanges of ceiling deflection channel.

Max separation between top of wall assembly gypsum board and bottom of cripple wall gypsum board (at time of installation of joint system) is 2 in. (51 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width.

2. Nonrated Horizontal Assembly – The nonrated horizontal assembly shall be constructed of the materials and in the manner described in the individual Roof Deck Constructions (Guide TGKX) in the UL Roofing Materials and Systems Directory and shall include the following construction features:

A. Purlin – Min 16 ga coated steel. Max spacing as specified in the individual Roof Deck Construction.

B. Lateral Bracing – (Not Shown) – As required.

C. Batts and Blankets – Insulation – Any faced compressible glass-fiber blanket insulation having a min 6 in. (152 mm) thickness before compression and a min density of 0.6 pcf (9.6 kg/m³). Insulation draped over purlins prior to installation of panel clips (Item 2F) and/or metal roof deck panels (Item 2D). Side edges of the batts shall be butted or overlapped a max of 3 in. (76 mm).

See Batts and Blankets (BZIJ) category in the UL Fire Resistance Directory or Batts and Blankets (BKNV) category in the UL Building Materials Directory for names of manufacturers.

D. Metal Roof Deck Panels – Min 26 ga coated steel. Panels continuous over two or more spans. Roof panel end laps, if required, centered over purlins with min 3 in. (76 mm) panel overlap as specified in the individual Roof Deck Construction. A line of tube sealant or tape sealant may be used at panel end and side laps.
See Metal Roof Deck Panels (TJPV) category in the UL Roofing Materials and Systems Directory for names of manufacturers.

E. **Fasteners** – Fasteners used for panel-to-purlin and panel-to-panel connections to be self-tapping, hex-head, plated steel or stainless steel screws with either an integral or a separate steel washer fitted with a compressible sealing washer. Fastener type, length, pilot hole diam and spacing to be as specified in the individual Roof Deck Construction.

F. **Roof Deck Fasteners** – **Panel Clips** – (Not Shown) – Panel clips used for panel-to-purlin connections to be secured to purlin through insulation as specified in the individual Roof Deck Construction.

See Roof Deck Fasteners (TLSX) category in the UL Roofing Materials and Systems Directory for names of manufacturers.

G. **Thermal Spacer Blocks** – (Not Shown) – Expanded polystyrene strips cut to fit between panel clips (Item 2F) as specified in the individual Roof Deck Construction. Thermal spacer blocks, when used, are to be installed between insulation (Item 2C) and metal roof deck panels (Item 2D) over purlins.

3. **Fill, Void or Cavity Material** – **Caulk** – Min 5/8 in. (16 mm) thickness of fill material installed to fill any gap between top of cripple wall gypsum board and insulation (Item 2C) or purlin flange on each side of the wall.

1. **Wall Assembly** – The minimum 1 h fire rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400, V400 or W400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Ceiling Deflection Channel** – U-shaped channel formed from min 16 ga steel sized to accommodate steel studs (Item 1D) and provided with nom 5 in. (127 mm) flanges. Deflection channel installed perp to purlins and secured to bottom flange of purlins with min No. 14 self-tapping, hex-head, plated steel or stainless steel screws.

   B. **Steel Floor and Ceiling Runners** – Floor runner of the wall assembly and the floor and ceiling runners of the cripple wall above the wall assembly shall consist of min 1-1/4 in. (32 mm) deep min 25 ga galv steel channels sized to accommodate steel studs (Item 1D). Floor runner of cripple wall aligned with and screw-attached to top of ceiling deflection channel. Ceiling runner of cripple wall installed to compress insulation (Item 2C) to min thickness of 3/8 in. (10 mm) by wedging lengths of stud (Item 1D) between the runners. Steel studs of cripple wall attached to each side of purlin web and to floor and ceiling runners with steel screws.

   C. **Batts and Blankets** – Packing Material – Unfaced compressible mineral wool batt insulation having a nom 2 in. (51 mm) thickness before compression and a nom density of 4 pcf (64 kg/m³). Strips of nom 2 in. (51 mm) thick batt cut to width of cripple wall ceiling runner and compressed min 50 percent in thickness between cripple wall ceiling runner and insulation (Item 2C). Compression of mineral wool batt packing material to result in compression of insulation (Item 2C) to nominal 3/8 in. (10 mm) thickness.

   See **Batts and Blankets** (BZJZ) category in the UL Fire Resistance Directory or **Batts and Blankets** (BKNV) category in the UL Building Materials Directory for names of manufacturers.

   D. **Studs** – Steel studs to be min 3-1/2 in. (89 mm) wide. Studs cut max 2 in. (51 mm) less in length than the wall assembly height beneath purlins with bottom nesting in and resting on the floor runner and with top nesting in ceiling deflection channel without attachment. Stud spacing not to exceed 24 in. (610 mm) O.C. Studs of cripple wall cut to length as required to compress packing material (Item 1C) and insulation (Item 2C) to min thicknesses of 1 in. (25 mm) and 3/8 in. (10 mm), respectively. Studs spaced max 24 in. (610 mm) O.C.

   E. **Gypsum Board** – (CKNX) – Min 5/8 in. (16 mm) thick gypsum board sheets installed on each side of wall. Wall to be constructed as specified in the individual U400, V400 or W400 Series Design in the UL Fire Resistance Directory except that a max 2 in. (51 mm) wide gap shall be maintained between the gypsum board of the wall assembly below the purlin and the gypsum board of the cripple wall. Top edge of gypsum board of wall assembly to be max 2 in. (51 mm) below top of ceiling deflection channel. Bottom edge of gypsum board of cripple wall to be flush with top of ceiling deflection channel. Screws securing gypsum board to steel studs of wall assembly to be located 2-1/4 in. to 2-1/2 in. (57 to 64 mm) below flange of ceiling deflection channel. Screws securing gypsum board of cripple wall to be driven into studs and cripple wall. No screws are to be driven into flanges of ceiling deflection channel.

   F. **Gypsum Board** – (CKNX) – Min 5/8 in. (16 mm) thick “rip strip” of gypsum board installed to cover first layer of gypsum board on cripple wall and to lap min 3 in. (76 mm) onto gypsum board of wall assembly on each side of wall. The “rip strip” of gypsum board is to be the same material used for the wall assembly and is to be secured to the studs and runners of the cripple wall. No screws are to be driven into flanges of ceiling deflection channel. Joints of “rip strip” to be offset from joints of gypsum board on wall assembly.

Max separation between top of wall assembly gypsum board and bottom of cripple wall gypsum board (at time of installation of joint system) is 2 in. (51 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width.

2. **Nonrated Horizontal Assembly** – The nonrated horizontal assembly shall be constructed of the materials and in the manner described in the individual Roof Deck Constructions (Guide TGKX) in the UL Roofing Materials and Systems Directory and shall include the following construction features:

   A. **Purlin** – Min 16 ga coated steel. Max spacing as specified in the individual Roof Deck Construction.

   B. **Lateral Brae**ng – (Not Shown) – As required.

   C. **Batts and Blankets** – **Insulation** – Any faced compressible glass-fiber blanket insulation having a min 6 in. (152 mm) thickness before compression and a min density of 0.6 pcf (9.6 kg/m³). Insulation draped over purlins prior to installation of panel clips (Item 2F) and/or
Design No. CJ-D-0006 continued

metal roof deck panels (Item 2D). Side edges of the batts shall be butted or overlapped a max of 3 in. (76 mm).

See Batts and Blankets (BZIZ) category in the UL Fire Resistance Directory or Batts and Blankets (BKNV) category in the UL Building Materials Directory for names of manufacturers.

D. Metal Roof Deck Panels* – Min 26 ga coated steel. Panels continuous over two or more spans. Roof panel end laps, if required, centered over purlins with min 3 in. (76 mm) panel overlap as specified in the individual Roof Deck Construction. A line of tube sealant or tape sealant may be used at panel end and side laps.

See Metal Roof Deck Panels (TJPV) category in the UL Roofing Materials and Systems Directory for names of manufacturers.

E. Fasteners – Fasteners used for panel-to-purlin and panel-to-panel connections to be self-tapping, hex-head, plated steel or stainless steel screws with either an integral or a separate steel washer fitted with a compressible sealing washer. Fastener type, length, pilot hole diam and spacing to be as specified in the individual Roof Deck Construction.

F. Roof Deck Fasteners* – Panel Clips – (Not Shown) – Panel clips used for panel-to-purlin connections to be secured to purlin through insulation as specified in the individual Roof Deck Construction.

See Roof Deck Fasteners (TLSX) category in the UL Roofing Materials and Systems Directory for names of manufacturers.

G. Thermal Spacer Blocks – (Not Shown) – Expanded polystyrene strips cut to fit between panel clips (Item 1F) as specified in the individual Roof Deck Construction. Thermal spacer blocks, when used, are to be installed between insulation (Item 2C) and metal roof deck panels (Item 2D) over purlins.

3. Fill, Void or Cavity Material* (XHHW) – Caulk – Min 5/8 in. (16 mm) thickness of fill material installed to fill any gap between top of cripple wall gypsum board and insulation (Item 2C) on each side of the wall. Additional sealant installed to fill annular space between purlin and gypsum board “rip strip” (Item 1F) on both sides of wall. Additional nom 1/2 in. (13 mm) diam bead of sealant to be applied around perimeter of purlin at its interface with the “rip strip” on each side of the wall.

1. **Wall Assembly** – The minimum 1 h fire rated gypsum board/steel stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400, V400 or W400 Series Wall and Partition Design in the UL Fire Resistance Directory and shall include the following construction features:

   A. **Ceiling Deflection Channel** – U-shaped channel formed from min 16 ga steel sized to accommodate steel studs (Item 2D) and provided with nom 5 in. (127 mm) flanges. Deflection channel installed parallel with and between purlins and secured to lateral bracing (Item 1B) with min No. 14 self-tapping, hex-head, plated steel or stainless steel screws.

   B. **Steel Floor and Ceiling Runners** – Floor runner of the wall assembly and the floor and ceiling runners of the cripple wall above the wall assembly shall consist of min 1-1/4 in. (32 mm) deep min 25 ga galv steel channels sized to accommodate steel studs (Item 2D). Floor runner of cripple wall aligned with and screw-attached to top of ceiling deflection channel. Ceiling runner of cripple wall installed to compress insulation (Item 1C) and packing material (Item 2C) to min thickness of 3/8 in. (10 mm) and 1 in. (25 mm), respectively, by wedging lengths of stud (Item 2D) between the runners. Steel studs of cripple wall attached to floor and ceiling runners with steel screws.

   C. **Batts and Blankets** – Unfaced compressible mineral wool batt insulation having a nom 2 in. (51 mm) thickness before compression and a nom density of 4 pcf (64 kg/m3). Strips of nom 2 in. (51 mm) thick batt cut to width of cripple wall ceiling runner and compressed min 50 percent in thickness between cripple wall ceiling runner and insulation (Item 1C). Compression of mineral wool batt packing material to result in compression of insulation (Item 1C) to nominal 3/8 in. (10 mm) thickness. When width of metal roof deck panels (Item 1D) rib exceeds 2 in. (51 mm).

   See **Batts and Blankets** (BZJZ) category in the UL Fire Resistance Directory or **Batts and Blankets** (BKNV) category in the UL Building Materials Directory for names of manufacturers.

   D. **Studs** – Steel studs to be min 3-1/2 in. (89 mm) wide. Studs cut max 2 in. (51 mm) less in length than the wall assembly height beneath purlins with bottom nesting in and resting on the floor runner and with top nesting in ceiling deflection channel without attachment. Stud spacing not to exceed 24 in. (610 mm) O.C. Studs of cripple wall cut to length as required to compress packing material (Item 2C) and insulation (Item 1C) to min thicknesses of 1 in. (25 mm) and 3/8 in. (10 mm), respectively. Studs spaced max 24 in. (610 mm) O.C.

   E. **Gypsum Board** – (CKNX) – Min 5/8 in. (16 mm) thick gypsum board sheets installed on each side of wall. Wall to be constructed as specified in the individual U400 or V400 Series Design in the UL Fire Resistance Directory except that a max 2 in. wide gap shall be maintained between the gypsum board of the wall assembly and the gypsum board of the cripple wall. Top edge of gypsum board of wall assembly to be max 2 in. (51 mm) below top of ceiling deflection channel. Bottom edge of cripple wall gypsum board to be flush with top of ceiling deflection channel. Screws securing gypsum board to steel studs of wall assembly to be located 2-1/4 in. to 2-1/2 in. (57 to 64 mm) below flange of ceiling deflection channel. Screws securing gypsum board of cripple wall to be driven into studs and runners of cripple wall. No screws are to be driven into flanges of ceiling deflection channel. Joints of “rip strip” to be offset from joints of gypsum board on wall assembly. Max separation between top of wall assembly gypsum board and bottom of cripple wall gypsum board (at time of installation of joint system) is 2 in. (51 mm). The joint system is designed to accommodate a max 100 percent compression or extension from its installed width.

2. **Nonrated Horizontal Assembly** – The nonrated horizontal assembly shall be constructed of the materials and in the manner described in the individual Roof Deck Constructions (Guide TGKX) in the UL Roofing Materials and Systems Directory and shall include the following construction features:

   A. **Purlin** – (Not Shown) – Min 16 ga coated steel. Max spacing as specified in the individual Roof-Ceiling Design.

   B. **Lateral Bracing** – Min 16 ga coated steel strap, channel, angle or other structural shape installed where required for lateral support of studs. Attached to steel purlins on each side of wall assembly with welds or with min No. 14 self-tapping, hex-head, plated steel or stainless steel screws.
C. **Batts and Blankets** – **Insulation** – Any faced compressible glass-fiber blanket insulation having a min 6 in. (152 mm) thickness before compression and a min density of 0.6 pcf (9.6 kg/m³). Insulation draped over purlins prior to installation of panel clips (Item 1F) and/or metal roof deck panels (Item 1D). Side edges of the batts shall be butted or overlapped a max of 3 in. (76 mm).

See **Batts and Blankets** (BZIZ) category in the UL Fire Resistance Directory or Batts and Blankets (BKNV) category in the UL Building Materials Directory for names of manufacturers.

D. **Metal Roof Deck Panels** – Min 26 ga coated steel. Panels continuous over two or more spans. Roof panel end laps, if required, centered over purlins with min 3 in. (76 mm) panel overlap as specified in the individual Roof-Ceiling Design. A line of tube sealant or tape sealant may be used at panel end and side laps.

See **Metal Roof Deck Panels** (TJPV) category in the UL Roofing Materials and Systems Directory for names of manufacturers.

E. **Fasteners** – Fasteners used for panel-to-purlin and panel-to-panel connections to be self-tapping, hex-head, plated steel or stainless steel screws with either an integral or a separate steel washer fitted with a compressible sealing washer. Fastener type, length, pilot hole diam and spacing to be as specified in the individual Roof-Ceiling Design.

F. **Roof Deck Fasteners** – **Panel Clips** – (Not Shown) - Panel clips used for panel-to-purlin connections to be secured to purlin through insulation as specified in the individual Roof-Ceiling Design.

See **Roof Deck Fasteners** (TLSX) category in the UL Roofing Materials and Systems Directory for names of manufacturers.

G. **Thermal Spacer Blocks** – (Not Shown) - Expanded polystyrene strips cut to fit between panel clips (Item 1F) as specified in the individual Roof-Ceiling Design. Thermal spacer blocks, when used, are to be installed between insulation (Item 1C) and metal roof deck panels (Item 1D) over purlins.

3. **Fill, Void or Cavity Material** – **Caulk** – Min 5/8 in. (16 mm) thickness of fill material installed to fill any gap between top of cripple wall gypsum board and insulation (Item 1C) on each side of the wall. Additional sealant installed to fill annular space between lateral bracing and gypsum board “rip strip” (Item 2F) on both sides of wall. Additional nom 1/2 in. (13 mm) diam bead of sealant to be applied around perimeter of lateral brace at its interface with the “rip strip” on each side of the wall.

Linear Opening Width – 4 in. Max
L Rating At Ambient – Less Than 1 CFM/sq ft
L Rating At 400°F – Less Than 1 CFM/sq ft
Class II Movement Capabilities – 5% Vertical Shear

1. Floor Assembly – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete.

2. Curtain Wall Assembly – The curtain wall assembly shall incorporate the following construction features:

A. Mullion Mounting Brackets – Min 3 in. (76 mm) by 3 in. (76 mm) by 1/4 in. steel angles attached through the mullion on each side with min 3/8 in. (10 mm) diam steel bolts with steel nuts and washers. The brackets are attached to a min 8 in. (203 mm) by 3-1/4 in. (83 mm) by 1/2 in. (13 mm) thick steel angles with a min 4 in. (51 mm) long with min 1/2 in. (13 mm) diam steel bolts with steel nuts and washers. The 8 in. (203 mm) by 3-1/4 in. (83 mm) angle is secured to the top of floor with two min 1/2 in. (13 mm) diam steel masonry anchors in conjunction with steel washers.

A1. Mullion Mounting Brackets – As an alternate to Item 2A, min 8 in. (203 mm) wide by 3/4 in. (19 mm) thick extruded aluminum Halfen mounting brackets with one nom 2 in. (51 mm) high leg for support and attachment of mullion and with one leg at least 6 in. (152 mm) longer than width of linear opening between floor assembly and mullion. Mounting bracket attached to top of floor with two min 1/2 in. (13 mm) diam steel masonry anchors in conjunction with washer plates supplied with mounting bracket.

B. Framing – The two-piece rectangular tubing mullions (vertical members) and transoms (horizontal members) shall be min 2-1/2 in. (64 mm) wide by 7-1/2 in. (191 mm) deep and shall be formed from min 0.100 in. (2.5 mm) thick aluminum. Mullions spaced max 60 in. (1.52 m) OC and secured to mullion mounting brackets (Item 2A) at each floor level. Interior face of mullions to be max 4 in. (102 mm) from edge of floor assembly. Transoms to be spaced min 24 in. (610 mm) OC. the minimum height from the top of the floor to the bottom of the vision panel sill is 0 in. The maximum height from the top of the floor to the bottom of horizontal transom is 3 in. (76 mm).

C. Spandrel Panels – The spandrel panels shall consist of one of the following types:

a. Glass Panels – Nom 1/4 in. (6 mm) thick opaque heat-strengthened glass. Each panel secured in position with aluminum pressure plates in conjunction with glazing gaskets and steel screws.

b. Aluminum Panels – Nom 1/8 in. (3 mm) thick aluminum panels with 1/4 in. (6 mm) thick edges. Each panel secured in position with aluminum pressure plates in conjunction with gaskets and steel screws.

c. Stone Panels – Nom 1-3/16 in. (46 mm) thick polished granite spandrel panels with 1 in. (25 mm) thick gauged edges. Each panel secured in position with aluminum pressure plates in conjunction with gaskets and steel screws.

D. Vision Panels – Nom 1/4 in. (6 mm) thick transparent heat-strengthened glass or nom 1 in. (25 mm) thick insulated glass units with two layers of nom 1/4 in. (6 mm) thick transparent heat-strengthened glass separated by a 1/2 in. (25 mm) air space. Each panel secured in position with aluminum pressure plates in conjunction with glazing gaskets and steel screws.

E. Curtain Wall Insulation* – Min. 2 in. (51 mm) thick mineral wool batt insulation faced on one side with aluminum foil/scrim vapor retarder. Impasse® Horizontal Hangers are installed in the insulation batt 6 in. (152 mm) from each mullion end and spaced max 16 in. (406 mm) OC across at the window sill transom. One Impasse® Vertical Hanger is installed along both vertical mullion sides of the insulation batt at 6 in. (152 mm) up from the bottom of the insulation batt. Insulation batt is then installed in spandrel area flush with the interior surface of the framing with no vertical or horizontal seams. Impasse® Horizontal Hangers are screw attached to top horizontal transom, Impasse® Vertical Hangers are screw attached to vertical Mullions using min No. 10 by min. 1/2 in. (13 mm) self-drilling/self-taping screws. No attachment to the lower horizontal transom is required.

THERMAFIBER INC – FIRESPAN® 90
F. Mullion Covers – Curtain Wall Insulation* – Nom 2 in. (51 mm) thick mineral wool batt insulation faced on one side with aluminum foil/scrim vapor retarder, supplied in min 24 by 48 in. (610 by 1219 mm) boards. Min. 12 in. (305 mm) wide strips to be centered over mullions secured to curtain wall insulation (Item 2E) with a min. of four Spiral Anchors (Item 2G) spaced a max 12 in. (305 mm) OC. Mullion covers to tightly abut the bottom of the forming material (Item 3A).

THERMAFIBER INC – FIRESPAN® 90

G. Light Gauge Framing* – Spiral Anchor – Galv steel wire spiral anchors used to secure the curtain wall insulation (Item 2F and 2G).
Nom length of spiral anchors to be 3-3/4 in. (95 mm), spaced max 12 in. (305 mm) OC.

THERMAFIBER INC – Spiral Anchor

3. Safing System – Max separation between edge of floor assembly and face of framing members (at time of installation) is 4 in. (102 mm). The safing system is designed to accommodate vertical shear movement up to a max of 5 percent of its installed width. The safing system shall incorporate the following construction features:

A. Forming Material* – Nom 4 pcf (64 kg/m³) density mineral wool batt insulation. Batt sections cut to a 4 in. (102 mm) width and stacked to a thickness which is min 25 percent greater than the width of the linear gap between the curtain wall insulation and the edge of the concrete floor slab. The forming material is compressed and inserted cut-edge-first into linear gap such that its top surface is flush with the top surface of the floor assembly. A max of one tightly-butted seam is permitted between mullions. Additional piece of forming material to be friction-fit into gap between batt sections above mullion mounting clip at each mullion location.

THERMAFIBER INC – SAF

B. Fill, Void or Cavity Material* – Min 1/8 in. (3 mm) wet thickness (min 1/16 in. (1.5 mm) dry thickness) of fill material spray-applied over top of forming material and lapping min 1/2 in. (13 mm) onto the top surface of the floor and onto the curtain wall insulation (Item 2E) and mullion covers (Item 2F). When 3M Fire Barrier Watertight Spray is used, min wet (and dry) thickness of spray is 1/10 in. (2.5 mm).

3M COMPANY
3M FIRE PROTECTION PRODUCTS – FireDam™ Spray 200, 3M Fire Barrier Watertight Spray

B1. Fill, Void or Cavity Material* – Tape – As an alternate to Item 3B, Tape cut to size and press applied to top surface of joint to completely cover mineral wool and overlap a min of 1 in. (25 mm) onto the top surface of the floor and onto the curtain wall insulation (Item 2E) and mullion covers (Item 2F). Tape shall be applied in min 1 ft (305 mm) lengths along the joint and adjoining lengths of Tape shall overlap min 1/2 in. (13 mm).

3M COMPANY
3M FIRE PROTECTION PRODUCTS – 3M Fire and Water Barrier Tape

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

Reprinted from the Online Certifications Directory with permission from UL®
1. **Floor Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete.

2. **Curtain Wall Assembly** – The curtain wall assembly shall incorporate the following construction features:
   
   A. **Mullion Anchor Plates** – Nom 7 in. (178 mm) wide by 9-1/4 in. (235 mm) long by 5/8 in. (16 mm) thick extruded aluminum plates with a nominal 1-3/4 in. (44 mm) high raised lip along one end to engage hooked ends of mullion mounting clips (Item 2B). Plates anchored to top surface of floor at each mullion location with steel wedge anchor bolts in conjunction with extruded aluminum washers.
   
   B. **Mullion Mounting Clips** – Nominal 3 in. (76 mm) wide by 7 in. (178 mm) high extruded aluminum anchor slides with tapped holes and with separate extruded aluminum hooks designed to engage the raised lip of the anchor plate (Item 2A). Anchor slides bolted to each side of mullion at each floor with 1/2 in. (13 mm) diam stainless steel screws with locking washers. Anchor hooks secured to anchor slides with steel jacking screws and secured to raised lip of anchor plate with steel set screw.
   
   C. **Framing** – The one-piece or split rectangular tubing mullions (vertical members) and transoms (horizontal members) shall be min 2-1/2 in. (64 mm) wide by 6 in. (152 mm) deep and shall be formed from min 0.125 in. thick aluminum. Mullions spaced max 60 in. (1524 mm) OC and secured to mullion anchor plates (Item 2A) with mounting clips (Item 2B) at each floor level. Interior face of mullions to be max 4 in. (102 mm) from edge of floor assembly. Transoms to be spaced min 69 in. (1753 mm) OC. The minimum height from the top of the floor to the bottom of the vision panel sill is 33 in. (838 mm).
   
   D. **Spandrel Panels** – The spandrel panels shall consist of one of the following types:
   
   a. **Glass Panels** – Nom 1/4 in. (6 mm) thick opaque heat-strengthened glass. Each panel secured in position with aluminum pressure plates in conjunction with glazing gaskets and steel screws.
   
   b. **Aluminum Panels** – Nom 1/8 in. (3 mm) thick aluminum panels with 1/4 in. (6 mm) thick edges. Each panel secured in position with aluminum pressure plates in conjunction with gaskets and steel screws.
   
   c. **Stone Panels** – Nom 1-3/16 in. (46 mm) thick polished granite spandrel panels with 1 in. (25 mm) thick gauged edges. Each panel secured in position with aluminum pressure plates in conjunction with gaskets and steel screws.
   
   E. **Vision Panels** – Nom 1 in. (25 mm) thick insulated glass units with two layers of nom 1/4 in. (6 mm) thick transparent heat-strengthened glass separated by a 1/2 in. (13 mm) air space. Each panel installed on silicone rubber setting blocks and secured in position with aluminum pressure plates in conjunction with glazing gaskets and steel screws.
   
   F. **Light Gauge Framing** – **T-Bar Support Brackets** – Nom 2 in. (51 mm) wide brackets formed from galv steel and designed to bridge extruded aluminum anchor slides of mullion mounting clips (Item 2B). Each T Bar support bracket provided with nominal 3 in. (76 mm) wide by 3 in. (76 mm) high leg with a nominal 3/4 in. (19 mm) hemmed edge to receive the bottom edge of the T-Bar (Item 2G). T Bar support bracket secured to each side of mullion using the same bolts used to attach the anchor slides of the mullion mounting clips. The hemmed edge of the T Bar support bracket is to be located 3-1/2 in. (89 mm) below the top surface of the floor slab such that, when installed, the stem of the T Bar (Item 2G) will be located 2 in. (51 mm) below the top plane of the floor slab. Angle of T Bar support bracket to be recessed from interior face of framing as necessary to accommodate the thickness of the curtain wall insulation (Item 2J).

   THERMAFIBER INC
   
   G. **Light Gauge Framing** – **T-Bar** – Nom 3 in. (76 mm) wide by 1-1/2 in. (38 mm) high tee section formed from galv steel. T Bar installed between mullions at each floor level to restrain curtain wall insulation (Item 2J) against outward movement when forming material (Item 3A) is installed. The T Bar shall be installed with a clearance of 1/2 to 3/4 in. at each end. The bottom edge of the T Bar shall rest in and
be supported by the hemmed edge of the T Bar support bracket (Item 2F) at each end. The top edge of the T Bar shall be locked in place with a locking clip (Item 2H) at one end and by a min No. 10 by 1/2 in. (13 mm) long self-drilling, self-tapping steel screw at the opposite end. Each T Bar shall be located with its stem at an elevation of 2 in. (51 mm) below the top plane of the floor.

**Thermofiber Inc.**

**H. Light Gauge Framing** – T-Bar Locking Clip – Nom 1 x 1-1/4 in. (25 x 32 mm) clips formed from galv steel and designed to lock top of T Bar (Item 2G) to support brackets (Item 2F).

**Thermofiber Inc.**

**I. Light Gauge Framing** – Vertical & Horizontal Hangers – Vertical and horizontal hangers formed from 1 in. (25 mm) wide galv steel strips, supplied in two configurations with length as needed to accommodate thickness of curtain wall insulation (Item 2J) and mullion cover (Item 2L). Vertical hangers (with 90 deg twist) screw-attached to interior face of mullions with No. 10 by min 1/2 in. (13 mm) long self-drilling, self-tapping steel screws. Vertical hangers on mullions to be located near each corner of each piece of curtain wall insulation except for the nominal 7 to 9 in. (178 to 914 mm) high piece of curtain wall insulation located immediately beneath the stem of the T Bar. The 7 to 9 in. (178 to 914 mm) high piece of curtain wall insulation immediately beneath the stem of the T Bar requires only one vertical hanger near its’ midheight at each end. Horizontal hangers (without twist) screw-attached to T Bar (Item 2G) and to transom at top of spandrel panel (sill of vision panel) with No. 10 by min 1/2 in. (13 mm) long self-drilling, self-tapping steel screws. Horizontal hangers on T Bar to be located within 6 in. of mullion at each end and spaced max 16 in. (406 mm) OC. Horizontal hanger on transom at top of spandrel panel to be located at center of transom. No hangers are to be used on the transom at the bottom of spandrel panel (lintel of vision panel).

**Thermofiber Inc.**

**J. Curtain Wall Insulation** – Min 2 in. (51 mm) thick mineral wool batt insulation faced on one side with aluminum foil/scrim vapor retarder, supplied in min 36 in. (914 mm) wide batts. Insulation batts to be installed with no vertical seams. A horizontal seam is to be located 7 to 9 in. (178 to 914 mm) below the stem of the T Bar in each spandrel area and is to be sealed with aluminum foil tape. In the spandrel area beneath the stem of the T Bar, insulation panels tightly-fitted between vertical Mullions and between the stem of the T Bar (Item 2G) and the transom, flank with the interior surface of framing. Insulation panels impaled on vertical and horizontal hangers (Item 2I) and secured in place with nom 2 x 2 in. (51 x 51 mm) steel locking washers (Item 2K).

**Thermofiber Inc.** – Firespan 90

**K. Light Gauge Framing** – Locking Washers – Nom 2 x 2 in. (51 x 51 mm) clips formed from galv steel and designed to secure curtain wall insulation and mullion covers on vertical and horizontal hangers (Item 2I).

**Thermofiber Inc.**

**L. Mullion Covers** – Curtain Wall Insulation – Nom 2 in. (51 mm) thick mineral wool batt insulation faced on one side with aluminum foil/scrim vapor retarder, supplied in min 24 x 48 in. (610 x 1219 mm) boards. Nom 12 in. (305 mm) wide strips to be centered over mullions and impaled on the same vertical hangers used to secure the spandrel panel insulation and secured in place with nom 2 x 2 in. (51 x 51 mm) locking washers (Item 2K). Mullion covers to abut the forming material (Item 3A) above and below the floor.

**Thermofiber Inc.** – Firespan 90

**M. Light Gauge Framing** – Spiral Anchor (not shown) – As an alternate to the vertical hangers (Item 2I), galv steel wire spiral anchors may be used to secure the framing covers (Item 2L) to the curtain wall insulation (Item 2J) on each side of the mullion. Nom length of spiral anchors to be equal to thickness of curtain wall insulation plus thickness of framing cover. Spiral anchors driven through mullion covers and into curtain wall insulation and spaced max 12 in. (305 mm) OC.

**Thermofiber Inc.**

**3. Safing System** – Max separation between the edge of the floor and the face of the framing members (at time of installation) is 4 in. (102 mm). The safing system is designed to accommodate vertical shear movement up to a max of 5 percent of its installed width. The safing system shall incorporate the following construction features:

**A. Forming Material** – Nom 4 pcf density mineral wool batt insulation. Batt sections cut to a min 4-1/2 in. (114 mm) width and stacked to a thickness which is min 25 percent greater than the width of linear gap between the curtain wall insulation and the edge of the concrete floor slab to attain a min 20 percent compression in the thickness direction. The forming material is compressed and inserted cut-edge-first into the linear gap such that its top surface is flush with the top surface of the floor assembly. Forming material to extend completely beneath mullion mounting plate (Item 2A). A max of two tightly-butted seams are permitted in the forming material between mullions.

**Thermofiber Inc.** – Type SAF

**B. Fill, Void or Cavity Material** – Min 1/8 in. (3 mm) wet thickness (min 1/16 in. or 1.6 mm dry thickness) of fill material spray-applied over top of forming material and lapping min 1/2 in. (13 mm) onto the top surface of the floor and onto the curtain wall insulation, mullion anchor plate (Item 2A) and framing covers. When 3M Fire Barrier Watertight Spray is used, min wet (and dry) thickness of spray is 1/10 in. (2.5 mm).

**3M Company**

**3M Fire Protection Products** – FireDam Spray 200, 3M Fire Barrier Watertight Spray

**B1. Fill, Void or Cavity Material** – Tape – As an alternate to Item 3B, Tape cut to size and press applied to top surface of joint to completely cover mineral wool and overlap a min of 1 in. (25 mm) onto the top surface of the floor and onto the curtain wall insulation, mullion anchor plate (Item 2A) and framing covers. Tape shall be applied in min 1 ft (305 mm) lengths along the joint and adjoining lengths of Tape shall overlap min 1/2 in. (13 mm).

**3M Company**

**3M Fire Protection Products** – 3M Fire and Water Barrier Tape

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively. Reprinted from the Online Certifications Directory with permission from UL ©
1. **Floor Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete. Perimeter of floor assembly to be provided with min 4 x 4 x 1/4 in. (102 x 102 x 6 mm) thick cast-in-place structural steel angle for weld-attachment of mullion mounting clips (Item 2A).

2. **Curtain Wall Assembly** – The curtain wall assembly shall incorporate the following construction features:
   
   **A. Mullion Mounting Clips** – Min 4 in. (102 mm) long angles with one leg approx 4 in. (102 mm) longer than distance to nearest face of mullion. Clips welded to steel angle at edge of floor assembly (Item 1) on each side of vertical mullion (Item 2B) at each floor level. Top edge of each mounting angle to be recessed min 1/2 in. (13 mm) below top surface of floor.

   **B. Framing** – The rectangular tubing mullions (vertical members) and transoms (horizontal members) shall be minimum 2-1/2 in. (64 mm) wide by 5 in. (127 mm) deep and shall be formed from min 0.100 in. thick aluminum. Mullions spaced max 60 in. (1524 mm) OC and secured to mullion mounting clips (Item 2A) at each floor level with two 1/2 in. diam by 4 in. long hex head steel bolts in conjunction with steel nuts and washers. Interior face of mullions to be max 8 in. (203 mm) from edge of floor assembly. Transoms framing top and bottom edges of spandrel panels (Item 2C) to be spaced min 72 in. (1829 mm) OC. Transom forming sill of vision panel (Item 2D) to be located such that its bottom surface is at height of 33 in. (838 mm) above the top surface of the floor (Item 1).

   **C. Spandrel Panels** – Nom 1/4 in. (6 mm) thick opaque heat-strengthened glass. Each panel secured in position with aluminum pressure plates in conjunction with glazing gaskets and steel screws.

   **D. Vision Panels** – Nom 1/4 in. (6 mm) thick transparent heat-strengthened glass. Each panel secured in position with aluminum pressure plates in conjunction with glazing gaskets and steel screws.

   **E. Spandrel Panel Perimeter Angles** – Nom 1-1/2 x 1-1/2 in. (38 x 38 mm) No. 22 gauge galvanized steel angles installed around entire perimeter of each spandrel panel. Angles recessed from interior face of framing as necessary to accommodate thickness of curtain wall insulation (Item 2H). Angles notched as necessary to be continuous over mullion mounting clips (Item 2A). Angles screw-attached to Mullions and transom along sides and top of each spandrel panel with No. 10 by 1/2 in. (13 mm) long self-drilling, self-tapping steel screws spaced max 12 in. (305 mm) OC. Angle along bottom of each spandrel panel to be screw-attached to leg of angle on mullion at each end without any direct attachment to transom.

   **F. Stiff Back Channel** – Nom 2-1/2 in. (64 mm) wide by 7/8 in. deep hat-shaped channel formed of 22 gauge galv steel to be installed to stiffen curtain wall insulation between mullions above, below and at elevation of safing joint. One stiff back channel to be located with its centerline approx 6 in. (152 mm) below floor and one stiff back channel to be located with its centerline approx 6 in. (152 mm) above floor. A third stiff back channel is to be located near the midheight of the safing joint. A clearance of 1/4 to 1/2 in. (6 to 13 mm) shall be maintained between the ends of the stiff back channels and the mullions. Stiff back channel secured to mullion at each end with channel attachment clip (Item 2G) in conjunction with a No. 8 by 1/2 in. (13 mm) long self-drilling, self-tapping wafer head steel screw or a 3/16 in. (4.8 mm) diam steel bolt with nut and washer.

   **G. Channel Attachment Clip** – Nom 1-1/2 x 2-1/2 x 1-1/2 in. (38 x 64 x 38 mm) long angle formed of 16 gauge galv steel. The 2-1/2 in. (64 mm) leg is provided with a 1/4 in. (6 mm) wide by 1-1/2 in. (38 mm) long slot along its centerline for attachment of the stiff back channel. Clips secured to mullions mounting clips (Item 2A) and mullions, through perimeter angles, with two No. 10 by 1/2 in. (13 mm) long self-drilling, self-tapping steel screws. Channel clips installed with 2-1/2 in. (64 mm) leg recessed from interior face of mullion to accommodate thickness of curtain wall insulation (Item 2H).
H. Curtain Wall Insulation* – Min 2 in. (51 mm) thick mineral wool board insulation, unfaced or faced on one side with aluminum foil/scrrim vapor retarder, supplied in min 36 in. (914 mm) wide boards. Insulation boards to be installed with no vertical seams. A full-width board shall be centered at the midheight of floor and tightly-fitted between vertical mullions, flush with interior surface of framing. The centered board shall be secured to the stiff back channels (Item 2F) located approx 6 in. (152 mm) above and below the floor with cup head weld pins (Item 2J) spaced max 10 in. (254 mm) OC along each channel. The remainder of the spandrel panel framing above and below the centered full-width board shall be filled in with additional lengths of board cut to fit tightly between mullions and with the horizontal seams between board sections tightly butted. The boards shall be secured to the spandrel panel perimeter angles with cup head weld pins at each corner of each board and spaced max 10 in. (254 mm) OC. When faced boards are used, butted seams to be covered with min 4 in. (102 mm) wide aluminum foil tape.

ROCKWOOL MALAYSIA SDN BHD – CurtainRock 80
ROXUL INC – CurtainRock 80

I. Framing Covers – Curtain Wall Insulation* – Min 8 in. wide strips cut from the same min 2 in. (51 mm) thick mineral wool batt insulation used for the curtain wall insulation (Item 2H). Framing covers to be centered over mullions, and secured to the spandrel panel perimeter angles (Item 2E) with cup head weld pins (Item 2J) spaced max 12 in. (305 mm) OC. Where more than one spandrel panel occurs between vertically separated vision panels, the horizontal transom between spandrel panels shall also be covered with an 8 in. (203 mm) wide framing cover in the same manner as on the vertical mullions. Framing covers on mullions to abut the mineral wool batt safing material (Item 3A) above and below floor.

ROCKWOOL MALAYSIA SDN BHD – CurtainRock 80
ROXUL INC – CurtainRock 80

J. Weld Pin – No. 12 gauge galv steel weld pin with nom 1-3/16 in. (30 mm) diam galv steel cup head. Cup head weld pins provided in two lengths. One length to be equal to thickness of curtain wall insulation (Item 2H) and second length to be equal to thickness of curtain wall insulation plus thickness of framing cover (Item 2I). Cup head weld pins inserted through curtain wall insulation and mullion covers and welded to spandrel panel perimeter angles at max OC spacings referenced in Items 2H and 2I.

ROCKWOOL MALAYSIA SDN BHD – SAFE
ROXUL INC – SAFE

3. Perimeter Fire Containment System – The perimeter fire containment system shall incorporated the following construction features:

A. Forming Material* – Nom 4 in. (102 mm) thick, mineral wool batt safing material to be installed in continuous pieces between mullion clips. Safing material to be cut to a min 4-1/2 in. (114 mm) width and stacked to a thickness which is at least 25 percent greater than the width of the linear gap between the curtain wall and the edge of the concrete floor slab. The safing material is compressed and inserted cut-edge-first into the linear gap such that its top surface is flush with the top-surfaces of the floor assembly and such that it is friction-fit between mullion mounting angles. Additional pieces of safing material to be friction-fit into space between mullion mounting clips at each mullion location with top edges of mullion clips covered with a min 1/2 in. (13 mm) thickness of compressed safing material.

ROCKWOOL MALAYSIA SDN BHD – SAFE
ROXUL INC – SAFE

B. Fill, Void or Cavity Material* – Min 1/16 in. (1.6 mm) dry (1/8 in. or 3 mm wet) thickness of fill material spray-applied over top of forming material and lapping min 1 in. (25 mm) onto the top surface of the concrete floor and onto the curtain wall insulation and framing covers. When 3M Fire Barrier Watertight Spray is used, min wet (and dry) thickness of spray is 1/10 in. (2.5 mm).

3M COMPANY – FireDam™ Spray 200, 3M Fire Barrier Watertight Spray

B1. Fill, Void or Cavity Material* – Tape – As an alternate to Item 3B, Tape cut to size and press applied to top surface of joint to completely cover mineral wool and overlap min 1 in. (25 mm) onto the top surface of the floor and onto the curtain wall insulation and mullion covers. Tape shall be applied in minimum 1 ft (305 mm) lengths along the joint and adjoining lengths of Tape shall overlap min 1/2 in. (13 mm).

3M COMPANY – 3M Fire and Water Barrier Tape

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

1. **Floor Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete. Perimeter of floor assembly to be provided with min 4 x 4 x 1/4 in. (102 x 102 x 6 mm) thick cast-in-place structural steel angle for weld-attachment of mullion mounting clips (Item 2A).

2. **Curtain Wall Assembly** – The curtain wall assembly shall incorporate the following construction features:

   A. **Mullion Mounting Clips** – Min 4 in. (102 mm) long angles with one nom 4 in. (102 mm) leg for attachment to edge of floor assembly and with one leg approx 4 in. (102 mm) longer than distance to nearest face of mullion. Clips welded to steel angle at edge of floor assembly (Item 1) on each side of vertical mullion (Item 2B) at each floor level. Top edge of each mounting angle to be recessed min 1/2 in. (13 mm) below top surface of floor.

   B. **Framing** – The rectangular tubing mullions (vertical members) and transoms (horizontal members) shall be minimum 2-1/2 in. (64 mm) wide by 5 in. (127 mm) deep and shall be formed from min 0.100 in. thick aluminum. Mullions spaced max 60 in. (1524 mm) OC and secured to mullion mounting clips (Item 2A) at each floor level with two 1/2 in. (13 mm) diam by 4 in. (102 mm) long hex head steel bolts in conjunction with steel nuts and washers. Interior face of mullions to be max 8 in. (203 mm) from edge of floor assembly. Transoms framing top and bottom edges of spandrel panels (Item 2C) to be spaced min 72 in. (1829 mm) OC. Transom forming sill of vision panel (Item 2D) to be located such that its bottom surface is at height of 33 in. (838 mm) above the top surface of the floor (Item 1).

   C. **Spandrel Panels** – Nom 1-3/16 in. (30 mm) thick polished granite spandrel panels with 1 in. (25 mm) thick gauged edges. Each panel secured in position with aluminum pressure plates in conjunction with gaskets and steel screws.

   D. **Vision Panels** – Nom 1/4 in. (6 mm) thick transparent heat-strengthened glass. Each panel secured in position with aluminum pressure plates in conjunction with glazing gaskets and steel screws.

   E. **Spandrel Panel Perimeter Angles** – Nom 1-1/2 x 1-1/2 x 1-1/2 in. (38 x 38 mm) by No. 22 gauge galvanized steel angles installed around entire perimeter of each spandrel panel. Angles recessed from interior face of framing as necessary to accommodate thickness of curtain wall insulation (Item 2H). Angles notched as necessary to be continuous over mullion mounting clips (Item 2A). Angles screw-attached to mullions and transom along sides and top of each spandrel panel with No. 10 by 1/2 in. long self-drilling, self-tapping steel screws spaced max 12 in. (305 mm) OC. Angle along bottom of each spandrel panel to be screw-attached to leg of angle on mullion at each end without any direct attachment to transom.

   F. **Stiff Back Channel** – Nom 2-1/2 in. (64 mm) wide by 7/8 in. (22 mm) deep hat-shaped channel formed of 22 gauge galv steel to be installed to stiffen curtain wall insulation between mullions above, below and at elevation of safin joint. One stiff back channel to be located with its centerline approx 6 in. (152 mm) below floor and one stiff back channel to be located with its centerline approx 6 in. (152 mm) above floor. A third stiff back channel is to be located near the midheight of the safin joint. A clearance of 1/4 to 1/2 in. (6 to 13 mm) shall be maintained between the ends of the stiff back channels and the mullions. Stiff back channel secured to mullion at each end with channel attachment clip (Item 2G) in conjunction with a No. 8 by 1/2 in. (13 mm) long self-drilling, self-tapping wafer head steel screw or a 3/16 in. (4.8 mm) diam steel bolt with nut and washer.

   G. **Channel Attachment Clips** – Nom 1-1/2 x 2-1/2 x 1-1/2 in. (38 x 64 x 38 mm) long angle formed of 16 gauge galv steel. The 2-1/2 in. (64 mm) leg is provided with a 1/4 in. (6 mm) wide by 1-1/2 in. (38 mm) long slot along its centerline for attachment of the stiff back channel. Clips secured to mullions mounting clips (Item 2A) and mullions, through perimeter angles, with two No. 10 by 1/2 in. (13 mm) long self-drilling, self-tapping steel screws. Channel clips installed with 2-1/2 in. (64 mm) leg recessed from interior face of mullion to accommodate thickness of curtain wall insulation (Item 2H).
H. Curtain Wall Insulation* – Min 2 in. (51 mm) thick mineral wool board insulation, unfaced or faced on one side with aluminum foil/scrim vapor retarder, supplied in min 36 in. (914 mm) wide boards. Insulation boards to be installed with no vertical seams. A full-width board shall be centered at the midheight of floor and tightly-fitted between vertical mullions, flush with interior surface of framing. The centered board shall be secured to the stiff back channels (Item 2F) located approx 6 in. (152 mm) above and below the floor with cup head weld pins (Item 2J) spaced max 10 in. (254 mm) OC along each channel. The remainder of the spandrel panel framing above and below the centered full-width board shall be filled in with additional lengths of board cut to fit tightly between mullions and with the horizontal seams between board sections tightly butted. The boards shall be secured to the spandrel panel perimeter angles with cup head weld pins at each corner of each board and spaced max 10 in. (254 mm) OC. When faced boards are used, butted seams to be covered with min 4 in. (102 mm) wide aluminum foil tape.

ROCKWOOL MALAYSIA SDN BHD – CurtainRock 80
ROXUL INC – CurtainRock 80

I. Framing Covers – Curtain Wall Insulation* – Min 8 in. (203 mm) wide strips cut from the same min 2 in. (51 mm) thick mineral wool batt insulation used for the curtain wall insulation (Item 2H). Framing covers to be centered over mullions, and secured to the spandrel panel perimeter angles (Item 2E) with cup head weld pins (Item 2J) spaced max 12 in. (305 mm) OC. Where more than one spandrel panel occurs between vertically separated vision panels, the horizontal transom between spandrel panels shall also be covered with an 8 in. (203 mm) wide framing cover in the same manner as on the vertical mullions. Framing covers on mullions to abut the mineral wool batt safing material (Item 3A) above and below floor.

ROCKWOOL MALAYSIA SDN BHD – CurtainRock 80
ROXUL INC – CurtainRock 80

J. Weld Pin – No. 12 gauge galv steel weld pin with nom 1-3/16 in. (30 mm) diam galv steel cup head. Cup head weld pins provided in two lengths. One length to be equal to thickness of curtain wall insulation (Item 2H) and second length to be equal to thickness of curtain wall insulation plus thickness of framing cover (Item 2I). Cup head weld pins inserted through curtain wall insulation and mullion covers and welded to spandrel panel perimeter angles at max OC spacings referenced in Items 2H and 2I.

3. Perimeter Fire Containment System – The perimeter fire containment system shall incorporate the following construction features:

A. Forming Material* – Nom 4 in. (102 mm) thick, mineral wool batt safing material to be installed in continuous pieces between mullion clips. Safing material to be cut to a min 4-1/2 in. (114 mm) width and stacked to a thickness which is at least 25 percent greater than the width of the linear gap between the curtain wall and the edge of the concrete floor slab. The safing material is compressed and inserted cut-edge-first into the linear gap such that its top surface is flush with the top-surface of the floor assembly and such that it is friction-fit between mullion mounting angles. Additional pieces of safing material to be friction-fit into space between mullion mounting clips at each mullion location with top edges of mullion clips covered with a min 1/2 in. (13 mm) thickness of compressed safing material.

ROCKWOOL MALAYSIA SDN BHD – SAFE
ROXUL INC – SAFE

B. Fill, Void or Cavity Material* – Min 1/16 in. (1.6 mm) dry (1/8 in. (3.2 mm) wet) thickness of fill material spray-applied over top of forming material and lapping min 1 in. (25 mm) onto the top surface of the concrete floor and onto the curtain wall insulation and framing covers. When 3M Fire Barrier Watertight Spray is used, min wet (and dry) thickness of spray is 1/10 in. (2.5 mm).

3M COMPANY – FireDam™ Spray 200, 3M Fire Barrier Watertight Spray

B1. Fill, Void or Cavity Material* – Tape – As an alternate to Item 3B, Tape cut to size and press applied to top surface of joint to completely cover mineral wool and overlap a min of 1 in. (25 mm) onto the top surface of the floor and onto the curtain wall insulation and framing covers. Tape shall be applied in min 1 ft (305 mm) lengths along the joint and adjoining lengths of Tape shall overlap min 1/2 in. (13 mm).

3M COMPANY – 3M Fire and Water Barrier Tape

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

Reprinted from the Online Certifications Directory with permission from UL©
1. **Floor Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) structural concrete. Perimeter of floor assembly to be provided with min 4 x 4 x 1/4 in. (102 x 102 x 6 mm) thick cast-in-place structural steel angle for weld-attachment of mullion mounting clips (Item 2A).

2. **Curtain Wall Assembly** – The curtain wall assembly shall incorporate the following construction features:
   
   A. **Mullion Mounting Clips** – Min 4 in. (102 mm) long angles with one leg approx 4 in. (102 mm) leg for attachment to edge of floor assembly and with one leg approx 4 in. (102 mm) longer than distance to nearest face of mullion. Clips welded to steel angle at edge of floor assembly (Item 1) on each side of vertical mullion (Item 2B) at each floor level. Top edge of each mounting angle to be recessed min 1/2 in. (13 mm) below top surface of floor.
   
   B. **Framing** – The rectangular tubing mullions (vertical members) and transoms (horizontal members) shall be minimum 2-1/2 in. (64 mm) wide by 5 in. (127 mm) deep and shall be formed from mini 0.100 in. thick aluminum. Mullions spaced max 60 in. (1524 mm) OC and secured to mullion mounting clips (Item 2A) at each floor level with two 1/2 in. (13 mm) diam hex head steel bolts in conjunction with steel nuts and washers. Interior face of mullions to be max 8 in. (204 mm) from edge of floor assembly. Transoms forming top and bottom edges of spandrel panels (Item 2C) to be spaced min 72 in. (1829 mm) OC. Transom forming sill of vision panel (Item 2D) to be located such that its bottom surface is at height of 33 in. (838 mm) above the top surface of the floor (Item 1).
   
   C. **Spandrel Panels** – Nom 1/8 in. (3 mm) thick aluminum panels with 1/4 in. (6 mm) thick edges. Each panel secured in position with aluminum pressure plates in conjunction with gaskets and steel screws.
   
   D. **Vision Panels** – Nom 1/4 in. (6 mm) thick transparent heat-strengthened glass. Each panel secured in position with aluminum pressure plates in conjunction with glazing gaskets and steel screws.
   
   E. **Spandrel Panel Perimeter Angles** – Nom 1-1/2 x 1-1/2 in. (38 x 38 mm) by No. 22 gauge galvanized steel angles installed around entire perimeter of each spandrel panel. Angles recessed from interior face of framing as necessary to accommodate thickness of curtain wall insulation (Item 2H). Angles notched as necessary to be continuous over mullion mounting clips (Item 2A). Angles screw-attached to mullions and transom along sides and top of each spandrel panel with No. 10 by 1/2 in. (13 mm) long self-drilling, self-tapping steel screws spaced max 12 in. (305 mm) OC. Angle along bottom of each spandrel panel to be screw-attached to leg of angle on mullion at each end without any direct attachment to transom.
   
   F. **Stiff Back Channel** – Nom 2-1/2 in. (64 mm) wide by 7/8 in. (22 mm) deep hat-shaped channel formed of 22 gauge galv steel to be installed to stiffen curtain wall insulation between mullions above, below and at elevation of safing joint. One stiff back channel to be located with its centerline approx 6 in. (152 mm) below floor and one stiff back channel to be located with its centerline approx 6 in. (152 mm) above floor. A third stiff back channel is to be located near the midheight of the safing joint. A clearance of 1/4 to 1/2 in. (6 to 13 mm) shall be maintained between the ends of the stiff back channels and the mullions. Stiff back channel secured to mullion at each end with channel attachment clip (Item 2G) in conjunction with a No. 8 by 1/2 in. (13 mm) long self-drilling, self-tapping wafer head steel screw or a 3/16 in. (4.8 mm) diam steel bolt with nut and washer.
   
   G. **Channel Attachment Clips** – Nom 1-1/2 x 2-1/2 x 1-1/2 in. (38 x 64 x 38 mm) long angle formed of 16 gauge galv steel. The 2-1/2 in. (64 mm) leg is provided with a 1-1/2 in. (6 mm) wide by 1-1/2 in. (38 mm) long slot along its centerline for attachment of the stiff back channel. Clips secured to mullion mounting clips (Item 2A) and mullions, through perimeter angles, with two No. 10 by 1/2 in. (13 mm) long self-drilling, self-tapping steel screws. Channel clips installed with 2-1/2 in. (64 mm) leg recessed from interior face of mullion to accommodate thickness of curtain wall insulation (Item 2H).
**H. Curtain Wall Insulation** – Min 2 in. (51 mm) thick mineral wool board insulation, unfaced or faced on one side with aluminum foil/scrim vapor retarder, supplied in min 36 in. (914 mm) wide boards. Insulation boards to be installed with no vertical seams. A full-width board shall be centered at the midheight of floor and tightly-fitted between vertical mullions, flush with interior surface of framing. The centered board shall be secured to the stiff back channels (Item 2F) located approx 6 in. (152 mm) above and below the floor with cup head weld pins (Item 2J) spaced max 10 in. (254 mm) OC along each channel. The remainder of the spandrel panel framing above and below the centered full-width board shall be filled in with additional lengths of board cut to fit tightly between mullions and with the horizontal seams between board sections tightly butted. The boards shall be secured to the spandrel panel perimeter angles with cup head weld pins at each corner of each board and spaced max 10 in. (254 mm) OC. When faced boards are used, butted seams to be covered with min 4 in. (102 mm) wide aluminum foil tape.

**ROCKWOOL MALAYSIA SDN BHD** – CurtainRock 80

**ROXUL INC** – CurtainRock 80

**I. Framing Covers – Curtain Wall Insulation** – Min 8 in. wide strips cut from the same min 2 in. (51 mm) thick mineral wool batt insulation used for the curtain wall insulation (Item 2H). Framing covers to be centered over mullions and secured to the spandrel panel perimeter angles (Item 2E) with cup head weld pins (Item 2J) spaced max 12 in. (305 mm) OC. Where more than one spandrel panel occurs between vertically separated vision panels, the horizontal transom between spandrel panels shall also be covered with an 8 in. (203 mm) wide framing cover in the same manner as on the vertical mullions. Framing covers on mullions to abut the mineral wool batt safing material (Item 3A) above and below floor.

**ROCKWOOL MALAYSIA SDN BHD** – CurtainRock 80

**ROXUL INC** – CurtainRock 80

**J. Weld Pin** – No. 12 gauge galv steel weld pin with nom 1-3/16 in. (30 mm) diam galv steel cup head. Cup head weld pins provided in two lengths. One length to be equal to thickness of curtain wall insulation (Item 2H) and second length to be equal to thickness of curtain wall insulation plus thickness of framing cover (Item 2I). Cup head weld pins inserted through curtain wall insulation and mullion covers and welded to spandrel panel perimeter angles at max OC spacings referenced in Items 2H and 2I.

**3. Perimeter Fire Containment System** – The perimeter fire containment system shall incorporated the following construction features:

**A. Forming Material** – Nom 4 in. (102 mm) thick mineral wool batt safing material to be installed in continuous pieces between mullion clips. Safing material to be cut to a min 4-1/2 in. (114 mm) width and stacked to a thickness which is at least 25 percent greater than the width of the linear gap between the curtain wall and the edge of the concrete floor slab. The safing material is compressed and inserted cut-edge-first into the linear gap such that its top surface is flush with the top surface of the floor assembly and such that it is friction-fit between mullion mounting angles. Additional pieces of safing material to be friction-fit into space between mullion mounting clips at each mullion location with top edges of mullion clips covered with a min 1/2 in. (13 mm) thickness of compressed safing material.

**ROCKWOOL MALAYSIA SDN BHD** – SAFE

**ROXUL INC** – SAFE

**B. Fill, Void or Cavity Material** – Min 1/16 in. (1.6 mm) dry [1/8 in. (3.2 mm) wet] thickness of fill material spray-applied over top of forming material and lapping min 1 in. (25 mm) onto the top surface of the concrete floor and onto the curtain wall insulation and framing covers. When 3M Fire Barrier Watertight Spray is used, min wet (and dry) thickness of spray is 1/10 in. (2.5 mm).

**3M COMPANY** – FireDam™ Spray 200, 3M Fire Barrier Watertight Spray

**B1. Fill, Void or Cavity Material – Tape** – As an alternate to Item 3B, Tape cut to size and press applied to top surface of joint to completely cover mineral wool and overlap min 1 in. (25 mm) onto the top surface of the floor and onto the curtain wall insulation (Item 2E) and mullion covers (Item 2F). Tape shall be applied in min 1 ft (305 mm) lengths along the joint and adjoining lengths of Tape shall overlap min 1/2 in. (13 mm).

**3M COMPANY** – 3M Fire and Water Barrier Tape

PERIMETER FIRE BARRIERS
3M Company
FireDam™ Spray 200, Fire Barrier Watertight Spray, Fire and Water Barrier Tape FWBT,
Fire Barrier 1000 NS Silicone Sealant and Fire Barrier 1003 SL Silicone Sealant

ASTM E 2307
T-Rating 0 hr
F-Rating 2 hr

ASTM E 2307/ASTM E 1399 Cycling
Class IV: 500 cycles @ 30 cpm
Rated for ± 10% horizontal movement @ 33% Compression (Reference Item 3A)
Rated for ± 6.25% vertical shear movement @ 33% Compression (Reference Item 3A)

UL 2079
L-Rating <1.0 SCFM/LF

1. **Concrete Floor Assembly** – Two-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pound per cubic foot (pcf), having a min thickness of 4-1/2 in. at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a min thickness of 4-1/2 in. and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. **Curtain Wall Assembly** – Incorporate the following construction features:
   
   A. **Mounting Attachment** (not shown) – Attach pre-cast concrete panels (Item 2B) to the structural framing according to the curtain wall manufacturer’s instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments to max 120 in.

   B. **Pre-Cast Concrete Panels** – Engineered structural panels: either tilt-up or formed panels, construct panels from steel-reinforced lightweight or normal weight (100-150 pcf) concrete, a min of 4 in. thick, 48 in. wide. Equip panels with structural mechanical attachments welded to the steel reinforcement within the panel for mechanical attachment to steel columns and spandrel beams in accordance with structural engineer’s requirements. When anchors are located within the perimeter joint protection (Item 3), maintain a min recess of 1/2 in. from the top of the concrete floor assembly (Item 1) and max spacing of 120 in. on center (oc) between anchors.

   C. **Concrete Panel Joint** – No through joints recommended. When required, seal the surface of the concrete panel joints with gaskets or sealants. Option: Treat the concrete panel joint with any weatherproofing material Listed as a Class 1 material in accordance with ASTM E-84. Use only Intertek certified products meeting these min requirements. Use one of the following for vertical and horizontal concrete panel joints:
Intertek System No. BPF 120-01 (cont.)

3. Perimeter Joint Protection – Do not exceed an 8 in. nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material – Use a min 4 in. thick, 4 pcfd density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using min 1/4 in. compression per piece of packing material. When a spray coating or tape is used, locate, size and install impaling pins according to the curtain wall system manufacturer’s guidelines, or be a min 4-1/2 in. long, 12 GA pin attached to one of the following: a nominal 2 x 2 x 2 in. long angle; a nominal 2 x 2 x 1 in. long angle; or can be directly attached to the pre-cast concrete panels (Item 2B) using mechanical fasteners. Space impaling pins a max of 12 in. oc. Add additional pins spaced a max of 16 in. oc at the centerline of the packing material (Item 3A). Install impaling pins around the periphery of the curtain wall insulation (Item 2F). A min of two impaling pins required located above the floor line per piece of insulation that has been cut from standard size with at least one in each corner.

ii. When through void or space exists between panels, the void in the spandrel region must be treated by packing a min 4 pcfd density, mineral wool into the joint to a min 33% compression (1-1/2 times width of opening), filling the entire void or space. Recess the mineral wool a min of 1/2 in. from each side of the wall. Install a min 1/2 in. thickness of 3M CP25WB+ firestop caulk on the internal surface of the wall assembly (Item 2). Use only Intertek certified products meeting these min requirements.

i. key way type (tongue and groove) (Item 2F2), or

iii. recessed (Item 2F3).

B. CERTIFIED MANUFACTURER – 3M Company
CERTIFIED PRODUCT – Fire Barrier™ Sealant
MODEL – CP25WB+

Flush type (butt joint) (Item 2F1), Prefer butted joints but allow a max 1 in. joint width for vertical and horizontal concrete panel joints.

When through void or space exists between panels, the void in the spandrel region must be treated by packing a min 4 pcfd density, mineral wool into the joint to a min 33% compression (1-1/2 times width of opening), filling the entire void or space. Recess the mineral wool a min of 1/2 in. from each side of the wall. Install a min 1/2 in. thickness of 3M CP25WB+ firestop caulk on the internal surface of the wall assembly (Item 2). Use only Intertek certified products meeting these min requirements.

ASTM E 2307/ASTM E 1399 Cycling
Class I: 500 cycles @ 1 cpm
Rated for ± 16.7% Horizontal Movement @ 50% Compression (Reference Item 3A)
Rated for ± 6.25% Vertical Shear Movement @ 50% Compression (Reference Item 3A)
Rated for ± 5% Horizontal Movement @ 20% Compression (Reference Item 3A)
UL 2079
L-Rating <1.0 SCFM/LF

1. Concrete Floor Assembly – Refer to Figure 1. Min. 2 hour rated monolithic concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf density. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a min. thickness of 4-1/2 in. and accommodate depth of blockout formed in the concrete: blockout width unrestricted.
   A. Concrete Floor – Min. 2 hour rated, nominal 4-1/2 in. thick reinforced, slab increasing to nominal 16 in. thick at joint face (slab edge) created by cast-in-place technique integral with concrete beam (Item 1B).
   B. Concrete Beam – Nominal 31 in. deep, 12 in. wide, 2 hour rated, pre-cast or cast-in-place reinforced concrete spandrel beam integral with concrete floor (Item 1A).

2. Curtain Wall Assembly – Refer to Figures 1 and 2. Incorporate the following construction features:
   A. Mounting Attachment (not shown) – Attach aluminum framing (Item 2B) to the structural framing according to the curtain wall manufacturer’s instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments a max. 120 in.
   B. Aluminum Framing – Use hollow rectangular aluminum extruded tubing with min. overall dimensions of 0.100 in. thick, 5-1/2 in. high, and 2-1/2 in. wide. Locate mullions (vertical aluminum framing) nominally 85-1/2 in. on center (oc) and locate transoms (horizontal aluminum framing) a max. 30-1/2 in. oc. For the spandrel region, locate the upper transom (horizontal aluminum framing) a min. 20 in. above the perimeter joint protection (Item 3) as measured from the top surface of the packing material (Item 3A) to the underside of the transom (horizontal aluminum framing).
   C. Glass Panels – Sized and installed into aluminum framing (Item 2B) according to the curtain wall system manufacturer’s guidelines. Use min. 1/4 in. thick clear, heat strengthened (HS) glass or tempered glass with a max. width and height less than the aluminum framing (Item 2B) and pressure bar. Secure glass panels with a thermal break (rubber extrusion), pressure (aluminum extrusion), min. 1/4-20 × 5/8 in. long screws, and a snap face (aluminum extrusion).
D. Impaling Pins – Use with curtain wall insulation (Item 2E) and framing covers (Item 2F), locate, size, and install impaling pins according to the curtain wall system manufacturer’s guidelines, or be a min. 4-1/2 in. long, 12 GA pin attached to one of the following: a nominal 2 in. × 2 in. plate; a nominal 2 in. × 2 in. × 2 in. long angle; or can be directly attached to the aluminum framing (Item 2B) using a stud gun. Cap all pins using a nominal 1 in. diameter speed washer. Spacing impaling pins a max. of 12 in. oc vertically and 20 in. oc horizontally. Install impaling pins around the periphery of the curtain wall insulation (Item 2F) so that its interior face is flush with the interior face of the aluminum framing (Item 2B).

E. Reinforcing Angle – Locate reinforcing angle at all horizontal butt joints of the curtain wall insulation (Item 2F) in the field of the glass spandrel panels (Item 2C) and at the mid-height of the packing material (Item 3A). Mount a min. 1-1/2 × 7/8 in., 20 GA, galvanized steel angle to the vertical aluminum framing millings (Item 2B), so that the vertical leg serves as a backer to the exterior face of the curtain wall insulation (Item 2F) and the horizontal leg extends away from the curtain wall insulation and is located at the centerline of the packing material (Item 3A). Size the angle 12 in. longer than the span between the interior edges of the vertical aluminum framing millings, (Item 2B) and form the angle so that it has a 6 in. vertical leg on each end. Secure the 6 in. vertical leg on each end to the vertical aluminum framing millings, (Item 2B) on each side with two No. 10 steel self-tapping sheet metal screws placed in a stable fashion with a max. spacing of 2 in. oc, or fastening method of equal strength and stability.

F. Curtain Wall Insulation – Use only Intertek certified products meeting the following min. requirements. Use nominal 24 in. wide, 4 in. thick 4pcf, density, 3 in. thick 6 pcf density, or 2 in. thick 8 pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior and installed in the stud cavity. Install curtain wall insulation between aluminum framing (Item 2B). Secure curtain wall insulation with impaling pins (Item 2D) attached to aluminum framing (Item 2B). Seal all meeting edges of curtain wall insulation with nominal 3 in. wide, pressure sensitive, aluminum foil-faced tape centered over the junction so that approximately 1-1/2 in. of tape covers each edge of the adjacent curtain wall insulation. Apply pressure sensitive aluminum foil-faced tape over all meeting edges of curtain wall insulation and framing covers (Item 2F) so that approximately 2 in. covers each edge of the adjacent material. Install curtain wall insulation flush with the interior face of the aluminum framing (Item 2B). Install 24 in. wide curtain wall insulation spanning the full length and height between aluminum framing (Item 2B). Refer to Figure 3. For vertical insulation butt joints, first install back-to-back angles created from min. 20 GA steel having min. 2 in. legs. Position back-to-back angles in front of reinforcing angle (Item 2E). Mechanically fasten ends of steel back-to-back angles to horizontal framing (Item 2B). Locate horizontal seams in the curtain wall insulation at least 6 in. from the top surface of the perimeter joint protection (Item 3). Maintain 1-1/4 in. air cavity between curtain wall insulation and glass panels (Item 2C). Option: In lieu of filling the full depth of the stud cavity with 4 in. thick, 4 pcf density curtain wall insulation, use min. 2 in. thick 8 pcf density, or 3 in. thick 6 pcf density, curtain wall insulation mechanically secured (do not secure by friction fit) use additional horizontal support angle (not shown). Locate a horizontal support angle consisting of a min. 20 GA steel angle, having 1-1/2 in. × 1-1/2 in. legs horizontally at the mid-height of the packing material (Item 3A) and attached to each mullion of aluminum framing (Item 2B) using min. No. 6, 1/2 in. long self-tapping sheet metal screws.

G. Framing Covers – Make from strips of min. 1 in. thick × min. 4 in. wide, 8 pcf density min., wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior. Center framing covers over all aluminum framing (Item 2B) and secure using impaling pins or cup-head weld pins (Item 2D). Do not pass framing covers through the perimeter joint protection (Item 3). Allow framing covers to abut top and bottom surfaces of the perimeter joint protection (Item 3) provided that no deformation occurs. Use only Intertek certified products meeting the above min. requirements.

H. Thermal Break Assembly – Secure panels with a thermal break (thermal-set rubber extrusion) pressure bar (aluminum extrusion). Protect spandrel panels according to Item 2F.
3. Perimeter Joint Protection – Refer to Figures 1 and 4. Install impaling pins (Item 2D), reinforcement angle (Item 2E), and protect spandrel panels using curtain wall insulation (Item 2F) before installing perimeter joint protection. Do not install framing covers (Item 2G) until after perimeter joint protection. Do not exceed a 12 in. nominal joint width (joint width at installation). Install perimeter joint protection from bottom of concrete floor assembly (Item 1). Sandwich the fill, void, or cavity material (Item 3B) between two pieces of packing material (Items 3A and 3C). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material – Use of min. 4 in. thick, 4 pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint created between the curtain wall insulation (Item 2F) and the concrete spandrel beam (Item 1B). Create a recess at least 4 in. deep between the bottom of the packing material and the bottom surface of the concrete spandrel beam (Item 1B) to allow installation of the fill, void, or cavity material (Item 3B) and the second piece of packing material (Item 3C). Tightly compress together splices (butt joints) in the lengths of packing material by using min. 1/4 in. compression per piece of packing material. When a spray coating or tape is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self-Leveling silicone sealant is used, recess the top surface of the packing material 1/4 in. from the top surface of the concrete floor assembly (Item 1). Use only Intertek certified products meeting the above min. requirements.

i. When horizontal movement of ±16.7% and vertical shear of ±6.25% is required, install packing material at 50% compression. Cut the width of the packing material 2 times wider than the nominal joint width.

ii. When horizontal movement of ±5% is required, install packing material at 20% compression. Cut the width of the packing material 1:4 times wider than the nominal joint width.

B. CERTIFIED MANUFACTURER – 3M Company

CERTIFIED PRODUCT – FireDam™ or Fire Barrier™

MODEL – FD Spray 200 (Elastomeric, Sprayable), Fire Barrier Watertight Spray (Elastomeric, Sprayable), or Fire and Water Barrier Tape

FWBT (Tape) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self-leveling)

Fill, Void or Cavity Material – Apply either spray coating or sealant over the packing material (Item 3A) as follows:

Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a min. wet film thickness of 1/8 in. and overlap the spray coating a min. 1/2 in. onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8 in. with the liquid spray coating.

Tape – Apply the tape such that there is a min. 1 in. overlap onto the adjacent curtain wall assembly (Item 2) and the concrete floor assembly (Item 1). Overlap joints in the tape system by 1/2 in.

Sealant – Apply non-sag or self-leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply min. 1/4 in. thickness non-sag or self-leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

C. Secondary Packing Material – Install after the fill, void, or cavity material (Item 3B) is cured. Use a min. 4 in. thick, 4 pcf density, mineral wool batt insulation with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve same compression as packing material (Item 3A). Compress the packing material into the perimeter joint created between the curtain wall insulation (Item 2F) and the concrete spandrel beam (Item 1B). Stagger butt joint of secondary packing material and packing material (Item 3A). Tightly compress together splices (butt joints) in the lengths of packing material by using min. 1/4 in. compression per piece of packing material. Verify finished installation flush with bottom of concrete spandrel beam (Item 1B). Use only Intertek certified products meeting the above min. requirements.

D. Cover Plate – Install a min. 18 GA, L-shaped, steel plate having a nominal 3 in. vertical leg and a horizontal leg sized to span the nominal joint width between the curtain wall insulation (Item 2F) and the concrete spandrel beam (Item 1B). Position the steel plate flush against bottom of concrete spandrel beam (Item 1B) and against the interior exposed vertical aluminum framing mullions (Item 2B). Attach the vertical leg of the L-shaped steel plate to each vertical aluminum framing mullion (Item 2B), using min. No. 10, self-tapping sheet metal screws nominally 2 in. below the horizontal leg. Space fasteners a max. of 48 in. oc and attach the horizontal leg of the L-shaped steel plate to the bottom of concrete spandrel beam (Item 1B) using Hilti XC-20 THP fasteners or equivalent pre-mounted, plastic top-head, concrete nails made of zinc-coated (5 to 13 μm thick), hardened steel, having a nominal 3/4 in. shank length, 0.138 in. diameter, cut-point and dome-head configuration.

1. Concrete Floor Assembly – 3 hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf, having a min. thickness of 4-1/2 in. at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a min. thickness of 4-1/2 in. and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. Curtain Wall Assembly – Incorporate the following construction features:

   A. Panel Mounting Attachment (not shown) – Attach steel framing (Item 2B) to the structural framing according to the curtain wall manufacturer’s instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments to max. 120 in.

   B. Steel Stud Framing – Use min. 3-5/8 in. × 1-5/8 in., 18 GA, C-shaped steel studs as vertical framing. Attach according to the curtain wall system manufacturer’s guidelines. Limit distance between vertical steel stud framing to max. 60 in. Limit distance between horizontal steel stud framing to min. 48 in. When required, install horizontal structural framing members according to the curtain wall system manufacturer’s guidelines and, in the spandrel area, locate a min. of 20 in. above the top surface of the concrete floor assembly (Item 1).

   C. Concrete Panels – Use any non-combustible exterior concrete based panels. Use min. 1-1/2 in. thick, 12 in. high, 12 in. long panels. Attach concrete panels to steel stud framing (Item 2B) according to the curtain wall system manufacturer’s requirements.

   D. Impaling Pins – Use with curtain wall insulation (Item 2E) and framing covers (Item 2F), locate, size, and install impaling pins according to the curtain wall system manufacturer’s guidelines, or be a min. 4-1/2 in. long, 12 GA pin attached to one of the following: a nominal 2 in. × 2 in. plate; a nominal 2 in. × 2 in. × 2 in. long angle; or can be directly attached to the steel framing (Item 2B) using a stud gun. Space impaling pins a max. of 12 in. on center (oc) vertically and 20 in. oc horizontally. Install impaling pins around the periphery of the curtain wall insulation (Item 2E) so that its interior face is flush with the interior face of the steel framing (Item 2B).
E. Curtain Wall Insulation – Use nominal 24 in. wide, 4 in. thick 4 pcf density, 3 in. thick 6 pcf density, or 2 in. thick 8 pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior and installed in the stud cavity. Install curtain wall insulation between steel framing (Item 2B). Secure curtain wall insulation with clips, impaling pins, or friction fit using curtain wall insulation length at least 1/4 in. longer than the distance between steel framing (Item 2B). Seal all meeting edges of curtain wall insulation with nominal 4 in. wide pressure sensitive aluminum foil-faced tape (not shown) centered over the junction so that approximately 2 in. of tape covers each edge of the adjacent curtain wall insulation. Apply pressure sensitive aluminum foil-faced tape over all meeting edges of curtain wall insulation and framing covers (Item 2F) so that approximately 2 in. covers each edge of the adjacent material. Install curtain wall insulation flush with the interior face of the steel framing (Item 2B). Install 24 in. wide curtain wall insulation without vertical seams, spanning the full length between steel framing (Item 2B). Locate horizontal seams in the curtain wall insulation at least 6 in. from the top surface of the perimeter joint protection (Item 3). Maintain 1-1/4 in. air cavity between curtain wall insulation and glass panels (Item 2C). Option: In lieu of filling the full depth of the stud cavity with 4 in. thick, 4 pcf density curtain wall insulation, use min. 2 in. thick, 8 pcf density curtain wall insulation mechanically secured (do not secure by friction fit) and use additional horizontal support angle (not shown). Use only Intertek certified products meeting the above min.requirements.

F. Framing Covers – Make from strips of min. 1 in. thick × min. 4 in. wide, 8 pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior. Center framing covers over all steel framing (Item 2B) and secure using impaling pins (Item 2D). Do not pass framing covers through the perimeter joint protection (Item 3). Allow framing covers to abut top and bottom surfaces of the perimeter joint protection (Item 3) so that no deformation occurs. Use only Intertek certified products meeting the above min.requirements.

G. Reinforcing Angle – Mount a min. 1-1/2 in. × 1-1/2 in., 20 GA, galvanized steel angle to the steel stud framing (Item 2B) so that the vertical leg serves as a backer to the exterior face of the curtain wall insulation (Item 2E), and the horizontal leg extends away from the interior face of the curtain wall insulation, and is located at the centerline of the packing material (Item 3A). Size the angle 12 in. longer than the span between the interior edges of the steel stud framing (Item 2B) and form the angle so that it has a 6 in. vertical leg on each end. Secure the 6 in. vertical leg on each end to the steel stud framing (Item 2B) on each side with three No. 10 steel self-tapping sheet metal screws placed in a triangular fashion with a max. spacing of 2 in. oc.

3. Perimeter Joint Protection – Do not exceed an 8 in. nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material – Use a min. 4 in. thick, 4 pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of the concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using min. 1/4 in. compression per piece of packing material. When a spray coating or tape is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self-leveling silicone sealant is used, recess the top surface of the packing material 1/4 in. from the top surface of the perimeter joint protection (Item 3). Maintain 1-1/4 in. air cavity between curtain wall insulation at least 6 in. from the top surface of the perimeter joint protection (Item 3). When installing the supporting wall insulation, leave a 1 in. horizontal gap at the top of the perimeter joint and install 1 in. of mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior. Center framing covers over all steel framing (Item 2B) and secure using impaling pins (Item 2D). Do not pass framing covers through the perimeter joint protection (Item 3). Allow framing covers to abut top and bottom surfaces of the perimeter joint protection (Item 3) so that no deformation occurs. Use only Intertek certified products meeting the above min.requirements.

I. When 50% compression is required cut the width of the packing material 2 times wider than the nominal joint width.

II. When 33% compression is required cut the width of the packing material 1-1/2 times wider than the nominal joint width.

B. CERTIFIED MANUFACTURER – 3M Company

CERTIFIED PRODUCT – FireDam™ or Fire Barrier™

MODEL – FD Spray 200 (Elastomeric, Sprayable), Fire Barrier Watertight Spray (Elastomeric, Sprayable), or Fire and Water Barrier Tape FWTB (Tape) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self-leveling)

Fill, Void or Cavity Material – Apply either spray coating or sealant over the packing material (Item 3A) as follows:

Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a min. wet film thickness of 1/8 in. and overlap the spray coating a min. 1/2 in. onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8 in. with the liquid spray coating.

Tape – Apply the tape such that there is a min. 1 in. overlap onto the adjacent curtain wall assembly (Item 2) and the concrete floor assembly (Item 1). Overlap joints in the tape system by 1/2 in.

Sealant – Apply non-sag or self-leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply min. 1/4 in. thickness non-sag or self-leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

C. Support Clips (optional) – Recommended for installations subject to vertical shear movement. Use standard 20 GA galvanized steel Z-shaped clips having the following nominal dimensions: 1 in. wide × 3 in. high with a 2 in. upper leg and a 3 in. lower leg.

Reprinted from the Directory of Building Products with permission from Intertek©
1. **Concrete Floor Assembly** – Max 3 hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100-150 pcf, with a min thickness of 4-1/2 in. at the joint face. Overall slab thickness may vary to accommodate various blockout depths (longitudinal recesses) formed in the concrete, to house the architectural cover plate. The blockout width may also vary without restriction.

2. **Curtain Wall Assembly**: The curtain wall assembly shall incorporate the following construction features:

   A. **Mounting Attachment** (not shown) – Attachment of the curtain wall framing to the structural framing shall be according to the curtain wall manufacturer’s instructions. When required, the mounting attachments to the floor slab shall be connected to the joint face of the floor slab, according to the curtain wall manufacturer’s instructions. Max distance between mounting attachments shall be 10 ft.

   B. **Aluminum Framing** – Rectangular aluminum tubing mullions and transoms, sized according to the curtain wall system manufacturer’s guidelines. Min overall dimensions of framing required is 0.100 in. thick aluminum with a min 5-1/2 in. height and a min of 2-1/2 in. width of the extrusion. Mullion and transom covers are added to the external side of the framing, giving the framing system a total depth of nominal. 8 in. Mullions are to be spaced a min 60 in. oc and transoms are to be spaced a min 48 in. oc. Transoms are to be located at a height of 20 in. above the top surface of the concrete floor assembly (as measured from the bottom of the transom).

   C. **Glass Panels** – Glass panels shall be sized and installed to curtain wall framing according to the curtain wall system manufacturer’s guidelines. Use a min 1/4 in. thick clear, heat-strengthened (HS) glass or tempered glass with a max width and height less than the aluminum framing oc spacing, which allows the glass to be secured to the notched shoulder of the aluminum framing and pressure bar. Panels are secured with a thermal break (rubber extrusion), pressure bar (aluminum extrusion), min 1/4–20 × 5/8 in. long screws, and a snap face (aluminum extrusion).

   D. **Impaling Pins** – Min 12 GA steel pins shall be located, sized, and installed according to the curtain wall system manufacturer’s guidelines, or be a min 1/2 in. longer than the thickness of the curtain wall insulation. Attach pins to a nominal 2 × 2 in. clip angle constructed with 20 GA galvanized sheet steel and secure the clips to the aluminum framing with No. 10 self-tapping sheet metal screws. Pins shall be spaced a max of 12 in. oc on the vertical framing members and a max of 20 in. oc on the horizontal framing members that make up the perimeter of the spandrel area. The interior face of the curtain wall insulation is to be installed so that it is flush with the interior face of the framing.
E. Curtain Wall Insulation – Install nominal 2 in. thick 8 pcf density mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder) which is exposed to the room interior. Secure with angle clips and impaling pins (2D). All meeting edges of insulation are sealed with nominal 4 in. wide pressure sensitive aluminum foil-faced tape, centered over the junction so that approximately 2 in. of tape covers each edge of the adjacent insulation. In lieu of the nominal 2 in. 8 pcf mineral wool curtain wall insulation, nominal 3 in. 6 pcf or nominal 4 in. 4 pcf mineral wool may be installed using the same securing method described in Item 2D. The interior face of the batt insulation is, if required compressed, flush with the interior face of the curtain wall framing. When using nominal 2 in. thick 8 pcf density mineral wool batt insulation, a min 1-1/4 in. air space is created between the insulation and panel. The batt insulation shall be installed without vertical seams, with a continuous span across the full length between the vertical curtain wall framing members. Horizontal seams in the nominal 24 in. wide batt insulation are to be at least 6 in. from the top surface of the perimeter joint treatment.

F. Framing Covers – Framing covers, comprised of nominal 4 in. wide strips of 8 pcf density mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder) which is exposed to the room interior, are centered over each vertical framing member and secured to the member with impaling pins and clips spaced a max 12 in. oc and attached in accordance with Item 2D. Framing covers below the perimeter joint treatment are nominal 2 in. thick, and those above the perimeter joint treatment are nominal 1 in. thick. Framing covers do not pass through the perimeter joint treatment. They are butted to the top and bottom surfaces of the perimeter joint treatment.

G. Reinforcing Angle – Mount a min 1-1/2 × 1-1/2 in. × 20 GA galvanized steel angle to the vertical framing members so that the vertical leg serves as a backer to the exterior face of the curtain wall insulation and the horizontal leg extends away from the curtain wall insulation, and the elevation is located at the centerline of the perimeter joint treatment. Size the angle 12 in. longer than the span between the interior edges of the vertical framing members and form the angle so that it has a 6 in. vertical leg on each end. Secure the 6 in. leg to the framing member on each side with three No. 10 steel self-tapping sheet metal screws placed in a triangular fashion with a max spacing of 2 in. oc.

3. Perimeter Joint Protection – The perimeter joint (linear opening) shall not exceed an 8 in. nominal joint width (joint width at installation) and the perimeter joint treatment shall incorporate the following construction features:

A. Packing Material – Use a min 4 in. thick, 4 pcf density, mineral wool batt insulation installed with the fibers running parallel to the slab edge and curtain wall. The packing material shall be compressed 50% for 16.7% horizontal movement and 6.25% vertical shear, or 20% for 5% horizontal movement in the nominal joint width. Compress the batt insulation into the perimeter joint such that the top surface of the batt insulation is flush with the top surface of the concrete floor slab and its mid-depth is compressed against the interior surface of the curtain wall insulation (2F) which is supported by the 20 GA steel reinforcing angle (2E). Splices (butt joints) in the lengths of mineral wool batt insulation are to be tightly compressed together. When using the Fire Barrier™ 1000 or 1003 Sealants, recess the mineral wool packing material a min 1/4 in. from the top surface of the floor slab to accommodate the required installation depth of the sealant.

B. CERTIFIED MANUFACTURER – 3M Company
CERTIFIED PRODUCT – FireDam™ or Fire Barrier
MODEL – FD Spray 200 (Elastomeric, Sprayable) Fire Barrier Watertight Spray (Elastomeric, Sprayable) or Fire and Water Barrier Tape FWBT (Tape) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling)

Fill, Void or Cavity Material – Apply either spray coating or sealant over the packing material (Item 3A) as follows:

Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a min wet film thickness of 1/8 in. and overlap the spray coating a min 1/2 in. onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8 in. with the liquid spray coating.

Tape – Apply the tape such that there is a min 1 in. overlap onto the adjacent curtain wall assembly (Item 2) and the concrete floor assembly (Item 1). Overlap joints in the tape system by 1/2 in.

Sealant – Apply non-sag or self-leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply min 1/4 in. thickness non-sag or self-leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

C. Support Clips (optional) – Recommended for installations subject to vertical shear movement. Use standard 20 GA galvanized steel Z-shaped clips having the following nominal dimensions: 1 in. wide by 3 in. high with a 2 in. upper leg and a 3 in. lower leg.

1. CONCRETE FLOOR ASSEMBLY: Two-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150pcf, having a minimum thickness of 4-1/2” at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a minimum thickness of 4-1/2” and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. CURTAIN WALL ASSEMBLY: Incorporate the following construction features:
   A. Mounting Attachment: (Not shown) Attach steel stud framing (Item 2B) to the structural framing according to the curtain wall manufacturer’s instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments to maximum 120”.
   B. Steel Stud Framing: Use minimum 3-5/8” by 1-5/8”, 18 GA, C-shaped steel studs as interior vertical framing. Attach according to the curtain wall system manufacturer’s guidelines. Limit distance between steel stud framing to maximum 60”. When required, install horizontal steel stud framing members according to the curtain wall system manufacturer’s guidelines and, in the spandrel area, locate a minimum of 33” above the top surface of the concrete floor assembly (Item 1).
   C. Concrete Panels: Use any non-combustible exterior concrete based panels. Use minimum 1-1/2” thick, 12” high, 12” long panels. Attach concrete panels to steel stud framing (Item 2B) according to the curtain wall system manufacturer’s requirements.
   D. Impaling Pins: (Optional) Use, locate, size, and install impaling pins according to the curtain wall system manufacturer’s guidelines.
   E. Curtain Wall Insulation: (Optional) When used, install either mineral wool or fiberglass batt curtain wall insulation after the perimeter joint protection (Item 3) without deforming it. Attach curtain wall insulation to steel stud framing (Item 2B) by friction fit or mechanical fasteners.
Design No. 3MU/JS 120-05 continued

F. Concrete Panel Joint: No through joints allowed. When required, the surface of the concrete panel joints can be sealed with gaskets or sealants. Use one of the following for vertical and horizontal concrete panel joints:
   I. flush type (butt joint) (Item 2F1),
   II. key way type (tongue and groove) (Item 2F2), or
   III. recessed (Item 2F3).

G. Framing Covers: (Optional) When used, locate, size, and install framing covers according to the curtain wall system manufacturer’s guidelines. Do not pass framing covers through the perimeter joint protection (Item 3). Allow framing covers to abut top and bottom surfaces of the perimeter joint protection (Item 3) provided that no deformation occurs.

H. Glass Vision Panels: (Optional) When used, locate glass vision panels above spandrel area and a minimum 33” above the top surface of the concrete floor assembly (Item 1). Install glass vision panels to window framing (Item 2I) according to manufacturer’s guidelines. Use a minimum 1/4” thick, clear tempered glass with maximum width and height width and height as determined by the window framing (Item 2I).

I. Window Gaskets: When glass vision panels (Item 2G) used, use a thermal break (thermo-set rubber extrusion) to secure glass vision panels (Item 2G).

J. Window Framing: When glass vision panels used, use steel framing members a minimum 3-5/8” by 1-5/8”, 18 GA steel, U-shaped channel or similar construction compatible with structural framing (Item 2B). Locate window framing at least 33” above the top surface of the concrete floor assembly (Item 1).

3. PERIMETER JOINT PROTECTION: Do not exceed an 8” nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):
   A. Packing Material: Use a minimum 4” thick, 4-pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using minimum 1/4” compression per piece of packing material. Use only Intertek certified products meeting the above minimum requirements. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self leveling silicone sealant is used, recess the top surface of the packing material 1/4” from the top surface of the concrete floor assembly (Item 1).
      I. When 50% compression is required cut the width of the packing material 2 times wider than the nominal joint width.
      II. When 33% compression is required cut the width of the packing material 1.5 times wider than the nominal joint width.
      III. When 20% compression is required cut the width of the packing material 1.25 times wider than the nominal joint width.
   B. CERTIFIED MANUFACTURER: 3M Company
      CERTIFIED PRODUCT: FireDam™ or Fire Barrier™
      MODEL: FD Spray 200 (Elastomeric, Sprayable) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling) Sealant Fill, Void or Cavity Material: Apply either spray coating or non-sag or self leveling silicone sealant over the packing material (Item 3A) as follows:
      Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a minimum wet film thickness of 1/8” and overlap the spray coating a minimum 1/2” onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8” with the liquid spray coating.
      Sealant – Apply non-sag or self leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply minimum 1/4” thickness non-sag or self leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).
      C. Support Clips: (Optional) Recommended for installations subject to vertical shear movement. Use standard 20 GA galvanized steel Z-shaped clips having the following nominal dimensions: 1” wide by 3” high with a 2” upper leg and a 3” lower leg.

1. CONCRETE FLOOR ASSEMBLY: Two-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a
density of 100 to 150 pcf, having a minimum thickness of 4-1/2" at the joint face. When a longitudinal recess (blockout) is required to contain
an architectural joint system, increase concrete floor assembly thickness to maintain a minimum thickness of 4-1/2" and accommodate depth
of blockout formed in the concrete: blockout width unrestricted.

2. CURTAIN WALL ASSEMBLY: Incorporate the following construction features:
   A. Mounting Attachment: (Not shown) Attach steel stud framing (Item 2B) to the structural framing according to the curtain wall
      manufacturer’s instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1)
      according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments to maximum 120”.
   B. Steel Stud Framing: Use minimum 3-5/8” by 1-5/8”, 18 GA, C-shaped steel studs as vertical framing. Attach according to the curtain
      wall system manufacturer’s guidelines. Limit distance between steel stud framing to maximum 48”. When required, install horizontal
      structural framing members according to the curtain wall system manufacturer’s guidelines and, in the spandrel area, locate a minimum
      of 33” above the top surface of the concrete floor assembly (Item 1).
   C. Aluminum Panels: Install minimum 1/8” thick aluminum panels with maximum dimensions of 48” by 144” to steel stud framing (Item
      2B) according to the curtain wall system manufacturer’s guidelines.
   D. Impaling Pins: When used with curtain wall insulation (Item 2E), locate, size and install impaling pins according to the curtain wall
      system manufacturer’s guidelines, or be a minimum 4-1/2” long, 12 GA pin attached to one of the following: a nominal 2” by 2” plate; a
      nominal 2” by 2” long angle; or can be directly attached to the steel stud framing (Item 2B) using a stud gun. Space impaling pins
      a maximum of 12” on center. Install impaling pins around the periphery of the curtain wall insulation (Item 2E) so that its interior face is
      flush with the interior face of the steel stud framing (Item 2B).
Design No. 3MU/JS 120-06 continued

E. Curtain Wall Insulation: Use nominal 24" wide, 4" thick, 4-pcf density, 3" thick, 6-pcf density, or 2" thick, 8-pcf density, mineral wool batt insulation. Install curtain wall insulation by fitting in each stud cavity between steel stud framing (Item 2B) using clips, impaling pins (Item 2D), or friction fit by using a curtain wall insulation lengths at least 1/4" longer than the distance between steel stud framing (Item 2B). Maintain 1-1/4" air cavity between curtain wall insulation and aluminum panels (Item 2C). Completely fill the recess of the "C-shaped" steel stud framing (Item 2B) with curtain wall insulation. Tightly compress together butt joints in the lengths of curtain wall insulation by using minimum 1/4" compression per piece of curtain wall insulation material. Use only Intertek certified products meeting the above minimum requirements.

F. Interior Curtain Wall Surface: Entirely cover interior face of steel stud framing (Item 2B) with one layer of 5/8" thick, Type X gypsum board. Fasten gypsum board to steel stud framing (Item 2B) using minimum #6, 1-1/8" long bugle-head phillips drywall screws spaced nominally 1/2" on center. Joint Tape and Compound – Apply vinyl or casein, dry or premixed joint compound to exposed face of gypsum board in two coats to all exposed screw heads and gypsum board joints. Embed minimum 2" wide paper, plastic, or fiberglass tape in first layer of premixed joint compound over joints in gypsum board. Create minimum 3-5/8" deep wall cavity between unexposed face of gypsum board to unexposed face of aluminum panel (Item 2C).

G. Glass Vision Panels: (Optional) When used, locate glass vision panels above spandrel area and a minimum 33" above the top surface of the concrete floor assembly (Item 1). Install glass vision panels to window framing (Item 2II) according to manufacturer's guidelines. Use a minimum 1/4" thick, clear tempered glass with maximum width and height width and height as determined by the window framing (Item 2II).

H. Window Gaskets: When glass vision panels (Item 2G) used, use a thermal break (thermo-set rubber extrusion) to secure glass vision panels (Item 2G).

I. Window Framing: When glass vision panels used, use steel framing members a minimum 3-5/8" by 1-5/8", 18 GA steel, U-shaped channel or similar construction compatible with structural framing (Item 2B). Locate window framing at least 33" above the top surface of the concrete floor assembly (Item 1).

3. PERIMETER JOINT PROTECTION: Do not exceed an 8 inch nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material: Use a minimum 4" thick, 4-pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using minimum 1/4" compression per piece of packing material. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self leveling silicone sealant is used, recess the top surface of the packing material 1/4" from the top surface of the concrete floor assembly (Item 1). Use only Intertek certified products meeting the above minimum requirements.

I. When 50% compression is required cut the width of the packing material 2 times wider than the nominal joint width.

II. When 33% compression is required cut the width of the packing material 1.5 times wider than the nominal joint width.

III. When 20% compression is required cut the width of the packing material 1.25 times wider than the nominal joint width.

B. CERTIFIED COMPANY: 3M Company

CERTIFIED PRODUCT: FireDam™ or Fire Barrier™

MODEL: FD Spray 200 (Elastomeric, Sprayable) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling)

Fill, Void or Cavity Material: Apply either spray coating or sealant over the packing material (Item 3A) as follows:

Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a minimum wet film thickness of 1/8" and overlap the spray coating a minimum 1/2" onto the adjacent curtain wall assembly (Item 2II) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8" with the liquid spray coating.

Sealant – Apply non-sag or self leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply minimum 1/4" thickness non-sag or self leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

C. Support Clips: (Optional) Recommended for installations subject to vertical shear movement. Use standard 20 GA galvanized steel Z-shaped clips having the following nominal dimensions: 1" wide by 3" high with a 2" upper leg and a 3" lower leg.

1. CONCRETE FLOOR ASSEMBLY: Two-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150pcf, having a minimum thickness of 4-1/2” at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a minimum thickness of 4-1/2” and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. CURTAIN WALL ASSEMBLY: Incorporate the following construction features:
   A. Mounting Attachment: (Not shown) Attach steel stud framing (Item 2B) to the structural framing according to the curtain wall manufacturer’s instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments to maximum 120”.
   B. Steel Stud Framing: Use minimum 3-5/8” by 1-5/8”, 18 GA, C-shaped steel studs as vertical framing. Attach according to the curtain wall system manufacturer’s guidelines. Limit distance between vertical steel stud framing to maximum 48”. Limit distance between horizontal steel stud framing to maximum 72”. When required, install horizontal structural framing members according to the curtain wall system manufacturer’s guidelines and, in the spandrel area, locate a minimum of 33” above the top surface of the concrete floor assembly (Item 1).
   C. Glass Panels: Install glass panels to window framing according to manufacturer’s guidelines. Use a minimum 1/4” thick, clear tempered glass with maximum width of 48” and height as determined by the window framing.
   D. Impaling Pins: When used with curtain wall insulation (Item 2E), locate, size and install impaling pins according to the curtain wall system manufacturer’s guidelines, or be a minimum 4-1/2” long, 12 GA pin attached to one of the following: a nominal 2” by 2” plate; a nominal 2” by 2” long angle; or can be directly attached to the steel stud framing (Item 2B) using a stud gun. Space impaling pins a maximum of 12” on center. Install impaling pins around the periphery of the curtain wall insulation (Item 2E) so that its interior face is flush with the interior face of the steel stud framing (Item 2B).
E. Curtain Wall Insulation: Use nominal 24” wide, 4” thick, 4-pcf density, 3” thick, 6-pcf density, or 2” thick, 8-pcf density, mineral wool batt insulation. Install curtain wall insulation by fitting in each stud cavity between steel stud framing (Item 2B) using clips, impaling pins (Item 2D), or friction fit by using a curtain wall insulation lengths at least 1/4” longer than the distance between steel stud framing (Item 2B). Maintain 1-1/4” air cavity between curtain wall insulation and aluminum panels (Item 2C). Completely fill the recess of the “C-shaped” steel stud framing (Item 2B) with curtain wall insulation. Tightly compress together butt joints in the lengths of curtain wall insulation by using minimum 1/4” compression per piece of curtain wall insulation material. Locate horizontal seams in the curtain wall insulation at least 6” from the top surface of the perimeter joint protection (Item 3). Use only Intertek certified products meeting the above minimum requirements.

F. Interior Curtain Wall Surface: Entirely cover interior face of steel stud framing (Item 2B) with one layer of 5/8” thick, Type X gypsum board. Fasten gypsum board to steel stud framing (Item 2B) using minimum #6, 1-1/8” long bugle-head phillips drywall screws spaced nominally 1/2” on center. Joint Tape and Compound – Apply vinyl or casein, dry or premixed joint compound to exposed face of gypsum board in two coats to all exposed screw heads and gypsum board joints. Embed minimum 2” wide paper, plastic, or fiberglass tape in first layer of premixed joint compound over joints in gypsum board. Create minimum 3-5/8” deep wall cavity between unexposed face of gypsum board to unexposed face of aluminum panel (Item 2C).

3. PERIMETER JOINT PROTECTION: Do not exceed an 8” nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material: Use a minimum 4” thick, 4-pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using minimum 1/4” compression per piece of packing material. Use only Intertek certified products meeting the above minimum requirements. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self leveling silicone sealant is used, recess the top surface of the packing material 1/4” from the top surface of the concrete floor assembly (Item 1). Use only Intertek certified products meeting the above minimum requirements.

I. When 50% compression is required cut the width of the packing material 2 times wider than the nominal joint width.
II. When 33% compression is required cut the width of the packing material 1.5 times wider than the nominal joint width.
III. When 20% compression is required cut the width of the packing material 1.25 times wider than the nominal joint width.

B. CERTIFIED MANUFACTURER: 3M Company

CERTIFIED PRODUCT: FireDam™ or Fire Barrier™
MODEL: FD Spray 200 (Elastomeric, Sprayable) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling) Sealant.

Fill, Void or Cavity Material: Apply either spray coating or sealant over the packing material (Item 3A) as follows:

Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a minimum wet film thickness of 1/8” and overlap the spray coating a minimum 1/2” onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8” with the liquid spray coating.

Sealant – Apply non-sag or self leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply minimum 1/4” thickness non-sag or self leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

C. Support Clips: (Optional) Recommended for installations subject to vertical shear movement. Use standard 20 GA galvanized steel Z-shaped clips having the following nominal dimensions: 1” wide by 3” high with a 2” upper leg and a 3” lower leg.

1. CONCRETE FLOOR ASSEMBLY: Two-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a
density of 100 to 150pcf, having a minimum thickness of 4-1/2” at the joint face. When a longitudinal recess (blockout) is required to contain
an architectural joint system, increase concrete floor assembly thickness to maintain a minimum thickness of 4-1/2” and accommodate depth
of blockout formed in the concrete: blockout width unrestricted.

2. CURTAIN WALL ASSEMBLY: Incorporate the following construction features:
   A. Mounting Attachment: (Not shown) Attach steel stud framing (Item 2B) to the structural framing according to the curtain wall
      manufacturer’s instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1)
      according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments to maximum 120”.
   B. Steel Stud Framing: Use minimum 3-5/8” by 1-5/8”, 18 GA, C-shaped steel studs as vertical framing. Attach according to the curtain
      wall system manufacturer’s guidelines. Limit distance between steel stud framing to maximum 48”. Install horizontal structural framing
      members according to the curtain wall system manufacturer’s guidelines and, in the spandrel area, locate a minimum of 33” above the top
      surface of the concrete floor assembly (Item 1).
   C. Aluminum Panels: Install minimum 1/8” thick aluminum panels with maximum dimensions of 48” by 144” to steel stud framing (Item
      2B) according to the curtain wall system manufacturer’s guidelines.
   D. Impaling Pins: When used with curtain wall insulation (Item 2E), locate, size and install impaling pins according to the curtain wall
      system manufacturer’s guidelines, or be a minimum 4-1/2” long, 12 GA pin attached to one of the following: a nominal 2” by 2” plate; a
      nominal 2” by 2” by 2” long angle; or can be directly attached to the steel stud framing (Item 2B) using a stud gun. Space impaling pins
      a maximum of 12” on center. Install impaling pins around the periphery of the curtain wall insulation (Item 2E) so that its interior face is
      flush with the interior face of the steel stud framing (Item 2B).
Design No. 3MU/JS 120-08 continued

E. Curtain Wall Insulation: Install perimeter fire barrier reinforcement (Item 3D) prior to curtain wall insulation. Use nominal 24” wide, 4” thick, 4-pcf density, 3” thick, 6-pcf density, or 2” thick, 8-pcf density, mineral wool batt insulation, sealed on one side with aluminum foil scrim (vapor retarder), which faces the room interior. Install curtain wall insulation by fitting in each stud cavity between steel stud framing (Item 2B) using clips, impaling pins (Item 2D), or friction fit by using a curtain wall insulation lengths at least 1/4” longer than the distance between steel stud framing (Item 2B). Maintain 1-1/4” air cavity between curtain wall insulation and aluminum panels (Item 2C). Completely fill the recess of the “C-shaped” steel stud framing (Item 2B) with curtain wall insulation. Tightly compress together butt joints in the lengths of curtain wall insulation by using minimum 1/4” compression per piece of curtain wall insulation material. Tape all adjacent edges between curtain wall insulation, or between steel stud framing (Item 2B) and curtain wall insulation, with min. 4” wide pressure sensitive aluminum foil tape, centered over the seam. Locate horizontal seams in the curtain wall insulation at least 6” above or below the top surface of the perimeter joint protection (Item 3). Use only Intertek certified products meeting the above minimum requirements.

F. Framing Covers: Make from strips of 1”, 8 pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior. Cut strips a minimum 1-1/2” wider than steel stud framing (Item 2B). Use only Intertek certified products meeting the above minimum requirements. Center framing covers over all steel stud framing (Item 2B) and secure using impaling pins (Item 2D). Do not pass framing covers through the perimeter joint protection (Item 3). Allow framing covers to abut the top and the bottom surfaces of the perimeter joint protection (Item 3) provided that no deformation occurs. Use only Intertek certified products meeting the above minimum requirements.

G. Glass Vision Panels: (Optional) When used, locate glass vision panels above spandrel area and a minimum 33” above the top surface of the concrete floor assembly (Item 1). Install glass vision panels to window framing (Item 2I) according to manufacturer’s guidelines. Use a minimum 1/4” thick, clear tempered glass with maximum width and height width and height as determined by the window framing (Item 2I).

H. Window Gaskets: When glass vision panels (Item 2G) used, use a thermal break (thermo-set rubber extrusion) to secure glass vision panels (Item 2G).

I. Window Framing: When glass vision panels used, use steel framing members a minimum 3-5/8” by 1-5/8”, 18 GA steel, U-shaped channel or similar construction compatible with structural framing (Item 2B). Locate window framing at least 33” above the top surface of the concrete floor assembly (Item 1).

3. PERIMETER JOINT PROTECTION: Do not exceed an 8” nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material: Use a minimum 4” thick, 4 pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splice (butt joints) in the lengths of packing material by using minimum 1/4” compression per piece of packing material. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self leveling silicone sealant is used, recess the top surface of the packing material 1/4” from the top surface of the concrete floor assembly (Item 1). Use only Intertek certified products meeting the above minimum requirements.

I. When 50% compression is required cut the width of the packing material 2 times wider than the nominal joint width.

II. When 33% compression is required cut the width of the packing material 1.5 times wider than the nominal joint width.

III. When 20% compression is required cut the width of the packing material 1.25 times wider than the nominal joint width.

B. CERTIFIED COMPANY: 3M Company

CERTIFIED PRODUCT: FireDam™ or Fire Barrier™

MODEL: FD Spray 200 (Elastomeric, Sprayable) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling) Sealant

Fill, Void or Cavity Material: Apply either spray coating or sealant over the packing material (Item 3A) as follows:

Spray Coating – Spray liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a minimum wet film thickness of 1/8” and overlap the spray coating a minimum 1/2” onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8” with the liquid spray coating.

Sealant – Apply non-sag or self leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply minimum 1/4” thickness non-sag or self leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

C. Support Clips: (Optional) Recommended for installations subject to vertical shear movement. Use standard 20 GA galvanized steel Z-shaped clips having the following nominal dimensions: 1” wide by 3” high with a 2” upper leg and a 3” lower leg.

D. Perimeter Fire Barrier Reinforcement: Use minimum 20 GA, steel angle having a 1-1/2” high vertical leg and a 1-1/2” wide horizontal leg. Fully embed horizontal leg into the curtain wall insulation (Item 2E) at the centerline of the packing material (Item 3A). Secure the vertical leg at each mullion interior face (steel stud framing – Item 2B) using at least two minimum 1/2” long, No. 10, sheet metal screws spaced nominally 1” on center. Install perimeter fire barrier reinforcement continuous along the length of the perimeter joint protection (Item 3). Overlap joints in the perimeter fire barrier reinforcement a minimum 12” and secure the overlap using at least three minimum 1/4” long, No. 10, sheet metal screws spaced nominally 4” on center, placed in both the vertical and horizontal legs of the angles.

1. CONCRETE FLOOR ASSEMBLY: Two-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a
density of 100 to 150 pcf, having a minimum thickness of 4-1/2" at the joint face. When a longitudinal recess (blockout) is required to contain
an architectural joint system, increase concrete floor assembly thickness to maintain a minimum thickness of 4-1/2" and accommodate depth
of blockout formed in the concrete: blockout width unrestricted.

2. CURTAIN WALL ASSEMBLY: Incorporate the following construction features:
   A. Mounting Attachment: (Not shown) Attach steel stud framing (Item 2B) to the structural framing according to the curtain wall
      manufacturer’s instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1)
      according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments to maximum 120”.
   B. Steel Stud Framing: Use minimum 5-1/2” by 1-5/8”, 18 GA, C-shaped steel studs as vertical framing. Attach according to the curtain
      wall system manufacturer’s guidelines. Limit distance between steel stud framing to maximum 48”. Install horizontal structural framing
      members to maximum 72” according to the curtain wall system manufacturer’s guidelines and, in the spandrel area, locate a minimum of
      33” above the top surface of the concrete floor assembly (Item 1).
   C. Glass Panels: Install glass panels into curtain wall framing according to the curtain wall system manufacturer’s guidelines. Use a
      minimum 1/4” thick, clear heat-strengthened (HS) or tempered glass with a maximum width of 48”.
   D. Impaling Pins: When used with curtain wall insulation (Item 2E), locate, size and install impaling pins according to the curtain wall
      system manufacturer’s guidelines, or be a minimum 4-1/2” long, 12 GA pin attached to one of the following: a nominal 2” by 2” plate; a
      nominal 2” by 2” by 2” long angle; or can be directly attached to the steel stud framing (Item 2B) using a stud gun. Space impaling pins
      a maximum of 12” on center. Install impaling pins around the periphery of the curtain wall insulation (Item 2E) so that its interior face is
      flush with the interior face of the steel stud framing (Item 2B).
Design No. 3MU/JS 120-09 continued

E. Curtain Wall Insulation: Use nominal 24” wide, 4” thick, 4-pcf density, 3” thick, 6-pcf density, or 2” thick, 8-pcf density, mineral wool batt insulation. Install curtain wall insulation by fitting in each stud cavity between steel stud framing (Item 2B) using clips, impaling pins (Item 2D), or friction fit by using a curtain wall insulation lengths at least 1/4” longer than the distance between steel stud framing (Item 2B). Maintain 1-1/4” air cavity between curtain wall insulation and glass panels (Item 2C). Completely fill the recess of the “C-shaped” steel stud framing (Item 2B) with curtain wall insulation. Tightly compress together butt joints in the lengths of curtain wall insulation by using minimum 1/4” compression per piece of curtain wall insulation material. Tape all adjacent edges between curtain wall insulation, or between steel stud framing (Item 2B) and curtain wall insulation, with min. 4” wide pressure sensitive aluminum foil tape, centered over the seam. Locate horizontal seams in the curtain wall insulation at least 6” above or below the top surface of the perimeter joint protection (Item 3). Use only Intertek certified products meeting the above minimum requirements.

F. Framing Covers: Make from strips of 1”, 8 pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior. Cut strips a minimum 1-1/2” wider than steel stud framing (Item 2B). Center framing covers over all steel stud framing (Item 2B) and secure using impaling pins (Item 2D). Do not pass framing covers through the perimeter joint protection (Item 3). Allow framing covers to abut the top and the bottom surfaces of the perimeter joint protection (Item 3) provided that no deformation occurs. Use only Intertek certified products meeting the above minimum requirements.

3. PERIMETER JOINT PROTECTION: Do not exceed an 8” nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material: Use a minimum 4” thick, 4 pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using minimum 1/4” compression per piece of packing material. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self leveling silicone sealant is used, recess the top surface of the packing material 1/4” from the top surface of the concrete floor assembly (Item 1). Use only Intertek certified products meeting the above minimum requirements.

I. When 50% compression is required cut the width of the packing material 2 times wider than the nominal joint width.

II. When 33% compression is required cut the width of the packing material 1.5 times wider than the nominal joint width.

III. When 20% compression is required cut the width of the packing material 1.25 times wider than the nominal joint width.

B. CERTIFIED COMPANY: 3M Company

CERTIFIED PRODUCT: FireDam™ or Fire Barrier™

MODEL: FD Spray 200 (Elastomeric, Sprayable) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling) Sealant.

Fill, Void or Cavity Material: Apply either spray coating or sealant over the packing material (Item 3A) as follows:

Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a minimum wet film thickness of 1/8” and overlap the spray coating a minimum 1/2” onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8” with the liquid spray coating.

Sealant – Apply non-sag or self leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply minimum 1/4” thickness non-sag or self leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

C. Support Clips: (Optional) Recommended for installations subject to vertical shear movement. Use standard 20 GA galvanized steel Z-shaped clips having the following nominal dimensions: 1” wide by 3” high with a 2” upper leg and a 3” lower leg.

D. Reinforcing Angle: (Not Shown) Locate reinforcing angle at all horizontal butt joints of the curtain wall insulation (Item 2E) in the field of the glass spandrel panels (Item 2C) and horizontal centerline of the perimeter joint protection (Item 3). Place two minimum 20 GA steel angles having 1.5” x 1.5” legs back to back to form a “T”.

This material was extracted and drawn by 3M Fire Protection Products from the 2012 Product Directory, © Intertek
1. CONCRETE FLOOR ASSEMBLY: Two-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf, having a minimum thickness of 4-1/2" at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a minimum thickness of 4-1/2" and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. CURTAIN WALL ASSEMBLY: Incorporate the following construction features:
   A. Mounting Attachment: (Not shown) Attach aluminum framing (Item 2B) to the structural framing according to the curtain wall manufacturer’s instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments to maximum 120".
   B. Aluminum Framing: Use rectangular aluminum tubing mullions and transoms, sized according to the curtain wall system manufacturer’s guidelines. Minimum required framing dimensions, use 0.100" thick walls with minimum 6-1/2" depth and minimum 2-1/2" width. Space mullions minimum 56-1/2" on center and space transoms minimum 69" on center. Locate transoms at a height of 33" above the top surface of the concrete floor assembly (Item 1) as measured from the bottom of the transom.
   C. Aluminum Panels: Install aluminum panels into curtain wall framing according to the curtain wall system manufacturer’s guidelines. Use a minimum 1/8" thick sheet aluminum panel with maximum dimensions of 60" wide x 72" high.
   D. Impaling Pins: When used with curtain wall insulation (Item 2E), locate, size and install impaling pins according to the curtain wall system manufacturer’s guidelines, or be a minimum 4-1/2" long, 12 GA pin attached to one of the following: a nominal 2" by 2" plate; a nominal 2" by 2" by 2/" long angle; or can be directly attached to the aluminum framing (Item 2B) using a stud gun. Space impaling pins a maximum of 12" on center. Install impaling pins around the periphery of the curtain wall insulation (Item 2E) so that its interior face is flush with the interior face of the aluminum framing (Item 2B).
E. Curtain Wall Insulation: Use nominal 24” wide, 4” thick, 4-pcf density, 3” thick, 6-pcf density, or 2” thick, 8-pcf density, mineral wool batt insulation. Install curtain wall insulation by fitting in each cavity between aluminum framing (Item 2B) using clips, impaling pins (Item 2D), or friction fit by using a curtain wall insulation lengths at least 1’/4” longer than the distance between aluminum framing (Item 2B). Maintain 1-1/4” air cavity between curtain wall insulation and aluminum panels (Item 2C). Tightly compress together butt joints in the length of curtain wall insulation by using minimum 1/4” compression per piece of curtain wall insulation material. Tape all adjacent edges between curtain wall insulation, or between aluminum framing (Item 2B) and curtain wall insulation, with min. 4” wide pressure sensitive aluminum foil tape, centered over the seam. Locate horizontal seams in the curtain wall insulation at least 6” above or below the top surface of the perimeter joint protection (Item 3). Use only Intertek certified products meeting the above minimum requirements.

F. Framing Covers: Make from strips of 1”, 8 pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior. Cut strips a minimum 1-1/2” wider than aluminum framing (Item 2B). Use only Intertek certified products meeting the above minimum requirements. Center framing covers over all aluminum framing (Item 2B) and secure using impaling pins (Item 2I). Do not pass framing covers through the perimeter joint protection (Item 3). Allow framing covers to abut the top and the bottom surfaces of the perimeter joint protection (Item 3) provided that no deformation occurs. Use only Intertek certified products meeting the above minimum requirements.

G. Glass Vision Panels: (Optional) When used, locate glass vision panels above spandrel area and a minimum 33” above the top surface of the concrete floor assembly (Item 1). Install glass vision panels to window framing (Item 2I) according to manufacturer’s guidelines. Use a minimum 1/4” thick, clear tempered glass with maximum width and height width and height as determined by the window framing (Item 2I).

H. Window Gaskets: When glass vision panels (Item 2G) used, use a thermal break (thermo-set rubber extrusion) to secure glass vision panels (Item 2G).

I. Window Framing: When glass vision panels are used, use aluminum framing members shall be a minimum 0.100” thick walls and a minimum 6-1/2” by 2-1/2” or similar construction compatible with structural framing (Item 2B). Locate window framing at least 33” above the top surface of the concrete floor assembly (Item 1).

3. PERIMETER JOINT PROTECTION: Do not exceed an 8” nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material: Use a minimum 4” thick, 4 pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using minimum 1/4” compression per piece of packing material. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self leveling silicone sealant is used, recess the top surface of the packing material 1/4” from the top surface of the concrete floor assembly (Item 1). Use only Intertek certified products meeting the above minimum requirements.

I. When 50% compression is required cut the width of the packing material 2 times wider than the nominal joint width.

II. When 33% compression is required cut the width of the packing material 1.5 times wider than the nominal joint width.

III. When 20% compression is required cut the width of the packing material 1.25 times wider than the nominal joint width.

B. CERTIFIED COMPANY: 3M Company

CERTIFIED PRODUCT: FireDam™ or Fire Barrier™

MODEL: FD Spray 200 (Elastomeric, Sprayable) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling) Sealant.

Fill, Void or Cavity Material: Apply either spray coating or sealant over the packing material (Item 3A) as follows:

Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a minimum wet film thickness of 1/8” and overlap the spray coating a minimum 1/2” onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8” with the liquid spray coating.

Sealant – Apply non-sag or self leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply minimum 1/4” thickness non-sag or self leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

C. Support Clips: (Optional) Recommended for installations subject to vertical shear movement. Use standard 20 GA galvanized steel Z-shaped clips having the following nominal dimensions: 1” wide by 3” high with a 2” upper leg and a 3” lower leg.

Rated for ± 16.7% horizontal movement @ 50% Compression (Reference Item 3A): T-Rating 1/4 hr
Rated for ± 11% horizontal movement @ 33% Compression (Reference Item 3A): T-Rating 0 hr
Rated for ± 5% horizontal movement @ 20% Compression (Reference Item 3A): T-Rating 0 hr
Rated for ± 6.25% vertical shear movement @ 50% Compression (Reference Item 3A)
UL 2079
L-Rating <1.0 SCFM/LF

1. CONCRETE FLOOR ASSEMBLY: Two-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf, having a minimum thickness of 4-1/2” at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a minimum thickness of 4-1/2” and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. CURTAIN WALL ASSEMBLY: Incorporate the following construction features:
   A. Mounting Attachment: (Not shown) Attach aluminum framing (Item 2B) to the structural framing according to the curtain wall manufacturer’s instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments to maximum 120”.
   B. Aluminum Framing: Use rectangular aluminum tubing mullions and transoms, sized according to the curtain wall system manufacturer’s guidelines. Minimum required framing dimensions, use 0.100” thick walls with minimum 6-1/2” depth and minimum 2-1/8” width. Space mullions minimum 56-1/2” oc and space transoms minimum 69” oc. Locate transoms at a height of 33” above the top surface of the concrete floor assembly (Item 1) as measured from the bottom of the transom.
   C. Steel Panels: Install steel panels to curtain wall framing according to the curtain wall system manufacturer’s guidelines. Use a minimum 20 GA sheet steel panel with maximum dimensions of 60” wide x 72” high.
   D. Impaling Pins: When used with curtain wall insulation (Item 2E), locate, size and install impaling pins according to the curtain wall system manufacturer’s guidelines, or be a minimum 4-1/2” long, 12 GA pin attached to one of the following: a nominal 2” by 2” plate; a nominal 2” by 2” by 2” long angle; or can be directly attached to the aluminum framing (Item 2B) using a stud gun. Space impaling pins a maximum of 12” oc. Install impaling pins around the periphery of the curtain wall insulation (Item 2E) so that its interior face is flush with the interior face of the aluminum framing (Item 2B).
**Design No. 3MU/JS 120-11 continued**

E. Curtain Wall Insulation: Use nominal 24" wide, 4" thick, 4-pcf density, 3" thick, 6-pcf density, or 2" thick, 8-pcf density, mineral wool batt insulation. Install curtain wall insulation by fitting in each cavity between aluminum framing (Item 2B) using clips, impaling pins (Item 2D), or friction fit by using a curtain wall insulation lengths at least 1/4" longer than the distance between aluminum framing (Item 2B). Maintain 1-1/4" air cavity between curtain wall insulation and steel panels (Item 2C). Tightly compress together butt joints in the lengths of curtain wall insulation by using minimum 1/4" compression per piece of curtain wall insulation material. Tape all adjacent edges between curtain wall insulation, or between aluminum framing (Item 2B) and curtain wall insulation, with min. 4" wide pressure sensitive aluminum foil tape, centered over the seam. Locate horizontal seams in the curtain wall insulation at least 6" above or below the top surface of the perimeter joint protection (Item 3). Use only Intertek certified products meeting the above minimum requirements.

F. Framing Covers: Make from strips of 1", 8 pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior. Cut strips a minimum 1-1/2" wider than aluminum framing (Item 2B). Center framing covers over all aluminum framing (Item 2B) and secure using impaling pins (Item 2I). Do not pass framing covers through the perimeter joint protection (Item 3). Allow framing covers to abut the top and the bottom surfaces of the perimeter joint protection (Item 3) provided that no deformation occurs. Use only Intertek certified products meeting the above minimum requirements.

G. Glass Vision Panels: (Optional) When used, locate glass vision panels above spandrel area and a minimum 33" above the top surface of the concrete floor assembly (Item 1). Install glass vision panels to window framing (Item 2I) according to manufacturer’s guidelines. Use a minimum 1/4" thick, clear tempered glass with maximum width and height and height as determined by the window framing (Item 2I).

H. Window Gaskets: When glass vision panels (Item 2G) used, use a thermal break (thermal-set rubber extrusion) to secure glass vision panels (Item 2G).

I. Window Framing: When glass vision panels are used, use aluminum framing members shall be a minimum 0.100" thick walls and a minimum 6-1/2" by 2-1/2" or similar construction compatible with structural framing (Item 2B). Locate window framing at least 33" above the top surface of the concrete floor assembly (Item 1).

3. PERIMETER JOINT PROTECTION: Do not exceed an 8" nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

   A. Packing Material: Use a minimum 4" thick, 4-pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using minimum 1/4" compression per piece of packing material. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self leveling silicone sealant is used, recess the top surface of the packing material 1/4" from the top surface of the concrete floor assembly (Item 1). Use only Intertek certified products meeting the above minimum requirements.

   B. CERTIFIED COMPANY: 3M Company

   C. CERTIFIED PRODUCT: FireDam™ or Fire Barrier™

   MODEL: FD Spray 200 (Elastomeric, Sprayable) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling)

   Fill, Void or Cavity Material: Apply either spray coating or sealant over the packing material (Item 3A) as follows:

   Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a minimum wet film thickness of 1/8" and overlap the spray coating a minimum 1/2" onto the adjacent curtain wall assembly (Item 2C) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8" with the liquid spray coating.

   Sealant – Apply non-sag or self leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply minimum 1/4" thickness non-sag or self leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

   C. Support Clips: (Optional) Recommended for installations subject to vertical shear movement. Use standard 20 GA galvanized steel Z-shaped clips having the following nominal dimensions: 1" wide by 3" high with a 2" upper leg and a 3" lower leg.

1. CONCRETE FLOOR ASSEMBLY: Two-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf, having a minimum thickness of 4-1/2" at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a minimum thickness of 4-1/2" and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. CURTAIN WALL ASSEMBLY: Incorporate the following construction features:
   A. Mounting Attachment: (Not shown) Attach aluminum framing (Item 2B) to the structural framing according to the curtain wall manufacturer’s instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments to maximum 120".
   B. Aluminum Framing: Use rectangular aluminum tubing mullions and transoms, sized according to the curtain wall system manufacturer’s guidelines. Minimum required framing dimensions, use 0.100" thick walls with minimum 6-1/2" depth and minimum 2-1/2" width. Space mullions minimum 56-1/2" oc and space transoms minimum 69" oc. Locate transoms at a height of 33” above the top surface of the concrete floor assembly (Item 1) as measured from the bottom of the transom.
   C. Concrete Panels: Use any non-combustible exterior concrete based panels. Use minimum 1-1/2" thick, 12" high, 12" long panels. Attach concrete panels to aluminum framing (Item 2B) according to the curtain wall system manufacturer’s requirements.
   D. Impaling Pins: When used with curtain wall insulation (Item 2E), locate, size and install impaling pins according to the curtain wall system manufacturer’s guidelines, or be a minimum 4-1/2" long, 12 GA pin attached to one of the following: a nominal 2" by 2" plate; a nominal 2" by 2" by 2" long angle; or can be directly attached to the aluminum framing (Item 2B) using a stud gun. Space impaling pins a maximum of 12" oc. Install impaling pins around the periphery of the curtain wall insulation (Item 2E) so that its interior face is flush with the interior face of the aluminum framing (Item 2B).
Design No. 3MU/JS 120-12 continued

E. Curtain Wall Insulation: Use nominal 24” wide, 4” thick, 4-pcf density, 3” thick, 6-pcf density, or 2” thick, 8-pcf density, mineral wool batt insulation. Install curtain wall insulation by fitting in each stud cavity between aluminum framing (Item 2B) using clips, impaling pins (Item 2D), or friction fit by using a curtain wall insulation lengths at least 1/4” longer than the distance between aluminum framing (Item 2B). Maintain 1-1/4” air cavity between curtain wall insulation and concrete panels (Item 2C). Tightly compress together butt joints in the lengths of curtain wall insulation by using minimum 1/4” compression per piece of curtain wall insulation material. Tape all adjacent edges between curtain wall insulation, or between aluminum framing (Item 2B) and curtain wall insulation, with min. 4” wide pressure sensitive aluminum foil tape, centered over the seam. Locate horizontal seams in the curtain wall insulation at least 6” above or below the top surface of the perimeter joint protection (Item 3). Use only Intertek certified products meeting the above minimum requirements.

F. Concrete Panel Joint: No through joints allowed. When required, the surface of the concrete panel joints can be sealed with gaskets or sealants. Use one of the following for vertical and horizontal concrete panel joints:
   I. flush type (butt joint) (Item 2F1),
   II. key way type (tongue and groove) (Item 2F2), or
   III. recessed (Item 2F3).

G. Framing Covers: Make from strips of 1”, 8 pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior. Cut strips a minimum 1-1/2” wider than aluminum framing (Item 2B). Center framing covers over all aluminum framing (Item 2B) and secure using impaling pins (Item 2I). Do not pass framing covers through the perimeter joint protection (Item 3). Allow framing covers to abut the top and the bottom surfaces of the perimeter joint protection (Item 3) provided that no deformation occurs. Use only Intertek certified products meeting the above minimum requirements.

H. Glass Vision Panels: When required, use optional glass vision panels a minimum 33” above the top surface of the floor assembly (Item 1). Install glass vision panels to curtain wall framing according to the curtain wall system manufacturer’s guidelines. Use a minimum 1/4” thick, clear tempered glass with a nominal width and height as determined by the framing.

I. Window Gaskets: When optional glass vision panels used, secure glass vision panels with a thermal break (thermal-set rubber extrusion).

J. Window Framing: Use rectangular aluminum tubing mullions and transoms, sized according to the curtain wall system manufacturer’s guidelines. Minimum required framing dimensions, use 0.100” thick walls with minimum 6-1/2” depth and minimum 2-1/2” width and window framing must be compatible with aluminum framing (2B). Locate window framing at least 33” above the top surface of the floor assembly.

3. PERIMETER JOINT PROTECTION: Do not exceed an 8” nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):
   A. Packing Material: Use a minimum 4” thick, 4 pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using minimum 1/4” compression per piece of packing material. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self leveling silicone sealant is used, recess the top surface of the packing material 1/4” from the corner of the concrete floor assembly (Item 1). Use only Intertek certified products meeting the above minimum requirements.
      I. When 50% compression is required cut the width of the packing material 2 times wider than the nominal joint width.
      II. When 75% compression is required cut the width of the packing material 1.5 times wider than the nominal joint width.
      III. When 100% compression is required cut the width of the packing material 1.25 times wider than the nominal joint width.

B. CERTIFIED COMPANY: 3M Company

   CERTIFIED PRODUCT: FireDam™ or Fire Barrier™

   MODEL: FD Spray 200 (Elastomeric, Sprayable) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling) Sealant

   Fill, Void or Cavity Material: Apply either spray coating or sealant over the packing material (Item 3A) as follows:

   Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a minimum wet film thickness of 1/8” and overlap the spray coating a minimum 1/2” onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8” with the liquid spray coating.

   Sealant – Apply non-sag or self leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply minimum 1/4” thickness non-sag or self leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

C. Support Clips: (Optional) Recommended for installations subject to vertical shear movement. Use standard 20 GA galvanized steel Z-shaped clips having the following nominal dimensions: 1” wide by 3” high with a 2” upper leg and a 3” lower leg.

1. CONCRETE FLOOR ASSEMBLY: Two-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf, having a minimum thickness of 4-1/2" at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a minimum thickness of 4-1/2" and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. CURTAIN WALL ASSEMBLY: Incorporate the following construction features into the concrete tilt-up curtain wall assembly:
   A. Panel Mounting Attachment: (Not shown) Install steel attachments to the tilt-up panels (Item 2C) and structural framing (Item 2B) according to the curtain wall manufacturer’s instructions. When required, connect the steel mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between steel mounting attachments to maximum 120".
   B. Structural Framing: (Not Shown) Install structural framing members according to the curtain wall system manufacturer’s requirements. Install horizontal structural framing members according to the curtain wall system manufacturer’s guidelines and, in the spandrel area, locate a minimum of 33" above the top surface of the concrete floor assembly (Item 1). When required, the panel mounting attachments (Item 2A) to the concrete floor assembly (Item 1) shall be connected to the joint face of the floor slab, according to the curtain wall manufacturer’s instructions. When aluminum is used, completely conceal aluminum structural framing with tilt-up panels (Item 2C).
   C. Tilt-up Panels: Use minimum 1-1/2" thick, reinforced lightweight or normal weight concrete (100 to 150 pcf density). Attach tilt-up panels to structural framing (Item 2B) according to the curtain wall system manufacturer’s requirements.
Design No. 3MU/JS 120-13 continued

D. Impaling Pins: When used with curtain wall insulation (Item 2E), locate, size and install impaling pins according to the curtain wall system manufacturer’s guidelines, or be a minimum 4-1/2” long, 12 GA pin attached to one of the following: a nominal 2” by 2” plate; a nominal 2” by 2” by 2” long angle; or can be directly attached to the steel stud framing (Item 2B) using a stud gun. Space impaling pins a maximum of 12” oc. Install impaling pins around the periphery of the curtain wall insulation (Item 2E) so that its interior face is flush with the interior face of the steel stud framing (Item 2B).

E. Curtain Wall Insulation: Use nominal 24” wide, 4” thick, 4-pcf density, 3” thick, 6-pcf density, or 2” thick, 8-pcf density, mineral wool batt insulation. Install curtain wall insulation by fitting in each stud cavity between steel stud framing (Item 2B) using clips, impaling pins (Item 2D), or friction fit by using a curtain wall insulation lengths at least 1/4” longer than the distance between steel stud framing (Item 2B). Maintain 1-1/4” air cavity between curtain wall insulation and tilt-up panels (Item 2C). Completely fill the recess of the “C-shaped” steel stud framing (Item 2B) with curtain wall insulation. Tightly compress together butt joints in the lengths of curtain wall insulation by using minimum 1/4” compression per piece of curtain wall insulation material. Tape all adjacent edges between curtain wall insulation, or between steel stud framing (Item 2B) and curtain wall insulation, with min. 4” wide pressure sensitive aluminum foil tape, centered over the seam. Locate horizontal seams in the curtain wall insulation at least 6” above or below the top surface of the perimeter joint protection (Item 3). Use only Intertek certified products meeting the above minimum requirements.

F. Concrete Panel Joint: No through joints allowed. When required, the surface of the concrete panel joints can be sealed with gaskets or sealants. Use one of the following for vertical and horizontal concrete panel joints:
   I. flush type (butt joint) (Item 2F1),
   II. key way type (tongue and groove) (Item 2F2), or
   III. recessed (Item 2F3).

G. Framing Covers: Make from strips of 1”, 8 pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior. Cut strips a minimum 1-1/2” wider than steel stud framing (Item 2B). Center framing covers over all steel stud framing (Item 2B) and secure using impaling pins (Item 2D). Do not pass framing covers through the perimeter joint protection (Item 3). Allow framing covers to abut the top and the bottom surfaces of the perimeter joint protection (Item 3) provided that no deformation occurs. Use only Intertek certified products meeting the above minimum requirements.

H. Glass Vision Panels: When required, use optional glass vision panels a minimum 33” above the top surface of the floor assembly (Item 1). Install glass vision panels to curtain wall framing according to the curtain wall system manufacturer’s guidelines. Use a minimum 1/4” thick, clear tempered glass with a nominal width and height as determined by the framing.

I. Window Gaskets: When optional glass vision panels used, secure glass vision panels with a thermal break (thermal-set rubber extrusion).

J. Window Framing: When glass vision panels used, use steel framing members a minimum 3-5/8” by 1-5/8”, 18 GA steel, U-shaped channel or similar construction compatible with structural framing (Item 2B). Locate window framing at least 33” above the top surface of the concrete floor assembly (Item 1).

3. PERIMETER JOINT PROTECTION: Do not exceed an 8” nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material: Use a minimum 4” thick, 4 pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using minimum 1/4” compression per piece of packing material. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self leveling silicone sealant is used, recess the top surface of the packing material 1/4” from the top surface of the concrete floor assembly (Item 1). Use only Intertek certified products meeting the above minimum requirements.

   I. When 50% compression is required cut the width of the packing material 2 times wider than the nominal joint width.
   II. When 33% compression is required cut the width of the packing material 1.5 times wider than the nominal joint width.
   III. When 20% compression is required cut the width of the packing material 1.25 times wider than the nominal joint width.

B. CERTIFIED COMPANY: 3M Company

CERTIFIED PRODUCT: FireDam™ or Fire Barrier™

MODEL: FD Spray 200 (Elastomeric, Sprayable) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling)

Fill, Void or Cavity Material: Apply either spray coating or sealant over the packing material (Item 3A) as follows:

   Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a minimum wet film thickness of 1/8” and overlap the spray coating a minimum 1/2” onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8” with the liquid spray coating.

   Sealant – Apply non-sag or self leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply minimum 1/4” thickness non-sag or self leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

C. Support Clips: (Optional) Recommended for installations subject to vertical shear movement. Use standard 20 GA galvanized steel Z-shaped clips having the following nominal dimensions: 1” wide by 3” high with a 2” upper leg and a 3” lower leg.

1. CONCRETE FLOOR ASSEMBLY: Two-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf, having a minimum thickness of 4-1/2” at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a minimum thickness of 4-1/2” and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. CURTAIN WALL ASSEMBLY: Incorporate the following construction features:
   A. Mounting Attachment: (Not shown) Attach steel stud framing (Item 2B) to the structural framing according to the curtain wall manufacturer’s instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments to maximum 120”.
   B. Steel Stud Framing: Use minimum 3-5/8” by 1-5/8”, 18 GA, C-shaped steel studs as vertical framing. Attach according to the curtain wall system manufacturer’s guidelines. Limit distance between vertical steel stud framing to maximum 48”. Limit distance between horizontal steel stud framing to maximum 72”. When required, install horizontal structural framing members according to the curtain wall system manufacturer’s guidelines and, in the spandrel area, locate a minimum of 33” above the top surface of the concrete floor assembly (Item 1).
   C. Steel Panels: Install steel panels to curtain wall framing according to the curtain wall system manufacturer’s guidelines. Use a minimum 20 GA sheet steel panel with maximum dimensions of 48” wide x 144” high.
   D. Impaling Pins: When used with curtain wall insulation (Item 2E), locate, size and install impaling pins according to the curtain wall system manufacturer’s guidelines, or be a minimum 4-1/2” long, 12 GA pin attached to one of the following: a nominal 2” by 2” plate; a nominal 2” by 2” by 2” long angle; or can be directly attached to the steel stud framing (Item 2B) using a stud gun. Space impaling pins a maximum of 12” o.c. Install impaling pins around the periphery of the curtain wall insulation (Item 2E) so that its interior face is flush with the interior face of the steel stud framing (Item 2B).
E. Curtain Wall Insulation (Optional): Use nominal 24” wide, 4” thick, 4-pcf density, 3” thick, 6-pcf density, or 2” thick, 8-pcf density, mineral wool batt insulation. Install curtain wall insulation by fitting in each stud cavity between steel stud framing (Item 2B) using clips, impaling pins (Item 2D), or friction fit by using a curtain wall insulation lengths at least 1/4” longer than the distance between steel stud framing (Item 2B). Completely fill the recess of the “C-shaped” steel stud framing (Item 2B) with curtain wall insulation. Tightly compress together butt joints in the lengths of curtain wall insulation by using minimum 1/4” compression per piece of curtain wall insulation material. Tape all adjacent edges between curtain wall insulation, or between steel stud framing (Item 2B) and curtain wall insulation, with min. 4” wide pressure sensitive aluminum foil tape, centered over the seam. Locate horizontal seams in the curtain wall insulation at least 6” above or below the top surface of the perimeter joint protection (Item 3). Use only Intertek certified products meeting the above minimum requirements.

F. Interior Curtain Wall Surface: Continuously cover interior face of steel stud framing (Item 2B) with one layer of 5/8” thick, Type X gypsum board. Fasten gypsum board to steel stud framing (Item 2B) using minimum #6 1-1/8” long bugle-head phillips drywall screws spaced nominally 12” oc. Joint Tape and Compound – Apply vinyl or casein, dry or premixed joint compound to exposed face of gypsum board in two coats to all exposed screw heads and gypsum board joints. Embed minimum 2” wide paper, plastic, or fiberglass tape in first layer of premixed joint compound over joints in gypsum board. Create wall cavity between unexposed face of gypsum board to unexposed face of steel panel (Item 2C).

G. Glass Vision Panels: When required, use optional glass vision panels a minimum 33” above the top surface of the floor assembly (Item 1). Install glass vision panels to curtain wall framing according to the curtain wall system manufacturer’s guidelines. Use a minimum 1/4” thick, clear tempered glass with a nominal width and height as determined by the framing.

H. Window Gaskets: (Not shown) When optional glass vision panels used, secure glass vision panels with a thermal break (thermal-set rubber extrusion).

I. Window Framing: When glass vision panels used, use steel framing members a minimum 3-5/8” by 1-5/8”, 18 GA steel, U-shaped channel or similar construction compatible with structural framing (Item 2B). Locate window framing at least 33” above the top surface of the concrete floor assembly (Item 1).

3. PERIMETER JOINT PROTECTION: Do not exceed an 8” nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material: Install reinforcing angle (Item 3C). Use a minimum 4” thick, 4-pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using minimum 1/4” compression per piece of packing material. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self leveling silicone sealant is used, recess the top surface of the packing material 1/4” from the top surface of the concrete floor assembly (Item 1). Use only Intertek certified products meeting the above minimum requirements.

I. When 50% compression is required cut the width of the packing material 2 times wider than the nominal joint width.
II. When 33% compression is required cut the width of the packing material 1.5 times wider than the nominal joint width.
III. When 20% compression is required cut the width of the packing material 1.25 times wider than the nominal joint width.

B. CERTIFIED COMPANY: 3M Company

CERTIFIED PRODUCT: FireDam™ or Fire Barrier™

MODEL: FD Spray 200 (Elastomeric, Sprayable) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling)

Fill, Void or Cavity Material: Apply either spray coating or sealant over the packing material (Item 3A) as follows:

Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a minimum wet film thickness of 1/8” and overlap the spray coating a minimum 1/2” onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8” with the liquid spray coating.

Sealant – Apply non-sag or self leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply minimum 1/4” thickness non-sag or self leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

C. Reinforcing Angle: Position reinforcing angle against interior curtain wall surface (Item 21) and mechanically attach with minimum #8, 1-1/2” long screws at each vertical steel stud framing (Item 2B), install a nominal 1-1/2 by 1-1/2”, 20 gauge, steel angle at mid depth of the packing material (Item 3A) and running perpendicular to the vertical steel stud framing (Item 2B).

FireDam™ Spray 200, Fire Barrier 1000 NS Silicone Sealant and
Fire Barrier 1003 SL Silicone Sealant

ASTM E 2307
T-Rating 0 hr
F-Rating 2 hr

ASTM E 2307/ASTM E 1399 Cycling
Class IV: 500 cycles @ 30 cpm
Rated for ± 16.7% horizontal movement @ 25% Compression (Reference Item 3A)

UL 2079
L-Rating <1.0 SCFM/LF

1. CONCRETE FLOOR ASSEMBLY: Two-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf, having a minimum thickness of 4-1/2" at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a minimum thickness of 4-1/2" and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. CURTAIN WALL ASSEMBLY: Incorporate the following construction features into the curtain wall assembly:
   A. Panel Mounting Attachment: (Not shown) Install steel attachments to the tilt-up panels (Item 2C) and steel stud framing (Item 2B) according to the curtain wall manufacturer’s instructions. When required, connect the steel mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between steel mounting attachments to maximum 120".
   B. Steel Stud Framing: Use minimum 3-5/8" by 1-5/8", 18 GA, C-shaped steel studs as vertical framing. Attach according to the curtain wall system manufacturer’s guidelines. Limit distance between vertical steel stud framing to maximum 48". Limit distance between horizontal steel stud framing to maximum 72". When required, install horizontal structural framing members according to the curtain wall system manufacturer’s guidelines and, in the spandrel area, locate a minimum of 33" above the top surface of the concrete floor assembly (Item 1).
   C. Aluminum Panels: Install minimum 1/8" thick aluminum panels with maximum dimensions of 48" by 144" to steel stud framing (Item 2B) according to the curtain wall system manufacturer’s guidelines.
   D. Impaling Pins: When used with curtain wall insulation (Item 2E), locate, size and install impaling pins according to the curtain wall system manufacturer’s guidelines, or be a minimum 4-1/2" long, 12 GA pin attached to one of the following: a nominal 2" by 2" plate; a nominal 2" by 2" by 2" long angle; or can be directly attached to the steel stud framing (Item 2B) using a stud gun. Space impaling pins a maximum of 12" oc. Install impaling pins around the periphery of the curtain wall insulation (Item 2E) so that its interior face is flush with the interior face of the steel stud framing (Item 2B).
**Design No. 3MU/JS 120-15 continued**

E. Curtain Wall Insulation: Use nominal 24" wide, 4" thick, 4-pcf density, 3" thick, 6-pcf density, or 2" thick, 8-pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior and installed in the stud cavity. Install curtain wall insulation by fitting in each stud cavity between steel stud framing (Item 2B) using clips, impaling pins (Item 2D), or friction fit by using a curtain wall insulation lengths at least 1/4" longer than the distance between steel stud framing (Item 2B). Maintain 1-1/4" air cavity between curtain wall insulation and aluminum panels (Item 2C). Completely fill the recess of the “C-shaped” steel stud framing (Item 2B) with curtain wall insulation. Tightly compress together butt joints in the lengths of curtain wall insulation by using minimum 1/4" compression per piece of curtain wall insulation material. Tape all adjacent edges between curtain wall insulation, or between steel stud framing (Item 2B) and curtain wall insulation, with min. 4" wide pressure sensitive aluminum foil tape, centered over the seam. Locate horizontal seams in the curtain wall insulation at least 6" above or below the top surface of the perimeter joint protection (Item 3). Use only Intertek certified products meeting the above minimum requirements.

F. Framing Covers: Make from strips of 1", 8 pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior. Cut strips a minimum 1-1/2" wider than steel stud framing (Item 2B). Use only Intertek certified products meeting the above minimum requirements. Center framing covers over all steel stud framing (Item 2B) and secure using impaling pins (Item 2I). Do not pass framing covers through the perimeter joint protection (Item 3). Allow framing covers to abut the top and the bottom surfaces of the perimeter joint protection (Item 3) provided that no deformation occurs. Use only Intertek certified products meeting the above minimum requirements.

G. Glass Vision Panels: When required, use optional glass vision panels a minimum 33" above the top surface of the floor assembly (Item 1). Install glass vision panels to curtain wall framing according to the curtain wall system manufacturer’s guidelines. Use a minimum 1/4" thick, clear tempered glass with a nominal width and height as determined by the framing.

H. Window Gaskets: When optional glass vision panels used, secure glass vision panels with a thermal break (thermo-set rubber extrusion).

I. Window Framing: When glass vision panels used, use steel framing members a minimum 3-5/8" by 1-5/8", 18 GA steel, U-shaped channel or similar construction compatible with structural framing (Item 2B). Locate window framing at least 33" above the top surface of the floor assembly.

3. PERIMETER JOINT PROTECTION: Do not exceed an 8" nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material: Install reinforcing angle (Item 3C). Use a minimum 4" thick, 4 pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using minimum 1/4" compression per piece of packing material. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self-leveling silicone sealant is used, recess the top surface of the packing material 1/4" from the top surface of the concrete floor assembly (Item 1). Use only Intertek certified products meeting the above minimum requirements.

I. When 25% compression is required cut the width of the packing material 1.34 times wider than the nominal joint width.

B. CERTIFIED COMPANY: 3M Company

CERTIFIED PRODUCT: FireDam™ or Fire Barrier™

MODEL: FD Spray 200 (Elastomeric, Sprayable) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling) Sealant

Fill, Void or Cavity Material: Apply either spray coating or sealant over the packing material (Item 3A) as follows:

Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a minimum wet film thickness of 1/8" and overlap the spray coating a minimum 1/2" onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8" with the liquid spray coating.

Sealant – Apply non-sag or self-leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply minimum 1/4" thickness non-sag or self-leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

C. Reinforcing Angle: Mount a minimum 1-1/2 x 1-1/2", 20 gauge, galvanized-steel angle to the steel stud framing (Item 2B) (vertical framing members) so that the vertical leg serves as a backer to the exterior face of the curtain wall insulation (Item 2E) and the horizontal leg extends away from the curtain wall insulation and is located at the centerline of the packing material (Item 3A). Size the angle 12" longer than the span between the interior edges of the steel stud framing (Item 2B) and form the angle so that it has a 6" vertical leg on each end. Secure the 6" vertical leg on each end to the steel stud framing (Item 2B) on each side with three #10 steel self-tapping sheet metal screws placed in a triangular fashion with a maximum spacing of 2" oc.

L-Rating <1.0 SCFM/LF

1. CONCRETE FLOOR ASSEMBLY: Two-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf, having a minimum thickness of 4-1/2" at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a minimum thickness of 4-1/2" and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. CURTAIN WALL ASSEMBLY: Incorporate the following construction features into the curtain wall assembly:
   A. Panel Mounting Attachment: (Not shown) Install steel attachments to the structural framing (Item 2B) according to the curtain wall manufacturer’s instructions. When required, connect the steel mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between steel mounting attachments to maximum 120".
   B. Steel Stud Framing: Use minimum 3-5/8" by 1-5/8", 18 GA, C-shaped steel studs as vertical framing. Attach according to the curtain wall system manufacturer’s guidelines. Limit distance between vertical steel stud framing to maximum 48". Limit distance between horizontal steel stud framing to maximum 72". When required, install horizontal structural framing members according to the curtain wall system manufacturer’s guidelines and, in the spandrel area, locate a minimum of 33" above the top surface of the concrete floor assembly (Item 1).
   C. Glass Panels: Sized and installed into steel framing (Item 2B) according to the curtain wall system manufacturer’s guidelines. Use minimum 1/4" thick clear, heat strengthened (HS) glass or tempered glass with a maximum width and height less than the steel framing (Item 2B) oc spacing, which allows the glass to be secured between the notched shoulder of the steel framing (Item 2B) and pressure bar. Secure glass panels with a thermal break (rubber extrusion), pressure bar (aluminum extrusion), minimum 1/4-20 x 5/8" long screws, and a snap face (aluminum extrusion).
   D. Impaling Pins: When used with curtain wall insulation (Item 2E), locate, size and install impaling pins according to the curtain wall system manufacturer’s guidelines, or be a minimum 4-1/2" long, 12 GA pin attached to one of the following: a nominal 2" by 2" plate; a nominal 2" by 2" by 2" long angle; or can be directly attached to the steel stud framing (Item 2B) using a stud gun. Space impaling pins a maximum of 12" oc. Install impaling pins around the periphery of the curtain wall insulation (Item 2E) so that its interior face is flush with the interior face of the steel stud framing (Item 2B).
Design No. 3MU/JS 120-16 continued

E. Curtain Wall Insulation: Use nominal 24” wide, 4” thick, 4-pcf density, 3” thick, 6-pcf density, or 2” thick, 8-pcf density, mineral wool batt insulation. Install curtain wall insulation by fitting in each stud cavity between steel stud framing (Item 2B) using clips, impaling pins (Item 2D), or friction fit by using a curtain wall insulation lengths at least 1/4” longer than the distance between steel stud framing (Item 2B). Maintain 1-1/4” air cavity between curtain wall insulation and glass panels (Item 2C). Completely fill the recess of the “C-shaped” steel stud framing (Item 2B) with curtain wall insulation. Tightly compress together butt joints in the lengths of curtain wall insulation by using minimum 1/4” compression per piece of curtain wall insulation material. Tape all adjacent edges between curtain wall insulation, or between steel stud framing (Item 2B) and curtain wall insulation, with min. 4” wide pressure sensitive aluminum foil tape, centered over the seam. Locate horizontal seams in the curtain wall insulation at least 6” above or below the top surface of the perimeter joint protection (Item 3). Use only Intertek certified products meeting the above minimum requirements.

F. Interior Curtain Wall Surface: Continuously cover interior face of steel stud framing (Item 2B) with one layer of 5/8” thick, Type X gypsum board. Fasten gypsum board to steel stud framing (Item 2B) using minimum #6 1-1/8” long bugle-head phillips drywall screws spaced nominally 12” oc. Joint Tape and Compound – Apply vinyl or casein, dry or premixed joint compound to exposed face of gypsum board in two coats to all exposed screw heads and gypsum board joints. Embed minimum 2” wide paper, plastic, or fiberglass tape in first layer of premixed joint compound over joints in gypsum board. Create wall cavity between unexposed face of gypsum board to unexposed face of steel panel (Item 2C).

3. PERIMETER JOINT PROTECTION: Do not exceed an 8” nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material: Install reinforcing angle (Item 3C). Use a minimum 4” thick, 4-pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using minimum 1/4” compression per piece of packing material. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self leveling silicone sealant is used, recess the top surface of the packing material 1/4” from the top surface of the concrete floor assembly (Item 1). Use only Intertek certified products meeting the above minimum requirements.

I. When 25% compression is required cut the width of the packing material 1.34 times wider than the nominal joint width.

B. CERTIFIED COMPANY: 3M Company
CERTIFIED PRODUCT: FireDam™ or Fire Barrier™
MODEL: FD Spray 200 (Elastomeric, Sprayable) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling)
Fill, Void or Cavity Material: Apply either spray coating or sealant over the packing material (Item 3A) as follows:

Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a minimum wet film thickness of 1/8” and overlap the spray coating a minimum 1/2” onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8” with the liquid spray coating.

Sealant – Apply non-sag or self leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply minimum 1/4” thickness non-sag or self leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

C. Reinforcing Angle: Position reinforcing angle against interior curtain wall surface (Item 2F) and mechanically attach with minimum #8, 1-1/2” long screws at each vertical steel stud framing (Item 2B), install a nominal 1-1/2 by 1-1/2”, 20 gauge, steel angle at mid depth of the packing material (Item 3A) and running perpendicular to the vertical steel stud framing (Item 2B).

1. **CONCRETE FLOOR ASSEMBLY:** Two-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf, having a min thickness of 4-1/2 in. at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a min thickness of 4-1/2 in. and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. **CURTAIN WALL ASSEMBLY:** Incorporate the following construction features:
   A. Mounting Attachment: (Not shown) Attach aluminum framing (Item 2B) to the structural framing according to the curtain wall manufacturer’s instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments to max 60 in. on center (oc).
   B. Aluminum Framing: Use hollow rectangular aluminum extruded tubing with min overall dimensions of 0.100 in. thick, 4 in. high and 2-1/2 in. wide. Locate mullions (vertical aluminum framing) minimum 60 in. oc and locate transoms (horizontal aluminum framing) a min 48-1/2 in. oc. For the spandrel region, locate the upper transom (horizontal aluminum framing) a min 20 in. above the concrete floor assembly (Item 1) as measured from the top surface of the concrete floor assembly (Item 1) to the underside of the transom (horizontal aluminum framing).
   C. Glass Panels: Sized and installed into aluminum framing (Item 2B) according to the curtain wall system manufacturer’s guidelines. Use...
min 1/4 in. thick clear, heat strengthened (HS) glass or tempered glass with a max width and height less than the aluminum framing (Item 2B) oc spacing, which allows the glass to be secured between the notched shoulder of the aluminum framing (Item 2B) and pressure bar. Secure glass panels with a thermal break (rubber extrusion), pressure bar (aluminum extrusion), min 1/4-20 x 5/8 in. long screws, and a snap face (aluminum extrusion).

D. Aluminum Anchor Brackets: (not shown) Use min 9/16 in. thick aluminum anchor brackets to serve as part of the mounting attachment (2A) and are rigidly secured to the aluminum framing (2B) with 1/2 in. diameter, 2-1/4 in. long, Grade 5, anchor bolts.

E. Steel Retainer Angle – Place a min 22 GA, 1-1/2 in. x 1-1/2 in. angle horizontally 12 in. above and below the floor line in the spandrel area, and is secured to the aluminum framing (2B) with No. 10 sheet metal screws. Orient the angle so that the horizontal flange is below the vertical flange and situate the horizontal flange to fully embed into the curtain wall insulation of the steel back pan.

F. Steel Backpan: Install min 22 GA, galvanized steel backpan filled with curtain wall insulation (2I) adhered to the back pan with latex adhesive and steel face facing the interior face of the aluminum framing in the spandrel region. Secure the backpan to the aluminum framing (2B) with 1 in. long, hex-head, sheet steel screws.

G. Backpan Stiffener: Secure min 18 GA, galvanized, hat-shaped, stiffener placed horizontally and measuring 4 in. wide x 3 in. deep and having 1 in. flanges to the backpan with No.10, sheet steel screws. Position the lower flange of the stiffener within the plane of the packing material (3A), and space the screw holding the top flange of the stiffener to the backpan (2F) a min of 2-7/32 in. above the top surface of the concrete floor assembly (Item 1).

H. Steel Patches: Where required, horizontally place 6 in. wide, 22 GA, galvanized steel C-shaped patches measuring 6 in. wide and 1-1/2 in. deep, centered on the outside of the backpan stiffener (2G) and secure patches to the stiffener with No. 10, sheet steel screws.

I. Curtain Wall Insulation: Fill the cavity of the steel backpan (Item 2F) with nominal 3 in. thick, 8-pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which faces the room interior. Tightly fit, compress at least 1/4 in. in all directions, the mineral wool batt insulation within the backpan (Item 2F) and adhere to the backpan with latex adhesive. Use only Intertek certified products meeting the above min requirements.

3. PERIMETER JOINT PROTECTION: Do not exceed an 6 in. nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material: Use a min 4 in. thick, 4-pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using min 1/4 in. compression per piece of packing material. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8 in. with the liquid spray coating. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8 in. with the liquid spray coating.

Tape – Apply the tape such that there is a min 1 in. overlap onto the adjacent curtain wall assembly (Item 2) and the concrete floor assembly (Item 1). Overlap joints in the tape system by 1/2 in.

Sealant – Apply non-sag or self leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply min 1/4 in. thickness non-sag or self leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

C. Support Clips: (Optional) Recommended for installations subject to vertical shear movement. Use standard 20 GA galvanized steel Z-shaped clips having the following nominal dimensions: 1 in. wide by 3 in. high with a 2 in. upper leg and a 3 in. lower leg.

1. CONCRETE FLOOR ASSEMBLY: Two-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf, having a minimum thickness of 4-1/2" at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a minimum thickness of 4-1/2" and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. CURTAIN WALL ASSEMBLY: Incorporate the following construction features:
   A. Mounting Attachment: (Not shown) Attach aluminum framing (Item 2B) to the structural framing according to the curtain wall manufacturer’s instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments to maximum 60”.
   B. Aluminum Framing: Use hollow rectangular aluminum extruded tubing with minimum overall dimensions of 0.100” thick, 4” high and 2-1/2” wide. Locate mullions (vertical aluminum framing) minimum 60” oc and locate transoms (horizontal aluminum framing) a minimum 48-1/2” oc. For the spandrel region, locate the upper transom (horizontal aluminum framing) a minimum 20” above the concrete floor assembly (Item 1) as measured from the top surface of the concrete floor assembly (Item 1) to the underside of the transom (horizontal aluminum framing).
   C. Glass Panels: Sized and installed into aluminum framing (Item 2B) according to the curtain wall system manufacturer’s guidelines. Use minimum 1/4” thick clear, heat strengthened (HS) glass or tempered glass with a maximum width and height less than the aluminum framing (Item 2B) oc spacing, which allows the glass to be secured between the notched shoulder of the aluminum framing (Item 2B) and pressure bar. Secure glass panels with a thermal break (rubber extrusion), pressure bar (aluminum extrusion), minimum 1/4-20 x 5/8” long screws, and a snap face (aluminum extrusion).
   D. Aluminum Spandrel Panel: Use minimum 1/8” thick, aluminum spandrel panel, having a minimum height of 48-1/2” and a minimum width of 60” as determined by the Mullion and transom spacing. Span the aluminum spandrel panel across the spandrel area and mechanically secure it to the aluminum framing members (Item 2B), in accordance with the manufacturer’s instructions.
Design No. 3MU/JS 120-18 continued

E. Aluminum Anchor Brackets: (not shown) Use minimum 9/16” thick aluminum anchor brackets to serve as part of the mounting attachment (2A) and are rigidly secured to the aluminum framing (2B) with 1/2” diameter, 2-1/4” long, Grade 5, anchor bolts.

F. Steel Retainer Angle – Place a minimum 22 GA, 1-1/2 x 1-1/2” angle horizontally 12” above and below the floor line in the spandrel area, and is secured to the aluminum framing (2B) with No. 10 sheet metal screws. Orient the angle so that the horizontal flange is below the vertical flange and situate the horizontal flange to fully embed into the curtain wall insulation of the steel back pan.

G. Steel Backpan: Install minimum 22 GA, galvanized steel backpan filled with curtain wall insulation (2I) adhered to the back pan with latex adhesive and steel face facing the interior face of the aluminum framing in the spandrel region. Secure the backpan to the aluminum framing (2B) with 1” long, hex-head, sheet steel screws.

H. Backpan Stiffener: Secure minimum 18 GA, galvanized, hat-shaped, stiffener placed horizontally and measuring 4” wide x 3” deep and having 1” flanges to the backpan with No. 10, sheet steel screws. Position the lower flange of the stiffener within the plane of the packing material (3A), and space the screw holding the top flange of the stiffener to the backpan (2F) a minimum of 2-7/32” above the top surface of the concrete floor assembly (Item 1).

I. Steel Patches: Where required, horizontally place 6” wide, 22 GA, galvanized steel C-shaped patches measuring 6” wide and 1-1/2” deep, centered on the outside of the backpan stiffener (2G) and secure patches to the stiffener with No. 10, sheet steel screws.

J. Curtain Wall Insulation: Fill the cavity of the steel backpan (Item 2F) with nominal 3” thick, 8-pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which faces the room interior. Tightly fit, compress at least 1/4” in all directions, the mineral wool batt insulation within the backpan (Item 2F) and adhere to the backpan with latex adhesive. Use only Intertek certified products meeting the above minimum requirements.

3. PERIMETER JOINT PROTECTION: Do not exceed a 6” nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material: Use a minimum 4” thick, 4-pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using minimum 1/4” compression per piece of packing material. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self leveling silicone sealant is used, recess the top surface of the packing material 1/4” from the top surface of the concrete floor assembly (Item 1). Use only Intertek certified products meeting the above minimum requirements.

i. When 33% compression is required cut the width of the packing material 1.5 times wider than the nominal joint width.

B. CERTIFIED MANUFACTURER: 3M Company

CERTIFIED PRODUCT: FireDam™ or Fire Barrier™

MODEL: FD Spray 200 (Elastomeric, Sprayable) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling) Sealant Fill, Void or Cavity Material: Apply either spray coating or sealant over the packing material (Item 3A) as follows:

Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a minimum wet film thickness of 1/8” and overlap the spray coating a minimum 1/2” onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8” with the liquid spray coating.

Sealant – Apply non-sag or self leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply minimum 1/4” thickness non-sag or self leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

C. Support Clips: (Optional) Recommended for installations subject to vertical shear movement. Use standard 20 GA galvanized steel Z-shaped clips having the following nominal dimensions: 1” wide by 3” high with a 2” upper leg and a 3” lower leg.

UL 2079
L-Rating <1.0 SCFM/LF

1. CONCRETE FLOOR ASSEMBLY: Two-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf, having a minimum thickness of 4-1/2 in. at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a minimum thickness of 4-1/2 in. and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. CURTAIN WALL ASSEMBLY: Incorporate the following construction features:
   A. Mounting Attachment: (Not shown) Attach steel stud framing (Item 2B) to the structural framing according to the curtain wall manufacturer’s instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments to maximum 120 in.
   B. Steel Stud Framing: Use minimum 3-5/8 in. by 1-5/8 in., 18 GA, C-shaped steel studs as interior vertical framing. Attach according to the curtain wall system manufacturer’s guidelines. Limit distance between steel stud framing to maximum 60 in.. When required, install horizontal steel stud framing members according to the curtain wall system manufacturer’s guidelines and, in the spandrel area, locate a minimum of 33 in. above the top surface of the concrete floor assembly (Item 1).
   C. Concrete Panels: Use any non-combustible exterior concrete based panels. Use minimum 1-1/2 in. thick, 12 in. high, 12 in. long panels. Attach concrete panels to steel stud framing (Item 2B) according to the curtain wall system manufacturer’s requirements. Option – Treat the exterior side of the concrete panels with any weatherproofing material Listed as a Class 1 material in accordance with ASTM E-84. Use only Intertek certified products meeting these minimum requirements
   D. Concrete Panel Joint: Through joints not recommended. When required, the surface of the concrete panel joints can be sealed with gaskets or sealants. Use one of the following for vertical and horizontal concrete panel joints:
I. CERTIFIED MANUFACTURER: 3M Company
CERTIFIED PRODUCT: Fire Barrier™ Sealant
MODEL: CP25WB+
Flush type (butt joint) (Item 2F1), Prefer butted joints but allow a maximum 1 in. joint width for vertical and horizontal concrete panel joints. When through void or space exists between panels, the void in the spandrel region must be treated by packing a minimum 4 pcf density, mineral wool into the joint to a minimum 33% compression (1-1/2 times width of opening), filling the entire void or space. Recess the mineral wool a minimum of 1/2 in. from each side of the wall. Install a minimum 1/2 in. thickness of 3M CP25WB+ firestop caulk on the internal surface of the wall assembly (Item 2). Use only Intertek certified products meeting these minimum requirements.

II. Keyway type (tongue and groove) (Item 2F2), or
III. Recessed (Item 2F3).

E. Glass Vision Panels: When required, use optional glass vision panels a minimum 33 in. above the top surface of the floor assembly (Item 1). Install glass vision panels to curtain wall framing according to the curtain wall system manufacturer’s guidelines. Use a minimum 1/4 in. thick, clear tempered glass with a nominal width and height as determined by the framing.

F. Window Gaskets: When optional glass vision panels used, secure glass vision panels with a thermal break (thermo-set rubber extrusion).

G. Window Framing: When glass vision panels used, use steel framing members a minimum 3-5/8 in. by 1-5/8 in., 18 GA steel, U-shaped channel or similar construction compatible with structural framing (Item 2B). Locate window framing at least 33 in. above the top surface of the floor assembly.

3. PERIMETER JOINT PROTECTION: Do not exceed an 8 in. nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):
   A. Packing Material: Use a minimum 4 in. thick, 4-pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using minimum 1/4 in. compression per piece of packing material. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self leveling silicone sealant is used, recess the top surface of the packing material 1/4 in. from the top surface of the concrete floor assembly (Item 1). Use only Intertek certified products meeting the above minimum requirements.
      I. When 50% compression is required cut the width of the packing material 2 times wider than the nominal joint width.
      II. When 33% compression is required cut the width of the packing material 1.5 times wider than the nominal joint width.
      III. When 20% compression is required cut the width of the packing material 1.25 times wider than the nominal joint width.

   B. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: FireDam™ or Fire Barrier™
   MODEL: FD Spray 200 (Elastomeric, Sprayable) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling) Sealant
   Fill, Void or Cavity Material: Apply either spray coating or non-sag or self leveling silicone sealant over the packing material (Item 3A) as follows:
      Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a minimum wet film thickness of 1/8 in. and overlap the spray coating a minimum 1/2 in. onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8 in. with the liquid spray coating.
      Sealant – Apply non-sag or self leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply minimum 1/4 in. thickness non-sag or self leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

   C. Support Clips: (Optional) Recommended for installations subject to vertical shear movement. Use standard 20 GA galvanized steel Z-shaped clips having the following nominal dimensions: 1 in. wide by 3 in. high with a 2 in. upper leg and a 3 in. lower leg.

This material was extracted and drawn by 3M Fire Protection Products from the 2012 Product Directory, © Intertek
1. CONCRETE FLOOR ASSEMBLY: Two-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf, having a minimum thickness of 4-1/2 in. at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a minimum thickness of 4-1/2 in. and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. CURTAIN WALL ASSEMBLY: Incorporate the following construction features:
   A. Mounting Attachment: (Not shown) Attach steel stud framing (Item 2B) to the structural framing according to the curtain wall manufacturer’s instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments to maximum 120 in.
   B. Steel Stud Framing: Use minimum 3-5/8 in. by 1-5/8 in., 18 GA, C-shaped steel studs as interior vertical framing. Attach according to the curtain wall system manufacturer’s guidelines. Limit distance between steel stud framing to maximum 60 in. When required, install horizontal steel stud framing members according to the curtain wall system manufacturer’s guidelines and, in the spandrel area, locate a minimum of 33 in. above the top surface of the concrete floor assembly (Item 1).
   C. Concrete Panels: Use any non-combustible exterior concrete based panels. Use minimum 1-1/2 in. thick, 12 in. high, 12 in. long panels. Attach concrete panels to steel stud framing (Item 2B) according to the curtain wall system manufacturer’s requirements. Option – Treat the exterior side of the concrete panels with any weatherproofing material Listed as a Class 1 material in accordance with ASTM E-84. Use only Intertek certified products meeting these minimum requirements
   D. Impaling Pins: (Optional) Use, locate, size, and install impaling pins according to the curtain wall system manufacturer’s guidelines.
   E. Curtain Wall Insulation: (Optional) When used, install either mineral wool or fiberglass batt curtain wall insulation after the perimeter joint protection (Item 3) without deforming it. Attach curtain wall insulation to steel stud framing (Item 2B) by friction fit or mechanical fasteners.
F. Concrete Panel Joint: No through joints allowed. When required, the surface of the concrete panel joints can be sealed with gaskets or sealants. Use one of the following for vertical and horizontal concrete panel joints:

I. CERTIFIED MANUFACTURER: 3M Company
CERTIFIED PRODUCT: Fire Barrier™ Sealant
MODEL: CP25WB+
Flush type (butt joint) (Item 2F1), Prefer butt joints but allow a maximum 1 in. joint width for vertical and horizontal concrete panel joints. When through void or space exists between panels, the void in the spandrel region must be treated by packing a minimum 4pcf density, mineral wool into the joint to a minimum 33% compression (1-1/2 times width of opening), filling the entire void or space. Recess the mineral wool a minimum of 1/2 in. from each side of the wall. Install a minimum 1/2 in. thickness of 3M CP25WB+ firestop caulk on the internal surface of the wall assembly (Item 2). Use only Intertek certified products meeting these minimum requirements.

II. key way type (tongue and groove) (Item 2F2), or
III. recessed (Item 2F3).

G. Framing Covers: (Optional) When used, locate, size, and install framing covers according to the curtain wall system manufacturer’s guidelines. Do not pass framing covers through the perimeter joint protection (Item 3). Allow framing covers to abut top and bottom surfaces of the perimeter joint protection (Item 3) provided that no deformation occurs.

H. Glass Vision Panels: When required, use optional glass vision panels a minimum 33 in. above the top surface of the floor assembly (Item 1). Install glass vision panels to curtain wall framing according to the curtain wall system manufacturer’s guidelines. Use a minimum 1/4 in. thick, clear tempered glass with a nominal width and height as determined by the framing.

I. Window Gaskets: When optional glass vision panels used, secure glass vision panels with a thermal break (thermo-set rubber extrusion).

J. Window Framing: When glass vision panels used, use steel framing members a minimum 3-5/8 in. by 1-5/8 in., 18 GA steel, U-shaped channel or similar construction compatible with structural framing (Item 2B). Locate window framing at least 33 in. above the top surface of the floor assembly.

3. PERIMETER JOINT PROTECTION: Do not exceed an 8 in. nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material: Use a minimum 4 in. thick, 4-pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using minimum 1/4 in. compression per piece of packing material. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self leveling silicone sealant is used, recess the top surface of the packing material 1/4 in. from the top surface of the concrete floor assembly (Item 1). Use only Intertek certified products meeting the above minimum requirements.

I. When 50% compression is required cut the width of the packing material 2 times wider than the nominal joint width.

II. When 33% compression is required cut the width of the packing material 1.5 times wider than the nominal joint width.

III. When 20% compression is required cut the width of the packing material 1.25 times wider than the nominal joint width.

B. CERTIFIED MANUFACTURER: 3M Company
CERTIFIED PRODUCT: FireDam™ or Fire Barrier™
MODEL: FD Spray 200 (Elastomeric, Sprayable) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling) Sealant
Fill, Void or Cavity Material: Apply either spray coating or non-sag or self leveling silicon sealant over the packing material (Item 3A) as follows:

Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a minimum wet film thickness of 1/8 in. and overlap the spray coating a minimum 1/2 in. onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8 in. with the liquid spray coating.

Sealant – Apply non-sag or self leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply minimum 1/4 in. thickness non-sag or self leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

C. Support Clips: (Optional) Recommended for installations subject to vertical shear movement. Use standard 20 GA galvanized steel Z-shaped clips having the following nominal dimensions: 1 in. wide by 3 in. high with a 2 in. upper leg and a 3 in. lower leg.

L-Rating <1.0 SCFM/LF

1. CONCRETE FLOOR ASSEMBLY: Two-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf, having a minimum thickness of 4-1/2 in. at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a minimum thickness of 4-1/2 in. and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. CURTAIN WALL ASSEMBLY: Incorporate the following construction features:
   A. Mounting Attachment: (Not shown) Attach the curtain wall framing (Item 2B) to the structural framing according to the curtain wall manufacturer’s instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments to maximum 120 in..
   B. Aluminum Framing: Use hollow rectangular aluminum extruded tubing with minimum overall dimensions of 0.100 in. thick, 5-1/2 in. high and 2-1/2 in. wide. Add covers to mullion and transom on the external side of the framing: creates total framing depth of nominal 8 in.. Locate mullions (vertical aluminum framing) minimum 60 in. oc and locate transoms (horizontal aluminum framing) a minimum 48 in. oc. For the spandrel region, locate the upper transom a minimum 20 in. above the concrete floor assembly (Item 1) as measured from the top surface of the concrete floor assembly (Item 1) to the underside of the transom (horizontal aluminum framing).
   C. Vision Glass Panels: Size and install vision glass panels to aluminum framing (Item 2B) according to the curtain wall system manufacturer’s guidelines. Use a minimum 1/4 in. thick clear, heat-strengthened (HS) glass or tempered glass with a maximum width and height less than the aluminum framing (Item 2B) on center spacing, which allows the glass to be secured between the notched shoulder of the aluminum framing and pressure bar. Secure panels with a thermal break (thermo-set rubber extrusion), pressure bar (aluminum extrusion), minimum 1/4-20 x 5/8 in. long screws, and a snap face (aluminum extrusion).
   D. Spandrel Panels: Use nominal 1-3/16 in. thick, polished, granite panels having nominal 1 in. thick edges. Size panels in accordance with the perimeter boundary requirements for the spandrel framing, as described in Item 2B. Install panels with aluminum pressure plates, glazing gaskets, and steel screws in accordance with the curtain wall manufacturer’s instructions.
3. PERIMETER JOINT PROTECTION: Do not exceed an 8 in. nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material: Use a minimum 4 in. thick, 4-pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using minimum 1/4 in. compression per piece of packing material. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self leveling silicone sealant is used, recess the top surface of the packing material 1/4 in. from the top surface of the concrete floor assembly (Item 1). Use only Intertek certified products meeting the above minimum requirements.
   i. When 50% compression is required cut the width of the packing material 2 times wider than the nominal joint width.
   ii. When 33% compression is required cut the width of the packing material 1.5 times wider than the nominal joint width.
   iii. When 25% compression is required cut the width of the packing material 1.33 times wider than the nominal joint width.

B. CERTIFIED MANUFACTURER: 3M Company

CERTIFIED PRODUCT: FireDam™ or Fire Barrier™

MODEL: FD Spray 200 (Elastomeric, Sprayable) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling) Sealant

Fill, Void or Cavity Material: Apply either spray coating or sealant over the packing material (Item 3A) as follows:

Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a minimum wet film thickness of 1/8 in. and overlap the spray coating a minimum 1/2 in. onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8 in. with the liquid spray coating.

Sealant – Apply non-sag or self leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply minimum 1/4 in. thickness non-sag or self leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

L-Rating <1.0 SCFM/LF  

1. **CONCRETE FLOOR ASSEMBLY:** Two-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150pcf, having a minimum thickness of 4-1/2 in. at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a min thickness of 4-1/2 in. and accommodate depth of blockout formed in the concrete: blockout width unrestricted.  

2. **CURTAIN WALL ASSEMBLY:** Incorporate the following construction features:  
   A. Mounting Attachment: (Not shown) Attach steel-stud framing (Item 2B) to the structural framing according to the curtain wall manufacturer’s instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments to max 120 in.  
   B. Steel-Stud Framing: Vertical framing members min 6 in. by 1-5/8 in., 16 GA, steel “C” studs secured in 16 GA steel tracks, top and bottom, using min #6 × 1.25 in., Bugle head, SD, PT screws. Max vertical framing spacing of 24 in. on center (oc). Secure the steel-stud framing to the concrete floor assembly (Item 1) with curtain wall clips.  
   C. Sandwiched Wall Surface: Use min 5/8 in. thick, 48 in. wide by 96 in. long, exterior grade, fiberglass sheathed, gypsum board placed over and secured to steel stud framing (Item 2B) with min 1-1/4 in. long, Type S, drywall screws placed nominally 8 in. oc.  
   D. Curtain Wall Clips: Affix min 18 GA, steel, “stair-like”, clip measuring min 1 in. wide to each vertical steel stud framing (Item 2B) using 5/8 in. long sheet metal screws and to the surface of the concrete floor assembly (Item 1) using min 1/4 in. diameter, 1 in. long, concrete screws. Option: weld clips to the vertical steel stud framing (Item 2B) and to the structural pour stop at the edge of the concrete floor assembly (Item 1) provided that this method does not interfere with the installation of the perimeter joint protection (Item 3).  
   E. Optional Curtain Wall Insulation: When desired, install curtain wall insulation above or below the perimeter joint protection (Item 3). When used, secure the insulation in accordance with the manufacturer’s installation instructions. Acceptable materials: mineral wool or glass fiber batt insulation.  
   F. Optional Interior Curtain Wall Surface: When desired, install an interior curtain wall surface. Install above or below the perimeter joint protection (Item 3). When used, secure the interior curtain wall surface in accordance with the manufacturer’s installation instructions. Acceptable material: gypsum board.
Design No. 3MU/JS 120-22 continued

G. Optional Knee-Wall: When desired, install a “knee-wall” above the perimeter joint protection (Item 3). Option: When using a knee-wall with 6 in. steel stud construction, replace the curtain wall clips with the 6 in. wide steel track at the bottom of the knee-wall. Attach the 6 in. steel track to each vertical steel stud framing (Item 2B) using 5/8 in. long, sheet metal screws and to the concrete floor assembly (Item 1) using min 1/4 in. diameter by 1 in. long concrete screws.

H. Exterior Curtain Wall Finish: Create no voids or openings in the exterior curtain wall finish or in the sandwiched wall surface (Item 2C) and extend exterior curtain wall finish at least 8 in. above and at least 24 in. below the surface of the concrete floor assembly (Item 1). Acceptable finishes are:

I. Exterior Insulation Finish System: Use any Listed and Labeled EIFS composed of expanded polystyrene foam (EPS) insulation, and an Exterior Curtain Wall Finish consisting of the following. Apply a plaster base coat and reinforcing mesh over the sandwiched wall surface. Precut, as needed, the mesh, which is a woven fiberglass reinforcing fabric that is compatible with the plaster base coat and finish coat materials. Apply 1/16 in. to 1/8 in. thick plaster base coat to the exposed surface of the EPS foam boards, which nominally measure 24 in. wide by 48 in. long by a max of 4 in. thick with a nominal 1-pcf density. Attach the EPS foam to the sandwiched wall surface (Item 2C) using mechanical fasteners or an adhesive in accordance with manufacturer’s recommendations. Install the EPS boards in a running bond (brick-like) pattern and staggered over sandwiched wall surface (Item 2C) joints. Apply pressure to the EPS boards to assist in the bonding process. Butt together all EPS boards with no gaps or voids between them. When using adhesive, allow 12 hours min before continuing the application process. When needed, rasp the EPS boards to remove all irregular seams and establish a continuous flat surface. Apply the mesh over the EPS; embed the mesh into the plaster base coat using a trowel. Start at the middle and work outwards towards edges. Establish a final thickness of the plaster base coat with the mesh embedded of approximately 1/16 in. Let the base coat dry completely before applying the plaster finish coat. Plaster finish coat is a gypsum based material, which may contain silica sand or marble aggregates. Apply the plaster finish coat using a trowel in the same manner as the plaster base coat. Other installation techniques are acceptable when detailed by the manufacturer. The EIFS system is a monolithic assembly without expansion or control joints.

II. Glass Panels: Size and install glass panels into steel stud framing (Item 2B) according to the curtain wall system manufacturer’s guidelines. Use a min 1/4 in. thick, clear, heat-strengthened (HS), glass or tempered glass with a max width and height less than the steel stud framing (Item 2B) spacing, which allows the glass to be secured between the notched shoulder of the steel stud framing (Item 2B) and pressure bar. Secure panels with a thermal break (thermo-set rubber extrusion), pressure bar (extrusion), min 1/4-20 x 5/8 in. long screws, and a snap face (extrusion) or other method as detailed by the manufacturer. The system is a monolithic assembly without expansion or control joints.

III. Aluminum Panels: Secure min 1/8 in. thick, aluminum panels to the steel stud framing (Item 2B) in accordance with the manufacturer’s installation instructions. When framing for the aluminum panels is required, it is to be compatible with the steel stud framing (Item 2B) and installed with the manufacturer’s installation instructions. The system is a monolithic assembly without expansion or control joints.

IV. Brick: Use any conventional brick, mortar type, and pattern. Do not exceed 7/8 in. wide mortar joints. Secure bricks to wall assembly (Item 2) using conventional acceptable masonry construction techniques. The system is a monolithic assembly without expansion or control joints.

V. Stucco: Use any Listed and Labeled stucco system provided that the following is met: When EPS is used, measure and verify EPS foam boards are 4 in. thick max with a nominal 1-pcf density. Confirm stucco is compatible with the sandwiched wall surface (Item 2C) with the stucco manufacturer. The system is a monolithic assembly without expansion or control joints.

VI. Stone: Use any conventional stone or stone panel measuring at least 1 in. thick, mortar type, and pattern. Do not exceed 7/8 in. wide mortar joints. Secure stone or stone panel to wall assembly (Item 2) using conventional acceptable masonry construction techniques. The system is a monolithic assembly without expansion or control joints.

VII. Siding: Use any Listed and Labeled siding system provided that the following is met: Verify that the siding is classified as non-combustible. The system is a monolithic assembly without expansion or control joints.

VIII. GFRC Panels: Use glass fiber reinforced concrete panels at least 1 in. thick and attached in accordance with the manufacturer’s installation instructions. The system is a monolithic assembly without expansion or control joints.

I. Glass Vision Panels: When required, use optional glass vision panels a min 8 in. above the top surface of the floor assembly (Item 1). Install glass vision panels to curtain wall framing according to the curtain wall system manufacturer’s guidelines. Use a min 1/4 in. thick, clear, tempered glass with a nominal width and height as determined by the window framing (Item 2K).

J. Window Gaskets: When optional glass vision panels used, secure glass vision panels with a thermal break (thermo-set rubber extrusion).

K. Window Framing: When glass vision panels used, use steel framing members a min 6 in. by 1-5/8 in., 16 GA steel, U-shaped channel or similar construction compatible with structural framing (Item 2B). Locate window framing at least 8 in. above the top surface of the floor assembly (Item 1).

3. PERIMETER JOINT PROTECTION: Do not exceed an 8-1/2 in. nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material: Use a min 4 in. thick, 4-pcf density, mineral wool batt insulation installed in the following two step process.

(1) Cut and install the mineral wool batt insulation with the fibers running perpendicular to the slab edge and the curtain wall. Cut the mineral wool batt insulation at least 1/4 in. longer than the length between the vertical framing members and 1/8 in. greater than the depth of the steel studs. There shall be no voids. (2) Install pieces of mineral wool batt insulation in the longitudinal void created between the vertical face of the concrete floor assembly and the mineral wool batt insulation. Cut and install the mineral wool batt insulation with the fibers running parallel to the slab edge and the curtain wall. Install the packing material as specified below to achieve required compression when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using min 1/4 in. compression per piece of packing material. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self leveling silicone sealant is used, recess the top surface of the packing material 1/4 in. from the top surface of the concrete floor assembly (Item 1). Use only Intertek certified products meeting the above min requirements.

i. When 20% compression is required cut the width of the packing material 1.25 times wider than the nominal joint width.

B. CERTIFIED MANUFACTURER: 3M Company

CERTIFIED PRODUCT: FireDam™ or Fire Barrier™

3M Fire Protection Products
Construction Joints Applicators and Specifiers Guide
3MU/JS 120-22  2 of 3
Design No. 3MU/JS 120-22 continued

MODEL: FD Spray 200 (Elastomeric, Sprayable) Fire Barrier Watertight Spray (Elastomeric, Sprayable) or Fire and Water Barrier Tape FWBT (Tape) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling) Sealant

Fill, Void or Cavity Material: Apply either spray coating or sealant over the packing material (Item 3A) as follows:

Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a min wet film thickness of 1/8 in. and overlap the spray coating a min 1/2 in. onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8 in. with the liquid spray coating.

Tape – Apply the tape such that there is a min 1 in. overlap onto the adjacent curtain wall assembly (Item 2) and the concrete floor assembly (Item 1). Overlap joints in the tape system by 1/2 in.

Sealant – Apply non-sag or self leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply min 1/4 in. thickness non-sag or self leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

F-Rating 2 hr  
ASTM E 2307/ASTM E 1399 Cycling  
Class IV: 500 cycles @ 30 cpm  
Rated for ± 10% horizontal movement @ 33% Compression (Reference Item 3A)  
Rated for ± 6.25% vertical shear movement @ 33% Compression (Reference Item 3A)  
UL 2079  
L-Rating <1.0 SCFM/LF

1. CONCRETE FLOOR ASSEMBLY: Two-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf, having a minimum thickness of 4-1/2 in. at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a minimum thickness of 4-1/2 in. and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. CURTAIN WALL ASSEMBLY: Incorporate the following construction features:
   A. Mounting Attachment: (Not shown) Attach pre-cast concrete panels (Item 2B) to the structural framing according to the curtain wall manufacturer’s instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments to maximum 120 in.
   B. Pre-Cast Concrete Panels: Engineered structural panels: either tilt-up or formed panels, construct panels from steel-reinforced lightweight or normal weight (100-150 pcf) concrete, a minimum of 4 in. thick, 48 in. wide. Equip panels with structural mechanical attachments welded to the steel reinforcement within the panel for mechanical attachment to steel columns and spandrel beams in accordance with structural engineer’s requirements. When anchors are located within the perimeter joint protection (Item 3), maintain a minimum recess of 1/2 in. from the top of the concrete floor assembly (Item 1) and maximum spacing of 120 in. oc between anchors.
   C. Concrete Panel Joint: No through joints recommended. When required, seal the surface of the concrete panel joints with gaskets or sealants. Option: Treat the concrete panel joint with any weatherproofing material Listed as a Class 1 material in accordance with ASTM E-84. Use only Intertek certified products meeting these minimum requirements. Use one of the following for vertical and horizontal concrete panel joints:
iii. key way type (tongue and groove) (Item 2F), or
ii. recessed (Item 2F3).

D. Impaling Pins: Use with curtain wall insulation (Item 2F), locate, size and install impaling pins according to the curtain wall system manufacturer’s guidelines, or be a minimum 4-1/2 in. long, 12 GA pin attached to one of the following: a nominal 2 in. by 2 in. plate; a nominal 2 in. by 2 in. by 2 in. long angle; or can be directly attached to the pre-cast concrete panels (Item 2B) using mechanical fasteners. Space impaling pins a maximum of 12 in. oc. Add additional pins spaced a maximum of 16 in. oc at the centerline of the packaging material (Item 3A). Install impaling pins around the periphery of the curtain wall insulation (Item 2F). A minimum of two impaling pins required located above the floor line per piece of insulation that has been cut from standard size with at least one in each corner.

E. Clutch Clips: (Installed over Impaling Pins) Minimum 18 GA, steel clutch clips, maximum 1-1/4 in.. Space clutch clips and impaling pins a maximum of 16 in. oc at the centerline of the packaging material (Item 3A). Install a clutch clip for each impaling pin. Create an air space between the pre-cast concrete panels (Item 2B) and the curtain wall insulation (Item 2F) using the clutch clips.

F. Curtain Wall Insulation: When required, install the concrete panel joint treatment (Item 2C) before curtain wall insulation (Item 2F). Install either nominal 4 in. thick 4pcf density, 3 in. thick 6 pcf density, or 2 in. thick 8 pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder) which is exposed to the room interior. Offset the seams between adjacent sections of curtain wall insulation a minimum 3 in. from the edge of any concrete panel joint (Item 2C). Secure with impaling pins (Item 2D). Seal all meeting edges of insulation with nominal 2 in. wide, pressure sensitive, aluminum foil faced tape. Terminate curtain wall insulation (Item 2F) at the window framing (Item 2I) above the perimeter joint protection (Item 3). Use only Intertek certified products meeting the above minimum requirements.

G. Glass Vision Panels: When required, use optional glass vision panels a minimum 20 in. above the top surface of the floor assembly (Item 1). Install glass vision panels to curtain wall framing according to the curtain wall system manufacturer’s guidelines. Use a minimum 1/4 in. thick, clear tempered glass with a nominal width and height as determined by the framing.

H. Window Gaskets: When optional glass vision panels used, secure glass vision panels with a thermal break (thermo-set rubber extrusion).

I. Window Framing: Use mullions and transoms, sized according to the curtain wall system manufacturer’s guidelines. Minimum required framing dimensions; window framing must be compatible with pre-cast concrete panels (Item 2F). Locate window framing at least 20 in. above the top surface of the floor assembly (Item 1).

3. PERIMETER JOINT PROTECTION: Do not exceed an 8 in. nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material: Use a minimum 4 in. thick, 4-pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using minimum 1/4 in. compression per piece of packing material. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self leveling silicone sealant is used, recess the top surface of the packing material 1/4 in. from the top surface of the concrete floor assembly (Item 1). Use only Intertek certified products meeting the above minimum requirements.

i. When 33% compression is required cut the width of the packing material 1.5 times wider than the nominal joint width.

B. CERTIFIED MANUFACTURER: 3M Company

CERTIFIED PRODUCT: FireDam™ or Fire Barrier™

MODEL: FD Spray 200 (Elastomeric, Sprayable) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling) Sealant

Fill, Void or Cavity Material: Apply either spray coating or sealant over the packing material (Item 3A) as follows:

Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a minimum wet film thickness of 1/8 in. and overlap the spray coating a minimum 1/2 in. onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8 in. with the liquid spray coating.

Sealant – Apply non-sag or self leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply minimum 1/4 in. thickness non-sag or self leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

1. CONCRETE FLOOR ASSEMBLY: Three-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf, having a minimum thickness of 4-1/2” at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a minimum thickness of 4-1/2” and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. CURTAIN WALL ASSEMBLY: Incorporate the following construction features into the curtain wall assembly:
   A. Panel Mounting Attachment: (Not shown) Install steel attachments to the structural framing (Item 2B) according to the curtain wall manufacturer’s instructions. When required, connect the steel mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between steel mounting attachments to maximum 120”.
   B. Steel Stud Framing: Use minimum 3-5/8” by 1-5/8”, 18 GA, C-shaped steel studs as vertical framing. Attach according to the curtain wall system manufacturer’s guidelines. Limit distance between vertical steel stud framing to maximum 48”. Limit distance between horizontal steel stud framing to maximum 72”. When required, install horizontal structural framing members according to the curtain wall system manufacturer’s guidelines and, in the spandrel area, locate a minimum of 30” above the top surface of the concrete floor assembly (Item 1).
   C. Steel Panels: Install steel panels to curtain wall framing according to the curtain wall system manufacturer’s guidelines. Use a minimum 20 GA sheet steel panel with maximum dimensions of 48” wide x 144” high.
   D. Impaling Pins: When used with curtain wall insulation (Item 2E), locate, size and install impaling pins according to the curtain wall system manufacturer’s guidelines, or be a minimum 4-1/2” long, 12 GA pin attached to one of the following: a nominal 2” by 2” plate; a nominal 2” by 2” by 2” long angle; or can be directly attached to the steel stud framing (Item 2B) using a stud gun. Space impaling pins a maximum of 12” oc. Install impaling pins around the periphery of the curtain wall insulation (Item 2E) so that its interior face is flush with the interior face of the steel stud framing (Item 2B).
Design No. 3MU/JS 180-01 continued

E. Curtain Wall Insulation: Use nominal 24” wide, 2” thick, 8-pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior and installed in the stud cavity. Install curtain wall insulation by fitting in each stud cavity between steel stud framing (Item 2B) using clips, impaling pins (Item 2D), or friction fit by using a curtain wall insulation lengths at least 1/4" longer than the distance between steel stud framing (Item 2B). Maintain 1-1/4" air cavity between curtain wall insulation and steel panels (Item 2C). Completely fill the recess of the “C-shaped” steel stud framing (Item 2B) with curtain wall insulation. Tightly compress together butt joints in the lengths of curtain wall insulation by using minimum 1/4" compression per piece of curtain wall insulation material. Tape all adjacent edges between curtain wall insulation, or between steel stud framing (Item 2B) and curtain wall insulation, with minimum 4” wide pressure sensitive aluminum foil tape, centered over the seams. Locate horizontal seams in the curtain wall insulation at least 6” above or below the top surface of the perimeter joint protection (Item 3). Use only Intertek certified products meeting the above minimum requirements.

F. Framing Covers: Make from strips of 1", 8-pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior. Cut strips a minimum 1-1/2" wider than steel stud framing (Item 2B). Center framing covers over steel stud framing (Item 2B) and secure using impaling pins (Item 2I). Do not pass framing covers through the perimeter joint protection (Item 3). Allow framing covers to abut the top and the bottom surfaces of the perimeter joint protection (Item 3) provided that no deformation occurs. Use only Intertek certified products meeting the above minimum requirements.

G. Glass Vision Panels: When required, use optional glass vision panels a minimum 20” above the top surface of the floor assembly (Item 1). Install glass vision panels to curtain wall framing according to the curtain wall system manufacturer’s guidelines. Use a minimum 1/4” thick, clear tempered glass with a nominal width and height as determined by the framing.

H. Window Gaskets: (Not shown) When optional glass vision panels used, secure glass vision panels with a thermal break (thermo-set rubber extrusion).

I. Window Framing: (Not shown) When glass vision panels used, use steel framing members a minimum 3-5/8” by 1-5/8”, 18 GA steel, U-shaped channel or similar construction compatible with structural framing (Item 2B). Locate window framing at least 20” above the top surface of the floor assembly.

3. PERIMETER JOINT PROTECTION: Do not exceed an 8” nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material: Install reinforcing angle (Item 3C). Use a minimum 4” thick, 4-pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (but joints) in the lengths of packing material by using minimum 1/4" compression per piece of packing material. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self leveling silicone sealant is used, recess the top surface of the packing material 1/4" from the top surface of the concrete floor assembly (Item 1). Use only Intertek certified products meeting the above minimum requirements.

I. When 50% compression is required cut the width of the packing material 2 times wider than the nominal joint width.

II. When 33% compression is required cut the width of the packing material 1.5 times wider than the nominal joint width.

B. CERTIFIED COMPANY: 3M Company

CERTIFIED PRODUCT: FireDam™ or Fire Barrier™

MODEL: FD Spray 200 (Elastomeric, Sprayable) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling)

Fill, Void or Cavity Material: Apply either spray coating or sealant over the packing material (Item 3A) as follows:

Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a minimum wet film thickness of 1/8” and overlap the spray coating a minimum 1/2” onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the sprayed liquid coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8” in width of the liquid spray coating.

Sealant – Apply non-sag or self leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply minimum 1/4” thickness non-sag or self leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

C. Reinforcing Angle: Mount a minimum 1-1/2” x 1-1/2”, 20 GA, galvanized-steel angle to the steel stud framing (Item 2B) (vertical framing members) so that the vertical leg serves as a backer to the exterior face of the curtain wall insulation (Item 2F) and the horizontal leg extends away the curtain wall insulation and is located at the centerline of the packing material (Item 3A). Size the angle 12” longer than the span between the interior edges of the steel stud framing (Item 2B) and form the angle so that it has a 6” vertical leg on each end. Secure the 6” vertical leg on each end to the steel stud framing (Item 2B) on each side with three #10 steel self-tapping sheet metal screws placed in a triangular fashion with a maximum spacing of 2” oc.

This material was extracted and drawn by 3M Fire Protection Products from the 2012 Product Directory, © Intertek
1. **CONCRETE FLOOR ASSEMBLY:** Three-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf, having a min thickness of 4-1/2 in. at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a min thickness of 4-1/2 in. and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. **CURTAIN WALL ASSEMBLY:** Incorporate the following construction features:
   
   A. **Mounting Attachment:** (Not shown) Attach aluminum framing (Item 2B) to the structural steel framing (not shown) according to the curtain wall manufacturer’s instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments to max 120 in.
   
   B. **Aluminum Framing:** Use hollow rectangular aluminum extruded tubing with min overall dimensions of 0.100 in. thick, 5-1/2 in. high and 2-1/2 in. wide. Locate mullions (vertical aluminum framing) max 60 in. on center (oc) and locate transoms (horizontal aluminum framing) a min 48 in. oc. For the spandrel region, locate the upper transom a max 20 in. above the concrete floor assembly (Item 1) as measured from the top surface of the concrete floor assembly (Item 1) to the underside of the transom.
   
   C. **Glass Panels:** Sized and installed into aluminum framing (Item 2B) according to the curtain wall system manufacturer’s guidelines. Use min 1/4 in. thick clear, heat strengthened (HS) glass or tempered glass with a max width and height less than the aluminum framing (Item 2B) oc spacing, which allows the glass to be secured between the notched shoulder of the aluminum framing (Item 2B) and pressure bar. Secure glass panels with a thermal break (rubber extrusion), pressure bar (aluminum extrusion), min 1/4-20 x 5/8 in. long screws, and a snap face (aluminum extrusion).
   
   D. **Impaling Pins:** When used with curtain wall insulation (Item 2E) and framing covers (Item 2F), locate, size and install impaling pins according to the curtain wall system manufacturer’s guidelines, or be a min 4-1/2 in. long, 12 GA pin attached to one of the following: a nominal 2 in. by 2 in. plate; a nominal 2 in. by 2 in. by 2 in. long angle; or can be directly attached to the aluminum framing (Item 2B) using a stud gun. Space impaling pins a max of 12 in. oc vertically and 20 in. oc horizontally. Install impaling pins around the periphery of the curtain wall insulation (Item 2E) so that its interior face is flush with the interior face of the aluminum framing (Item 2B).
   
   E. **Curtain Wall Insulation:** Use nominal 24 in. wide, 4 in. thick, 4-pcf density, 3 in. thick, 6-pcf density, or 2 in. thick, 8-pcf density, mineral
wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior and installed in the stud cavity. Install curtain wall insulation between aluminum framing (Item 2B). Secure curtain wall insulation with clips, impaling pins, or friction fit using curtain wall insulation length at least 1/4 in. longer than the distance between aluminum framing (Item 2B). Seal all meeting edges of curtain wall insulation with nominal 4 in. wide pressure sensitive aluminum foil faced tape (not shown) centered over the junction so that approximately 2 in. of tape covers each edge of the adjacent curtain wall insulation. Apply pressure sensitive aluminum foil faced tape over all meeting edges of curtain wall insulation and framing covers (Item 2F) so that approximately 2 in. covers each edge of the adjacent material. Install curtain wall insulation flush with the interior face of the aluminum framing (Item 2B). Install 24 in. wide curtain wall insulation without vertical seams, spanning the full length between aluminum framing (Item 2B). Locate horizontal seams in the curtain wall insulation at least 6 in. from the top surface of the perimeter joint protection (Item 3). Maintain 1-1/4 in. air cavity between curtain wall insulation and glass panels (Item 2C). Option – in lieu of filling the full depth of the stud cavity with 4 in. thick, 4-pcf density curtain wall insulation, use minimum 2 in. thick, 8-pcf density curtain wall insulation mechanically secured (do not secure by friction fit) and use additional horizontal support angle (not shown). Locate a horizontal support angle consisting of a minimum 20 GA steel angle, having 1.5 in. × 1.5 in. legs horizontally at the mid height of the packing material (Item 3A) and attached to each mullion of aluminum framing (Item 2B) using min #6, 1/2 in. long self-tapping sheet metal screws. Use only Intertek certified products meeting the above min requirements.

F. Framing Covers: Make from strips of min 1 in. thick by min 4 in. wide, 8 pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior. Center framing covers over all aluminum framing (Item 2B) and secure using impaling pins (Item 2D). Do not pass framing covers through the perimeter joint protection (Item 3). Allow framing covers to abut top and bottom surfaces of the perimeter joint protection (Item 3) provided that no deformation occurs. Use only Intertek certified products meeting the above min requirements.

G. Reinforcing Angle: Locate reinforcing angle at all horizontal butt joints of the curtain wall insulation (Item 2E) in the field of the glass spandrel panels (Item 2C) and at the mid height of the packing material (Item 3A). Mount a min 1-1/2 × 1-1/2 in., 20 gauge, galvanized-steel angle to the aluminum mullions (Item 2B) (vertical framing members) so that the vertical leg serves as a backer to the exterior face of the curtain wall insulation (Item 2E) and the horizontal leg extends away from the curtain wall insulation and is located at the centerline of the packing material (Item 3A). Size the angle 12 in. longer than the span between the interior edges of the aluminum mullions (Item 2B) and form the angle so that it has a 6 in. vertical leg on each end. Secure the 6 in. vertical leg on each end to the aluminum mullions (Item 2B) on each side with three #10 steel self-tapping sheet metal screws placed in a triangular fashion with a max spacing of 2 in. oc. When horizontal butt joint is located at the horizontal centerline of the perimeter joint protection (Item 3) additional horizontal support angle (not shown) not required.

3. PERIMETER JOINT PROTECTION: Do not exceed an 8 in. nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material: Use a min 4 in. thick, 4 pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using min 1/4 in. compression per piece of packing material. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self-leveling silicone sealant is used, recess the top surface of the packing material 1/4 in. from the top surface of the concrete floor assembly (Item 1). Use only Intertek certified products meeting the above min requirements.
   i. When 50% compression is required cut the width of the packing material 2 times wider than the nominal joint width.
   ii. When 33% compression is required cut the width of the packing material 1.5 times wider than the nominal joint width.

B. CERTIFIED MANUFACTURER: 3M Company

CERTIFIED PRODUCT: FireDam™ or Fire Barrier™

MODEL: FD Spray 200 (Elastomeric, Sprayable) or Fire Barrier Watertight Spray (Elastomeric, Sprayable) or Fire and Water Barrier Tape FWBT (Tape) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling) Sealant

Fill, Void or Cavity Material: Apply either spray coating or sealant over the packing material (Item 3A) as follows:

Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a min wet film thickness of 1/8 in. and overlap the spray coating a min 1/2 in. onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8 in. with the liquid spray coating.

Tape – Apply the tape such that there is a min 1 in. overlap onto the adjacent curtain wall assembly (Item 2) and the concrete floor assembly (Item 1). Overlap in the joint system by 1/2 in.

Sealant – Apply non-sag or self-leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply min 1/4 in. thickness non-sag or self-leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

C. Support Clips: (Optional) Recommended for installations subject to vertical shear movement. Use standard 20 GA galvanized steel Z-shaped clips having the following nominal dimensions: 1 in. wide by 3 in. high with a 2 in. upper leg and a 3 in. lower leg.

1. CONCRETE FLOOR ASSEMBLY: Three-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf, having a minimum thickness of 4-1/2” at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a minimum thickness of 4-1/2” and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. CURTAIN WALL ASSEMBLY: Incorporate the following construction features into the curtain wall assembly:
   A. Panel Mounting Attachment: (Not shown) Install steel attachments to the structural framing (Item 2B) according to the curtain wall manufacturer’s instructions. When required, connect the steel mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between steel mounting attachments to maximum 120”.
   B. Steel Stud Framing: Use minimum 3-5/8” by 1-5/8”, 18 GA, C-shaped steel studs as vertical framing. Attach according to the curtain wall system manufacturer’s guidelines. Limit distance between vertical steel stud framing to maximum 48”. Limit distance between horizontal steel stud framing to maximum 72”. When required, install horizontal structural framing members according to the curtain wall system manufacturer’s guidelines and, in the spandrel area, locate a minimum of 20” above the top surface of the concrete floor assembly (Item 1).
   C. Aluminum Panels: Install minimum 1/8” thick aluminum panels with maximum dimensions of 48” by 144” to steel stud framing (Item 2B) according to the curtain wall system manufacturer’s guidelines.
   D. Impaling Pins: When used with curtain wall insulation (Item 2E), locate, size and install impaling pins according to the curtain wall system manufacturer’s guidelines, or be a minimum 4-1/2” long, 12 GA pin attached to one of the following: a nominal 2” by 2” plate; a nominal 2” by 2” by 2” long angle; or can be directly attached to the steel stud framing (Item 2B) using a stud gun. Space impaling pins a maximum of 12” oc vertically and 20” oc horizontally. Install impaling pins around the periphery of the curtain wall insulation (Item 2E) so that its interior face is flush with the interior face of the steel stud framing (Item 2B).
Design No. 3MU/JS 180-03 continued

E. Curtain Wall Insulation: Use nominal 24” wide, 4” thick, 4-pcf density, 3” thick, 6-pcf density, or 2” thick, 8-pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior and installed in the stud cavity. Install curtain wall insulation by fitting in each stud cavity between steel stud framing (Item 2B) using clips, impaling pins (Item 2D), or friction fit by using a curtain wall insulation lengths at least 1/4” longer than the distance between steel stud framing (Item 2B). Maintain 1-1/4” air cavity between curtain wall insulation and aluminum panels (Item 2C). Completely fill the recess of the “C-shaped” steel stud framing (Item 2B) with curtain wall insulation. Tightly compress together butt joints in the lengths of curtain wall insulation by using minimum 1/4” compression per piece of curtain wall insulation material. Tape all adjacent edges between curtain wall insulation, or between steel stud framing (Item 2B) and curtain wall insulation, with minimum 4” wide pressure sensitive aluminum foil tape, centered over the seam. Locate horizontal seams in the curtain wall insulation at least 6” above or below the top surface of the perimeter joint protection (Item 3). Use only Intertek certified products meeting the above minimum requirements.

F. Framing Covers: Make from strips of 1”, 8 pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior. Cut strips a minimum 1-1/2” wider than steel stud framing (Item 2B). Center framing covers over all steel stud framing (Item 2B) and secure using impaling pins (Item 2D). Do not pass framing covers through the perimeter joint protection (Item 3). Allow framing covers to abut the top and the bottom surfaces of the perimeter joint protection (Item 3) provided that no deformation occurs. Use only Intertek certified products meeting the above minimum requirements.

G. Glass Vision Panels: When required, use optional glass vision panels a minimum 20” above the top surface of the floor assembly (Item 1). Install glass vision panels to curtain wall framing according to the curtain wall system manufacturer’s guidelines. Use a minimum 1/4” thick, clear tempered glass with a nominal width and height as determined by the framing.

H. Window Gaskets: (Not shown) When optional glass vision panels used, secure glass vision panels with a thermal break (thermo-set rubber extrusion).

I. Window Framing: (Not shown) When glass vision panels used, use steel framing members a minimum 3-5/8” by 1-5/8”, 18 GA steel, U-shaped channel or similar construction compatible with structural framing (Item 2B). Locate window framing at least 20” above the top surface of the floor assembly.

3. PERIMETER JOINT PROTECTION: Do not exceed an 8” nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material: Install reinforcing angle (Item 3C). Use a minimum 4” thick, 4 pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using minimum 1/4” compression piece of packing material. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self leveling silicone sealant is used, recess the top surface of the packing material under the block of packing material. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). Use only Intertek certified products meeting the above minimum requirements.

i. When 50% compression is required cut the width of the packing material 2 times wider than the nominal joint width.

ii. When 33% compression is required cut the width of the packing material 1.5 times wider than the nominal joint width.

B. CERTIFIED COMPANY: 3M Company

CERTIFIED PRODUCT: FireDam™ or Fire Barrier™

MODEL: FD Spray 200 (Elastomeric, Sprayable) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling) Sealant

Fill, Void or Cavity Material: Apply either spray coating or sealant over the packing material (Item 3A) as follows:

Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a minimum wet film thickness of 1/8” and overlap the spray coating a minimum 1/2” onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8” with the liquid spray coating.

Sealant – Apply non-sag or self leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply minimum 1/4” thickness non-sag or self leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

C. Reinforcing Angle: Mount a minimum 1-1/2” x 1-1/2”, 20 GA galvanized-steel angle to the steel stud framing (Item 2B) so that the vertical leg serves as a backer to the exterior face of the curtain wall insulation (Item 2E) and the horizontal leg extends away from the curtain wall insulation and is located at the centerline of the packing material (Item 3A). Size the angle 12” longer than the span between the interior edges of the steel stud framing (Item 2B) and form the angle so that it has a 6” vertical leg on each end. Secure the 6” vertical leg on each end to the steel stud framing (Item 2B) on each side with three #10 steel self-tapping sheet metal screws placed in a triangular fashion with a maximum spacing of 2” oc.

1. CONCRETE FLOOR ASSEMBLY: Three-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf, having a minimum thickness of 4-1/2” at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a minimum thickness of 4-1/2” and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. CURTAIN WALL ASSEMBLY: Incorporate the following construction features into the curtain wall assembly:
   A. Panel Mounting Attachment: (Not shown) Install steel attachments to the steel stud framing (Item 2B) according to the curtain wall manufacturer’s instructions. When required, connect the steel mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between steel mounting attachments to maximum 120”.
   B. Steel Stud Framing: Use minimum 3-5/8” by 1-5/8”, 18 GA, C-shaped steel studs as vertical framing. Attach according to the curtain wall system manufacturer’s guidelines. Limit distance between vertical steel stud framing to maximum 48”. Limit distance between horizontal steel stud framing to maximum 72”. When required, install horizontal structural framing members according to the curtain wall system manufacturer’s guidelines and, in the spandrel area, locate a minimum of 20” above the top surface of the concrete floor assembly (Item 1).
   C. Glass Panels: Secure glass panels to curtain wall framing according to the curtain wall system manufacturer’s guidelines. Use a minimum 1/4” thick clear, heat-strengthened (HS) or tempered glass with a maximum width of 48”.
   D. Impaling Pins: When used with curtain wall insulation (Item 2E), locate, size and install impaling pins according to the curtain wall system manufacturer’s guidelines, or be a minimum 4-1/2” long, 12 GA pin attached to one of the following: a nominal 2” by 2” plate; a nominal 2” by 2” by 2” long angle; or can be directly attached to the steel stud framing (Item 2B) using a stud gun. Space impaling pins a maximum of 12” oc vertically and 20” oc horizontally. Install impaling pins around the periphery of the curtain wall insulation (Item 2E) so that its interior face is flush with the interior face of the steel stud framing (Item 2B).
Design No. 3MU/JS 180-04 continued

E. Curtain Wall Insulation: Use nominal 24” wide, 4” thick, 4-pcf density, 3” thick, 6-pcf density, or 2” thick, 8-pcf density, mineral wool batt insulation on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior and installed in the stud cavity. Install curtain wall insulation by fitting in each stud cavity between steel stud framing (Item 2B) using clips, impaling pins (Item 2D), friction fit by using a curtain wall insulation lengths at least 1/4” longer than the distance between steel stud framing (Item 2B). Maintain 1-1/4” air cavity between curtain wall insulation and aluminum panels (Item 2C). Completely fill the recess of the “C-shaped” steel stud framing (Item 2B) with curtain wall insulation. Tightly compress together but joints in the lengths of curtain wall insulation by using minimum 1/4” compression per piece of curtain wall insulation material. Tape all adjacent edges between curtain wall insulation, or between steel stud framing (Item 2B) and curtain wall insulation, with minimum 4” wide pressure sensitive aluminum foil tape, centered over the seam. Locate horizontal seams in the curtain wall insulation at least 6” above or below the top surface of the perimeter joint protection (Item 3). Use only Intertek certified products meeting the above minimum requirements.

F. Framing Covers: Make from strips of 1”, 8-pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior. Cut strips a minimum 1-1/2” wider than steel stud framing (Item 2B). Center framing covers over all steel stud framing (Item 2B) and secure using impaling pins (Item 2D). Do not pass framing covers through the perimeter joint protection (Item 3). Allowing framing covers to abut the top and the bottom surfaces of the perimeter joint protection (Item 3) provides no deformation occurs. Use only Intertek certified products meeting the above minimum requirements.

G. Glass Vision Panels: When required, use optional glass vision panels a minimum 20” above the top surface of the floor assembly (Item 1). Install glass vision panels to curtain wall framing according to the curtain wall system manufacturer’s guidelines. Use a minimum 1/4” thick, clear tempered glass with a nominal width and height determined by framing.

H. Window Gaskets: When optional glass vision panels used, secure glass vision panels with a thermal break (thermo-set rubber extrusion).

I. Window Framing: When glass vision panels used, use steel framing members a minimum 3-5/8” by 1-5/8”, 18 GA steel, U-shaped channel or similar construction compatible with structural framing (Item 2B). Locate window framing at least 20” above the top surface of the floor assembly.

3. PERIMETER JOINT PROTECTION: Do not exceed an 8” nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material: Install reinforcing angle (Item 3C). Use a minimum 4” thick, 4-pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using minimum 1/4” compression per piece of packing material. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self-leveling silicone sealant is used, recess the top surface of the packing material 1/4” from the top surface of the concrete floor assembly (Item 1). Use only Intertek certified products meeting the above minimum requirements.

   I. When 50% compression is required cut the width of the packing material 2 times wider than the nominal joint width.
   II. When 33% compression is required cut the width of the packing material 1.5 times wider than the nominal joint width.

B. CERTIFIED COMPANY: 3M Company

CERTIFIED PRODUCT: FireDam™ or Fire Barrier™

MODEL: FD Spray 200 (Elastomeric, Sprayable) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling) Sealant Fill, Void or Cavity Material: Apply either spray coating or sealant over the packing material (Item 3A) as follows:

Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a minimum wet film thickness of 1/8” and overlap the spray coating a minimum 1/2” onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8” with the liquid spray coating.

Sealant – Apply non-sag or self leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply minimum 1/4” thickness non-sag or self leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

C. Reinforcing Angle: Mount a minimum 1-1/2” x 1-1/2”, 20 GA galvanized-steel angle to the steel stud framing (Item 2B) so that the vertical leg serves as a backer to the exterior face of the curtain wall insulation (Item 2E) and the horizontal leg extends away from the curtain wall insulation and is located at the centerline of the packing material (Item 3A). Size the angle 12” longer than the span between the interior edges of the steel stud framing (Item 2B) and form the angle so that it has a 6” vertical leg on each end. Secure the 6” vertical leg on each end to the steel stud framing (Item 2B) on each side with three No. 10 steel self-tapping sheet metal screws placed in a triangular fashion with a maximum spacing of 2” oc.

1. CONCRETE FLOOR ASSEMBLY: Three-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf, having a minimum thickness of 4-1/2” at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a minimum thickness of 4-1/2” and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. CURTAIN WALL ASSEMBLY: Incorporate the following construction features:
   A. Mounting Attachment: (Not shown) Attach aluminum framing (Item 2B) to the structural framing according to the curtain wall manufacturer’s instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments to maximum 120”.
   B. Aluminum Framing: Use hollow rectangular aluminum extruded tubing with minimum overall dimensions of 0.100” thick, 5-1/2” high and 2-1/2” wide. Locate mullions (vertical aluminum framing) minimum 60” oc and locate transoms (horizontal aluminum framing) a minimum 48” oc. For the spandrel region, locate the upper transom a minimum 20” above the concrete floor assembly (Item 1) as measured from the top surface of the concrete floor assembly (Item 1) to the underside of the transom.
   C. Aluminum Panels: Install minimum 1/8” thick aluminum panels with minimum dimensions of 48” by 60” to aluminum framing (Item 2B) according to the curtain wall system manufacturer’s guidelines.
   D. Impaling Pins: Use with curtain wall insulation (Item 2E) and framing covers (Item 2F), locate, size and install impaling pins according to the curtain wall system manufacturer’s guidelines, or be a minimum 4-1/2” long, 12 GA pin attached to one of the following: a nominal 2” by 2” plate; a nominal 2” by 2” by 2” long angle; or can be directly attached to the aluminum framing (Item 2B) using a stud gun. Space impaling pins a maximum of 12” oc vertically and 20” oc horizontally. Install impaling pins around the periphery of the curtain wall insulation (Item 2E) so that its interior face is flush with the interior face of the aluminum framing (Item 2B).
Design No. 3MU/JS 180-05 continued

E. Curtain Wall Insulation: Use nominal 24" wide, 4” thick, 4-pcf density, 3" thick, 6-pcf density, or 2” thick, 8-pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior and installed in the stud cavity. Install curtain wall insulation between aluminum framing (Item 2B). Secure curtain wall insulation with clips or impaling pins. Seal all meeting edges of curtain wall insulation with nominal 4" wide pressure sensitive aluminum foil faced tape (not shown) centered over the junction so that approximately 2" of tape covers each edge of the adjacent curtain wall insulation. Apply pressure sensitive aluminum foil faced tape over all meeting edges of curtain wall insulation and framing covers (Item 2F) so that approximately 2" covers each edge of the adjacent material. Install curtain wall insulation flush with the interior face of the aluminum framing (Item 2B). Install 24" wide curtain wall insulation without vertical seams, spanning the full length between aluminum framing (Item 2B). Locate horizontal seams in the curtain wall insulation at least 6” from the top surface of the perimeter joint protection (Item 3). Maintain 1-1/4” air cavity between curtain wall insulation and aluminum panels (Item 2C). Option – in lieu of filling the full depth of the stud cavity with 4” thick, 4-pcf density curtain wall insulation, use minimum 2” thick, 8-pcf density curtain wall insulation mechanically secured (do not secure by friction fit) and use additional horizontal support angle (not shown). Locate a horizontal support angle consisting of a minimum 20 GA steel angle, having 1.5" x 1.5” legs horizontally at the mid height of the packing material (Item 3A) and attached to each mullion of aluminum framing (Item 2B) using minimum #6, 1/2” long self-tapping sheet metal screws. Use only Intertek certified products meeting the above minimum requirements.

F. Framing Covers: Make from strips of minimum 1” thick by minimum 4” wide, 8-pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior. Center framing covers over all aluminum framing (Item 2B) and secure using impaling pins (Item 2D). Do not pass framing covers through the perimeter joint protection (Item 3). Allow framing covers to abut top and bottom surfaces of the perimeter joint protection (Item 3) provided that no deformation occurs. Use only Intertek certified products meeting the above minimum requirements.

G. Reinforcing Angle: Mount a minimum 1-1/2 x 1-1/2”, 20 gauge, galvanized-steel angle to the aluminum mullions (Item 2B) so that the vertical leg serves as a backer to the exterior face of the curtain wall insulation (Item 2E) and the horizontal leg extends away from the curtain wall insulation and is located at the centerline of the packing material (Item 3A). Size the angle 12” longer than the span between the interior edges of the aluminum mullions (Item 2B) and form the angle so that it has a 6” vertical leg on each end. Secure the 6” vertical leg on each end to the steel stud framing (Item 2B) on each side with three No. 10 steel self-tapping sheet metal screws placed in a triangular fashion with a maximum spacing of 2” oc.

H. Glass Vision Panels: When required, use optional glass vision panels a minimum 20” above the top surface of the floor assembly (Item 1). Install glass vision panels to curtain wall framing according to the curtain wall system manufacturer’s guidelines. Use a minimum 1/4” thick, clear tempered glass with a nominal width and height as determined by the framing.

I. Window Gaskets: When optional glass vision panels used, secure glass vision panels with a thermal break (thermo-set rubber extrusion).

J. Window Framing: Use tubing mullions and transoms, sized according to the curtain wall system manufacturer’s guidelines. Minimum required framing dimensions, use 0.100” thick walls with minimum 5-1/2” depth and minimum 2-1/2” width and window framing must be compatible with steel framing (Item 2B). Locate window framing at least 20” above the top surface of the floor assembly.

3. PERIMETER JOINT PROTECTION: Do not exceed an 8” nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material: Use a minimum 4” thick, 4-pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using minimum 1/4” compression per piece of packing material. Use only Intertek certified products meeting the above minimum requirements. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self leveling silicone sealant is used, recess the top surface of the packing material 1/4” from the top surface of the concrete floor assembly (Item 1).
   i. When 50% compression is required cut the width of the packing material 2 times wider than the nominal joint width.
   ii. When 33% compression is required cut the width of the packing material 1.5 times wider than the nominal joint width.

B. CERTIFIED MANUFACTURER: 3M Company

CERTIFIED PRODUCT: FireDam™ or Fire Barrier™
MODEL: FD Spray 200 (Elastomeric, Spratable) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling) Sealant
Fill, Void or Cavity Material: Apply either spray coating or sealant over the packing material (Item 3A) as follows:
Spray Coating – Spray apply the liquid to the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a minimum wet film thickness of 1/8” and overlap the spray coating a minimum 1/2” onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8” with the liquid spray coating.
Sealant – Apply non-sag or self leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply minimum 1/4” thickness non-sag or self leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

C. Support Clips: (Optional) Recommended for installations subject to vertical shear movement. Use standard 20 GA galvanized steel Z-shaped clips having the following nominal dimensions: 1” wide by 3” high with a 2” upper leg and a 3” lower leg.

1. CONCRETE FLOOR ASSEMBLY: Three-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf, having a minimum thickness of 4-1/2” at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a minimum thickness of 4-1/2” and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. CURTAIN WALL ASSEMBLY: Incorporate the following construction features:
   A. Mounting Attachment: (Not shown) Attach aluminum framing (Item 2B) to the structural framing according to the curtain wall manufacturer’s instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments to maximum 120”.
   B. Aluminum Framing: Use hollow rectangular aluminum extruded tubing with minimum overall dimensions of 0.100” thick, 5-1/2” high and 2-1/2” wide. Locate mullions (vertical aluminum framing) minimum 60” oc and locate transoms (horizontal aluminum framing) a minimum 48” oc. For the spandrel region, locate the upper transom a minimum 20” above the concrete floor assembly (Item 1) as measured from the top surface of the concrete floor assembly (Item 1) to the underside of the transom.
   C. Steel Panels: Install minimum 20 GA steel panels with minimum dimensions of 48” by 60” to aluminum framing (Item 2B) according to the curtain wall system manufacturer’s guidelines.
   D. Impaling Pins: Use with curtain wall insulation (Item 2E) and framing covers (Item 2F), locate, size and install impaling pins according to the curtain wall system manufacturer’s guidelines, or be a minimum 4-1/2” long, 12 GA pin attached to one of the following: a nominal 2” by 2” plate; a nominal 2” by 2” by 2” long angle; or can be directly attached to the aluminum framing (Item 2B) using a stud gun. Space impaling pins a maximum of 12” oc vertically and 20” oc horizontally. Install impaling pins around the periphery of the curtain wall insulation (Item 2E) so that its interior face is flush with the interior face of the aluminum framing (Item 2B).
E. **Curtain Wall Insulation:** Use nominal 24” wide, 4” thick, 4-pcf density, 3” thick, 6-pcf density, or 2” thick, 8-pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior and installed in the stud cavity. Install curtain wall insulation between aluminum framing (Item 2B). Secure curtain wall insulation with clips, impaling pins, or friction fit using curtain wall insulation length at least 1/4” longer than the distance between aluminum framing (Item 2B). Seal all meeting edges of curtain wall insulation with nominal 4” wide pressure sensitive aluminum foil faced tape (not shown) centered over the junction so that approximately 2” of tape covers each edge of the adjacent curtain wall insulation. Apply pressure sensitive aluminum foil faced tape over all meeting edges of curtain wall insulation and framing covers (Item 2F) so that approximately 2” covers each edge of the adjacent material. Install curtain wall insulation flush with the interior face of the aluminum framing (Item 2B). Install 24” wide curtain wall insulation without vertical seams, spanning the full length between aluminum framing (Item 2B). Locate horizontal seams in the curtain wall insulation at least 6” from the top surface of the perimeter joint protection (Item 3). Maintain 1-1/4” air cavity between curtain wall insulation and steel panels (Item 2C). Option – in lieu of filling the full depth of the stud cavity with 4” thick, 4-pcf density curtain wall insulation, use minimum 2” thick, 8-pcf density curtain wall insulation mechanically secured (do not secure by friction fit) and use additional horizontal support angle (not shown). Use only Intertek certified products meeting the above minimum requirements.

F. **Framing Covers:** Make from strips of minimum 1” thick by minimum 4” wide, 8-pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior. Center framing covers over all aluminum framing (Item 2B) and secure using impaling pins (Item 2D). Do not pass framing covers through the perimeter joint protection (Item 3). Allow framing covers to abut top and bottom surfaces of the perimeter joint protection (Item 3) provided that no deformation occurs. Use only Intertek certified products meeting the above minimum requirements.

G. **Reinforcing Angle:** Mount a minimum 1-1/2” x 1-1/2”, 20 GA galvanized-steel angle to the aluminum mullions (Item 2B) so that the vertical leg serves as a backer to the exterior face of the curtain wall insulation (Item 2E) and the horizontal leg extends away from the curtain wall insulation and is located at the centerline of the packing material (Item 3A). Size the angle 12” longer than the span between the interior edges of the aluminum mullions (Item 2B) and form the angle so that it has a 6” vertical leg on each end. Secure the 6” vertical leg on each end to the steel stud framing (Item 2B) on each side with three #10 steel self-tapping sheet metal screws placed in a triangular fashion with a maximum spacing of 2” oc.

H. **Glass Vision Panels:** When required, use optional glass vision panels a minimum 20” above the top surface of the floor assembly (Item 1). Install glass vision panels to curtain wall framing according to the curtain wall system manufacturer’s guidelines. Use a minimum 1/4” thick, clear tempered glass with a nominal width and height as determined by the framing.

I. **Window Gaskets:** When optional glass vision panels used, secure glass vision panels with a thermal break (thermo-set rubber extrusion).

J. **Window Framing:** Use tubing munibings and transoms, sized according to the curtain wall system manufacturer’s guidelines. Minimum required framing dimensions, use 0.100” thick walls with minimum 5-1/2” depth and minimum 2-1/2” width and window framing must be compatible with steel framing (Item 2B). Locate window framing at least 20” above the top surface of the floor assembly.

3. **PERIMETER JOINT PROTECTION:** Do not exceed an 8” nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

   A. **Packing Material:** Use a minimum 4” thick, 4-pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using minimum 1/4” compression per piece of packing material. When a spray coating is used, locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self leveling silicone sealant is used, recess the top surface of the packing material 1/4” from the top surface of the concrete floor assembly (Item 1). Use only Intertek certified products meeting the above minimum requirements.

i. **When 50% compression is required cut the width of the packing material 2 times wider than the nominal joint width.**

ii. **When 33% compression is required cut the width of the packing material 1.5 times wider than the nominal joint width.**

B. **CERTIFIED MANUFACTURER:** 3M Company

**CERTIFIED PRODUCT:** FireDam™ or Fire Barrier™

**MODEL:** FD Spray 200 (Elastomeric, Sprayable) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling) Sealant

**Fill, Void or Cavity Material:** Apply either spray coating or sealant over the packing material (Item 3A) as follows:

- **Spray Coating –** Spray applied to liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a minimum wet film thickness of 1/8” and overlap the spray coating a minimum 1/2” onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8” with the liquid spray coating.

- **Sealant –** Apply non-sag or self leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply minimum 1/4” thickness non-sag or self leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

C. **Support Clips:** (Optional) Recommended for installations subject to vertical shear movement. Use standard 20 GA galvanized steel Z-shaped clips having the following nominal dimensions: 1” wide by 3” high with a 2” upper leg and a 3” lower leg.

UL 2079  
L-Rating <1.0 SCFM/LF

1. CONCRETE FLOOR ASSEMBLY: Three-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf, having a minimum thickness of 4-1/2 in. at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a minimum thickness of 4-1/2 in. and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. CURTAIN WALL ASSEMBLY: Incorporate the following construction features:
   A. Mounting Attachment: (Not shown) Attach aluminum framing (Item 2B) to the structural framing according to the curtain wall manufacturer’s instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments to maximum 120 in..
   B. Aluminum Framing: Use hollow rectangular aluminum extruded tubing with minimum overall dimensions of 0.100 in. thick, 5-1/2 in. high and 2-1/2 in. wide. Locate mullions (vertical aluminum framing) minimum 60 in. oc and locate transoms (horizontal aluminum framing) a minimum 48 in. oc. For the spandrel region, locate the upper transom a minimum 20 in. above the concrete floor assembly (Item 1) as measured from the top surface of the concrete floor assembly (Item 1) to the underside of the transom.
   C. Concrete Panels: Use any non-combustible exterior concrete based panels. Use minimum 1-1/2 in. thick, 12 in. high, 12 in. long panels. Attach concrete panels to aluminum framing (Item 2B) according to the curtain wall system manufacturer’s requirements.
   D. Impaling Pins: Use with curtain wall insulation (Item 2E) and framing covers (Item 2F), locate, size and install impaling pins according to the curtain wall system manufacturer’s guidelines, or be a minimum 4-1/2 in. long, 12 GA pin attached to one of the following: a nominal 2 in. by 2 in. plate; a nominal 2 in. by 2 in. by 2 in. long angle; or can be directly attached to the aluminum framing (Item 2B) using a stud gun. Space impaling pins a maximum of 12 in. oc. Install impaling pins around the periphery of the curtain wall insulation (Item 2E) so that its interior face is flush with the interior face of the aluminum framing (Item 2B).
E. Curtain Wall Insulation: Use nominal 24 in. wide, 4 in. thick, 4pcf density, 3 in. thick, 6pcf density, or 2 in. thick, 8pcf density, mineral wool batt insulation on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior and installed in the aluminum framing cavity. Install curtain wall insulation between aluminum framing (Item 2B). Secure curtain wall insulation with clips, impaling pins, or friction fit using curtain wall insulation length at least 1/4 in. longer than the distance between aluminum framing (Item 2B). Seal all meeting edges of curtain wall insulation with nominal 4 in. wide, press sensitive aluminum foil faced tape (not shown) centered over the junction so that approximately 2 in. of tape covers each edge of the adjacent curtain wall insulation. Apply pressure sensitive aluminum foil faced tape over all meeting edges of curtain wall insulation and framing covers (Item 2F) so that approximately 2 in. covers each edge of the adjacent material. Install curtain wall insulation flush with the interior face of the aluminum framing (Item 2B). Install 24 in. wide curtain wall insulation without vertical seams, spanning the full length between aluminum framing (Item 2B). Locate horizontal seams in the curtain wall insulation at least 6 in. from the top surface of the perimeter joint protection (Item 3). Maintain 1-1/4 in. air cavity between curtain wall insulation and concrete panels (Item 2C). Option – in lieu of filling the full depth of the aluminum framing with 4 in. thick, 4pcf density curtain wall insulation, use minimum 2 in. thick, 8pcf density curtain wall insulation mechanically secured (do not secure by friction fit) and use additional horizontal support angle (not shown). Locate a horizontal support angle consisting of a minimum 20 GA steel angle, having 1.5 in. x 1.5 in. legs horizontally at the mid-height of the packing material (Item 3A) and attached to each mullion of aluminum framing (Item 2B) using minimum #6, 1/2 in. long self-tapping sheet metal screws. Use only Intertek certified products meeting the above minimum requirements.

F. Framing Covers: Make from strips of minimum 1 in. thick by minimum 4 in. wide, 8pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior. Center framing covers over all aluminum framing (Item 2B) and secure using impaling pins (Item 2D). Do not pass framing covers through the perimeter joint protection (Item 3). Allow framing covers to abut top and bottom surfaces of the perimeter joint protection (Item 3) provided that no deformation occurs. Use only Intertek certified products meeting the above minimum requirements.

G. Reinforcing Angle: Locate reinforcing angle at all horizontal butt joints of the curtain wall insulation (Item 2E) in the field of the concrete spandrel panels (Item 2C). When horizontal butt joint is located at the horizontal centerline of the perimeter joint protection (Item 3) additional horizontal support angle (not shown) not required.

H. Glass Vision Panels: When required, use optional glass vision panels a minimum 20 in. above the top surface of the floor assembly (Item 1). Install glass vision panels to curtain wall framing according to the curtain wall system manufacturer’s guidelines. Use a minimum 1/4 in. thick, clear tempered glass with a nominal width and height as determined by the framing.

I. Window Gaskets: When optional glass vision panels used, secure glass vision panels with a thermal break (thermo-set rubber extrusion).

J. Window Framing: Use tubing mullions and transoms, sized according to the curtain wall system manufacturer’s guidelines. Minimum required framing dimensions, use 0.100 in. thick walls with minimum 6-1/2 in. depth and minimum 2-1/2 in. width and window framing must be compatible with steel framing (2B). Locate window framing at least 20 in. above the top surface of the floor assembly.

3. PERIMETER JOINT PROTECTION: Do not exceed an 8 in. nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material: Use a minimum 4 in. thick, 4pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using minimum 1/4 in. compression per piece of packing material. When a spray coating is used, locate the top surface of the packing material with the top surface of the concrete floor assembly (Item 1). When the non-sag or self levelling silicone sealant is used, recess the top surface of the packing material 1/4 in. from the top surface of the concrete floor assembly (Item 1). Use only Intertek certified products meeting the above minimum requirements.

i. When 50% compression is required cut the width of the packing material 2 times wider than the nominal joint width.

ii. When 33% compression is required cut the width of the packing material 1.5 times wider than the nominal joint width.

B. CERTIFIED MANUFACTURER: 3M Company

CERTIFIED PRODUCT: FireDam™ or Fire Barrier™

MODEL: FD Spray 200 (Elastomeric, Sprayable) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling) Sealant Fill, Void or Cavity Material: Apply either spray coating or sealant over the packing material (Item 3A) as follows:

Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a minimum wet film thickness of 1/8 in. and overlap the spray coating a minimum 1/2 in. onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8 in. with the liquid spray coating.

Sealant – Apply non-sag or self leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply minimum 1/4 in. thickness non-sag or self leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

C. Support Clips: (Optional) Recommended for installations subject to vertical shear movement. Use standard 20 GA galvanized steel Z-shaped clips having the following nominal dimensions: 1 in. wide by 3 in. high with a 2 in. upper leg and a 3 in. lower leg.

This material was extracted and drawn by 3M Fire Protection Products from the 2012 Product Directory, © Intertek
1. **Concrete Floor Assembly** – Three-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf, having a min thickness of 4-1/2 in. at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a min thickness of 4-1/2 in. and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. **Curtain Wall Assembly** – Incorporate the following construction features:

   A. **Mounting Attachment** (not shown) – Attach steel-stud framing (Item 2B) to the structural framing according to the curtain wall manufacturer’s instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments to max 120 in.

   B. **Steel-Stud Framing** – Erect vertical framing members using a min 3-5/8 x 1-5/8 in., 18 GA steel “C” studs. Erect vertical framing, and when required install horizontal framing members, according to the curtain wall system manufacturer’s guidelines. Max 24 in. on center (oc) vertical framing spacing.

   C. **Sandwiched Wall Surface** – Use a min 1/2 in. thick, 48 in. wide by 96 in. long, exterior grade gypsum wallboard (ASTM C 79), placed over and secured to framing (Item 2B) with min 1-1/4 in. long Type S drywall screws spaced 8 in. oc.

   D. **Curtain Wall Insulation** – Use nominal 24 in. wide, 4 in. thick, 4 pcf density, 3 in. thick, 6 pcf density, or 2 in. thick, 8 pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior and installed in the stud cavity. Install curtain wall insulation between steel-stud framing (Item 2B). Secure curtain wall insulation with clips, impaling pins, or friction fit using curtain wall insulation length at least 1/4 in. longer than the distance between steel-stud framing (Item 2B). Seal all meeting edges of curtain wall insulation with nominal 4-inch wide pressure sensitive aluminum foil faced tape (not shown) centered over the junction so that approximately 2 in. of tape covers each edge of the adjacent curtain wall insulation. Apply pressure sensitive...
Construction Joints

Perimeter Joint

A. Packing Material – Use a min 4 in. thick, 4 pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compressthe packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using min 1/4 in. compression per piece of packing material. Use only Intertek certified products meeting the above min requirements. When a spray coating or tape is used, locate the top surface of the packing material at least 1/2 in. above the top surface of the perimeter joint protection (Item 3). Maintain 1-1/4 in. air cavity between curtain wall insulation and sandwiched wall surface (Item 2C). Option – in lieu of filling the full depth of the stud cavity with 4 in. thick, 4 pcf density curtain wall insulation, use either min 6 pcf density, or 2 in. thick, or 2 in. thick, 8 pcf density curtain wall insulation mechanically secured (do not secure by friction fit) and use additional horizontal support angle (not shown). Install perimeter fire barrier reinforcement (Item 3C). Use only Intertek certified products meeting the above min requirements.

B. CERTIFIED MANUFACTURER – 3M Company

CERTIFIED PRODUCT – FireDam™ or Fire Barrier

MODEL – FD Spray 200 (Elastomeric, Sprayable) or Fire Barrier Watertight Spray (Elastomeric, Sprayable) or Fire and Water Barrier Tape FWBT (Tape) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling) Sealant

Fill, Void or Cavity Material – Apply either spray coating or sealant over the packing material (Item 3A) as follows:

Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a min wet film thickness of 1/8 in. and overlap the spray coating a min 1/2 in. onto the adjacent curtain wall assembly (Item 2) and concrete floor process assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8 in. with the liquid spray coating.

Tape – Apply the tape such that there is a min 1 in. overlap onto the adjacent curtain wall assembly (Item 2) and the concrete floor assembly (Item 1). Overlap joints in the tape system by 1/2 in.
Intertek System No. JS 180-08 (cont.)

Sealant – Apply non-sag or self-leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply min 1/4 in. thickness non-sag or self-leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

C. Perimeter Fire Barrier Reinforcement – Use when either min 6 pcf density, or 2 in. thick, or 2 in. thick, 8 pcf density curtain wall insulation installed. Use min 20 GA, steel angle having a 1-1/2 in. high vertical leg and a 1-1/2 in. wide horizontal leg. Fully embed horizontal leg into the curtain wall insulation (Item 2E) at the centerline of the packing material (Item 3A). Secure the vertical leg at each mullion interior face (aluminum framing – Item 2B) using at least two min. 1/2 in. long, No. 10, sheet metal screws spaced nominally 1 in. oc. Install perimeter fire barrier reinforcement continuous along the length of the perimeter joint protection (Item 3). Overlap joints in the perimeter fire barrier reinforcement a min 12 in. and secure the overlap using at least three min 1/4 in. long, No. 10, sheet metal screws spaced nominally 4 in. oc, placed in both the vertical and horizontal legs of the angles.

Table 1 - Ratings

1. **CONCRETE FLOOR ASSEMBLY:** Use a 3 hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf, having a min. thickness of 4-1/2 in. at the joint face. Increase floor assembly thickness as required for concrete type to meet the specified rating period. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a min. thickness of 4-1/2 in. and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

![FIGURE 1 – Perimeter Fire Barrier System with Angle Reinforcement](image-url)
2. CURTAIN WALL ASSEMBLY: The curtain wall assembly shall incorporate the following construction features:

A. MOUNTING ATTACHMENT (Not Shown) – Attach aluminum framing (Item 2B) to the structural framing according to the curtain wall manufacturer’s instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments to max. 120 in.

B. ALUMINUM FRAMING – Install l-shaped mullions and transoms, sized according to the curtain wall system manufacturer’s guidelines. Min. overall dimensions of mullion framing extrusions: 0.125 in. thick with a min. 5-1/2 in. height and a min. of 2-1/2 in. width. Min. overall dimensions of transom framing is 0.125 in. thick with a min. 2 in. height and a min. of 2 in. width of the extrusion. Mullions are to be spaced a min. 60 in. on center (oc) and transoms are to be spaced a min. 48 in. oc. Transoms are to be located at a height of 20 in. above the top surface of the concrete floor assembly (Item 1) (as measured from the bottom of the transom).

C. GLASS PANELS – Size and install glass panels to aluminum framing (Item 2B) according to the curtain wall system manufacturer’s guidelines. Use a min. 1/4 in. thick clear, heat-strengthened (HS) glass or tempered glass with a max. width and height less than the aluminum framing (Item 2B) oc spacing, which allows the glass to be secured between the notched shoulder of the aluminum framing and pressure bar. Secure panels with a thermal break (rubber extrusion), pressure bar (aluminum extrusion), min. 1/4-20 × 5/8 in. long screws, and a snap face (aluminum extrusion).

D. IMPALING PINS – Use min. 12 GA steel pins, a min. 1/2 in. longer than the thickness of the curtain wall insulation. Attach pins to a nominal 2 × 2 in. clip angle constructed with 20 GA, galvanized sheet steel and secure the clips to the aluminum framing (Item 2B) with No. 10, self-tapping, sheet metal screws. Space pins a max. of 12 in. oc on the vertical framing members and a max. of 20 in. oc on the horizontal framing members that make up the perimeter of the spandrel area. Install the interior face of the curtain wall insulation (Item 2F) so that it is flush with the interior face of the aluminum framing (Item 2B).

E. REINFORCING MEMBERS – Reinforce and support the back side of the curtain wall insulation (Item 2F) using one of the following two options:

i. Reinforcing Angle: (See Figure 1) Mount a min. 1/2 × 1-1/2 in., 20 GA galvanized, steel angle to the vertical framing members so that the vertical leg serves as a backer to the exterior face of the curtain wall insulation (Item 2F) and the horizontal leg extends away from the curtain wall insulation (Item 2F) and locate at the centerline of the perimeter joint protection (Item 3). Size the angle 12 in. longer than the span between the interior edges of the vertical framing members and form the angle so that it has a 6 in. vertical leg on each end. Secure the 6 in. vertical leg to the vertical framing member on each side with three, No. 10, steel, self-tapping, sheet metal screws placed in a triangular fashion with a max. spacing of 2 in. oc.

ii. Reinforcing Hat Channel: (See Figure 2) Install galvanized steel, 24 GA, hat channel, nominally 2-1/2 in. wide × 7/8 in. deep, to span the mullion-to- mullion space for the attachment of the curtain wall insulation. Orient each hat channel section with the wide section facing the curtain wall glazing. Cut each section to a min. 4 in. longer than the mullion spacing, with the ends cut, flattened and folded across the narrow width (toward the joint system) into mounting flanges perpendicular to the hat channel length. These flanges will each be nominally 2 in. long and will be attached to the inside faces of the mullions with No. 10 × 1 in. long self-drilling, self-tapping screws. Install three such hat channel stiffening channels with the flattened flanges in contact with each other to set the spacing, with the central hat channel centered on the joint centerline. The curtain wall insulation is to be supported by, and fastened into, these stiffening hat channel sections.

F. CURTAIN WALL INSULATION – Use only Intertek certified products meeting the following min. requirements. Use nominal 24 in. wide, 4 in. thick, 4 pcf density; nominal 3 in. thick, 6 pcf density; or nominal 2 in. thick, 8 pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior. Install curtain wall insulation between aluminum framing (Item 2B). Install curtain wall insulation flush with the interior face of the aluminum framing (Item 2B). Secure curtain wall insulation with clips and impaling pins for 2 in. thick 8 pcf insulation or 3 in. thick 6 pcf insulation. Friction fit 4 in. thick 4 pcf insulation using curtain wall insulation length at least 1/4 in. longer than the distance between aluminum framing (Item 2B). Install 24 in. wide curtain wall insulation without vertical seams, spanning the full length between aluminum framing (Item 2B). Locate horizontal seams in the curtain wall insulation at least 6 in. from the top surface of the perimeter joint protection (Item 3). Maintain 1-1/4 in. air cavity.

FIGURE 2 – Perimeter Fire Barrier System with Hat Channel Reinforcement
between curtain wall insulation and glass panel surface (Item 2C). Seal all meeting edges of curtain wall insulation with nominal 4 in. wide pressure sensitive aluminum foil faced tape (not shown) centered over the junction so that approximately 2 in. of tape covers each edge of the adjacent curtain wall insulation. Option – in lieu of filling the full depth of the space between aluminum framing (Item 2B) with 4 in. thick, 4 pcf density curtain wall insulation, use either min. 3 in. thick 6 pcf density, or 2 in. thick 8 pcf density curtain wall insulation mechanically secured (do not secure by friction fit). Install perimeter fire barrier reinforcement (Item 3C).

**G. FRAMING COVERS** – Use only Intertek certified products meeting the following min. requirements. Make framing covers, of nominal 4 in. wide strips of 8 pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder). Install with aluminum foil scrim exposed to the room interior. Install framing covers centered over each vertical framing member and secured to the member with impaling pins and clips spaced a max. 12 in. oc and attached in accordance with Item 2D. Make framing covers below the perimeter joint protection (Item 3) nominal 2 in. thick and those above the perimeter joint treatment, nominal 1 in. thick. Do not pass framing covers through the perimeter joint protection (Item 3). Abut framing covers to the top and bottom surfaces of the perimeter joint protection (Item 3). Apply pressure sensitive aluminum foil faced tape (not shown) over all meeting edges of curtain wall insulation and framing covers (Item 2C) so that approximately 2 in. covers each edge of the adjacent material.

3. **PERIMETER JOINT PROTECTION:** The perimeter joint (linear opening) is not to exceed an 8 in. nominal joint width (joint width at installation). The perimeter joint treatment shall incorporate the following construction features:

**A. PACKING MATERIAL** – Use only Intertek certified products meeting the following min. requirements. Use a min. 4 in. thick, 4 pcf density, mineral wool batt insulation. Cut insulation into 4 in wide strips and install with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Stack 4 in wide packing material strips to achieve required compression (refer below) when installed in the nominal joint width at the required 4 in. depth. Compress the packing material into the perimeter joint. Tightly compress together splices (butt joints) in the lengths of packing material by using min. 1/4 in. compression per piece of packing material. When a spray coating or tape is used as the fill, void, or cavity material (Item 3B), recess the top surface of the packing material 1/4 in. from the top surface of the concrete floor assembly (Item 1). When the non-sag or self-leveling silicone sealant is used as the fill, void, or cavity material (Item 3B), locate the top surface of the packing material flush with the top surface of the concrete floor assembly (Item 1). When the non-sag or self-leveling silicone sealant is used as the fill, void, or cavity material (Item 3B), recess the top surface of the packing material 1/4 in. from the top surface of the concrete floor assembly (Item 1).

i. When 50% compression is required stack the width of the packing material 2 times wider than the nominal joint width.

ii. When 33% compression is required stack the width of the packing material 1.5 times wider than the nominal joint width.

**B. FILL, VOID, OR CAVITY MATERIAL** – Apply either spray coating or sealant over the packing material (Item 3A) as follows:

i. **CERTIFIED MANUFACTURER:** 3M Company

**CERTIFIED PRODUCT:** Joint Sealant Spray
**CERTIFIED MODEL:** FD Spray 200 (Elastomeric, Sprayable)

Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a min. wet film thickness of 1/8 in. and overlap the spray coating a min. 1/2 in. onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8 in. with the liquid spray coating.

ii. **CERTIFIED MANUFACTURER:** 3M Company

**CERTIFIED PRODUCT:** Joint Sealant Spray
**CERTIFIED MODEL:** Fire Barrier Watertight Spray (Elastomeric, Sprayable)

Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a min. wet film thickness of 1/8 in. and overlap the spray coating a min. 1/2 in. onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8 in. with the liquid spray coating.

iii. **CERTIFIED MANUFACTURER:** 3M Company

**CERTIFIED PRODUCT:** Joint Sealant Tape
**CERTIFIED MODEL:** Fire and Water Barrier Tape FWBT (Tape)

Apply the tape such that there is a min. 1 in. overlap onto the adjacent curtain wall assembly (Item 2) and the concrete floor assembly (Item 1). Overlap joints in the tape system by 1/2 in.

iv. **CERTIFIED MANUFACTURER:** 3M Company

**CERTIFIED PRODUCT:** Joint Sealant
**CERTIFIED MODEL:** FB 1000 N/S Silicone Sealant (Non-sag)

Apply non-sag or self-leveling sealant to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply min. 1/4 in. thickness non-sag or self-leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

v. **CERTIFIED MANUFACTURER:** 3M Company

**CERTIFIED PRODUCT:** Joint Sealant
**CERTIFIED MODEL:** FB 1003 S/L (Self-leveling) Sealant
Apply non-sag or self-leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply min. 1/4 in. thickness non-sag or self-leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

C. PERIMETER FIRE BARRIER REINFORCEMENT (Not Shown) – Use when either 3 in. thick 6 pcf density, or 2 in. thick 8 pcf density curtain wall insulation (Item 2F) is installed. Use min. 20 GA, steel angle having a 1-1/2 in. high vertical leg and a 1-1/2 in. wide horizontal leg. Fully embed horizontal leg into the packing material (Item 3A) at the vertical centerline of the packing material. Secure the vertical leg at each mullion interior face (aluminum framing – Item 2B) using at least two min. 1/2 in. long, No. 10, sheet metal screws spaced nominally 1 in. oc. Install perimeter fire barrier reinforcement continuous along the length of the perimeter joint protection (Item 3). Overlap joints in the perimeter fire barrier reinforcement a min. 12 in. and secure the overlap using at least three min. 1/4 in. long, No. 10, sheet metal screws spaced nominally 4 in. oc, placed in both the vertical and horizontal legs of the angles.

1. **CONCRETE FLOOR ASSEMBLY:** Three-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf, having a min thickness of 5.7 in. at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a min thickness of 5.7 in. at the joint face and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. **CURTAIN WALL ASSEMBLY:** Incorporate the following construction features:
   A. Mounting Attachment: (Not shown) Attach the pre-cast concrete panels (Item 2B) to the joint face or top of the concrete floor assembly (Item 1), according to the curtain wall manufacturer’s instructions. Max distance horizontally between mounting attachments shall be 10 ft.
   B. Pre-Cast Concrete Panels: Use engineered structural pre-cast concrete panels made from steel reinforced lightweight or normal weight (100 to 150 pcf) concrete min 4 in. thick and 48 in. high. Equip panels with structural mounting attachments (Item 2A). When anchors are located at the joint face within the perimeter joint protection (Item 3), maintain a min recess of 1/2 in. from the top of the concrete floor assembly (Item 1) and max spacing of 120 in. on center (oc) between anchors.
   C. **CERTIFIED MANUFACTURER:** 3M  
      **CERTIFIED PRODUCT:** Joint sealant  
      **MODEL:** Fire Barrier™ 2000 Silicone Joint Sealant

Concrete Panel Joint: Use the following concrete panel joints: either key way type (tongue and groove, option 1) or butt joint type (flush, option 2). Apply a 1/2 in. bead of joint sealant along the pre-cast concrete panel joints on the interior side. When curtain wall insulation...
System No. 3MU/JS 180-12 continued

(Item 2F) is used, the joint sealant may be omitted provided that the seams between adjacent sections of curtain wall insulation (Item 2F) are offset a min of 3 in. from the edge of any joint in the pre-cast concrete panels. Then treat the concrete panel joint with any weatherproofing material listed as having a flame spread index (FSI) less than or equal to 25 and a smoke developed index (SI) of less than or equal to 450 in accordance with ASTM E84. Use only Intertek certified products meeting the above requirements.

D. Impaling Pins (Optional, not shown): Use only when curtain wall insulation (Item 2F) is installed. Install min 12 GA steel impaling pins spaced 24 in. oc in all directions on the interior face of the pre-cast concrete panels (Item 2B). Equip each impaling pin with a min 1-1/2 in. diameter locking washer. For a piece of curtain wall insulation (Item 2F) having a width equal to or greater than 3 in., install a min of two impaling pins located above the floor line with at least one in each bottom corner of the piece of curtain wall insulation (Item 2F). For a piece of curtain wall insulation (Item 2F) having a width of less than 3 in., install one impaling pin located above the floor line at the bottom center of the piece of curtain wall insulation (Item 2F).

E. Clutch Clips (Optional, not shown): Install min 18 GA steel, max 1-1/4 in. clutch clips placed over impaling pins (Item 2D). When this option is used, install a clutch clip with each impaling pin. When clutch clips are installed, create an air space between the pre-cast concrete panels (Item 2B) and the curtain wall insulation (Item 2F).

F. Curtain Wall Insulation (Optional, not shown): Install one of the following: nominal 4 in. thick 4 pcf, 3 in. thick 6 pcf, or 2 in. 8 pcf density mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior. Secure the curtain wall insulation with impaling pins (Item 2D). Seal all meeting edges of curtain wall insulation with nominal 2 in. wide pressure sensitive aluminum foil faced tape. Install curtain wall insulation tightly above and below the perimeter joint protection (Item 3) and terminate at the concrete panel return above the perimeter joint protection (Item 3). Use only Intertek certified products meeting the above min requirements.

G. Glass Vision Panels (Optional): Install glass vision panels outside spandrel area a min 20 in. above the top surface of the floor assembly (Item 1) and a min of 28 in. below the top surface of the floor assembly (Item 1). Install glass vision panels in window framing (Item 2I) according to the curtain wall system manufacturer’s guidelines. Use a min 1/4 in. thick, clear heat-strengthened glass with a nominal width and height as determined by the window framing (Item 2I).

H. Window Gaskets (Optional): Secure glass vision panels (Item 2G) with a thermal break (thermal-set rubber extrusion).

I. Window Framing (Optional): Use steel or aluminum framing members with a min 3-5/8 in. by 1-5/8 in. 18 GA steel “U” channel or similar construction that is compatible with the pre-cast concrete panels (Item 2B) and concrete panel joints (Item 2C). Locate window framing at least 20 in. above the top surface of the concrete floor assembly (Item 1) and a min of 28 in. below the top surface of the floor assembly (Item 1).

3. PERIMETER JOINT PROTECTION: Do not exceed a 6 in. nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material: Install min 4 in. thick, 4 pcf mineral wool batt insulation with the fibers parallel to the edge of the concrete floor assembly (Item 1) and the curtain wall assembly (Item 2). Compress the packing material 33% in the nominal joint width. Compress the splices (butt joints) in the lengths of mineral wool batt insulation tightly together. When using non-sag or self-leveling joint sealants (Item 3B), recess the mineral wool packing material a min 1/4 in. from the top surface of the concrete floor assembly (Item 1) to accommodate the required installation depth of the non-sag or self-leveling joint sealants (Item 3B). Use only Intertek certified products meeting the above min requirements.

B. CERTIFIED MANUFACTURER: 3M Company
C. CERTIFIED PRODUCT: FireDam™ or Fire Barrier™
D. MODEL: FWBT (Tape) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling) Sealant
E. Fill, Void or Cavity Material: Apply either spray coating or sealant over the packing material (Item 3A) as follows:

1. Spray Coating – Spray apply the liquid to cover the exposed top surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a min wet film thickness of 1/8 in. and overlap the spray coating a min 1/2 in. onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8 in. with the liquid spray coating.

2. Tape – Apply the tape such that there is a min 1 in. overlap onto the adjacent curtain wall assembly (Item 2) and the concrete floor assembly (Item 1). Overlap joints in the tape system by 1/2 in.

Sealant – Apply non-sag or self leveling sealant to cover the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply min 1/4 in. thickness non-sag or self leveling sealant over the packing material (Item 3A) and finish flush with the top surface of the concrete floor assembly (Item 1).

This material was extracted and drawn by 3M Fire Protection Products from the 2016 Product Directory, © Intertek
1. CONCRETE FLOOR ASSEMBLY: Three-hour rated concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150 pcf, having a minimum thickness of 5.7 inches at the joint face. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a minimum thickness of 5.7 inches at the joint face and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

2. CURTAIN WALL ASSEMBLY: The curtain wall assembly shall incorporate the following construction features:
   A. Mounting Attachments: (Not shown) Attach the pre-cast concrete panels (Item 2B) to the joint face or top of the concrete floor assembly (Item 1), according to the curtain wall manufacturer’s instructions. Maximum distance horizontally between mounting attachments shall be 10 feet.
   B. Pre-Cast Concrete Panels: Use engineered structural pre-cast concrete panels made from steel-reinforced lightweight or normal weight (100-150 pcf) concrete, minimum 4 inches thick and 48 inches high. Equip panels with structural mounting attachments (Item 2A). When anchors are located at the joint face within the perimeter joint protection (Item 3), maintain a minimum recess of 1/2-inch from the top of the concrete floor assembly (Item 1) and maximum spacing of 120 inches on center between anchors.
   C. CERTIFIED MANUFACTURER: 3M
      CERTIFIED PRODUCT: Joint Sealant
      MODEL: Fire Barrier™ 2000 Silicone Joint Sealant
      Concrete Panel Joint: Use the following concrete panel joints: either key way type (tongue and groove) (Option 1), butt joint type (flush) (Option 2) or butt joint type with maximum 1-inch gap (Option 3). When using Option 1 or 2, as an option, apply a 1/2-in. bead of joint sealant along the pre-cast concrete panel joints on the interior side.
      When using Option 3, tightly pack 4-pcf mineral wool batt insulation in the concrete joint space. Pack the mineral wool insulation 3 inches deep, recessed 1/2 inch from the interior side of the pre-cast concrete panels (Item 2B). Fill the 1/2-inch recess with joint sealant along the concrete panel joints on the interior side. Use only Intertek certified products meeting the above minimum requirements. Offset the seams between adjacent sections of curtain wall insulation (Item 2F) a minimum of 3 inches from the edge of any concrete panel joints. Then treat the concrete panel joint with any weatherproofing material Listed as having a flame spread index ≤ 25 and a smoke developed index ≤ 450 in accordance with ASTM E-84. Use only Intertek certified products meeting the above minimum requirements.
D. Impaling Pins: Install minimum 12 GA steel impaling pins spaced 24 inches on center in all directions on the interior face of the pre-cast concrete panels (Item 2B). Equip each impaling pin with a minimum 1-1/2-inch diameter locking washer. For a piece of curtain wall insulation (Item 2F) having a width equal to or greater than 3 inches, install a minimum of two impaling pins located above the floor line with at least one in each bottom corner of the piece of curtain wall insulation (Item 2F). For a piece of curtain wall insulation (Item 2F) having a width less than 3 inches, install one impaling pin located above the floor line at the bottom center of the piece of curtain wall insulation (Item 2F).

E. Clutch Clips (Optional – Not shown): Install minimum 18 GA steel, maximum 1-1/4-inch clutch clips placed over impaling pins (Item 2D). When this option is used, install a clutch clip with each impaling pin. When clutch clips are installed, create an air space between the precast concrete panels (Item 2B) and the curtain wall insulation (Item 2F).

F. Curtain Wall Insulation: Use one of the following materials: nominal 4-inch thick 4-pcf, 3-inch thick 6-pcf, or 2-inch thick 8-pcf density mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder). When the concrete panel joint (Item 2C) is installed with sealant and mineral wool batt insulation (packed tightly), install the sealant and mineral wool batt insulation before the curtain wall insulation. Install the curtain wall insulation with the aluminum foil scrim side exposed to the room interior. Secure with impaling pins (Item 2D). Seal all mating edges with nominal 2-inch wide pressure sensitive aluminum foil faced tape. Install curtain wall insulation tightly above and below the perimeter joint protection (Item 3) and terminate at the concrete panel return above the perimeter joint protection (item 3). Use only Intertek certified products meeting the above minimum requirements

G. Glass Vision Panels: (Optional) Install glass vision panels outside spandrel area a minimum 20 inches above the top surface of the floor assembly (Item 1) and a minimum of 28 inches below the top surface of the floor assembly (Item 1). Install glass vision panels in window framing (Item 2I) according to the curtain wall system manufacturer’s guidelines. Use a minimum 1/4-inch thick, clear heat-strengthened glass with a nominal width and height as determined by the window framing (Item 2I).

H. Window Gaskets: (Optional) Secure glass vision panels (Item 2G) with a thermal break (thermal-set rubber extrusion).

I. Window Framing: (Optional) Use steel or aluminum framing members with a minimum 3-5/8-inch by 1-5/8-inch 18 GA steel “U” channel or similar construction that is compatible with the pre-cast concrete panels (Item 2B) and concrete panel joints (Item 2C). Locate window framing at least 20 inches above the top surface of the concrete floor assembly (Item 1) and a minimum of 28 inches below the top surface of the floor assembly (Item 1).

3. PERIMETER JOINT PROTECTION: Do not exceed a 6-inch nominal joint width (joint width at installation). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material: Install minimum 4-inch thick, 4-pcf mineral wool batt insulation with the fibers parallel to the edge of the concrete floor assembly (Item 1) and the curtain wall assembly (Item 2). Compress the packing material 33% in the nominal joint width. Compress the splices (butt joints) in the lengths of mineral wool batt insulation tightly together. When using non-sag or self leveling joint sealants (Item 3B), recess the mineral wool packing material a minimum 1/4-inch from the top surface of the concrete floor assembly (Item 1) to accommodate the required installation depth of the non-sag or self leveling joint sealants (Item 3B). Use only Intertek certified products meeting the above minimum requirements.

B. CERTIFIED MANUFACTURER: 3M
   CERTIFIED PRODUCT: Joint Sealant

   MODEL: FireDam™ Spray 200 (Elastomeric, Spray), Fire Barrier 1000 NS Sealant (Non-sag) or Fire Barrier 1003 SL Sealant (Self Leveling)

   Fill, Void or Cavity Material: Apply joint sealant (sprayed, brushed, or troweled as indicated by the manufacturer’s installation instructions) to cover the top exposed surface of the mineral wool installed in the nominal joint width. When using a spray apply a minimum wet film thickness of 1/8-inch and overlap the spray a minimum 1/2-inch onto the adjacent curtain wall assembly (Item 2) and concrete floor assembly (Item 1). When the application process is stopped and the applied spray has cured to an elastomeric film before the application process is restarted, overlap at least 1/8-inch with the new spray the edge of the cured spray. When using the non-sag or self leveling joint sealants, apply in a minimum 1/4-inch thick layer.

FireDam™ Spray 200, Fire Barrier 1000 NS Silicone Sealant and Fire Barrier 1003 SL Silicone Sealant
ASTM E 2307-04
T-Rating: 0 Hr
F-Rating: 2 hr
ASTM E 2307/ASTM E 1399 Cycling
Class I: 500 cycles @ 1 cpm

1. Concrete Floor Assembly – Refer to Figure 1. Minimum 2-hour rated monolithic concrete floor assembly made from either lightweight or normal weight concrete with a density of 100 to 150-pcf density. When a longitudinal recess (blockout) is required to contain an architectural joint system, increase concrete floor assembly thickness to maintain a minimum thickness of 4-1/2 in. and accommodate depth of blockout formed in the concrete: blockout width unrestricted.

A. Concrete Floor – Minimum 2-hour rated, nominal 4-1/2 in. thick, reinforced, slab increasing to nominal 16 in. thick at joint face (slab edge) created by cast-in-place technique integral with concrete beam (Item 1B).

B. Concrete Beam – Nominal, 31 in. deep, 12 in. wide, 2-hour rated, pre-cast or cast-in-place reinforced concrete spandrel beam integral with concrete floor (Item 1A).

2. Curtain Wall Assembly – Refer to Figures 1 and 2. Incorporate the following construction features:

A. Mounting Attachment (not shown) – Attach aluminum framing (Item 2B) to the structural framing according to the curtain wall manufacturer's instructions. When required, connect the mounting attachments to the joint face of the concrete floor assembly (Item 1) according to the curtain wall manufacturer’s instructions. Limit distance between mounting attachments to maximum 120 in..

B. Aluminum Framing – Use hollow rectangular aluminum extruded tubing with minimum overall dimensions of 0.100 in. thick, 5-1/2 in. high and 2-1/2 in. wide. Locate mullions (vertical aluminum framing) nominally 85.5 in. on center and locate transoms (horizontal aluminum framing) a maximum 30-1/2 in. on center. For the spandrel region, locate the upper transom (horizontal aluminum framing) a minimum 20 in. above the perimeter joint protection (Item 3) as measured from the top surface of the packing material (Item 3A) to the underside of the transom (horizontal aluminum framing).

C. Glass Panels – Sized and installed into aluminum framing (Item 2B) according to the curtain wall system manufacturer’s guidelines. Use minimum 1/4 in. thick clear, heat strengthened (HS) glass or tempered glass with a maximum width and height less than the aluminum framing (Item 2B) on center spacing, which allows the glass to be secured between the notched shoulder of the aluminum framing (Item 2B) and pressure bar. Secure glass panels with a thermal break (rubber extrusion), pressure bar (aluminum extrusion), minimum 1/4–20 x 5/8 in. long screws, and a snap face (aluminum extrusion).

D. Impaling Pins – Use with curtain wall insulation (Item 2E) and framing covers (Item 2F), locate, size and install impaling pins according to the curtain wall system manufacturer’s guidelines, or be a minimum 4-1/2 in. long, 12 GA pin attached to one of the following: a nominal 2 x 2 in. plate; a nominal 2 x 2 x 2 in. long angle; or can be directly attached to the aluminum framing (Item 2B) using a stud gun. Cap all pins using a nominal 1 in. diameter speed washer. Space impaling pins a maximum of 12 in. on center vertically and 20 in. on center horizontally. Install impaling pins around the periphery of the curtain wall insulation (Item 2F) so that its interior face is flush with the interior face of the aluminum framing (Item 2B).

E. Reinforcing Angle – Locate reinforcing angle at all horizontal butt joints of the curtain wall insulation (Item 2F) in the field of the glass spandrel panels (Item 2C) and at the mid height of the packing material (Item 3A). Mount a minimum 1-1/2 x 7/8 in., 20 gauge, galvanized-steel angle to the vertical aluminum framing, mullions, (Item 2B) so that the vertical leg serves as a backer to the exterior face of the curtain wall insulation (Item 2F) and the horizontal leg extends away from the curtain wall insulation and is located at the centerline.

Figure 1 – Lower Left Wall Assembly Isometric and Aluminum Framing Extrusion Assembly (Transoms & Mullions) Isometric

Figure 2 – Aluminum Framing Isometric, Aluminum Framing Elevation, Impaling Pin Isometric, and Reinforcement Angle Isometric
of the packing material (Item 3A). Size the angle 12 in. longer than the span between the interior edges of the vertical aluminum framing, mullions, (Item 2B) and form the angle so that it has a 6 in. vertical leg on each end. Secure the 6 in. vertical leg on each end to the vertical aluminum framing, mullions, (Item 2B) on each side with two No. 10 steel self-tapping sheet metal screws placed in a stable fashion with a maximum spacing of 2 in. on center, or fastening method of equal strength and stability.

F. Curtain Wall Insulation – Use only Intertek certified products meeting following minimum requirements. Use nominal 24 in. wide, 4 in. thick, 4-pcf density, 3 in. thick, 6-pcf density, or 2 in. thick, 8-pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior and installed in the stud cavity. Install curtain wall insulation between aluminum framing (Item 2B). Secure curtain wall insulation with impaling pins (Item 2D) attached to aluminum framing (Item 2B). Seal all meeting edges of curtain wall insulation with nominal 3 in. wide, pressure sensitive, aluminum-foil-faced tape centered over the junction so that approximately 1-1/2 in. of tape covers each edge of the adjacent curtain wall insulation. Apply pressure sensitive aluminum foil faced tape over all meeting edges of curtain wall insulation and framing covers (Item 2F) so that approximately 2 in. covers each edge of the adjacent material. Install curtain wall insulation flush with the interior face of the aluminum framing (Item 2B). Install 24 in. wide curtain wall insulation spanning the full length and height between aluminum framing (Item 2B). Refer to Figure 3. For vertical insulation butt joints, first install back-to-back angles created from minimum, 20 GA, steel having minimum 2 in. legs. Position back-to-back angles in front of reinforcing angle (Item 2E). Mechanically fasten ends of steel back-to-back angles to horizontal framing (Item 2B). Locate horizontal seams in the curtain wall insulation at least 6 in. from the top surface of the perimeter joint protection (Item 3). Maintain 1-1/4 in. air cavity between curtain wall insulation and glass panels (Item 2C). Option – in lieu of filling the full depth of the stud cavity with 4 in. thick, 4-pcf density curtain wall insulation, use minimum 2 in. thick, 8-pcf density or 3 in. thick, 6-pcf density curtain wall insulation mechanically secured (do not secure by friction fit) and use additional horizontal support angle (not shown). Locate a horizontal support angle consisting of a minimum 20 GA steel angle, having 1.5 x 1.5 in. legs horizontally at the mid height of the packing material (Item 3A) and attached to each mullion of aluminum framing (Item 2B) using minimum #6, 1/2 in. long self-tapping sheet metal screws.

G. Framing Covers – Make from strips of minimum 1 in. thick by minimum 4 in. wide, 8-pcf density, mineral wool batt insulation faced on one side with aluminum foil scrim (vapor retarder), which is exposed to the room interior. Center framing covers over all aluminum framing (Item 2B) and secure using impaling pins or cup-head weld pins (Item 2D). Do not pass framing covers through the perimeter joint protection (Item 3). Allow framing covers to abut top and bottom surfaces of the perimeter joint protection (Item 3) provided that no deformation occurs. Use only Intertek certified products meeting the above minimum requirements.

H. Thermal Break Assembly – Secure panels with a thermal break (thermal-set rubber extrusion), pressure bar (aluminum extrusion), 1/4–20 x 5/8 in. long screws, and a snap face (aluminum extrusion). Protect spandrel panels according to Item 2F.

3. Perimeter Joint Protection – Refer to Figures 1 and 4. Install impaling pins (Item 2D), reinforcement angle (Item 2E), and protect spandrel panels using curtain wall insulation (Item 2F) before installing perimeter joint protection. Do not install framing covers (Item 2G) until after perimeter joint protection. Do not exceed a 12 in. nominal joint width (joint width at installation). Install perimeter joint protection from bottom of concrete floor assembly (Item 1). Sandwich the fill, void or cavity material (Item 3B) between two pieces of packing material (Item 3A and Item 3C). Incorporate the following construction features for the perimeter joint protection (also known as perimeter fire barrier system):

A. Packing Material – Use a minimum 4 in. thick, 4-pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve required compression, refer below, when installed in the nominal joint width. Compress the packing material into the perimeter joint created between the curtain wall insulation (Item 2F) and the concrete spandrel beam (Item 1B). Create a recess at least 4 in. deep between the bottom of the packing material and the bottom surface of the concrete spandrel beam (Item 1B) to allow installation of the fill, void or cavity material (Item 3B) and the second piece of packing material (Item 3C). Tightly compress together splices (butt joints) in the lengths of packing material by using minimum 1/4 in. compression per piece of packing material. Use only Intertek certified products meeting the above minimum requirements.
i. When horizontal movement of ±16.7% and vertical shear of ±6.25% is required, install packing material at 50% compression. Cut the width of the packing material 2 times wider than the nominal joint width.

ii. When horizontal movement of ±5% is required, install packing material at 20% compression. Cut the width of the packing material 1.25 times wider than the nominal joint width.

B. CERTIFIED MANUFACTURER – 3M Company
CERTIFIED PRODUCT – FireDam™ or Fire Barrier
MODEL – FD Spray 200 (Elastomeric, Sprayable) or FB 1000 N/S Silicone Sealant (Non-sag) or FB 1003 S/L (Self Leveling)

Fill, Void or Cavity Material – Apply either spray coating or sealant over the bottom of the packing material (Item 3A) as follows:
Spray Coating – Spray apply the liquid to cover the exposed bottom surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply a minimum wet film thickness of 1/8 in. and overlap the spray coating a minimum 1/2 in. onto the adjacent curtain wall insulation (Item 2F) and concrete spandrel beam (Item 1B). When the spraying process is stopped and the applied spray coating cures to an elastomeric film before installation process is restarted, then overlap the edge of the cured spray coating at least 1/8 in. with the liquid spray coating.

Sealant – Apply non-sag sealant to cover the bottom of the exposed surface of the packing material (Item 3A) compressed and installed in the perimeter joint. Apply minimum 1/4 in. thickness non-sag sealant over the bottom of the packing material (Item 3A) and finish flush against the adjacent curtain wall insulation (Item 2F) and concrete spandrel beam (Item 1B).

C. Secondary Packing Material – Install after the fill, void or cavity material (Item 3B) is cured. Use a minimum 4 in. thick, 4-pcf density, mineral wool batt insulation installed with the fibers running parallel to the edge of concrete floor assembly (Item 1) and curtain wall assembly (Item 2). Cut packing material width to achieve same compression as packing material (Item 3A). Compress the packing material into the perimeter joint created between the curtain wall insulation (Item 2F) and the concrete spandrel beam (Item 1B). Stagger butt joints of secondary packing material and packing material (Item 3A). Tightly compress together splices (butt joints) in the lengths of packing material by using minimum 1/4 in. compression per piece of packing material. Verify finished installation flush with bottom of concrete spandrel beam (Item 1B). Use only Intertek certified products meeting the above minimum requirements.

D. Cover Plate – Install a minimum 18 GA, L-shaped, steel plate having a nominal 3 in. vertical leg and a horizontal leg sized to span the nominal joint width between the curtain wall insulation (Item 2F) and the concrete spandrel beam (Item 1B). Position the steel plate flush against bottom of concrete spandrel beam (Item 1B) and against the interior exposed vertical aluminum framing, mullions, (Item 2B). Attach the vertical leg of the L-shaped, steel plate to each vertical aluminum framing, mullion, (Item 2B) using minimum #10, self-tapping sheet metal screws nominally 2 in. below the horizontal leg. Space fasteners a maximum of 48 in. on center and attach the horizontal leg of the L-shaped, steel plate to the bottom of concrete spandrel beam (Item 1B) using Hilti XC-20 THP fasteners or equivalent pre-mounted, plastic top-head, concrete nails made of zinc-coated (5 to 13μm thick), hardened steel having a nominal 3/4 in. shank length, 0.138 in. diameter, and dome head configuration.

1. FLOOR ASSEMBLY – The floor assembly consists of the following:
   A. Steel Floor and Steel Units – Minimum 18 GA steel fluted decking with open flutes measuring nominally 6-1/2 inches wide at the base, nominally 5-1/4 inches wide at the top, and nominally 3 inches deep. The direction of the flutes is perpendicular to the top of the wall assembly (Item 2).
   B. Concrete – Steel fluted decking (Item 1A) covered with normal weight concrete (approximately 150pcf and nominally 2000 psi) nominally 2 inches deep at its minimum thickness above the flutes in the steel fluted decking (Item 1A).

2. WALL ASSEMBLY – Non-loadbearing wall assembly positioned perpendicular to the floor ceiling assembly (Item 1) and consisting of the following:
   A. Steel Floor Tracks and Ceiling Runners – Two “C-shaped” roll formed nominal 0.030 inch thick steel tracks nominally measuring 3-5/8 inches wide with two 1-3/8 inch vertical legs. Use nominal 3/16-inch diameter, 1-1/4-inch long, Tapcons, hexhead concrete screws, to attach one track perpendicular to the flutes in the steel decking (Item 1A) on the bottom of floor ceiling assembly (Item 1) and the other track to the top of the floor assembly (Item 1) so that it is aligned plumb with the top track.
   B. Studs – Use “C-shaped” roll formed nominal 0.030 inch thick telescoping steel stud assemblies measuring 3-5/8 inches wide with two 1-3/8 inch vertical legs. Telescoping stud assembly consists of a stud (Item 2B1) and an extension stud (Item 2B2) inserted into the stud. Snap lock steel studs into the steel tracks (Item 2A) at nominal 24-inches on center.

Listed Manufacturer:
Trakloc International LLC
358TTS-030-138 Tracks (Item 2A)
358TSA-030-114 Telescoping Stud Assembly (Item 2B)
358TSO-030-114 Stud (Item 2B1)
358TSE-030-114 Extension Stud (Item 2B2)
C. Gypsum Board – Affix one layer of Type X 5/8-inch thick gypsum board affixed to each side of the telescoping stud assemblies (Item 2B) and tracks (Item 2A) using #8 1-1/2-inch bugle head screws spaced nominally 8-inches on center in the field and around the perimeter. Place no screws nominally 4-inches from the top of the Type X 5/8-inch thick gypsum board. Create a maximum 1-inch head of wall joint at the top of the wall assembly (Item 2) by cutting the Type X 5/8-inch thick gypsum board 1-inch shorter than the height between the steel tracks (Item 2A).

3. JOINT TREATMENT – Maximum 1-inch joint.
   A. Flute Packing Material – Use only mineral wool bearing an Intertek Certified Product Label and meeting the following minimum requirements. Fill the voids created between the flutes in the steel decking (Item 1A) with minimum 4 pcf mineral wool cut into trapezoidal “plug” shapes measuring nominally 3/4 inches less in length than the distance from exposed face to exposed face between the Type X 5/8-inch thick gypsum board (Item 2C) and larger than the trapezoidal openings being filled. Install the trapezoidal “plug” shapes measuring minimum 7-3/4 inches wide at the base, 5 inches wide at the top, and 4 inches deep into the open flutes in the steel decking (Item 1A).

   B. Joint Packing Material – Use only mineral wool bearing an Intertek Certified Product Label and meeting the following minimum requirements. Fill the joint created between the flute packing material (Item 3A) and the top edge of the Type X 5/8-inch thick gypsum board (Item 2C) with 4 pcf mineral wool cut into two filler strips nominally measuring 1-1/2 inches wide by 3/8-inch thick by 24-inches long. Install the filler strips and compress their butt joints. The surface of the flute packing material (trapezoidal shapes) (Item 3A) and the filler strips make a flush recessed surface. Confirm nominal 1/4-inch recess from the exposed face of the Type X 5/8-inch thick gypsum board (Item 2C) to the flush face of the mineral wool insulation.

   C. FILL, VOID OR CAVITY MATERIAL – Fill the nominal 1/4-inch recess with sealant measuring minimum 1/4-inch thick. Trowel-apply sealant over all of the flute packing material (Item 3A) and the joint packing material (Item 3B) overlapping the sealant onto the Type X 5/8-inch thick gypsum board (Item 2C) nominally 1/2 inch.

Listed Manufacturer:
   3M Joint Sealant
   Interam™ FireDam™ 150+ Caulk (Item 3C)

1. **FLOOR ASSEMBLY** – The floor assembly consists of the following:
   
   A. Steel Floor and Steel Units – Minimum 18 GA steel fluted decking with open flutes measuring nominally 6-1/2 inches wide at the base, nominally 5-1/4 inches wide at the top, and nominally 3 inches deep. The direction of the flutes is parallel to the top of the wall assembly (Item 2).
   
   B. Concrete – Steel fluted decking (Item 1A) covered with normal weight concrete (approximately 150 pcf and nominally 2000 psi) nominally 2 inches deep at its minimum thickness above the flutes in the steel fluted decking (Item 1A).

2. **WALL ASSEMBLY** – Non-loadbearing wall assembly positioned perpendicular to the floor ceiling assembly (Item 1) and consisting of the following:
   
   A. Steel Floor Tracks and Ceiling Runners – Two “C-shaped” roll formed nominal 0.030 inch thick steel tracks nominally measuring 3-5/8 inches wide with two 1-3/8 inch vertical legs. Use nominal 3/16-inch diameter, 1-1/4-inch long, Tapcons, hexhead concrete screws, to attach one track to the bottom of a flute (parallel to the remaining flutes) in the steel fluted decking (Item 1A) on the bottom of floor ceiling assembly (Item 1) and the other track to the top of the floor assembly (Item 1) so that it is aligned plumb with the top track.

   B. Studs – Use “C-shaped” roll formed nominal 0.030 inch thick telescoping steel stud assemblies measuring 3-5/8 inches wide with two 1-3/8 inch vertical legs. Telescoping stud assembly consists of a stud (Item 2B1) and an extension stud (Item 2B2) inserted into the stud. Snap lock steel studs into the steel tracks (Item 2A) at nominal 24-inches on center.

F Rating – 1 hr.

Rated for +18.25% vertical movement
Design No. CEJ 481 H continued

C. Gypsum Board – Affix one layer of Type X 5/8-inch thick gypsum board affixed to each side of the telescoping stud assemblies (Item 2B) and tracks (Item 2A) using #8 1-1/2-inch bugle head screws spaced nominally 8-inches on center in the field and around the perimeter. Place no screws nominally 4-inches from the top of the Type X 5/8-inch thick gypsum board. Create a maximum 1-inch head of wall joint at the top of the wall assembly (Item 2) by cutting the Type X 5/8-inch thick gypsum board 1-inch shorter than the height between the top of the flute in the steel fluted decking (Item 1A) and the bottom steel track (Item 2A) attached to the top of the concrete (Item 1B) in the floor assembly (Item 1).

3. JOINT TREATMENT – Maximum 1-inch joint.
   A. Joint Packing Material – Use only mineral wool bearing an Intertek Certified Product Label and meeting the following minimum requirements. Fill the joint created between the top of the flute in the steel fluted decking (Item 1A) and the top edge of the Type X 5/8-inch thick gypsum board (Item 2C) with 4 pcf mineral wool cut into two filler strips nominally measuring 1-1/2 inches wide by 3/8-inch thick by 24-inches long. Install the filler strips and compress their butt joints. Confirm nominal 1/4-inch recess from the exposed face of the Type X 5/8-inch thick gypsum board (Item 2C) to the flush face of the mineral wool insulation.
   B. FILL VOID OR CAVITY MATERIAL – Fill the nominal 1/4-inch recess with sealant measuring minimum 1/4-inch thick. Trowel-apply sealant over all of the joint packing material (Item 3A) overlapping the sealant onto the Type X 5/8-inch thick gypsum board (Item 2C) nominally 1/2 inch.

Listed Manufacturer:
   3M Joint Sealant
   Interam™ FireDam™ 150+ Caulk (Item 3C)
   This material was extracted and drawn by 3M Fire Protection Products from the 2010 Product Directory, © Intertek
1. FLOOR ASSEMBLY – The floor assembly consists of the following:
   A. Concrete – Poured-in-place normal weight concrete (approximately 150 pcf and nominally 2000 psi) nominally 4.5 inches deep at its minimum thickness with steel rebar reinforcement.

2. WALL ASSEMBLY – Non-loadbearing wall assembly positioned perpendicular to the floor ceiling assembly (Item 1) and consisting of the following:
   A. Steel Floor Tracks and Ceiling Runners – Two “C-shaped” roll formed nominal 0.030 inch thick steel tracks nominally measuring 3-5/8 inches wide with two 1-3/8 inch vertical legs. Use nominal 3/16-inch diameter, 1-1/4-inch long, Tapcons, hexhead concrete screws, to attach one track to the bottom of floor ceiling assembly (Item 1) and the other track to the top of the floor assembly (Item 1) so that it is aligned plumb with the top track.

   Listed Manufacturer:
   Trakloc International LLC
   358TTS-030-138 Tracks (Item 2A)

   B. Studs – Use “C-shaped” roll formed nominal 0.030 inch thick telescoping steel stud assemblies measuring 3-5/8 inches wide with two 1-3/8 inch vertical legs. Telescoping stud assembly consists of a stud (Item 2B1) and an extension stud (Item 2B2) inserted into the stud. Snap lock steel studs into the steel tracks (Item 2A) at nominal 24-inches on center.

   Listed Manufacturer:
   Trakloc International LLC
   358TSA-030-114 Telescoping Stud Assembly (Item 2B)
   358TSO-030-114 Stud (Item 2B1)
   358TSE-030-114 Extension Stud (Item 2B2)

   C. Gypsum Board – Affix one layer of Type X 5/8-inch thick gypsum board affixed to each side of the telescoping stud assemblies (Item 2B) and tracks (Item 2A) using #8 1-1/2-inch bugle head screws spaced nominally 8-inches on center in the field and around the perimeter. Place no screws nominally 4-inches from the top of the Type X 5/8-inch thick gypsum board. Create a maximum 1 inch head of wall joint at the top of the wall assembly (Item 2) by cutting the Type X 5/8-inch thick gypsum board 1 inch shorter than the height between the bottom of floor ceiling assembly (Item 1) and the bottom steel track attached to the top of the concrete (Item 1A) in the floor assembly (Item 1).
Design No. CEJ 482 H continued

3. JOINT TREATMENT – Maximum 1-inch joint.
   A. Joint Packing Material - Use only mineral wool bearing an Intertek Certified Product Label and meeting the following minimum requirements. Fill the joint created between the bottom of floor ceiling assembly (Item 1) and the top edge of the Type X 5/8-inch thick gypsum board (Item 2C) with 4pcf mineral wool cut into two filler strips nominally measuring 1-1/2 inch wide by 3/8-inch thick by 24-inches long. Install the filler strips and compress their butt joints. Confirm nominal 1/4-inch recess from the exposed face of the Type X 5/8-inch thick gypsum board (Item 2C) to the flush face of the mineral wool insulation.
   B. FILL, VOID OR CAVITY MATERIAL – Fill the nominal 1/4-inch recess with sealant measuring minimum 1/4-inch thick. Trowel-apply sealant over all of the joint packing material (Item 3A) overlapping the sealant onto the Type X 5/8-inch thick gypsum board (Item 2C) nominally 1/2 inch.

Listed Manufacturer:
   3M Joint Sealant
   Interam™ FireDam™ 150+ Caulk (Item 3C)

FIRE RESISTANT GREASE DUCT
3M Company
3M Fire Barrier™ Duct Wrap 615+
ASTM E 2336-04 (2009) and
ICC-ES Acceptance Criteria for Grease Duct Enclosure Systems (AC101)
Noncombustibility Test (ASTM E 136) – Pass
Fire Resistance Test (ASTM E 119) – 2 hr
Durability Test (ASTM C 518 modified) – Pass
Internal Fire Test – 4 hr @ 500°F and 30 minutes @ 2000°F – Pass
Fire-Engulfment Test (ASTM E 119 Exposure) – 2 hr

1. GREASE DUCT: Use a continuously-welded, liquid-tight, L-shaped, rectangular duct system with horizontal and vertical shafts constructed of 16 GA sheet steel with a maximum 2304 inch² area and a maximum 48-inch dimension. When required, equip the duct with a pre-fabricated access door (Item 6) or field-fabricated access door (Item 7).
   A. Construct the grease duct using sections affixed to each other with welded joints.
   B. Reinforce the grease duct to IMC or NFPA 96 requirements designed to carry the weight of the grease duct assembly covered with two layers of insulation (Item 4) under a fire load equivalent to the ASTM E 2336 exposure and the ASTM E 119 time-temperature curve.
   C. Rigidly support the grease duct (Item 1) as specified in Item 5 or in accordance with IMC or NFPA 96 requirements when those requirements are greater.
   D. Protect the annular space around the grease duct (Item 1) passing through a fire-rated assembly with an Intertek-certified, compatible, 3M, penetration firestop system, refer to Section 10, having the same fire rating as the assembly.

2. FASTENERS: Refer to Figure 1. Weld minimum 12 GA, 6-1/2-inch long, copper-coated, steel insulation pins or 12 GA, insulated cup head steel pins to the grease duct (Item 1). Match the following fastener method with corresponding insulation (Item 4) method.
   A. Compression Butt Joint: Refer to 4A Section View B-B. Locate pins at all blanket overlaps, on all sides of the grease duct (Item 1), and meet the following requirements.
      i. Space pins maximum 12 inches apart in rows across the width of grease duct (Item 1). Locate pins maximum 6-3/4 inches from the edges of the grease duct (Item 1). Refer to section view A-A.
      ii. Space the rows of pins as follows: use pattern nominal 9 inches apart, then maximum 2 inches apart, then nominal 9 inches apart along the length of the grease duct (Item 1). Refer to Item 4A section view B-B.

1 ACCEPTANCE CRITERIA FOR GREASE DUCT ENCLOSURE ASSEMBLIES, AC101, Approved April 2001 (Editorially revised October 2004) states, “The system may be installed with zero clearance from the insulating materials to combustibles.”
iii. After insulation (Item 4A) is installed, place minimum 2-1/2 x 2-1/2-inch square, galvanized steel, self-locking washer clips onto all insulation pins.

iv. After clips are installed, cut off or bend flush with insulation (Item 4A) the pins that are too long.

B. Butt Joint with Collar: Refer to 4B Section View B-B. Locate pins at all blanket overlaps, on all sides of the grease duct (Item 1), and meet the following requirements.

i. Space pins maximum 12 inches apart in rows across the width of grease duct (Item 1). Locate pins maximum 6-3/4 inches from the edges of the grease duct (Item 1). Refer to section view A-A.

ii. Space the rows of pins as follows: use pattern nominal 9 inches apart, then maximum 3 inches apart, then nominal 9 inches apart along the length of the grease duct (Item 1). Refer to Item 4B section view B-B.

iii. After insulation (Item 4B) is installed, place minimum 2-1/2 x 2-1/2-inch square, galvanized steel, self-locking washer clips onto all insulation pins.

iv. After clips are installed, cut off or bend flush with insulation (Item 4B) the pins that are too long.

C. Single End Overlap (Telescope): Refer to 4C Section View B-B. Locate pins at all blanket overlaps, on all sides of the grease duct (Item 1), and meet the following requirements.

i. Space pins maximum 12 inches apart in rows across the width of grease duct (Item 1). Locate pins maximum 6-3/4 inches from the edges of the grease duct (Item 1). Refer to section view A-A.

ii. Space the rows of pins maximum 10-1/2 inches apart along the length grease duct (Item 1). Where pieces of insulation (Item 4C) are butted together, space pins a maximum 1-1/2 inches from the edge of the insulation. Refer to Item 4C section view B-B.

iii. After insulation (Item 4C) is installed, place minimum 2-1/2 x 2-1/2-inch square, galvanized steel, self-locking washer clips onto all insulation pins.

iv. After clips are installed, cut off or bend flush with insulation (Item 4C) the pins that are too long.

D. Dual End Overlap (Checkerboard): Refer to 4D Section View B-B. Locate pins at all blanket overlaps, on all sides of the grease duct (Item 1), and meet the following requirements.

i. Space pins maximum 12 inches apart in rows across the width of grease duct (Item 1). Locate pins maximum 6-3/4 inches from the edges of the grease duct (Item 1). Refer to section view A-A.

ii. Space the rows of pins maximum 10-1/2 inches apart along the length grease duct (Item 1). Where pieces of insulation (Item 4D) are butted together, space pins a maximum 1-1/2 inches from the edge of the insulation. Refer to Item 4D section view B-B.

iii. After insulation (Item 4D) is installed, place minimum 2-1/2 x 2-1/2-inch square, galvanized steel, self-locking washer clips onto all insulation pins.

iv. After clips are installed, cut off or bend flush with insulation (Item 4D) the pins that are too long.

3. BANDING: Do not use banding for the installation of insulation method (Item 4A), Compression Butt Joint. Banding is an option to fastener methods (Items 2B, 2C and 2D) but not fastener method (Item 2A). After insulation (Item 4) is installed, apply minimum 1/2 inch wide, 0.015-inch thick stainless steel bands or minimum 1/2 inch wide, 0.020-inch thick carbon steel bands and secured with minimum 1-inch long stainless or carbon steel crimp clamps to be used with corresponding banding type. When needed to ease installation, use filament tape as a temporary hold for the insulation (Item 4) prior to banding. Place banding a maximum 1-1/2 inches from all insulation (Item 4) edges and a maximum of 10-1/2 inches on center (O.C.). Tension the banding to hold the insulation (Item 4) in place without cutting or damaging the insulation (Item 4) or grease duct (Item 1).

4. CERTIFIED MANUFACTURER: 3M Company

CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
MODEL: 615+

INSULATION: Apply the non-combustible (ASTM E136) and durable (ASTM C518) insulation in two layers of nominal 1-1/2-inches thick, 6-pcf density blanket, made of calcium-, silica-, and magnesium-oxide (CSM) fibers, encapsulated with polypropylene-foil or aluminized polyester-foil scrim over the entire surface of the grease duct. (Item 1). Apply the inner first layer (Figure 1, 4.1) in accord with one of the four methods (A, B, C, or D) that follow. Offset the second outer layer (Figure 1, 4.2) one half the width of the outer first layer (Figure 1, 4.1) so that the joints of the first layer (Figure 1, 4.1) are covered by and approximately in the center of the second outer layer (Figure 1, 4.2). Apply the second outer layer (Figure 1, 4.2) in accord with the same method selected for the first inner layer (Figure 1, 4.1). Use blanket, available in various widths, that is fully encapsulated or single faced with a polypropylene-foil or polyester-foil scrim. Expose a foil-faced side of insulation to view. Wrap one layer of insulation around the grease duct (Item 1) perimeter so that each terminating end of insulation overlaps onto the starting end of insulation a minimum of 3 inches at all transverse joints. Stagger the transverse overlap location so that no two consecutive adjacent overlaps align. Refer to section view A-A for transverse overlap section view. Cover all visually-exposed ends and edges of insulation with nominal 4-inch wide, pressure-sensitive, aluminum foil tape.

A. Compression Butt Joint: Refer to Item 4A section view B-B. Wrap the grease duct (Item 1) with two layers of insulation installed with compression butt joints at all circumferential joints. Apply the first layer, center pieces of insulation (Item 4A) over 2-inch-wide pin bay, so that each piece nominal 24-inch-wide blanket occupies two (2) full 9-inch-wide bays and three (3) full 2-inch-wide bays. Compress each edge of each piece of insulation together and butt to preceding edge of insulation in 2-inch-wide bays. After installation, each piece of installed insulation width is 2 inches less than insulation nominal width. (Example: each piece of nominal 24-inch-wide insulation when installed is 22 inches wide.) Verify all insulation butt joints are compressed minimum 50% at compression butt joints. Offset the second layer of insulation so that the compression butt joint of the first layer of insulation is centered under the second layer of insulation and install in same manner as first layer of insulation.

B. Butt Joint with Collar: Refer to Item 4B section view B-B. Wrap the grease duct (Item 1) with two layers of insulation installed with butt joints at all circumferential joints. Apply the first layer, center pieces of insulation (Item 4A) over 3 inch wide pin bay, so that each piece nominal 24-inch-wide blanket occupies two (2) full 9-inch-wide bays and one (1) full 3-inch-wide bays and half of two (2) 3-inch-wide bays at each circumferential edge. Butt each end of each piece of insulation together with preceding edge of insulation. Each piece of installed insulation width is its nominal width. (Example: each piece of nominal 24-inch-wide insulation when installed
6. CERTIFIED MANUFACTURER: 3M Company

CERTIFIED PRODUCT: 3M Fire Barrier™ Grease Duct Access Door

MODELS:
- 000-51115-16584-9 (door for 20x20 opening),
- 000-51115-16583-2 (door for 12x8 opening), and
- 000-51115-16582-5 (door for 10x6 opening)

CERTIFIED MANUFACTURER: Ductmate Industries, Inc.

CERTIFIED PRODUCT: Grease Duct Access Door

MODELS: Ductmate ULtimate Door™
- D2020ULWS (door for 20x20 opening),
- D128ULWS (door for 12x8 opening), and
- D106ULWS (door for 10x6 opening)

ACCESS DOOR ASSEMBLY: When required, apply an access door and insulated cover plate as described:

A. OPTIONAL PRE-FABRICATED ACCESS DOOR: Mark a clean-out access opening location on the grease duct (Item 1) with insulation (Item 4) at its mid-height along the horizontal section. Cut an opening (maximum 22 x 22 inches) in the insulation (Item 4) the same size as the outside dimension of the desired pre-fabricated access door model. Remove and discard the cut insulation (Item 4). Cut an opening (maximum 20 x 20 inches) into the side of the grease duct (Item 1) according to the manufacturer’s instructions for the size of the pre-fabricated access door to be installed. Install and tightly secure the pre-fabricated access door in accordance with the manufacturer’s instructions to the grease duct (Item 1). Fit pre-fabricated access door with four (4), 3/8-inch diameter, corner-thumb bolts through the exterior face.

B. CERTIFIED MANUFACTURER: 3M Company

CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap

MODEL: 615+
DESIGN NO. 3MU/FRD 120-18 continued

Figure 2 – 3M Pre-fabricated Access Door

ACCESS INSULATION: Remove the four (4), 3/8-inch diameter, corner-thumb bolts and replace them with four (4), 3/8-inch diameter, all-thread, steel rods extending from pre-fabricated access door (Item 6A). Apply three (3) layers of access insulation over the pre-fabricated access door (Item 6A) as follows. Cut the first piece of rectangular access insulation a minimum 1/4 inch larger than the clean-out access opening. Position, square, and impale the first piece of the access insulation over the four (4), 3/8-inch diameter, all-thread, steel rods extending from pre-fabricated access door (Item 6A). Press the first piece of access insulation flush over the pre-fabricated access door (Item 6A). Compress and abut the cut edges of the first piece of the access insulation against the cut edges of opening in the insulation (Item 4). Cut a second piece of access insulation the same size as the first piece of access insulation. Press the second piece of access insulation flush over the first piece of access insulation. Compress and abut the cut edges of the first piece of the access insulation against the cut edges of opening in the insulation (Item 4). Cut a third piece of rectangular access insulation a minimum of 2 inches larger than the second piece of access insulation on all sides. Seal cut edges of the third piece of access insulation with nominal 4-inch-wide aluminum foil tape. Position, square, and impale the third piece of the access insulation over the four (4), 3/8-inch diameter, all-thread, steel rods extending from pre-fabricated access door (Item 6A). Press the third piece of access insulation flush over second piece of access insulation.

C. COVER PLATE: Cut a cover plate to the same dimensions as the third piece of access insulation (Item 6B) using a minimum 16 GA steel sheet. Drill holes in the cover plate that match the location of the four (4), 3/8-inch diameter, all-thread, steel rods and locate the holes so that the cover plate is squared to the third piece of access insulation (Item 6B). After all three (3) layers of access insulation (Item 6B) are impaled over the four (4), 3/8-inch diameter, all-thread, steel rods install the cover plate. Pass the four (4), 3/8-inch diameter, all-thread, steel rods through the cover plate. Place washers and wing nuts onto each of the four (4), 3/8-inch diameter, all-thread, steel rods. Secure the cover plate by tightening wing nuts.

Figure 3 – Field Fabricated Access Door Option A

7. OPTIONAL FIELD-FABRICATED ACCESS DOORS: Mark a clean-out access opening location on the grease duct (Item 1) with insulation (Item 4) at its mid-height along the horizontal section. Use either Option A or B.

A. (OPTION A) Cut a 12x12-inch opening in the insulation (Item 4). Remove and discard the cut insulation (Item 4). Cut and center a 10x10-inch opening into the side of the grease duct (Item 1) by maintaining a 1-inch clearance between the perimeter of the opening and the cut insulation (Item 4). Remove and discard the cut steel. Weld four (4), minimum 4-inch long, 1/4-inch diameter, all-thread, steel
**DESIGN NO. 3MU/FRD 120-18**

rods to the grease duct (Item 1). Locate one (1) steel rod at each corner of the grease duct (Item 1) opening so that they are 11 inches on center and squared within the insulation (Item 4) opening.

i. **ACCESS DOOR:** Cut a 12x12-inch, 16 GA, steel plate to be used as an access door. Drill clearance holes in the access door to match the all-thread, steel rod pattern. Place the access door over the all-thread, steel rods. Seal the opening in the grease duct (Item 1) by overlapping the access door over the opening cut in the insulation (Item 4) by 1 inch on all sides. Weld four (4), minimum 6-1/2-inch long, 12 GA, copper-coated, steel insulation pins to the access door corners so that the insulation pins are 9 inches on center.

ii. **CERTIFIED MANUFACTURER:** 3M Company

**CERTIFIED PRODUCT:** 3M Fire Barrier™ Duct Wrap

**MODEL:** 615+

**ACCESS INSULATION:** Apply three (3) layers of access insulation over the access door. Cut the first piece of access insulation into a 12x12-inch square and install it over the insulation pins and cover the access door (Item 7a). Cut the second piece of access insulation into a 14x14-inch square. Square it and install it over the insulation pins. Cover the first piece of access insulation so that a 1-inch overlap exists. Cut the third piece of access insulation into a 16x16-inch square. Square it and install it over the insulation pins. Cover the second piece of access insulation so that a 1-inch overlap exists. Secure access insulation to the insulation pins with 1-1/2-inch long, 12 GA, copper-coated, steel insulation pins. Turn down or cut off insulation pins that extend beyond the second piece of access insulation. Secure the access door by tightening the wing nuts.

**B. (OPTION B)** Cut a maximum 16x16-inch opening into the insulation (Item 4) and the grease duct (Item 1). Remove and discard the cut insulation (Item 4) and steel. Weld together four (4) pieces of 1-1/2 x 1-1/4 x 1/8-inch steel angle, with the flange outward, to form a 1-1/2-inch tall, flanged frame. Position, center, and continuously weld the flanged frame around the opening in the grease duct (Item 1). Position one (1), minimum 4-inch long, 1/4-inch diameter, all-thread, steel rod in the center of each of the four (4) corners of the flange and weld them in place.

i. **ACCESS DOOR:** Cut an 18-1/2 x 18-1/2-inch, 16 GA, steel plate to be used as an access door. Drill clearance holes in the access door to match the all-thread, steel rod pattern on the flange. Place the access door over the all-thread, steel rods.

ii. **COVER PLATE:** Cut a 20-1/2 x 20-1/2-inch cover plate out of 16 GA steel sheet and drill clearance holes matching the locations of the all-thread, steel rods on the flange. Weld minimum four (4), 12 GA, copper-coated, steel insulation pins onto the internal surface of the cover plate, spaced minimum 14 inches on center. Limit insulation pin length to one-half total access insulation thickness. Install access insulation (Item 7bii). Position the cover plate with access insulation over the all-thread, steel rods flush to access door. Apply washers and wing nuts over the all-thread, steel rods. Secure the access door by tightening the wing nuts.

iii. **CERTIFIED MANUFACTURER:** 3M Company

**CERTIFIED PRODUCT:** 3M Fire Barrier™ Duct Wrap

**MODEL:** 615+

**ACCESS INSULATION:** Apply two layers of access insulation over the interior of the cover plate. Cut the first piece of access insulation into a 20-1/2 x 20-1/2-inch square and install it over the insulation pins on the internal surface of the cover plate. Cut the second piece of access insulation into a 24 x 24-inch square. Square it to and install it over the insulation pins. Cover the first piece of access insulation so that a 1-3/4-inch overlap exists. Secure access insulation to insulation pins with 1-1/2-inch long, 12 GA, copper-coated, steel insulation pins. Turn down or cut off insulation pins that extend beyond the second piece of access insulation.

8. **NONCOMBUSTIBLE SUPPORTING CONSTRUCTION:** Refer to Figures 3 and 4. Use one of the following wall or floor assemblies.

A. **GYPSUM WALL ASSEMBLY:** Symmetrical two-hour rated gypsum wall assembly constructed of the following:

i. **Steel Studs – Minimum 25 GA galvanized steel studs measuring 3-5/8 inch wide with 1-1/4-inch legs spaced maximum 24 inch on center (O.C.). Attach studs with minimum #6 x 3-8/8-inch steel stud framing screws to floor and ceiling tracks.**
DESIGN NO. 3MU/FRD 120-18 continued

Figure 5 – Noncombustible Supporting Constructions

ii. Tracks – Channel U-shaped floor and ceiling runners measuring 1/2-inch deep by 3-5/8-inch wide, which are secured to floor and ceiling with 1-inch long fasteners suitable for the mounting to substrate and spaced maximum 18-inch O.C.

iii. Gypsum Board – Cover studs and runners with two layers of 5/8 inch thick, Type X gypsum board on each face. Fasten base layer of gypsum board to steel studs with #6 1-1/8 inch bugle head phillips drywall screws spaced maximum 12 inch O.C. Fasten face layer of gypsum board with #6, 1-5/8 inch long bugle phillips drywall screws spaced maximum 8 inches O.C. Apply vinyl or casein, dry or premixed joint compound to face layers of gypsum board in two coats to all exposed screw heads and gypsum board joints. Embed minimum 2 inch wide paper, plastic or fiberglass tape in first layer of joint compound over joints in gypsum board. Minimum wall assembly thickness of 6 inches measured from face layer of gypsum board to opposite face layer of gypsum board.

B. SHAFT WALL ASSEMBLY:
Asymmetrical two-hour rated gypsum shaft wall assembly constructed of the following:

1. Visual Gypsum Board – Cover studs and runners with two layers of minimum 1/2 inch thick, Type X gypsum board on each face. Fasten base layer of gypsum board to steel studs with #6 1-1/8 inch bugle head phillips drywall screws spaced maximum 12 inch O.C. Fasten face layer of gypsum board with #6, 1-5/8 inch long bugle phillips drywall screws spaced maximum 8 inches O.C. Apply vinyl or casein, dry or premixed joint compound to face layers of gypsum board in two coats to all exposed screw heads and gypsum board joints. Embed minimum 2 inch wide paper, plastic or fiberglass tape in first layer of joint compound over joints in gypsum board. Minimum wall assembly thickness of 4-1/2 inches measured from face layer of gypsum board to opposite face layer of gypsum board.

2. Interior Gypsum Board – Cut 1-inch thick Type X gypsum board 1-inch less than floor to ceiling height. Insert the longitudinal edges of the 1-inch thick Type X gypsum board into the C-T or C-H studs. Secure the transverse edge of the 1-inch thick Type X gypsum board to the long leg of J-runner using its tabs or minimum 1-5/8-inch long Type S self-tapping bugle head steel screws spaced maximum 12 inches on center.

3. Steel Studs – Cut minimum 25 GA galvanized steel C-T or C-H studs measuring minimum 2-1/2 inches wide with minimum 1-1/2-inch flanges 3/4-inches less than floor to ceiling height and spaced maximum 24 inch on center (O.C.) in runners with T or H section abutting long leg of runner.

4. Runners – Use minimum 2-1/2-inch wide J-runner compatible with studs and having unequal vertical legs: minimum 1-inch short leg and minimum 2-inch long leg. Position J-runners with short leg towards visual face of shaft wall. Attach to floor and ceiling using steel fasteners located a maximum of 2-inches from each end and a maximum of 24 inch O.C.

C. CONCRETE WALL ASSEMBLY: Symmetrical, two-hour rated, solid concrete, wall assembly made from reinforced lightweight or normal weight (100-150pcf or 1600-2400 kg/m3) concrete, which may also be used as a shaft wall assembly. Constructed of solid concrete with a minimum concrete thickness measured from exposed face to exposed face using one of the following:

1. lightweight concrete is 3.6 inches;
2. sand-lightweight concrete is 3.8 inches;
3. carbonate aggregate concrete is 4.6 inches; and
4. siliceous aggregate concrete is 5.0 inches.

D. MASONRY WALL ASSEMBLY: Symmetrical, two-hour rated, nominal 8 x 8 x 16 CMU, wall assembly made from lightweight or normal weight (100-150pcf or 1600-2400 kg/m3) concrete, which may also be used as a shaft wall assembly.

E. CONCRETE FLOOR ASSEMBLY: Symmetrical two-hour rated solid concrete floor assembly made from reinforced lightweight or normal weight (100-150pcf or 1600-2400 kg/m3) concrete. Constructed of solid concrete with a minimum concrete thickness measured from exposed face to exposed face using one of the following:

1. lightweight concrete is 3.6 inches;
2. sand-lightweight concrete is 3.8 inches;
3. carbonate aggregate concrete is 4.6 inches; and
4. siliceous aggregate concrete is 5.0 inches

1 Refers to building construction referenced in the building codes.
9. OPENING – Create an opening in the assembly. Position the grease duct (Item 1) concentrically or eccentrically in the opening so that the annular space ranges from minimum 0.5 inch to maximum 4-1/2 inches. Establish an opening designed to house the grease duct (Item 1) covered with insulation (Item 4) and the desired annular space but not exceeding a cross-sectional area of maximum 3136 inch² and a maximum dimension of 59.5 inches.
10. PENETRATION FIRESTOP: Install two-hour, fire-resistant, ASTM E 814, firestop system. Install firestop between the supporting construction (Item 6) and the grease duct (Item 1) or the grease duct (Item 1) protected with the insulation (Item 4). Use a symmetrical wall penetration firestop, an asymmetrical shaft penetration firestop, or an asymmetrical floor penetration firestop constructed of the following components.

A. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
   MODEL: 615+
   PACKING MATERIAL: Fill the entire annular space’s width with minimum 4-pcf density mineral wool or certified insulation without the encapsulation (foil scrim).
   Cut the packing material into strips not less than one and one half (1-1/2) times the width of the annular space to be filled. Compress packing material nominally 33% and insert packing material into the annual space.
   For wall assemblies, recess the surface of packing material nominally 5/8 inches from surfaces of both faces of the supporting construction (Item 8).
   For floor assemblies, recess the surface of packing material nominally 5/8 inches from the visual surface of the supporting construction (Items 8) and install a minimum depth of 4-inches.

B. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M™ Fire Barrier™ Sealant
   MODEL: Water-Tight 1000-NS Silicone, 1003-SL Silicone (Floor Assembly Only), 2000+ Silicone, or CP 25 WB+
   FILL, VOID OR CAVITY MATERIAL:
   Install minimum 5/8-inch depth of fill material into the recess over the entire surface of the packing material (Item 7A). Screed the fill material flush with the surface of the supporting construction (Item 8). Overlap a minimum of 1/4 inches, the fill material onto face of supporting construction (Item 8).

FIRE RESISTANT GREASE DUCT
3M Company
3M Fire Barrier™ Duct Wrap 615+
ASTM E 2336-04 (2009) and
ICC-ES Acceptance Criteria for Grease Duct Enclosure Systems (AC101)
Noncombustibility Test (ASTM E 136) – Pass
Fire Resistance Test (ASTM E 119) – 2 hr
Durability Test (ASTM C 518 modified) – Pass
Internal Fire Test – 4 hr @ 500°F and 30 minutes @ 2000°F – Pass
Fire-Engulfment Test (ASTM E 119 Exposure) – 2 hr

1. GREASE DUCT: Use a continuously-welded, liquid-tight, L-shaped, circular duct system with horizontal and vertical shafts constructed of 16 GA sheet steel with a maximum 1809 inch² area and a maximum 48-inch diameter. When required, equip the duct with a pre-fabricated access door (Item 6) or field-fabricated access door (Item 7).

A. Construct the grease duct using sections affixed to each other with welded joints.
B. Reinforce the grease duct to IMC or NFPA 96 requirements designed to carry the weight of the grease duct assembly covered with two layers of insulation (Item 4) under a fire load equivalent to the ASTM E 2336 exposure and the ASTM E 119 time-temperature curve.
C. Rigidly support the grease duct (Item 1) as specified in Item 5 or in accordance with IMC or NFPA 96 requirements when those requirements are greater.
D. Protect the annular space around the grease duct (Item 1) passing through a fire-rated wall assembly with an Intertek-certified, compatible, 3M, penetration firestop system, refer to section 10, having the same fire rating as the assembly.

2. FASTENERS: Refer to Figure 1. Weld minimum 12 GA, 6-1/2-inch long, copper-coated, steel insulation pins or 12 GA, insulated cup head steel pins to the grease duct (Item 1). Match the following fastener method with corresponding insulation (Item 4) method.

A. Compression Butt Joint: Refer to 4A Section View B-B. Locate pins at all blanket overlaps, on all sides of the grease duct (Item 1), and meet the following requirements.
iii. After insulation (Item 4A) is installed, place minimum 2-1/2 x 2-1/2-inch square, galvanized steel, self locking washer clips onto all insulation pins.
iv. After clips are installed, cut off or bend flush with insulation (Item 4A) the pins that are too long.

Figure 1

1. ACCEPTANCE CRITERIA FOR GREASE DUCT ENCLOSURE ASSEMBLIES, AC101, Approved April 2001 (Editorially revised October 2004) states, “The system may be installed with zero clearance from the insulating materials to combustibles.”
DESIGN NO. 3MU/FRD 120-19 continued

B. Butt Joint with Collar: Refer to 4B Section View B-B. Locate pins at all blanket overlaps, on all sides of the grease duct (Item 1), and meet the following requirements.
   i. Space pins maximum 12 inches apart in rows across the width of grease duct (Item 1). Locate pins maximum 6-3/4 inches from the edges of the grease duct (Item 1). Refer to section view A-A.
   ii. Space the rows of pins as follows: use pattern nominal 9 inches apart, then maximum 3 inches apart, then nominal 9 inches apart along the length of the grease duct (Item 1). Refer to Item 4B section view B-B.
   iii. After insulation (Item 4B) is installed, place minimum 2-1/2 x 2-1/2-inch square, galvanized steel, self-locking washer clips onto all insulation pins.
   iv. After clips are installed, cut off or bend flush with insulation (Item 4B) the pins that are too long.

C. Single End Overlap (Telescope): Refer to 4C Section View B-B. Locate pins at all blanket overlaps, on all sides of the grease duct (Item 1), and meet the following requirements.
   i. Space pins maximum 12 inches apart in rows across the width of grease duct (Item 1). Locate pins maximum 6-3/4 inches from the edges of the grease duct (Item 1). Refer to section view A-A.
   ii. Space the rows of pins maximum 10-1/2 inches apart along the length grease duct (Item 1). Where pieces of insulation (Item 4C) are butted together, space pins a maximum 1-1/2 inches from the edge of the insulation. Refer to Item 4C section view B-B.
   iii. After insulation (Item 4C) is installed, place minimum 2-1/2 x 2-1/2-inch square, galvanized steel, self-locking washer clips onto all insulation pins.
   iv. After clips are installed, cut off or bend flush with insulation (Item 4C) the pins that are too long.

D. Dual End Overlap (Checkerboard): Refer to 4D Section View B-B. Locate pins at all blanket overlaps, on all sides of the grease duct (Item 1), and meet the following requirements.
   i. Space pins maximum 12 inches apart in rows across the width of grease duct (Item 1). Locate pins maximum 6-3/4 inches from the edges of the grease duct (Item 1). Refer to section view A-A.
   ii. Space the rows of pins maximum 10-1/2 inches apart along the length grease duct (Item 1). Where pieces of insulation (Item 4D) are butted together, space pins a maximum 1-1/2 inches from the edge of the insulation. Refer to Item 4D section view B-B.
   iii. After insulation (Item 4D) is installed, place minimum 2-1/2 x 2-1/2-inch square, galvanized steel, self-locking washer clips onto all insulation pins.
   iv. After clips are installed, cut off or bend flush with insulation (Item 4D) pins that are too long.

3. BANDING: Do not use banding for the installation of insulation method (Item 4A), Compression Butt Joint. Banding is an option to fastener methods (Items 2B, 2C and 2D) but not fastener method (Item 2A). After insulation (Item 4) is installed, apply minimum 1/2 inch wide, 0.015-inch thick stainless steel bands or minimum 1/2 inch wide, 0.020-inch thick carbon steel bands and secured with minimum 1 inch long stainless or carbon steel crimp clamps to be used with corresponding banding type. When needed to ease installation, use filament tape as a temporary hold for the insulation (Item 4) prior to banding. Place banding a maximum 1-1/2 inches from all insulation (Item 4) edges and a maximum of 10-1/2 inches on center (O.C.). Tension the banding to hold the insulation (Item 4) in place without cutting or damaging the insulation (Item 4) or grease duct (Item 1).

4. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
   MODEL: 615+
   INSULATION: Apply the non-combustible (ASTM E136) and durable (ASTM C518) insulation in two layers of nominal 1-1/2-inches thick, 6-pcf density blanket, made of calcium-, silica-, and magnesium-oxide (CSM) fibers, encapsulated with polypropylene-foil or aluminized polyester-foil scrim over the entire surface of the grease duct (Item 1). Apply the inner first layer (Figure 1, 4.1) in accord with one of the four methods (A, B, C, or D) that follow. Offset the second outer layer (Figure 1, 4.2) one half the width of the inner first layer (Figure 1, 4.1) so that the joints of the inner first layer (Figure 1, 4.1) are covered by and approximately in the center of the second outer layer (Figure 1, 4.2). Apply the second outer layer (Figure 1, 4.2) in accord with the same method selected for the first inner layer (Figure 1, 4.1). Use blanket, available in various widths, that is fully encapsulated or single faced with a polypropylene-foil or polyester-foil scrim. Expose a foil-faced side of insulation to view. Wrap one layer of insulation around the grease duct (Item 1) perimeter so that each terminating end of insulation overlaps onto the starting end of insulation a minimum of 3 inches at all transverse joints. Stagger the transverse overlap location so that no side of insulation to view. Wrap one layer of insulation around the grease duct (Item 1) perimeter so that each terminating end of insulation overlaps onto the starting end of insulation a minimum of 3 inches at all transverse joints. Stagger the transverse overlap location so that no side of insulation to view. Wrap one layer of insulation around the grease duct (Item 1) perimeter so that each terminating end of insulation overlaps onto the starting end of insulation a minimum of 3 inches at all transverse joints. Stagger the transverse overlap location so that no side of insulation to view.

A. Compression Butt Joint: Refer to Item 4A section view B-B. Wrap the grease duct (Item 1) with two layers of insulation installed with compression butt joints at all circumferential joints. Apply the first layer, center pieces of insulation (Item 4A) over 2-inch-wide pin bay, so that each piece nominal 24-inch-wide blanket occupies two (2) full 9-inch-wide bays and three (3) full 2-inch-wide bays. Compress each edge of each piece of insulation together and butt to preceding edge of insulation in 2-inch-wide bays. After installation, each piece of installed insulation width is 2 inches less than insulation nominal width. (Example: each piece of nominal 24-inch-wide insulation when installed is 22 inches wide.) Verify all insulation butt joints are compressed minimum 50% at compression butt joints. Offset the second layer of insulation so that the compression butt joint of the first layer of insulation is centered under the second layer of insulation and install in same manner as first layer of insulation.

B. Butt Joint with Collar: Refer to Item 4B section view B-B. Wrap the grease duct (Item 1) with two layers of insulation installed with butt joints at all circumferential joints. Apply the first layer, center pieces of insulation (Item 4A) over 3 inch wide pin bay, so that each piece nominal 24-inch-wide blanket occupies two (2) full 9-inch-wide bays and one (1) full 3-inch-wide bays and half of two (2) 3-inch-wide bays at each circumferential edge. Butt each end of each piece of insulation together with preceding edge of insulation. Each piece of installed insulation width is its nominal width. (Example: each piece of nominal 24-inch-wide insulation when installed is 24 inches wide.) Offset the second layer of insulation so that the butt joint of the first layer of insulation is centered under the second layer of insulation and install in same manner as first layer of insulation. Place and center 6-inch-wide collar of insulation over the butt joint. Overlap 6-inch-wide collar onto each adjacent insulation 3 inches. Verify all insulation butt joints with collars are three layers of insulation in overall thickness.
C. Single End Overlap (Telescope): Refer to Item 4C section view B-B. Wrap the grease duct (Item 1) with two layers of insulation installed with 3-inch minimum overlaps at all longitudinal joints. Overlap each adjacent insulation edge with the edge of the next piece of insulation. Verify all insulation overlaps are three layers of insulation in overall thickness.

i. Starting at one end of the grease duct (Item 1), apply the first piece of insulation around the grease duct (Item 1) to overlap fasteners (Item 2C). Refer section view A-A.

ii. Position and overlap the leading edge of the second piece of insulation nominally 3 inches over the flush edge of the first piece of insulation. Place the opposite edge of the second piece of insulation flush against the surface of the grease duct (Item 1). An “S-shaped” cross section of the insulation is created. Refer to Item 4C section view B-B.

iii. Apply all additional pieces of insulation as “S-shaped” cross section of the insulation in compliance with Item 4Cii.

iv. Position the second layer of insulation so that the joint of the first layer of insulation is centered under the second layer of insulation and install in same manner as first layer of insulation.

D. Dual End Overlap (Checkerboard): Refer to Item 4D section view B-B. Verify all insulation overlaps are a minimum 3 inches in overall thickness. Do not align two consecutive insulation end overlaps. Overlap each full width insulation edge with the edge of the “gull wing” (v) shaped piece of insulation. Install insulation with zero clearance at the overlaps, or in the field between overlaps. Verify all insulation overlaps are four layers of insulation in overall thickness.

i. Wrap the first piece of insulation around the grease duct (Item 1) so that the insulation is flush against the surface of the grease duct (Item 1). Position the starting end of the insulation to overlap pins (Item 2A) a minimum of 1-1/2 inches while the edges of the insulation overlap the rows of pins (Item 2B) a minimum of 1-1/2 inches.

ii. Position the second piece of insulation nominally 18 inches from the edge of the first piece of insulation. Install the second piece in the same manner as the first.

iii. Cover the grease duct (Item 1) that is exposed between the edges of the first two pieces of insulation with another piece of insulation. Position the starting end of the insulation to overlap pins (Item 2A) a minimum of 1-1/2 inches while the edges of the insulation overlap the adjacent edges of the two pieces installed insulation a minimum of 1-1/2 inches.

iv. Position the second layer of insulation so that the first layer of insulation is centered under the second layer of insulation and install in same manner as first layer of insulation.

5. SUPPORTS: When the grease duct (Item 1) is 24-inches in diameter or smaller, support the grease duct (Item 1) with insulation (Item 4) using a 1/8-inch “trapeze” system composed of a minimum 2 x 2 x 1/8-inch steel angle as the trapeze cross-member and two (2), minimum 3/8-inch diameter, all-thread steel rods connected using nuts and washers. For grease ducts (Item 1) larger than 24-inches in diameter, support the grease duct (Item 1) with insulation (Item 4) using a un-insulated “trapeze” system composed of a minimum 2 x 2 x 1/4-inch steel angle as the trapeze cross-member and two (2), minimum 1/2-inch diameter, all-thread, steel rods connected using nuts and washers. Connect the all-thread steel rods to the bottom of the floor assembly using an attachment method designed to carry the weight of the grease duct (Item 1) with insulation (Item 4) under a fire load equivalent to ASTM E 119 time-temperature curve. Place one (1) all-thread steel rod at each end of trapeze cross-member. Center grease duct (Item 1) with insulation (Item 4) on trapeze cross-member. Space all-thread steel rods a maximum 6 inches from surface of the insulated grease duct or allowing all-thread steel rods to contact with the insulation (Item 4) at the minimum distance. Extend trapeze cross-member at least 2 inches past each all-thread, steel rod. Space trapeze supports a maximum 60 inches center.

6. CERTIFIED MANUFACTURER: Ductmate Industries, Inc.
CERTIFIED PRODUCT: Grease Duct Access Door

MODELS: Ductmate ULtimate Door™
- DR106†UL (Door for 10x6 opening),
- DR128†UL (Door for 12x8 opening), and
- DR1814†UL (Door for 18x14 opening)

* Insert duct diameter. (All doors are available for duct diameters of 12” and larger in 2” increments.)

ACCESS DOOR ASSEMBLY: When required, apply an access door and insulated cover plate as described:

A. OPTIONAL PRE-FABRICATED ACCESS DOOR: Mark a clean-out access opening location on the grease duct (Item 1) with insulation (Item 4) at its mid-height along the horizontal section. Cut an opening (maximum 22 x 22 inches) in the insulation (Item 4) the same size as the outside dimension of the desired pre-fabricated access door model. Remove and discard the cut insulation (Item 4). Cut an opening (maximum 20 x 20 inches) into the side of the grease duct (Item 1) according to the manufacturer’s instructions for the size of the pre-fabricated access door to be installed. Install and tightly secure the pre-fabricated access door in accordance with the manufacturer’s instructions to the grease duct (Item 1). Fit pre-fabricated access door with four (4), 3/8-inch diameter, corner-thumb bolts through the exterior face.

B. CERTIFIED MANUFACTURER: 3M Company
CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap

MODEL: 615+
DESIGN NO. 3MU/FRD 120-19 continued

Note: Section view not curved for clarity.

Figure 2 – Ductmate Pre-fabricated Access Door

ACCESS INSULATION: Remove the four (4), 3/8-inch diameter, corner-thumb bolts and replace them with four (4), 3/8-inch diameter, all-thread, steel rods extending from pre-fabricated access door (Item 6A). Apply three (3) layers of access insulation over the pre-fabricated access door (Item 6A) as follows. Cut the first piece of rectangular access insulation a minimum 1/4 inch larger than the clean-out access opening. Position, square, and impale the first piece of the access insulation over the four (4), 3/8-inch diameter, all-thread, steel rods extending from pre-fabricated access door (Item 6A). Press the first piece of access insulation flush over the pre-fabricated access door (Item 6A). Compress and abut the cut edges of the first piece of the access insulation against the cut edges of opening in the insulation (Item 4). Cut a second piece of access insulation the same size as the first piece of access insulation. Press the second piece of access insulation flush over the first piece of access insulation. Compress and abut the cut edges of the first piece of the access insulation against the cut edges of opening in the insulation (Item 4). Cut a third piece of rectangular access insulation a minimum of 2 inches larger than the second piece of access insulation on all sides. Seal cut edges of the third piece of access insulation with nominal 4-inch-wide aluminum foil tape. Position, square, and impale the third piece of the access insulation over the four (4), 3/8-inch diameter, all-thread, steel rods extending from pre-fabricated access door (Item 6A). Press the third piece of access insulation flush over second piece of access insulation.

C. COVER PLATE: Cut a cover plate to the same dimensions as the third piece of access insulation (Item 6B) using a minimum 16 GA steel sheet. Drill holes in the cover plate that match the location of the four (4), 3/8-inch diameter, all-thread, steel rods and locate the holes so that the cover plate is squared to the third piece of access insulation (Item 6B). After all three (3) layers of access insulation (Item 6B) are impaled over the four (4), 3/8-inch diameter, all-thread, steel rods install the cover plate. Pass the four (4), 3/8-inch diameter, all-thread, steel rods through the cover plate. Place washers and wing nuts onto each of the four (4), 3/8-inch diameter, all-thread, steel rods. Secure the cover plate by tightening wing nuts.

Figure 3 – Field Fabricated Access Door Option A

6. OPTIONAL FIELD-FABRICATED ACCESS DOORS: Mark a clean-out access opening location on the grease duct (Item 1) with insulation (Item 4) at its mid-height along the horizontal section. Use either Option A or B.

A. (OPTION A) Cut a 12x12-inch opening in the insulation (Item 4). Remove and discard the cut insulation (Item 4). Cut and center a 10x10-inch opening into the side of the grease duct (Item 1) by maintaining a 1-inch clearance between the perimeter of the opening and the cut insulation (Item 4). Remove and discard the cut steel. Weld four (4), minimum 4-inch long, 1/4-inch diameter, all-thread, steel rods to the grease duct (Item 1). Locate one (1) steel rod at each corner of the grease duct (Item 1) opening so that they are 11 inches on center and squared within the insulation (Item 4) opening.

i. ACCESS DOOR: Cut a 12x12-inch, 16 GA, steel plate to be used as an access door. Drill clearance holes in the access door to match the all-thread, steel rod pattern. Place the access door over the all-thread, steel rods. Seal the opening in the grease duct (Item 1) by overlapping the access door over the opening cut in the insulation (Item 4) by 1 inch on all sides. Weld four (4), minimum 6-1/2-inch long, 12 GA, copper-coated, steel insulation pins to the access door corners so that the insulation pins are 9 inches on center.
ii. **CERTIFIED MANUFACTURER:** 3M Company  
**CERTIFIED PRODUCT:** 3M Fire Barrier™ Duct Wrap  
**MODEL:** 615+  
**ACCESS INSULATION:** Apply three (3) layers of access insulation over the access door. Cut the first piece of access insulation into a 12x12-inch square and install it over the insulation pins and cover the access door (Item 7Ai). Cut the second piece of access insulation into a 14x14-inch square. Square it and install it over the insulation pins. Cover the first piece of access insulation so that a 1-inch overlap exists. Cut the third piece of access insulation into a 16x16-inch square. Square it and install it over the insulation pins. Cover the second piece of access insulation so that a 1-inch overlap exists. Secure access insulation to the insulation pins with 1-1/2-inch square or round, galvanized or stainless steel, speed clips. Turn down or cut off insulation pins that extend beyond the second piece of access insulation. Place maximum 4-inch long, steel tubing over each all-thread, steel rods. Apply washers and wing nuts over the all-thread, steel rods. Secure the access door by tightening the wing nuts.

B. **OPTION B**  
Cut a maximum 16x16-inch opening into the insulation (Item 4) and the grease duct (Item 1). Remove and discard the cut insulation (Item 4) and steel. Weld together four (4) pieces of 1-1/2 x 1-1/4 x 1/8-inch steel angle, with the flange outward, to form a 1-1/2-inch tall, flanged frame. Position, center, and continuously weld the flanged frame around the opening in the grease duct (Item 1). Position one (1), minimum 4-inch long, 1/4-inch diameter, all-thread, steel rod in the center of each of the four (4) corners of the flange and weld them in place.

i. **ACCESS DOOR:** Cut an 18-1/2 x 18-1/2-inch, 16 GA, steel plate to be used as an access door. Drill clearance holes in the access door to match the all-thread, steel rod pattern on the flange. Place the access door over the all-thread, steel rods.

ii. **COVER PLATE:** Cut a 20-1/2 x 20-1/2-inch external cover plate out of 16 GA steel sheet and drill clearance holes matching the locations of the all-thread, steel rods on the flange. Weld minimum four (4), 12 GA, copper-coated, steel insulation pins onto the internal surface of the cover plate, spaced minimum 14 inches on center. Limit insulation pin length to one-half total access insulation thickness. Install access insulation (Item 7Biii). Position the cover plate with access insulation over the all-thread, steel rods flush to access door. Apply washers and wing nuts over the all-thread, steel rods. Secure the access door by tightening the wing nuts.

iii. **CERTIFIED MANUFACTURER:** 3M Company  
**CERTIFIED PRODUCT:** 3M Fire Barrier™ Duct Wrap  
**MODEL:** 615+  
**ACCESS INSULATION:** Apply two layers of access insulation over the interior of the cover plate. Cut the first piece of access insulation into a 20-1/2 x 20-1/2-inch square and install it over the insulation pins on the internal surface of the cover plate. Cut the second piece of access insulation into a 24 x 24-inch square. Square it to and install it over the insulation pins. Cover the first piece of access insulation so that a 1-3/4-inch overlap exists. Secure access insulation to insulation pins with 1-1/2-inch square or round, galvanized or stainless steel speed clips. Turn down or cut off insulation pins that extend beyond the second piece of access insulation.

7. **NONCOMBUSTIBLE**² SUPPORTING CONSTRUCTION: Refer to Figures 3 and 4. Use one of the following wall or floor assemblies.

A. **GYPSUM WALL ASSEMBLY:** Symmetrical two-hour rated gypsum wall assembly constructed of the following:

i. **Steel Studs** – Minimum 25 GA galvanized steel studs measuring 3-5/8 inch wide with 1-1/4-inch legs spaced maximum 24 inch on center (O.C.). Attach studs with minimum #6 x 3/8-inch steel stud framing screws to floor and ceiling tracks.

---

² Refers to building construction referenced in the building codes.
DESIGN NO. 3MU/FRD 120-19 continued

Figure 5 – Noncombustible Supporting Constructions

ii. Tracks – Channel U-shaped floor and ceiling runners measuring 1/2-inch deep by 3-5/8-inch wide, which are secured to floor and ceiling with 1-inch long fasteners suitable for the mounting to substrate and spaced maximum 18-inch O.C.

iii. Gypsum Board – Cover studs and runners with two layers of 5/8-inch thick, Type X gypsum board on each face. Fasten base layer of gypsum board to steel studs with #6 1-1/8 inch bugle head Phillips drywall screws spaced maximum 12 inch O.C. Fasten face layer of gypsum board with #6, 1-5/8 inch long bugle Phillips drywall screws spaced maximum 8 inches O.C. Apply vinyl or casein, dry or premixed joint compound to face layers of gypsum board in two coats to all exposed screw heads and gypsum board joints. Embed minimum 2 inch wide paper, plastic or fiberglass tape in first layer of joint compound over joints in gypsum board. Minimum wall assembly thickness of 6 inches measured from face layer of gypsum board to opposite face layer of gypsum board.

B. SHAFT WALL ASSEMBLY:
Asymmetrical two-hour rated gypsum shaft wall assembly constructed of the following:

i. Visual Gypsum Board – Cover studs and runners with two layers of minimum 1/2 inch thick, Type X gypsum board on each face. Fasten base layer of gypsum board to steel studs with #6 1-1/8 inch bugle head Phillips drywall screws spaced maximum 12 inch O.C. Fasten face layer of gypsum board with #6, 1-5/8 inch long bugle Phillips drywall screws spaced maximum 8 inches O.C. Apply vinyl or casein, dry or premixed joint compound to face layers of gypsum board in two coats to all exposed screw heads and gypsum board joints. Embed minimum 2 inch wide paper, plastic or fiberglass tape in first layer of joint compound over joints in gypsum board. Minimum wall assembly thickness of 4-1/2 inches measured from face layer of gypsum board to opposite face layer of gypsum board.

ii. Interior Gypsum Board – Cut 1-inch thick Type X gypsum board 1-inch less than floor to ceiling height. Insert the longitudinal edges of the 1-inch thick Type X gypsum board into the C-T or C-H studs. Secure the transverse edge of the 1-inch thick Type X gypsum board to the long leg of J-runner using its tabs or minimum 1-5/8-inch long Type S self-tapping bugle head steel screws spaced maximum 12 inches on center.

iii. Steel Studs – Cut minimum 25 GA galvanized steel C-T or C-H studs measuring minimum 2-1/2 inches wide with minimum 1-1/2-inch flanges 3/4-inches less than floor to ceiling height and spaced maximum 24 inch on center (O.C.) in runners with T or H section abutting long leg of runner.

iv. Runners – Use minimum 2-1/2-inch wide J-runner compatible with studs and having unequal vertical legs: minimum 1-inch short leg and minimum 2-inch long leg. Position J-runners with short leg towards visual face of shaft wall. Attach to floor and ceiling using steel fasteners located a maximum of 2-inches from each end and a maximum of 24 inch O.C.

C. CONCRETE WALL ASSEMBLY: Symmetrical, two-hour rated, solid concrete, wall assembly made from reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m3) concrete, which may also be used as a shaft wall assembly. Constructed of solid concrete with a minimum concrete thickness measured from exposed face to exposed face using one of the following:

i. lightweight concrete is 3.6 inches;

ii. sand-lightweight concrete is 3.8 inches;

iii. carbonate aggregate concrete is 4.6 inches; and

iv. siliceous aggregate concrete is 5.0 inches.

D. MASONRY WALL ASSEMBLY: Symmetrical, two-hour rated, nominal 8 x 8 x 16 CMU, wall assembly made from lightweight or normal weight (100-150 pcf or 1600-2400 kg/m3) concrete, which may also be used as a shaft wall assembly.

E. CONCRETE FLOOR ASSEMBLY: Symmetrical two-hour rated solid concrete floor assembly made from reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m3) concrete. Constructed of solid concrete with a minimum concrete thickness measured from exposed face to exposed face using one of the following:

i. lightweight concrete is 3.6 inches;

ii. sand-lightweight concrete is 3.8 inches;

iii. carbonate aggregate concrete is 4.6 inches; and

iv. siliceous aggregate concrete is 5.0 inches.
8. OPENING – Create an opening in the assembly. Position the grease duct (Item 1) concentrically or eccentrically in the opening so that the annular space ranges from minimum 0.5 inch to maximum 4-1/2 inches. Establish an opening designed to house the grease duct (Item 1) covered with insulation (Item 4) and the desired annular space but not exceeding a cross-sectional area of maximum 3136 inch² and a maximum dimension of 59.5 inches.
9. **PENETRATION FIRESTOP**: Install two-hour, fire-resistant, ASTM E 814, firestop system. Install firestop between the supporting construction (Item 6) and the grease duct (Item 1) or the grease duct (Item 1) protected with the insulation (Item 4). Use a symmetrical wall penetration firestop, an asymmetrical shaft penetration firestop or an asymmetrical floor penetration firestop constructed of the following components.

A. **CERTIFIED MANUFACTURER**: 3M Company  
   **CERTIFIED PRODUCT**: 3M Fire Barrier™ Duct Wrap  
   **MODEL**: 615+  
   **PACKING MATERIAL**: Fill the entire annular space’s width with minimum 4-pcf density mineral wool or certified insulation without the encapsulation (foil scrim).  
   Cut the packing material into strips not less than one and one half (1-1/2) times the width of the annular space to be filled. Compress packing material nominally 33% and insert packing material into the annual space.  
   For wall assemblies, recess the surface of packing material nominally 5/8 inches from surfaces of both faces of the supporting construction (Item 8).  
   For floor assemblies, recess the surface of packing material nominally 5/8 inches from the visual surface of the supporting construction (Items 8) and install a minimum depth of 4-inches.

B. **CERTIFIED MANUFACTURER**: 3M Company  
   **CERTIFIED PRODUCT**: 3M™ Fire Barrier™ Sealant  
   **MODEL**: Water-Tight 1000-NS Silicone, 1003-SL Silicone (Floor Assembly Only), 2000+ Silicone, or CP 25 WB+  
   **FILL, VOID OR CAVITY MATERIAL**: Install minimum 5/8-inch depth of fill material into the recess over the entire surface of the packing material (Item 7A). Screed the fill material flush with the surface of the supporting construction (Item 8). Overlap a minimum of 1/4 inches, the fill material onto face of supporting construction (Item 8).

(Ratings applicable for Ventilation Ducts installed with or without branches)

Maximum Size of Duct – 0.93m² maximum area with no dimension exceeding 1219 mm.

Support Spacing – 1525 mm maximum.

Duct Use Limitation – Duct is intended for use in exhaust systems serving commercial and institutional kitchen cooking appliances. Duct system, when constructed of the materials and in the manner described below, also meets the intent of NFPA 96, Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations. Clearance to combustible materials - 0 mm.

1. Fire Separation –
   (a) Masonry Wall or Floor – Minimum depth or thickness as necessary for the grade of fire separation but not less than 115 mm. Normal-density or low-density concrete wall can also be constructed of nominal 190 mm thick concrete block laid up with mortar.

   OR

   (b) Wall Assembly – The fire-rated gypsum wallboard and steel or wood stud assembly shall be constructed of the materials and in the manner described in the individual Wall or Partition design in the ULC Fire Resistance directory.

   OR

   (c) Floor/Ceiling Assembly – The fire-rated combustible floor/ceiling assembly shall be constructed of the materials and in the manner described in the individual Floor-Ceiling design in the ULC Fire Resistance directory.

   The Fire Resistance Rating of a wrapped duct penetrating a combustible floor/ceiling assembly is limited to the fire resistance rating of the combustible floor/ceiling assembly.

2. Grease Duct – Duct to be constructed in accordance with the requirements of the Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations, NFPA 96. Minimum thickness of steel permitted, 1.6 mm thick carbon steel or 1.2 mm thick stainless steel; maximum size of duct 1219 mm by 762 mm nominal.
3. **Grease Duct Insulation** – (YYETC) – See ULC Heating and Ventilating Equipment and Flammable Liquids and Gases Equipment Directory. Two layers of 38 mm thick, Calcium-Magnesium-Silicate (CMS) duct wrap, installed in accordance with the manufacturer’s installation instructions including the following features:

(a) Copper-coated steel insulation pins (not shown), inductive weld pins or cup-head weld pins, nominal 3 mm thick, minimum 102 mm long, shall be stud welded to the bottom surface of steel duct on horizontal runs and on the widest surface on vertical runs of the steel duct at 300 mm OC maximum.

(b) The base layer of the duct wrap shall be installed around the duct with an overlap of minimum 76 mm. The face layer of duct wrap shall be wrapped around the base layer with overlapping joints staggered minimum 267 mm. All first and second layer joints are to be covered with minimum 76 mm wide aluminum tape.

(c) The layers of blanket are locked into place over the insulation pins with 25 mm by 25 mm speed clips (not shown). Banding material (Item 6), 13 mm wide and minimum 0.3 mm thick, shall be installed with a tensioning tool and spaced a maximum 267 mm OC and within 38 mm of edges of perimeter overlapped seams.

3M COMPANY – 3M Fire Barrier Duct Wrap 615

4. **Support Rod** – Steel threaded rod, nominal 13 mm minimum diameter, shall be used. For ducts not exceeding a duct perimeter of 2235 mm, steel threaded rod of nominal 10 mm diameter through Cradle (Item 5) and mounted to concrete floor by:

(a) Passing through pre-drilled hole and bolting with nut and washer on top of floor, or

(b) Carbon steel or stainless steel masonry anchors, nominal 13 mm or 10 mm diameter by 50 mm long, drop-in style anchors embedded a minimum of 50 mm into concrete, or nominal 13 mm or 10 mm diameter stud wedge/expansion type anchors embedded a minimum of 60 mm into concrete.

5. **Cradle** – Steel angle, 50 mm by 50 mm by 5 mm or Unistrut® P5500 channel, used to support wrapped duct at 1525 mm OC maximum. Hung from concrete floor with Support Rods (Item 4).

For ducts not exceeding a duct perimeter of 2235 mm, steel angle 38 mm by 38 mm by 4 mm or Unistrut® P2000 channel can be used.

6. **Steel Band** – Nominal 13 mm wide, 0.3 mm thick, made of carbon or stainless steel for 1 h rating and stainless steel for 2 h rating, installed on wrapped duct with tensioning tool and spaced at minimum 267 mm OC. Firestop System Installation

The duct shall be installed within the opening such that the annular space between the wrapped duct and the edges of the opening is maximum 82 mm. For installations in gypsum wallboard assemblies, the opening to accommodate the duct shall be framed on all sides using lengths of stud installed between vertical studs and secured to the vertical studs.

For installations in combustible floor/ceiling assemblies the maximum and minimum annular spaces to be 82 and 22 mm respectively. The opening to accommodate the duct to be framed on all sides using lengths of nominal 38 mm by minimum 240 mm solid wood joists.

Firestop System Installation through Non-Combustible Floor or Combustible or Non-Combustible Wall Opening

7(a) **Firestop Insulation** – Unfaced scrap duct wrap (Item 3) or ULC labelled mineral wool insulation with minimum 64 kg/m$^3$ density compressed 50% minimum and installed into the opening to a minimum depth of 100 mm. Material to be recessed 6.4 mm from top surface of floor or 16 mm from both surfaces of wall to allow for the installation of sealant (Item 7b).

7(b) **Firestop System Component** – (XHJZC) – Sealant applied over insulation (Item 7a) to a minimum depth of 6.4 mm flush with top surface of floor or 16 mm symmetrically to both surfaces of wall.

3M COMPANY – 3M Fire Barrier Sealants CP25 WB+, 1003 SL (for floors only), 1000 NS, IC 15WB+ or 3000 WT

Firestop System Installation Through Combustible Floor/Ceiling Opening

8(a). **Firestop Insulation** – Unfaced scrap duct wrap (Item 3) or ULC labelled mineral wool insulation with minimum 64 kg/m$^3$ density compressed 50% minimum and installed into the opening to a minimum depth of 240 mm. Material to be recessed from surface of floor to accommodate required thickness of sealant (Item 8b).

8(b). **Firestop System Component** – (XHJZC) – Sealant applied over insulation (Item 8a) to a minimum depth of 6.4 mm flush with top surface of floor.

3M COMPANY – 3M Fire Barrier Sealants CP-25WB+, 1003 SL, 1000 NS, IC 15WB+ or 3000 WT.

1. GREASE DUCT: Use a continuously-welded, liquid-tight, L-shaped, rectangular duct system with horizontal and vertical shafts constructed of 16 GA sheet steel with a max. 2304 in.² area and a max. 48 in. dimension. When required, equip the duct with a pre-fabricated access door (Item 6) or field-fabricated access door (Item 7).
   
   A. Construct the grease duct using sections affixed to each other with welded joints.
   
   B. Reinforce the grease duct to IMC or NFPA 96 requirements designed to carry the weight of the grease duct assembly covered with two layers of insulation (Item 4) under a fire load equivalent to the ASTM E 2336 exposure and the ASTM E 119 time-temperature curve.
   
   C. Rigidly support the grease duct (Item 1) as specified in Item 5 or in accordance with IMC or NFPA 96 requirements when those requirements are greater.
   
   D. Protect the annular space around the grease duct (Item 1) passing through a fire-rated assembly with an Intertek-certified, compatible, 3M, penetration firestop system, refer to Section 10, having the same fire rating as the assembly.

2. FASTENERS: Refer to Figure 1. Weld min. 12 GA, 6-1/2 in. long, copper-coated, steel insulation pins or 12 GA, insulated cup head steel pins to the grease duct (Item 1). Match the following fastener method with corresponding insulation (Item 4) method.

   A. Compression Butt Joint: Refer to 4A Section View B-B. Locate pins at all blanket overlaps, on all sides of the grease duct (Item 1), and meet the following requirements.
      
      i. Space pins max. 12 in. apart in rows across the width of grease duct (Item 1). Locate pins max. 6-3/4 in. from the edges of the grease duct (Item 1). Refer to section view A-A.
      
      ii. Space the rows of pins as follows: use pattern nominal 9 in. apart, then max. 2 in. apart, then nominal 9 in. apart along the length of the grease duct (Item 1). Refer to Item 4A section view B-B.
      
      iii. After insulation (Item 4A) is installed, place min. 2-1/2 x 2-1/2 in. square, galvanized steel, self locking washer clips onto all insulation pins.
      
      iv. After clips are installed, cut off or bend flush with insulation (Item 4A) the pins that are too long.

   B. Butt Joint with Collar: Refer to 4B Section View B-B. Locate pins at all blanket overlaps, on all sides of the grease duct (Item 1), and meet the following requirements.
      
      i. Space pins max. 12 in. apart in rows across the width of grease duct (Item 1). Locate pins max. 6-3/4 in. from the edges of the grease duct (Item 1). Refer to section view A-A.
3MU/BI 120-03 (cont.)

ii. Space the rows of pins as follows: use pattern nominal 9 in. apart, then max. 3 in. apart, then nominal 9 in. apart along the length of the grease duct (Item 1). Refer to Item 4B section view B-B.

iii. After insulation (Item 4B) is installed, place min. 2-1/2 x 2-1/2 in. square, galvanized steel, self-locking washer clips onto all insulation pins.

iv. After clips are installed, cut off or bend flush with insulation (Item 4B) the pins that are too long.

C. Single End Overlap (Telescope): Refer to 4C Section View B-B. Locate pins at all blanket overlaps, on all sides of the grease duct (Item 1), and meet the following requirements.

i. Space pins max. 12 in. apart in rows across the width of grease duct (Item 1). Locate pins max. 6-3/4 in. from the edges of the grease duct (Item 1). Refer to section view A-A.

ii. Space the rows of pins max. 10-1/2 in. apart along the length grease duct (Item 1). Where pieces of insulation (Item 4C) are butted together, space pins a max. 1-1/2 in. from the edge of the insulation. Refer to Item 4C section view B-B.

iii. After insulation (Item 4C) is installed, place min. 2-1/2 x 2-1/2 in. square, galvanized steel, self-locking washer clips onto all insulation pins.

iv. After clips are installed, cut off or bend flush with insulation (Item 4C) the pins that are too long.

D. Dual End Overlap (Checkerboard): Refer to 4D Section View B-B. Locate pins at all blanket overlaps, on all sides of the grease duct (Item 1), and meet the following requirements.

i. Space pins max. 12 in. apart in rows across the width of grease duct (Item 1). Locate pins max. 6-3/4 in. from the edges of the grease duct (Item 1). Refer to section view A-A.

ii. Space the rows of pins max. 10-1/2 in. apart along the length grease duct (Item 1). Where pieces of insulation (Item 4D) are butted together, space pins a max. 1-1/2 in. from the edge of the insulation. Refer to Item 4D section view B-B.

iii. After insulation (Item 4D) is installed, place min. 2-1/2 x 2-1/2 in. square, galvanized steel, self-locking washer clips onto all insulation pins.

iv. After clips are installed, cut off or bend flush with insulation (Item 4D) the pins that are too long.

E. Compression Butt Joint – Single End Overlap: Refer to 4E Section View B-B. Locate pins at all blanket overlaps, on all sides of the grease duct (Item 1), and meet the following requirements.

i. Space pins max. 12 in. apart in rows across the width of grease duct (Item 1). Locate pins max. 6-3/4 in. from the edges of the grease duct (Item 1). Refer to section view A-A.

ii. Space the rows of pins as follows: use pattern nominal 9 in. apart, then max. 3 in. apart, then nominal 9 in. apart along the length of the grease duct (Item 1). Refer to Item 4E section view B-B.

iii. After insulation (Item 4E) is installed, place min. 2-1/2 x 2-1/2 in. square, galvanized steel, self-locking washer clips onto all insulation pins.

iv. After clips are installed, cut off or bend flush with insulation (Item 4A) the pins that are too long.

3. BANDING: Do not use banding for the installation of insulation method (Item 4A or 4E), Compression Butt Joint. Banding is an option to fastener methods (Items 2B, 2C and 2D) but not fastener method (Item 2A or 2E). After insulation (Item 4) is installed, apply min. 1/2 in. wide, 0.015 in. thick stainless steel bands or min. 1/2 in. wide, 0.020 in. thick carbon steel bands and secured with min. 1 in. long stainless or carbon steel crimp clamps to be used with corresponding banding type. When needed to ease installation, use filament tape as a temporary fastener methods (A, B, C, or D) that follow. Offset the second layer of insulation so that the joints of the inner first layer (Figure 1, 4.1) are covered by and approximately in the center of the second outer layer (Figure 1, 4.2). Use blanket, available in various widths, that is fully encapsulated or single faced with a polypropylene-foil or polyester-foil scrim. Expose a foil-faced side of the second outer layer (Figure 1, 4.2) in accord with the same method selected for the first inner layer (Figure 1, 4.1). Apply blanket, available in various widths, that is fully encapsulated or single faced with a polypropylene-foil or polyester-foil scrim. Expose a foil-faced side of the grease duct (Item 1). Refer to 4D Section View B-B. Locate pins at all blanket overlaps, on all sides of the grease duct (Item 1). Refer to section view A-A. Stagger the transverse overlap location so that no two consecutive adjacent overlaps align. Refer to section view A-A for transverse overlap section view. Cover all visually-exposed ends and edges of insulation with nominal 4 in. wide, pressure-sensitive, aluminum foil tape.

A. Compression Butt Joint: Refer to Item 4A section view B-B. Wrap the grease duct (Item 1) with two layers of insulation installed with compression butt joints at all circumferential joints. Apply the first layer, center pieces of insulation (Item 4A) over 2 in. wide pin bay, so that each piece nominal 24 in. wide blanket occupies two (2) full 9 in. wide bays and three (3) full 2 in. wide bays. Compress each edge of each piece of insulation together and butt to preceding edge of insulation in 2 in. wide bays. After installation, each piece of installed insulation width is 2 in. less than insulation nominal width. (Example: each piece of nominal 24 in.-wide insulation when installed is 22 in. wide.) Verify all insulation butt joints are compressed min. 50% at compression butt joints. Offset the second layer of insulation so that
the compression butt joint of the first layer of insulation is centered under the second layer of insulation and install in same manner as first layer of insulation.

B. Butt Joint with Collar: Refer to Item 4B section view B-B. Wrap the grease duct (Item 1) with two layers of insulation installed with butt joints at all circumferential joints. Apply the first layer, center pieces of insulation (Item 4A) over 3 in. wide pin bay, so that each piece nominal 24 in. wide blanket occupies two (2) full 9 in.-wide bays and one (1) full 3 in. wide bays and half of two (2) 3 in. wide bays at each circumferential edge. Butt each end of each piece of insulation together with preceding edge of insulation. Each piece of installed insulation width is its nominal width. (Example: each piece of nominal 24 in. wide insulation when installed is 24 in. wide.) Offset the second layer of insulation so that the butt joint of the first layer of insulation is centered under the second layer of insulation and install in same manner as first layer of insulation. Place and center 6 in. wide collar of insulation over the butt joint. Overlap 6 in. wide collar onto each adjacent insulation 3 in. Verify all insulation butt joints with collars are three layers of insulation in overall thickness.

C. Single End Overlap (Telescope): Refer to Item 4C section view B-B. Wrap the grease duct (Item 1) with two layers of insulation installed with 3 in. min. overlaps at all longitudinal joints. Overlap each adjacent insulation edge with the edge of the next piece of insulation. Verify all insulation overlaps are three layers of insulation in overall thickness.

i. Starting at one end of the grease duct (Item 1), apply the first piece of insulation around the grease duct (Item 1) to overlap fasteners (Item 2C). Refer section view A-A.

ii. Position and overlap the leading edge of the second piece of insulation nominally 3 in. over the flush edge of the first piece of insulation. Place the opposite edge of the second piece of insulation flush against the surface of the grease duct (Item 1). An “S-shaped” cross section of the insulation is created. Refer to Item 4C section view B-B.

iii. Apply all additional pieces of insulation as “S-shaped” cross section of the insulation in compliance with Item 4Ci.

iv. Position the second layer of insulation so that the joint of the first layer of insulation is centered under the second layer of insulation and install in same manner as first layer of insulation.

D. Dual End Overlap (Checkerboard): Refer to Item 4D section view B-B. Verify all insulation overlaps are a min. 3 in. in overall thickness. Do not align two consecutive insulation end overlaps. Overlap each full width insulation edge with the edge of the “gull wing” (V-) shaped piece of insulation. Install insulation with zero clearance at the overlaps, or in the field between overlaps. Verify all insulation overlaps are four layers of insulation in overall thickness.

i. Wrap the first piece of insulation around the grease duct (Item 1) so that the insulation is flush against the surface of the grease duct (Item 1). Position the starting end of the insulation to overlap pins (Item 2A) a min. of 1-1/2 in. while the edges of the insulation overlap the rows of pins (Item 2B) a min. of 1-1/2 in.

ii. Position the second piece of insulation nominally 18 in. from the edge of the first piece of insulation. Install the second piece in the same manner as the first.

iii. Cover the grease duct (Item 1) that is exposed between the edges of the first two pieces of insulation with another piece of insulation. Position the starting end of the insulation to overlap pins (Item 2A) a min. of 1-1/2 in. while the edges of the insulation overlap the adjacent edges of the two pieces installed insulation a min. of 1-1/2 in.

iv. Position the second layer of insulation so that the first layer of insulation is centered under the second layer of insulation and install in same manner as first layer of insulation.

E. Compression Butt Joint – Single End Overlap: Refer to Item 4E section view B-B. Wrap the grease duct (Item 1) with one layer of insulation installed with compression butt joints at all circumferential joints and a second layer with single end overlap joints. Apply the first layer, center pieces of insulation (Item 4) over 3 in.-wide pin bay, so that each piece nominal 24 in. wide blanket occupies two (2) full 9 in.-wide bays and two (2) full 3 in. wide bays. Compress each edge of each piece of insulation together and butt to preceding edge of insulation in 3 in. wide bays. After installation, each piece of installed insulation width is 3 in. less than insulation nominal width. (Example: each piece of nominal 24 in. wide insulation when installed is 21 in. wide.) Verify all insulation butt joints are three layers of insulation in overall thickness.

5. SUPPORTS: If the grease duct is 24 in. x 24 in. or smaller, support the grease duct (Item 1) with insulation (Item 4) using a un-insulated “trapeze” system composed of a min. 2 x 2 x 1/8 in. steel angle as the trapeze cross-member and two (2), min. 3/8 in. diameter, all-thread, steel rods connected using nuts and washers. For ducts larger than 24 in. x 24 in., support the grease duct (Item 1) with insulation (Item 4) using a un-insulated “trapeze” system composed of a min. 2 x 2 x 1/4 in. steel angle as the trapeze cross-member and two (2), min. 5/8 in. diameter, all-thread, steel rods connected using nuts and washers. Connect the all-thread steel rods to the bottom of the floor assembly using an attachment method designed to carry the weight of the grease duct (Item 1) with insulation (Item 4) under a fire load equivalent to ASTM E 119 time-temperature curve. Place one (1) all-thread steel rod at each end of trapeze cross-member. Center grease duct (Item 1) with insulation (Item 4) on trapeze cross-member. Space all-thread steel rods a max. 6 in. from surface of the insulated grease duct or allowing all-thread steel rods to contact with the insulation (Item 4) at the min. distance. Extend trapeze cross-member at least 2 in. past each adjacent insulation 3 in. Verify all insulation butt joints with collars are three layers of insulation in overall thickness.

6. CERTIFIED MANUFACTURER: 3M Company

CERTIFIED PRODUCT: 3M Fire Barrier™ Grease Duct Access Door

MODELS:

- 000-51115-16584-9 (20 x 20 Door),
- 000-51115-16583-2 (12 x 8 Door), and
- 000-51115-16582-5 (10 x 6 Door)
ACCESS DOOR ASSEMBLY: When required, apply an access door and insulated cover plate as described:

A. OPTIONAL PRE-FABRICATED ACCESS DOOR: Mark a clean-out access opening location on the grease duct (Item 1) with insulation (Item 4) at its mid-height along the horizontal section. Cut an opening (max. 22 x 22 in.) in the insulation (Item 4) the same size as the outside dimension of the desired pre-fabricated access door model. Remove and discard the cut insulation (Item 4). Cut an opening (max. 20 x 20 in.) into the side of the grease duct (Item 1) according to the manufacturer's instructions for the size of the pre-fabricated access door to be installed. Install and tightly secure the pre-fabricated access door in accordance with the manufacturer's instructions to the grease duct (Item 1). Fit pre-fabricated access door with four (4), 3/8 in. diameter, corner-thumb bolts through the exterior face.

B. CERTIFIED MANUFACTURER: 3M Company
CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
MODEL: 615+

ACCESS INSULATION: Remove the four (4), 3/8 in. diameter, corner-thumb bolts and replace them with four (4), 3/8 in. diameter, all-thread, steel rods extending from pre-fabricated access door (Item 6A). Apply three (3) layers of access insulation over the pre-fabricated access door (Item 6A) as follows. Cut the first piece of rectangular access insulation a min. 1/4 in. larger than the clean-out access opening. Position, square, and impale the first piece of the access insulation over the four (4), 3/8 in. diameter, all-thread, steel rods extending from pre-fabricated access door (Item 6A). Press the first piece of access insulation flush over the pre-fabricated access door (Item 6A). Compress and abut the cut edges of the first piece of the access insulation against the cut edges of opening in the insulation (Item 4). Cut a second piece of access insulation the same size as the first piece of access insulation. Press the second piece of access insulation flush over the first piece of access insulation. Compress and abut the cut edges of the first piece of the access insulation against the cut edges of opening in the insulation (Item 4). Cut a third piece of rectangular access insulation a min. of 2 in. larger than the second piece of access insulation on all sides Seal cut edges of the third piece of access insulation with nominal 4 in. wide aluminum foil tape. Position, square, and impale the third piece of the access insulation over the four (4), 3/8 in. diameter, all-thread, steel rods extending from pre-fabricated access door (Item 6A). Press the third piece of access insulation flush over second piece of access insulation.

C. COVER PLATE: Cut a cover plate to the same dimensions as the third piece of access insulation (Item 6B) using a min. 16 GA steel sheet. Drill holes in the cover plate that match the location of the four (4), 3/8 in. diameter, all-thread, steel rods and locate the holes so that the cover plate is squared to the third piece of access insulation (Item 6B). After all three (3) layers of access insulation (Item 6B) are impaled over the four (4), 3/8 in. diameter, all-thread, steel rods install the cover plate. Pass the four (4), 3/8 in. diameter, all-thread, steel rods through the cover plate. Place washers and wing nuts onto each of the four (4), 3/8 in. diameter, all-thread, steel rods. Secure the cover plate by tightening wing nuts.
Figure 3 – Option A

7. **OPTIONAL FIELD-FABRICATED ACCESS DOORS**: Mark a clean-out access opening location on the grease duct (Item 1) with insulation (Item 4) at its mid-height along the horizontal section. Use either Option A or B.

A. **(OPTION A)** Cut a 12x12 in. opening in the insulation (Item 4). Remove and discard the cut insulation (Item 4). Cut and center a 10x10 in. opening into the side of the grease duct (Item 1) by maintaining a 1 in. clearance between the perimeter of the opening and the cut insulation (Item 4). Remove and discard the cut steel. Weld four (4), min. 4 in. long, 1/4 in. diameter, all-thread, steel rods to the grease duct (Item 1). Locate one (1) steel rod at each corner of the grease duct (Item 1) opening so that they are 11 in. oc and squared within the insulation (Item 4) opening.

i. **ACCESS DOOR**: Cut a 12x12 in., 16 GA, steel plate to be used as an access door. Drill clearance holes in the access door to match the all-thread, steel rod pattern. Place the access door over the all-thread, steel rods. Seal the opening in the grease duct (Item 1) by overlapping the access door over the opening cut in the insulation (Item 4) by 1 in. on all sides. Weld four (4), min. 6-1/2 in. long, 12 GA, copper-coated, steel insulation pins to the access door corners so that the insulation pins are 9 in. oc.

ii. **CERTIFIED MANUFACTURER**: 3M Company

**CERTIFIED PRODUCT**: 3M Fire Barrier™ Duct Wrap

**MODEL**: 615+

**ACCESS INSULATION**: Apply three (3) layers of access insulation over the access door. Cut the first piece of access insulation into a 12x12 in. square and install it over the insulation pins and cover the access door (Item 7Ai). Cut the second piece of access insulation into a 14x14 in. square. Square it and install it over the insulation pins. Cover the first piece of access insulation so that a 1 in. overlap exists. Cut the third piece of access insulation into a 16x16 in. square. Square it and install it over the insulation pins. Cover the second piece of access insulation so that a 1 in. overlap exists. Secure access insulation to the insulation pins with 1-1/2 in. square or round, galvanized or stainless steel, speed clips. Turn down or cut off insulation pins that extend beyond the second piece of access insulation. Place max. 4 in. long, steel tubing over each all-thread, steel rods. Apply washers and wing nuts over the all-thread, steel rods. Secure the access door by tightening the wing nuts.

B. **(OPTION B)** Cut a max. 16x16 in. opening into the insulation (Item 4) and the grease duct (Item 1). Remove and discard the cut insulation (Item 4) and steel. Weld together four (4) pieces of 1-1/2 x 1-1/4 x 1/8 in. steel angle, with the flange outward, to form a 1-1/2 in. tall, flanged frame. Position, center, and continuously weld the flanged frame around the opening in the grease duct (Item 1). Position one (1), min. 4 in. long, 1/4 in. diameter, all-thread, steel rod in the center of each of the four (4) corners of the flange and weld them in place.

i. **ACCESS DOOR**: Cut an 18-1/2 x 18-1/2 in., 16 GA, steel plate to be used as an access door. Drill clearance holes in the access door to match the all-thread, steel rod pattern on the flange. Place the access door over the all-thread, steel rods.

ii. **COVER PLATE**: Cut a 20-1/2 x 20-1/2 in. external cover plate out of 16 GA steel sheet and drill clearance holes matching the locations of the all-thread, steel rods on the flange. Weld min. four (4), 12 GA, copper-coated, steel insulation pins onto the internal surface of the cover plate, spaced min. 14 in. oc. Limit insulation pin length to one-half total access insulation thickness. Install access insulation (Item 7Bii). Position the cover plate with access insulation over the all-thread, steel rods flush to access door. Apply washers and wing nuts over the all-thread, steel rods. Secure the access door by tightening the wing nuts.
iii. CERTIFIED MANUFACTURER: 3M Company
CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
MODEL: 615+
ACCESS INSULATION: Apply two layers of access insulation over the interior of the cover plate. Cut the first piece of access insulation into a 20-1/2 x 20-1/2 in. square and install it over the insulation pins on the internal surface of the cover plate. Cut the second piece of access insulation into a 24 x 24 in. square. Square it to and install it over the insulation pins. Cover the first piece of access insulation so that a 1-3/4 in. overlap exists. Secure access insulation to insulation pins with 1-1/2 in. square or round, galvanized or stainless steel speed clips. Turn down or cut off insulation pins that extend beyond the second piece of access insulation.

8. NONCOMBUSTIBLE\(^2\) SUPPORTING CONSTRUCTION: Refer to Figures 3 and 4. Use one of the following wall or floor assemblies.

A. GYPSUM WALL ASSEMBLY: Symmetrical two-hour rated gypsum wall assembly constructed of the following:
   i. **Steel Studs** – Min. 25 GA galvanized steel studs measuring 3-5/8 in. wide with 1-1/4 in. legs spaced max. 24 in. oc. Attach studs with min. #6 x 3/8 in. steel stud framing screws to floor and ceiling tracks.

8A - Gypsum Wall
8B - Shaft Wall
8C - Concrete Wall
8D - Concrete Floor
8E - CMU Wall

\(^2\) Refers to building construction referenced in the building codes

Figure 4 – Option B

Figure 5 – Noncombustible Supporting Constructions
ii. **Tracks** – Channel U-shaped floor and ceiling runners measuring 1/2 in. deep by 3-5/8 in. wide, which are secured to floor and ceiling with 1 in. long fasteners suitable for the mounting to substrate and spaced max. 18 in. oc.

iii. **Gypsum Board** – Cover studs and runners with two layers of 5/8 in. thick, Type X gypsum board on each face. Fasten base layer of gypsum board to steel studs with #6 1-1/8 in. bugle head phillips drywall screws spaced max. 12 in. oc. Fasten face layer of gypsum board with #6, 1-5/8 in. long bugle phillips drywall screws spaced max. 8 in. oc. Apply vinyl or casein, dry or premixed joint compound to face layers of gypsum board in two coats to all exposed screw heads and gypsum board joints. Embed min. 2 in. wide paper, plastic or fiberglass tape in first layer of joint compound over joints in gypsum board. Min. wall assembly thickness of 6 in. measured from face layer of gypsum board to opposite face layer of gypsum board.

**B. SHAFT WALL ASSEMBLY**: Asymmetrical two-hour rated gypsum shaft wall assembly constructed of the following:

i. **Visual Gypsum Board** – Cover studs and runners with two layers of min. 1/2 in. thick, Type X gypsum board on each face. Fasten base layer of gypsum board to steel studs with #6 1-1/8 in. bugle head phillips drywall screws spaced max. 12 in. oc. Fasten face layer of gypsum board with #6, 1-5/8 in. long bugle phillips drywall screws spaced max. 8 in. oc. Apply vinyl or casein, dry or premixed joint compound to face layers of gypsum board in two coats to all exposed screw heads and gypsum board joints. Embed min. 2 in. wide paper, plastic or fiberglass tape in first layer of joint compound over joints in gypsum board. Min. wall assembly thickness of 4-1/2 in. measured from face layer of gypsum board to opposite face layer of gypsum board.

ii. **Interior Gypsum Board** – Cut 1 in. thick Type X gypsum board 1 in. less than floor to ceiling height. Insert the longitudinal edges of the 1 in. thick Type X gypsum board into the C-T or C-H studs. Secure the transverse edge of the 1 in. thick Type X gypsum board to the long leg of J-runner using its tabs or min. 1-5/8 in. long Type S self-tapping bugle head steel screws spaced max. 12 in. oc.

iii. **Steel Studs** – Cut min. 25 GA galvanized steel C-T or C-H studs measuring min. 2-1/2 in. wide with min. 1-1/2 in. flanges 3/4 in. less than floor to ceiling height and spaced max. 24 in. oc in runners with T or H section abutting long leg of runner.

iv. **Runners** – Use min. 2-1/2 in. wide J-runner compatible with studs and having unequal vertical legs: min. 1 in. short leg and min. 2 in. long leg. Position J-runners with short leg towards visual face of shaft wall. Attach to floor and ceiling using steel fasteners located a max. of 2 in. from each end and a max. of 24 in. oc.

**C. CONCRETE WALL ASSEMBLY**: Symmetrical, two-hour rated, solid concrete, wall assembly made from reinforced lightweight or normal weight (100–150 pcf or 1600–2400 kg/m³) concrete, which may also be used as a shaft wall assembly. Constructed of solid concrete with a min. concrete thickness measured from exposed face to exposed face using one of the following:

i. lightweight concrete is 3.6 in.;

ii. sand-lightweight concrete is 3.8 in.;

iii. carbonate aggregate concrete is 4.6 in.; and

iv. siliceous aggregate concrete is 5.0 in.

**D. MASONRY WALL ASSEMBLY**: Symmetrical, two-hour rated, nominal 8 x 8 x 16 CMU, wall assembly made from lightweight or normal weight (100–150 pcf or 1600–2400 kg/m³) concrete, which may also be used as a shaft wall assembly.

**E. CONCRETE FLOOR ASSEMBLY**: Symmetrical two-hour rated solid concrete floor assembly made from reinforced lightweight or normal weight (100–150 pcf or 1600–2400 kg/m³) concrete. Constructed of solid concrete with a min. concrete thickness measured from exposed face to exposed face using one of the following:

i. lightweight concrete is 3.6 in.;

ii. sand-lightweight concrete is 3.8 in.;

iii. carbonate aggregate concrete is 4.6 in.; and

iv. siliceous aggregate concrete is 5.0 in.

**9. OPENING** – Create an opening in the assembly. Position the grease duct (Item 1) concentrically or eccentrically in the opening so that the annular space ranges from min. 0.5 in. to max. 4-1/2 in. Establish an opening designed to house the grease duct (Item 1) covered with insulation (Item 4) and the desired annular space but not exceeding a cross-sectional area of max. 3136 in.² and a max. dimension of 59.5 in.
10. **PENETRATION FIRESTOP**: Install two-hour, fire-resistant, ASTM E 814, firestop system. Install firestop between the supporting construction (Item 6) and the grease duct (Item 1) or the grease duct (Item 1) protected with the insulation (Item 4). Use a symmetrical wall penetration firestop, an asymmetrical shaft penetration firestop, or an asymmetrical floor penetration firestop constructed of the following components.
A. **CERTIFIED MANUFACTURER:** 3M Company  
**CERTIFIED PRODUCT:** 3M Fire Barrier™ Duct Wrap  
**MODEL:** 615+  
**PACKING MATERIAL:** Fill the entire annular space’s width with min. 4 pcf density mineral wool or certified insulation without the encapsulation (foil scrim). Cut the packing material into strips not less than one and one half (1-1/2) times the width of the annular space to be filled. Compress packing material nominally 33% and insert packing material into the annular space.  
For wall assemblies, recess the surface of packing material nominally 5/8 in. from surfaces of both faces of the supporting construction (Item 8).  
For floor assemblies, recess the surface of packing material nominally 5/8 in. from the visual surface of the supporting construction (Items 8) and install a min. depth of 4 in.  

B. **CERTIFIED MANUFACTURER:** 3M Company  
**CERTIFIED PRODUCT:** 3M™ Fire Barrier™ Sealant  
**MODEL:** Water-Tight 1000-NS Silicone, 1003-SL Silicone (Floor Assembly Only), 2000+ Silicone, or CP 25 WB+  
**FILL, VOID OR CAVITY MATERIAL:** Install min. 5/8 in. depth of fill material into the recess over the entire surface of the packing material (Item 7A). Screed the fill material flush with the surface of the supporting construction (Item 8). Overlap a min. of 1/4 in., the fill material onto face of supporting construction (Item 8).

</table>

A. Construct the ventilation duct using sections affixed to each other with seams or flanges.

B. Reinforce the ventilation duct to IMC, SMACNA* or NFPA 90A requirements designed to carry the weight of the ventilation duct assembly covered with insulation (Item 4) under a fire load equivalent to ASTM E 119 time-temperature curve.

*Exception: SMACNA 3rd Edition - 2005, RT3 Drawband Joint or equivalent are not approved for use under this design listing with circular ventilation ducts.

C. Rigidly support the ventilation duct in accordance with IMC, SMACNA or NFPA 90A requirements designed to carry the weight of the ventilation duct assembly covered with insulation (Item 4) under a fire load equivalent to ASTM E 119 time-temperature curve or as specified in Item 5.

D. Protect the annular space around the ventilation duct passing through a fire rated wall assembly with an Intertek certified, compatible, 3M, penetration firestop system, refer to Section 8, having the same fire rating as the wall assembly.
2. FASTENERS: Refer to Figure 2. Weld min. 12 GA, 4-1/2 in. long, copper-coated steel insulation pins or 12 GA insulated cup head pins to the ventilation duct (Item 1). Match fastener method with corresponding insulation (Item 4) method.

A. Compression Butt Joint: Refer to 4A Section View B-B. Locate pins at all blanket overlaps, on all sides of the ventilation duct (Item 1), and meet the following requirements.

I. Space pins max. 12 in. apart in rows across the width of ventilation duct (Item 1). Locate pins max. 6-3/4 in. from the edges of the rectangular ventilation duct (Item 1).

II. Space the rows of pins max. 9-1/2 in. apart along the length ventilation duct (Item 1). Where pieces of insulation (Item 4A) are to be butted together, space the pins a max. of 2 in. apart.

III. After insulation (Item 4A) is installed, place min. 2.5 in. x 2.5 in. square, galvanized steel, self-locking washer clips onto all insulation pins.

IV. After clips are installed, cut off or bend flush with insulation (Item 4) the pins that are too long.

B. Butt Joint with Collar: Refer to 4B Section View B-B. Locate pins at all blanket overlaps, on all sides of the ventilation duct (Item 1), and meet the following requirements.

I. Space pins max. 12 in. apart in rows around the circumference for circular ventilation ducts (Item 1) or on all sides for rectangular ventilation ducts (Item 1). Locate pins max. 6-3/4 in. from the edges.

II. Space the rows of pins max. 9 in. apart along the length ventilation duct (Item 1). Where pieces of insulation (Item 4B) are to be butted together, space pins a max. of 3 in. apart.

III. After insulation (Item 4B) is installed, place min. 2.5 in. x 2.5 in. square, galvanized steel, self-locking washer clips onto all insulation pins.

IV. After clips are installed, cut off or bend flush with insulation (Item 4B) the pins that are too long.

C. Single End Overlap (Telescope): Refer to 4C Section View B-B. Locate pins at all blanket overlaps, on all sides of the ventilation duct (Item 1), and meet the following requirements.

I. Space pins max. 12 in. apart in rows across the width of ventilation duct (Item 1). Locate pins max. 6-3/4 in. from the edges of the rectangular ventilation duct (Item 1).

II. Space the rows of pins max. 10-1/2 in. apart along the length ventilation duct (Item 1). Where pieces of insulation (Item 4C) are to be butted together, space the pins a max. of 1-1/2 in. apart.

III. After insulation (Item 4C) is installed, place min. 2.5 in. x 2.5 in. square, galvanized steel, self-locking washer clips onto all insulation pins.

IV. After clips are installed, cut off or bend flush with insulation (Item 4C) the pins that are too long.

D. Dual End Overlap (Checkerboard): Refer to 4D Section View B-B. Locate pins at all blanket overlaps, on all sides of the ventilation duct (Item 1), and meet the following requirements.

I. Space pins max. 12 in. apart in rows across the width of ventilation duct (Item 1). Locate pins max. 6-3/4 in. from the edges of the rectangular ventilation duct (Item 1).

II. Space the rows of pins max. 10-1/2 in. apart along the length ventilation duct (Item 1). Where pieces of insulation (Item 4D) are to be butted together, space the pins a max. of 1-1/2 in. apart.

III. After insulation (Item 4D) is installed, place min. 2.5 in. x 2.5 in. square, galvanized steel, self-locking washer clips onto all insulation pins.

IV. After clips are installed, cut off or bend flush with insulation (Item 4D) the pins that are too long.
Design No. 3MU/DI 120-01 continued

3. BANDING: Do not use banding for the installation of insulation method (Item 4A), Compression Butt Joint. Banding is an option to fastener methods (Items 2B, 2C and 2D) but not fastener method (Item 2A). After insulation (Item 4) is installed, apply min. 1/2 in. wide, 0.015 in. thick stainless steel bands or min. 1/2 in. wide, 0.020 in. thick carbon steel bands and secured with min. 1 in. long stainless or carbon steel crimp clamps to be used with corresponding banding type. When needed to ease installation, use filament tape as a temporary hold for the insulation (Item 4) prior to banding. Place banding a max. 1-1/2 in. from all insulation (Item 4) edges and a max. of 10-1/2 in. on center (oc). Tension the banding to hold the insulation (Item 4) in place without cutting or damaging the insulation (Item 4) or ventilation duct (Item 1).

4. CERTIFIED MANUFACTURER: 3M Company
CERTIFIED PRODUCT: 3M™ Fire Barrier Duct Wrap
MODEL: 615 or 615+;

INSULATION: Refer to Figure 2. Apply one layer of nominal 1-1/2 in. thick, 6 pcf blanket, made of fibers, encapsulated with foil scrim over the entire surface of the ventilation duct (Item 1) and a collar on each side of the penetration firestop (Item 1D). Apply the insulation in accord with one of the four methods (A, B, C, or D) that follow. Use blanket that is encapsulated with a polypropylene/foil scrim or an aluminumized polyester/scrim/foil. Wrap one layer of insulation around the ventilation duct (Item 1) perimeter so that each terminating end of insulation overlaps onto the starting end of insulation a min. of 3 in. at all transverse joints. Alternate the transverse overlap location so that no two consecutive adjacent overlaps align. Refer to Section View A-A for transverse overlap section view. Cover and seal all visually exposed ends and edges of insulation with nominal 4 in. wide pressure-sensitive aluminum foil tape.

A. Compression Butt Joint: Refer to 4A Section View B-B. Wrap the ventilation duct (Item 1) with one layer of insulation installed with compression butt joints at all longitudinal joints. Compress each end of each piece of insulation together and butt to preceding edge of insulation. Each piece of installed insulation width is 2 in. less than insulation nominal width. (Example: each piece of nominal 24 in. wide insulation when installed is 22 in. wide.) Install the insulation overlap in contact (pressed against) with the insulation being overlapped. Verify all insulation butt joints are a min. 1-1/2 in. overall thickness at compression butt joints.

B. Butt Joint with Collar: Refer to 4B Section View B-B. Wrap the ventilation duct (Item 1) with one layer of insulation installed with butt joints at all longitudinal joints. Butt each end of each piece of insulation together with preceding edge of insulation. Each piece of installed insulation width is its nominal width. (Example: each piece of nominal 24 in. wide insulation when installed is 24 in. wide.) Install the insulation overlap in contact (pressed against) with the insulation being overlapped. Place and center 6 in. wide collar of insulation over the butt joint. Overlap 6 in. wide collar onto each adjacent insulation 3 in. Verify all insulation butt joints with collars are a min. 3 in. in overall thickness.

C. Single End Overlap (Telescope): Refer to 4C Section View B-B. Wrap the ventilation duct (Item 1) with one layer of insulation installed with 3 in. min. overlaps at all longitudinal joints. Overlap each adjacent insulation edge with the edge of the next piece of insulation. Install the insulation overlap in contact (pressed against) with the insulation being overlapped. Verify all insulation overlaps are nominally 3 in. in overall thickness.

   I. Starting at one end of the ventilation duct (Item 1), apply the first piece of insulation around the ventilation duct (Item 1) to overlap fasteners. Refer section view A-A.

   II. Position and overlap the leading edge of the second piece of insulation nominally 3 in. over the flush edge of the first piece of insulation. Place the opposite edge of the second piece of insulation flush against the surface of the ventilation duct (Item 1). An “S-shaped” cross section of the insulation is created. Refer to 4C section view B-B.

   III. Apply all additional pieces of insulation as “S-shaped” cross section of the insulation in compliance with Item 4CII.

D. Dual End Overlap (Checkerboard): Refer to 4D Section View B-B. Verify all insulation overlaps are a min. 3 in. in overall thickness. Do not align two consecutive insulation end overlaps. Overlap each full-width insulation edge with the edge of the “Gull Wing”, “U” shaped insulation. Install the insulation overlap in contact (pressed against) with the insulation being overlapped. Verify all insulation overlaps are nominally 3 in. in overall thickness.

   I. Wrap the first piece of insulation around the ventilation duct (Item 1) so that the insulation is flush against the surface of the ventilation duct (Item 1). Position the starting end of the insulation to overlap pins (Item 2A) a min. of 1-1/2 in. while the edges of the insulation overlap the rows of pins (Item 2B) a min. of 1-1/2 in.

   II. Position the second piece of insulation nominally 18 in. from the edge of the first piece of insulation. Install the second piece in the same manner as the first.

   III. Cover the ventilation duct (Item 1) that is exposed between the edges of the first two pieces of insulation with another piece of insulation. Position the starting end of the insulation to overlap pins (Item 2A) a min. of 1-1/2 in. while the edges of the insulation overlap the adjacent edges of the two pieces installed insulation a min. of 1-1/2 in.

5. SUPPORTS: Support the insulated ventilation duct (Item 1) using a support system composed of min. 3/8 in. diameter steel, all-thread rods and min. 2 x 2 x 1/4 in. steel angle cross-member for rectangular ducts or a min. 2 x 2 x 1/4 in. steel angle cross-member for circular ducts. Connect all-thread steel rods (insulation (Item 4) not required) to the angle or angle ring cross-member using nuts and washers. Connect the all-thread steel rods to the bottom of the floor assembly using an attachment method designed to carry the weight of the ventilation duct (Item 1) with insulation (Item 4) under a fire load equivalent to ASTM E119 time-temperature curve. Center ventilation duct (Item 1) with insulation (Item 4) on support cross-member. Space all-thread steel rods a max. distance of 6 in. from surface of the insulated ventilation duct or allowing all-thread steel rods to contact with the insulation (Item 4) at the min. distance. Extend support cross-member at least 2 in. past each all-thread steel rod. Space supports a max. 60 in. oc.
6. SUPPORTING CONSTRUCTION: Refer to Figures 3 and 4. Use one of the following wall or floor assemblies.

A. GYPSUM WALL ASSEMBLY: Symmetrical two-hour rated gypsum wall assembly, which may also be used as a shaft wall assembly, constructed of the following:

I. Steel Studs – Min. 25 GA galvanized steel studs measuring 3-5/8 in. wide with 1-1/4 in. legs spaced max. 24 in. oc. Attach studs with min. #4 x 3/8 in. steel stud framing screws to floor and ceiling tracks.

II. Tracks – Channel U-shaped floor and ceiling runners measuring 1/2 in. deep by 3-5/8 in. wide, which are secured to floor and ceiling with 1 in. long fasteners suitable for the mounting to substrate and spaced max. 18 in. oc.

III. Gypsum Board – Cover studs and runners with two layers of 5/8 in. thick, Type X gypsum board on each face. Fasten base layer of gypsum board to steel studs with #6 1-1/8 in. buggle head phillips drywall screws spaced max. 12 in. oc. Fasten face layer of gypsum board with #6, 1-5/8 in. long buggle phillips drywall screws spaced max. 8 in. oc. Apply vinyl or casein, dry or premixed joint compound to face layers of gypsum board in two coats to all exposed screw heads and gypsum board joints. Embed min. 2 in. wide paper, plastic or fiberglass tape in first layer of joint compound over joints in gypsum board. Min. wall assembly thickness of 6 in. measured from face layer of gypsum board to opposite face layer of gypsum board.

B. SHAFT WALL ASSEMBLY: Asymmetrical two-hour rated gypsum shaft wall assembly constructed of the following:

I. Visual Gypsum Board – Cover studs and runners with two layers of min. 1/2 in. thick, Type X gypsum board on each face. Fasten base layer of gypsum board to steel studs with #6 1-1/8 in. buggle head phillips drywall screws spaced max. 12 in. oc. Fasten face layer of gypsum board with #6, 1-5/8 in. long buggle phillips drywall screws spaced max. 8 in. oc. Apply vinyl or casein, dry or premixed joint compound to face layers of gypsum board in two coats to all exposed screw heads and gypsum board joints. Embed min. 2 in. wide paper, plastic or fiberglass tape in first layer of joint compound over joints in gypsum board. Min. wall assembly thickness of 4-1/2 in. measured from face layer of gypsum board to opposite face layer of gypsum board.

II. Interior Gypsum Board – Cut 1 in. thick Type X gypsum board 1 in. less than floor to ceiling height. Insert the longitudinal edges of the 1 in. thick Type X gypsum board into the C-T or C-H studs. Secure the transverse edge of the 1 in. thick Type X gypsum board to the long leg of J-runner using its tabs or min. 1-5/8 in. long Type S self-tapping buggle head steel screws spaced max. 12 in. oc.

III. Steel Studs – Cut min. 25 GA galvanized steel C-T or C-H studs measuring min. 2-1/2 in. wide with min. 1-1/2 in. flanges 3/4 in. less than floor to ceiling height and spaced max. 24 in. oc in runners with T or H section abutting long leg of runner.

IV. Runners – Use min. 2-1/2 in. wide J-runner compatible with studs and having unequal vertical legs: min. 1 in. short leg and min. 2 in. long leg. Position J-runners with short leg towards visual face of shaft wall. Attach to floor and ceiling using steel fasteners located a max. of 2 in. from each end and a max. of 24 in. oc.
Design No. 3MU/DI 120-01 continued

C. CONCRETE WALL ASSEMBLY: Symmetrical, two-hour rated, solid concrete, wall assembly made from reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete, which may also be used as a shaft wall assembly. Constructed of solid concrete with a min. concrete thickness measured from exposed face to exposed face using one of the following:
   I. lightweight concrete is 3.6 in.;
   II. sand-lightweight concrete is 3.8 in.;
   III. carbonate aggregate concrete is 4.6 in.; and
   IV. siliceous aggregate concrete is 5.0 in..

D. MASONRY WALL ASSEMBLY: Symmetrical, two-hour rated, nominal 8 x 8 x 16 CMU, wall assembly made from lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete, which may also be used as a shaft wall assembly.

E. CONCRETE FLOOR ASSEMBLY: Symmetrical two-hour rated solid concrete floor assembly made from reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Constructed of solid concrete with a min. concrete thickness measured from exposed face to exposed face using one of the following:
   I. lightweight concrete is 3.6 in.;
   II. sand-lightweight concrete is 3.8 in.;
   III. carbonate aggregate concrete is 4.6 in.; and
   IV. siliceous aggregate concrete is 5.0 in..

7. OPENING: – Refer to Figures 3 and 4. Create an opening in the supporting construction (wall or floor assembly). Determine the opening shape and size to house the ventilation duct’s (Item 1), whether with or without insulation (Item 4) passing through the opening, shape and size. Position the penetrating item (Item 1) concentrically or eccentrically in the opening so that the annular space ranges from min. to max. as in Table 2. Make the opening with in accord with the following:
   A. For gypsum wall assemblies (Item 6A) and shaft wall assemblies (Item 6B), frame the opening with steel studs (Item 6AI) and tracks (Item 6AII).

8. PENETRATION FIRESTOP: Install firestop between the supporting construction (Item 6) and the ventilation duct (Item 1) or the ventilation duct (Item 1) protected with the insulation (Item 4). Use a symmetrical wall penetration firestop, an asymmetrical shaft penetration firestop, or an asymmetrical floor penetration firestop constructed of the following components:

A. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M™ Fire Barrier Duct Wrap Insulation
   MODEL: 615 or 615+
   PACKING MATERIAL: Fill the entire annular space’s width and a min. depth of 4 in. with min. 4 pcf density mineral wool or certified insulation without the encapsulation (foil scrim). Cut the packing material into strips not less than one and one half (1-1/2) times the width of the annular space to be filled. Compress packing material nominally 33% and insert packing material into the annular space. For wall assemblies, recess the surface of packing material nominally 5/8 in. from surfaces of both faces of the supporting construction (Item 6). For floor and shaft wall assemblies, recess the surface of packing material nominally 5/8 in. from the visual surface of the supporting construction (Items 6).

B. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M™ Fire Barrier™ Sealant
   MODEL: Water-Tight 1000-NS Silicone, Water-Tight 1003-SL Silicone (floors only), 2000+ Silicone, or CP 25 WB+
   FILL, VOID OR CAVITY MATERIAL: Install min. 5/8 in. depth of fill material into the recess over the entire surface of the packing material (Item 7A). Screw the fill material flush with the surface of the supporting construction (Item 6). Overlap a min. of 1/4 in., the fill material onto face of supporting construction (Item 6).

C. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M™ Fire Barrier Duct Wrap Insulation
   MODEL: 615 or 615+

D. COLLAR: Required for R4 ventilation ducts (Item 1) in Table 1. After the ventilation duct (Item 1) is covered with insulation (Item 4), install a collar, which is another layer of min. 24 in. wide, min. 6 pcf density, insulation (Item 4) over the insulated ventilation duct (Item 1) on each side of the supporting construction (Item 6). Match and use the same installation method as used to install the insulation (Item 4) applied to the ventilation duct (Item 1) creating two (2) layers of insulation (Item 4) on the ventilation duct (Item 1) adjacent to the supporting construction (Item 6). About one perimeter edge of each collar to the exposed surface supporting construction (Item 6).

E. STEEL ANGLE: Required for R4 ventilation ducts (Item 1) in Table 1. Before the ventilation duct (Item 1) is covered with insulation (Item 4) and after the packing material (Item 7A) and fill material (Item 7B) are installed, install a nominal 16 GA 2 x 1-1/2 in. steel angle around the perimeter of the ventilation duct (Item 1) with notched ends to create a continuous frame. Place the 1-1/2 in. leg of the steel angle flush against the surface of the supporting construction (Item 6). Attach the 2 in. leg of the steel angle to the ventilation duct (Item 1) using self drilling, 12-24x2 hex head, screws with a #5 point, spaced a max. of 6 in. oc.

A. Construct the ventilation duct using sections affixed to each other with seams or flanges.
B. Reinforce the ventilation duct to IMC, SMACNA or NFPA 90A requirements designed to carry the weight of the ventilation duct assembly covered with insulation (Item 4) under a fire load equivalent to ASTM E 119 time-temperature curve.
C. Rigidly support the ventilation duct in accordance with IMC, SMACNA or NFPA 90A requirements designed to carry the weight of the ventilation duct assembly covered with insulation (Item 4) under a fire load equivalent to ASTM E 119 time-temperature curve or as specified in Item 5.
D. Protect the annular space around the ventilation duct passing through a fire rated wall assembly with an Intertek certified, compatible, 3M penetration firestop system, refer to Section 8, having the same fire rating as the wall assembly.

2. FASTENERS: Refer to Figure 2. Weld minimum 12 GA, 4-1/2-inch long, copper-coated steel insulation pins or 12 GA insulated cup head pins to the ventilation duct (Item 1). Match fastener method with corresponding insulation (Item 4) method.
A. Compression Butt Joint: Refer to 4A Section View B-B. Locate pins at all blanket overlaps, on all sides of the ventilation duct (Item 1), and meet the following requirements.
   I. Space pins maximum 12 inches apart in rows across the width of ventilation duct (Item 1). Locate pins maximum 6-3/4 inches from the edges of the rectangular ventilation duct (Item 1).
Design No. 3MU/DI 60-01 continued

II. Space the rows of pins maximum 9-1/2 inches apart along the length ventilation duct (Item 1). Where pieces of insulation (Item 4A) are to be butt together, space the pins a maximum of 2 inches apart.

III. After insulation (Item 4A) is installed, place minimum 2.5 in. x 2.5 in. square, galvanized steel, self locking washer clips onto all insulation pins.

IV. After clips are installed, cut off or bend flush with insulation (Item 4) the pins that are too long.

B. Butt Joint with Collar: Refer to 4B Section View B-B. Locate pins at all blanket overlaps, on all sides of the ventilation duct (Item 1), and meet the following requirements.
   I. Space the rows of pins maximum 12 inches apart in rows around the circumference for circular ventilation ducts (Item 1) or on all sides for rectangular ventilation ducts (Item 1). For rectangular ventilation ducts (Item 1), locate pins maximum 6-3/4 inches from the edges.
   II. Space the rows of pins maximum 9 inches apart along the length ventilation duct (Item 1). Where pieces of insulation (Item 4B) are to be butted together, space the pins a maximum of 3 inches apart.
   III. After insulation (Item 4B) is installed, place minimum 2.5 in. x 2.5 in. square, galvanized steel, self locking washer clips onto all insulation pins.
   IV. After clips are installed, cut off or bend flush with insulation (Item 4B) the pins that are too long.

C. Single End Overlap (Telescope): Refer to 4C Section View B-B. Locate pins at all blanket overlaps, on all sides of the ventilation duct (Item 1), and meet the following requirements.
   I. Space the rows of pins maximum 12 inches apart in rows across the width of ventilation duct (Item 1). Locate pins maximum 6-3/4 inches from the edges of the rectangular ventilation duct (Item 1).
   II. Space the rows of pins maximum 10-1/2 inches apart along the length ventilation duct (Item 1). Where pieces of insulation (Item 4C) are to be butted together, space the pins a maximum 1-1/2 inches apart.
   III. After insulation (Item 4C) is installed, place minimum 2.5 in. x 2.5 in. square, galvanized steel, self locking washer clips onto all insulation pins.
   IV. After clips are installed, cut off or bend flush with insulation (Item 4C) the pins that are too long.

D. Dual End Overlap (Checkerboard): Refer to 4D Section View B-B. Locate pins at all blanket overlaps, on all sides of the ventilation duct (Item 1), and meet the following requirements.
   I. Space the rows of pins maximum 12 inches apart in rows across the width of ventilation duct (Item 1). Locate pins maximum 6-3/4 inches from the edges of the rectangular ventilation duct (Item 1).
   II. Space the rows of pins maximum 10-1/2 inches apart along the length ventilation duct (Item 1). Where pieces of insulation (Item 4D) are to be butted together, space the pins a maximum 1-1/2 inches apart.
   III. After insulation (Item 4D) is installed, place minimum 2.5 in. x 2.5 in. square, galvanized steel, self locking washer clips onto all insulation pins.
   IV. After clips are installed, cut off or bend flush with insulation (Item 4D) the pins that are too long.

III. BANDING: Do not use banding for the installation of insulation method (Item 4A), Compression Butt Joint. Banding is an option to fastener methods (Items 2B, 2C and 2D) but not fastener method (Item 2A). After insulation (Item 4) is installed, apply minimum 1/2 inch wide, 0.015-inch thick stainless steel bands or minimum 1/2 inch wide, 0.020-inch thick carbon steel bands and secured with minimum 1-inch long stainless or carbon steel crimp clamps to be used with corresponding banding type. When needed to ease installation, use filament tape as a temporary hold for the insulation (Item 4) prior to banding. Place banding a maximum 1-1/2 inches from all insulation (Item 4) edges and a maximum of 10-1/2 inches on center (O.C.). Tension the banding to hold the insulation (Item 4) in place without cutting or damaging the insulation (Item 4) or ventilation duct (Item 1).

---

**Figure 2**

![Diagram of Design No. 3MU/DI 60-01 continued](image-url)
4. CERTIFIED MANUFACTURER: 3M Company
CERTIFIED PRODUCT: 3M™ Fire Barrier Duct Wrap
MODEL: 615 or 615+ 

INSULATION: Refer to Figure 2. Apply one layer of nominal 1-1/2 in. thick, 6-pcf blanket, made of fibers, encapsulated with foil scrim over the entire surface of the ventilation duct (Item 1) and a collar on each side of the penetration firestop (Item 1D). Apply the insulation in accord with one of the four methods (A, B, C, or D) that follow. Use blanket that is encapsulated with a polypropylene/foil scrim or an aluminized polyester/scrim/foil. Wrap one layer of insulation around the ventilation duct (Item 1) perimeter so that each terminating end of insulation overlaps onto the starting end of insulation a minimum of 3 inches at all transverse joints. Alternate the transverse overlap location so that no two consecutive adjacent overlaps align. Refer to Section View A-A for transverse overlap section view. Cover and seal all visually exposed edges and edges of insulation with nominal 4-inch wide pressure-sensitive aluminum foil tape.

A. Compression Butt Joint: Refer to 4A Section View B-B. Wrap the ventilation duct (Item 1) with one layer of insulation installed with compression butt joints at all longitudinal joints. Compress each end of each piece of insulation together and butt to preceding edge of insulation. Each piece of installed insulation width is 2 inches less than insulation nominal width. (Example: each piece of nominal 24-inch wide insulation when installed is 22-inches wide.) Install the insulation overlap in contact (pressed against) with the insulation being overlapped. Verify all insulation butt joints are a minimum 1-1/2 inches in overall thickness at compression butt joints.

B. Butt Joint with Collar: Refer to 4B Section View B-B. Wrap the ventilation duct (Item 1) with one layer of insulation installed with butt joints at all longitudinal joints. Butt each end of each piece of insulation together with preceding edge of insulation. Each piece of installed insulation width is its nominal width. (Example: each piece of nominal 24-inch wide insulation when installed is 24-inches wide.) Install the insulation overlap in contact (pressed against) with the insulation being overlapped. Place and center 6-inch wide collar of insulation over the butt joint. Overlap 6-inch wide collar onto each adjacent insulation 3-inches. Verify all insulation butt joints with collars are a minimum 3 inches in overall thickness.

C. Single End Overlap (Telescope): Refer to 4C Section View B-B. Wrap the ventilation duct (Item 1) with one layer of insulation installed with 3-inch minimum overlaps at all longitudinal joints. Overlap each adjacent insulation edge with the edge of the next piece of insulation. Install the insulation overlap in contact (pressed against) with the insulation being overlapped. Verify all insulation overlaps are nominally 3 inches in overall thickness.

I. Starting at one end of the ventilation duct (Item 1), apply the first piece of insulation around the ventilation duct (Item 1) to overlap fasteners (Item 2C). Refer section view A-A.

II. Position and overlap the leading edge of the second piece of insulation nominally 3 inches over the flush edge of the first piece of insulation. Place the opposite edge of the second piece of insulation flush against the surface of the ventilation duct (Item 1). An “S-shaped” cross section of the insulation is created. Refer to 4C section view B-B.

III. Apply all additional pieces of insulation as “S-shaped” cross section of the insulation in compliance with Item 4CII.

D. Dual End Overlap (Checkerboard): Refer to 4D Section View B-B. Verify all insulation overlaps are a minimum 3 inches in overall thickness. Do not align two consecutive insulation end overlaps. Overlap each full-width insulation edge with the edge of the “Gull Wing” or “U” shaped insulation. Install the insulation overlap in contact (pressed against) with the insulation being overlapped. Verify all insulation overlaps are nominally 3 inches in overall thickness.

I. Wrap the first piece of insulation around the ventilation duct (Item 1) so that the insulation is flush against the surface of the ventilation duct (Item 1). Position the starting end of the insulation overlap pins (Item 2A) a minimum of 1-1/2 inches while the edges of the insulation overlap the rows of pins (Item 2B) a minimum of 1-1/2 inches.

II. Position the second piece of insulation nominally 18 inches from the edge of the first piece of insulation. Install the second piece in the same manner as the first.

III. Cover the ventilation duct (Item 1) that is exposed between the edges of the first two pieces of insulation with another piece of insulation. Position the starting end of the insulation to overlap pins (Item 2A) a minimum of 1-1/2 inches while the edges of the insulation overlap the adjacent edges of the two pieces installed insulation a minimum of 1-1/2 inches.

5. SUPPORTS: Support the ventilation duct (Item 1) with insulation (Item 4) using a “trapeze” system composed of a minimum 2 x 2 x 1/4-inch steel angle as the trapeze cross-member and minimum 3/8-inch diameter rods. Connect all-thread steel rods (insulation (Item 4) not required) to the trapeze cross-member using nuts and washers. Connect the all-thread steel rods to the bottom of the floor assembly using an attachment method designed to carry the weight of the ventilation duct (Item 1) with insulation (Item 4) under a fire load equivalent to ASTM E119 time-temperature curve. Center ventilation duct (Item 1) with insulation (Item 4) on trapeze cross-member. Space all-thread steel rods a maximum distance of 6 inches from surface of the insulated ventilation duct or allowing all-thread steel rods to contact with the insulation (Item 4) at the minimum distance. Extend trapeze cross-member at least 2-inches past each all-thread steel rod. Space trapeze supports a maximum 60-inches O.C.
6. SUPPORTING CONSTRUCTION: Refer to Figures 3 and 4. Use one of the following wall or floor assemblies.

A. GYPSUM WALL ASSEMBLY: Symmetrical one-hour rated gypsum wall assembly, which may also be used as a shaft wall assembly, constructed of the following:

I. Steel Studs – Minimum 25 GA galvanized steel studs measuring 3-5/8 inch wide with 1-1/4-inch legs spaced maximum 24 inch on center (O.C.). Attach studs with minimum #6 x 3/8-inch steel stud framing screws to floor and ceiling tracks.

II. Tracks – Channel U-shaped floor and ceiling runners measuring 1/2-inch deep by 3-5/8-inch wide, which are secured to floor and ceiling with 1-inch long fasteners suitable for the mounting to substrate and spaced maximum 18-inch O.C.

III. Gypsum Board – Cover studs and runners with one layer of 5/8 inch thick, Type X gypsum board on each face. Fasten the layer of gypsum board to steel studs with #6 1-1/8 inch bugle head phillips drywall screws spaced maximum 8 inch O.C. Apply vinyl or casein, dry or premixed joint compound to face layers of gypsum board in two coats to all exposed screw heads and gypsum board joints. Embed minimum 2 inch wide paper, plastic or fiberglass tape in first layer of joint compound over joints in gypsum board. Minimum wall assembly thickness of 4-3/4 inches measured from face layer of gypsum board to opposite face layer of gypsum board.

B. SHAFT WALL ASSEMBLY: Asymmetrical one-hour rated gypsum shaft wall assembly constructed of the following:

I. Visual Gypsum Board – Cover studs and runners with one layer of minimum 5/8 inch thick, Type X gypsum board on each face. Fasten gypsum board to steel studs with #6 1-5/8 inch bugle head phillips drywall screws spaced maximum 8 inch O.C. Apply vinyl or casein, dry or premixed joint compound to face layers of gypsum board in two coats to all exposed screw heads and gypsum board joints. Embed minimum 2 inch wide paper, plastic or fiberglass tape in first layer of joint compound over joints in gypsum board. Minimum wall assembly thickness of 6 inches measured from face layer of gypsum board to opposite face layer of gypsum board.

II. Interior Gypsum Board – Cut 1-inch thick Type X gypsum board 1-inch less than floor to ceiling height. Insert the longitudinal edges of the 1-inch thick Type X gypsum board into the C-T or C-H studs. Secure the transverse edge of the 1-inch thick Type X gypsum board to the long leg of J-runner using its tabs or minimum 1-5/8-inch long Type S self-tapping bugle head steel screws spaced maximum 12 inches on center.

III. Steel Studs – Cut minimum 25 GA galvanized steel C-T or C-H studs measuring minimum 2-1/2 inches wide with minimum 1-1/2-inch flanges 3-4 inches less than floor to ceiling height and spaced maximum 24 inch on center (O.C.) in runners with T or H section abutting long leg of runner.

IV. Runners – Use minimum 2-1/2-inch wide J-runner compatible with studs and having unequal vertical legs: minimum 1-inch short leg and minimum 2-inch long leg. Position J-runners with short leg towards visual face of shaft wall. Attach to floor and ceiling using steel fasteners located a maximum of 2-inches from each end and a maximum of 24 inch O.C.
Design No. 3MU/DI 60-01 continued

C. CONCRETE WALL ASSEMBLY: Symmetrical, one-hour rated, solid concrete, wall assembly made from reinforced lightweight or normal weight (100-150pcf or 1600-2400 kg/m³) concrete, which may also be used as a shaft wall assembly. Constructed of solid concrete with a minimum concrete thickness measured from exposed face to exposed face using one of the following:
   I. lightweight concrete is 3.6 inches;
   II. sand-lightweight concrete is 3.8 inches;
   III. carbonate aggregate concrete is 4.6 inches; and
   IV. siliceous aggregate concrete is 5.0 inches.

D. MASONRY WALL ASSEMBLY: Symmetrical, minimum one-hour rated, nominal 8 x 8 x 16 CMU, wall assembly made from lightweight or normal weight (100-150pcf or 1600-2400 kg/m³) concrete, which may also be used as a shaft wall assembly.

E. CONCRETE FLOOR ASSEMBLY: Symmetrical one-hour rated solid concrete floor assembly made from reinforced lightweight or normal weight (100-150pcf or 1600-2400 kg/m³) concrete. Constructed of solid concrete with a minimum concrete thickness measured from exposed face to exposed face using one of the following:
   I. lightweight concrete is 3.6 inches;
   II. sand-lightweight concrete is 3.8 inches;
   III. carbonate aggregate concrete is 4.6 inches; and
   IV. siliceous aggregate concrete is 5.0 inches.

F. WOOD FLOOR ASSEMBLY: Asymmetrical ASTM E 119 (UL 263 or NFPA 251) one-hour fire-rated floor assembly having the following components as part of its construction:
   I. Joists – Minimum 2 x 10 wood joists spaced a maximum 18-1/2 inches on center (OC).
   II. Flooring – Minimum 3/4-inch thick plywood attached to the top of wood joists.
   III. Gypsum Board – Minimum one layer of 5/8-inch thick, Type X, gypsum board attached to the bottom of wood joists with minimum #8, 1-5/8-inch long, bugle head screws.
   IV. Reinforcement – When the opening (Item 6G) penetrates the joists, additional 2 x 10 solid wood perimeter framing is required to maintain the floor assembly’s strength at that location.

7. OPENING: – Refer to Figures 3 and 4. Create an opening in the supporting construction (wall or floor assembly). Determine the opening shape and size to house the ventilation duct’s (Item 1), whether with or without insulation (item 4) passing through the opening, shape and size. Position the penetrating item (Item 1) concentrically or eccentrically in the opening so that the annular space ranges from minimum to maximum as in Table 2. Make the opening with in accord with the following:
   A. For gypsum wall assemblies (Item 6A) and shaft wall assemblies (Item 6B), frame the opening with steel studs (Item 6AI) and tracks (Item 6All).

8. PENETRATION FIRESTOP: The following firestop assemblies have be firestop between the supporting construction (Item 6) and the ventilation duct (Item 1) or the ventilation duct (Item 1) protected with the insulation (Item 4). Use a symmetrical wall penetration firestop, an asymmetrical shaft penetration firestop, or an asymmetrical floor penetration firestop constructed of the following components:

A. CERTIFIED MANUFACTURER: 3M Company  
CERTIFIED PRODUCT: 3M™ Fire Barrier Duct Wrap Insulation  
MODEL: 615 or 615+  
Packing MATERIAL: Fill the entire annular space’s width and a minimum depth of 4-inches with minimum 4-pcf density mineral wool or certified insulation without the encapsulation (foil scrim).  
Cut the packing material into strips not less than one and one half (1-1/2) times the width of the annular space to be filled. Compress packing material nominally 33% and insert packing material into the annular space.  
For wall assemblies, recess the surface of packing material nominally 5/8 inches from surfaces of both faces of the supporting construction (Item 6).  
For floor and shaft wall assemblies, recess the surface of packing material nominally 5/8 inches from the visual surface of the supporting construction (Items 6).

B. CERTIFIED MANUFACTURER: 3M Company  
CERTIFIED PRODUCT: 3M™ Fire Barrier™ Sealant  
MODEL: Water-Tight 1000-NS Silicone, Water-Tight 1003-SL Silicone (floors only), 2000+ Silicone, or CP 25 WB+  
FILL, VOID OR CAVITY MATERIAL: Install minimum 5/8-inch depth of fill material into the recess over the entire surface of the packing material (Item 7A). Screed the fill material flush with the surface of the supporting construction (Item 6). Overlap a minimum of 1/4 inches, the fill material onto face of supporting construction (Item 6).

C. CERTIFIED MANUFACTURER: 3M Company  
CERTIFIED PRODUCT: 3M™ Fire Barrier Duct Wrap Insulation  
MODEL: 615 or 615+  
D. COLLAR: Required for R4 ventilation ducts (Item 1) in Table 1. After the ventilation duct (Item 1) is covered with insulation (Item 4), install a collar, which is another layer of minimum 24-inch wide, minimum 6-pcf density, insulation (Item 4) over the insulated ventilation duct (Item 1) on each side of the supporting construction (Item 6). Match and use the same installation method as used to install the insulation (Item 4) applied to the ventilation duct (Item 1) creating two (2) layers of insulation (Item 4) on the ventilation duct (Item 1) adjacent to the supporting construction (Item 6). Abut one perimeter edge of each collar to the exposed surface supporting construction (Item 6).

E. STEEL ANGLE: Required for R4 ventilation ducts (Item 1) in Table 1. Before the ventilation duct (Item 1) is covered with insulation (Item 4) and after the packing material (Item 7A) and fill material (Item 7B) are installed, install a nominal 16 GA 2 x 1-1/2-inch steel angle around the perimeter of the ventilation duct (Item 1) with notched ends to create a continuous frame. Place the 1-1/2-inch leg of the steel angle flush against the surface of the supporting construction (Item 6). Attach the 2-inch leg of the steel angle to the ventilation duct (Item 1) using self drilling, 12-24x2 hex head, screws with a #5 point, spaced a maximum of 6 inches on center.
**Assembly No. V-20**  
February 16, 2010  
Duct A  
Fire Resistance Rating – 2 Hr  
(Ratings applicable for Ventilation Ducts installed with or without branches)

1. **Floor or Wall Assembly** – Min 4-1/2 in. (114 mm) thick reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete floor or min 5-1/4 in. (133 mm) thick reinforced lightweight or normal weight concrete wall. Wall may also be constructed of any UL Classified Concrete Blocks.  
See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. **Steel Air Duct** – Min 0.035 in. (0.9 mm) thick (or heavier) steel duct having a max perimeter of 168 in. (1.52 m) with max individual dimension of 60 in. (1.52 m) and constructed in accordance with SMACNA HVAC Duct Construction standards. The sections shall be assembled using bolted flanges or SMACNA approved Transverse Joint Reinforcements. Duct to be rigidly supported in accordance with SMACNA requirement and as specified in Item 4.

3. **Fire Resistive System** – The fire resistive system shall consist of the following:
   A. **Batts and Blankets** – Min 1-1/2 in. (38 mm) thick, totally encapsulated within foil-scrim facers. The steel duct shall be wrapped with two layers of duct wrap installed with 3 in. (76 mm) transverse and longitudinal overlaps, or tightly butted transverse joints, in accordance with the manufacturer’s installation instructions. All cut edges and ends shall be sealed with 3 in. (76 mm) wide pressure sensitive aluminum foil tape.
      
      **3M COMPANY** – 3M FireBarrier Duct Wrap 15A, 3M FireBarrier Duct Wrap 20A, 3M FireBarrier Duct Wrap 615 or 3M FireBarrier Duct Wrap 615+  
   A1. **Batts and Blankets** – **Collars** – Min 1-1/2 in. (38 mm) thick, 6 in. (152 mm) wide collars, totally encapsulated within foil-scrim facers. The transverse butt joints shall be wrapped using a collar. The collar shall be centered over each butt joint with a 3 in. (76 mm) longitudinal overlap.  
      
      **3M COMPANY** – 3M FireBarrier Duct Wrap 15A Collars, 3M FireBarrier Duct Wrap 20A Collars, 3M FireBarrier Duct Wrap 615 Collars or 3M FireBarrier Duct Wrap 615+ Collars
   B. **Steel Banding Straps** – Min 1/2 in. (13 mm) wide by 0.015 in. (0.4 mm) thick stainless steel banding straps used in conjunction with min 1 in. (25 mm) long stainless steel crimp clips. Banding straps spaced a max 12 in. (305 mm) OC and 1-1/2 in. (38 mm) from edges of collars.
      
      **3M COMPANY** – 3M FireBarrier Duct Wrap 15A Steel Banding Straps, 3M FireBarrier Duct Wrap 20A Steel Banding Straps, 3M FireBarrier Duct Wrap 615 Steel Banding Straps  
   B1. **Steel Pins** (Not shown) – Min 0.118 in. (3 mm) thick, 4 in. (102 mm) long copper coated steel insulation pins used in conjunction with 1 by 1 in. (25 by 25 mm) square 0.020 in. (0.5 mm) thick, galvanized steel speed clips. Pins spaced max 10 in. (254 mm) max, transversely around the duct and secured to the duct wrap in accordance with the manufacturers installation instructions.
   C. **Firestop System** – When the ventilation duct passes through a fire rated wall or floor assembly, the through openings shall be firestopped in accordance with Through-Penetration System No. C-AJ-7096. See Through–Penetration Firestop Systems in Vol. 2 of the Fire Resistance Directory.

4. **Hanger System** – (Not shown) – No additional protection is required for hanger systems providing that a min 1/2 in. (13 mm) diameter threaded steel hanger rod is used in conjunction with min 3 by 3 by 3/8 in. (76 by 76 by 10 mm) steel angle with steel drop in or wedge expansion type masonry anchors.

Assembly No. V-27
February 16, 2010

Duct A

Fire Resistance Rating – 1 or 2 Hr
(Ratings applicable for Ventilation Ducts installed with or without branches)

1. Wall or Floor Assembly –
   A. Masonry Wall – Min 7-1/2 in. (190 mm) thick reinforced lightweight or normal weight concrete wall. Wall may also be constructed of any UL Classified Concrete Blocks.

   OR

   B. Gypsum Board Wall Assembly – The 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

      B1. Studs – Wall framing shall consist of steel “C” studs min 3-5/8 in. (92 mm) wide and spaced max 24 in. (610 mm) OC. Additional framing members shall be used to completely frame around opening.

      B2. Gypsum Board* – Min 5/8 in. (15.9 mm) thick, 4 ft (1220 mm) wide with square or tapered edges as specified in the individual U400 or V400 Wall and Partition Design.

See Gypsum Board (CKNX) category in the Fire Resistance Directory for names of manufacturers.

   OR

   C. Floor-Ceiling Assembly – The 1 hr fire-rated solid wood joist floor-ceiling assembly shall be constructed of the materials and in the manner described in the individual L500 Series Design in the UL Fire Resistance Directory. The general construction features of the floor-ceiling assembly are summarized below:

      C1. Flooring System – Lumber or plywood subfloor with finish floor as specified in the individual Floor-Ceiling Design.

      C2. Wood Joists – Nom 10 in. (240 mm) deep (or deeper) wood joists with bridging as required and with ends firestopped. Opening to be framed on all 4 sides with sections of solid wood joist.

      C3. Gypsum Board* – Thickness, type, number of layers and fasteners shall be as specified in individual Floor-Ceiling Design.

See Concrete Blocks (CAZT) category in the Fire Resistance Directory for names of manufacturers.

2. Steel Air Duct – Min 0.030 in. (0.76 mm) thick (or heavier) steel duct having a max perimeter of 218 in. (5.54 m) with max individual dimension of 85 in. (2.16 m) and constructed in accordance with SMACNA HVAC Duct Construction Standards - Metal and Flexible. The sections shall be assembled using bolted flanges or SMACNA approved Transverse Joint Reinforcements. Duct to be rigidly supported in accordance with SMACNA requirement and as specified in Item 4.

3. Fire Resistive System – The fire resistive system shall consist of the following:

   A1. Batts and Blankets* – Min 1-1/2 in. (38 mm) thick, totally encapsulated within foil-scrim facers. The steel duct shall be wrapped with one layer of duct wrap installed in a telescope, checkerboard or butt-joint-and-collar pattern with 3 in. (76 mm) transverse and longitudinal overlaps, in accordance with the manufacturer’s installation instructions. All cut edges and ends shall be sealed with 3 in. (76 mm) wide pressure sensitive aluminum foil tape.

   3M COMPANY
   3M FIRE PROTECTION PRODUCTS – 3M FireBarrier Duct Wrap 615 or 3M FireBarrier Duct Wrap 615+
Assembly No. V-27 continued

A2. Batts and Blankets* – Collars – Min 1-1/2 in. (38 mm) thick, 6 in. (152 mm) wide collars, totally encapsulated within foil-scrim facers. The transverse butt joints shall be wrapped using a collar. The collar shall be centered over each butt joint with a 3 in. (76 mm) longitudinal overlap.

3M COMPANY
3M FIRE PROTECTION PRODUCTS – 3M FireBarrier Duct Wrap 615 Collars or 3M FireBarrier Duct Wrap 615+Collars

B1. Steel Banding Straps (Not shown) – Min 1/2 in. (13 mm) wide by 0.015 in. (0.4 mm) thick stainless steel banding straps used in conjunction with min 1 in. (25 mm) long stainless steel crimp clips. Banding straps spaced a max 12 in. (305 mm) OC and 1-1/2 in. (38 mm) from edges of collars.

B2. Steel Pins (Not shown) – Min 0.118 in. (3 mm) thick, 6 in. (150 mm) long copper coated steel insulation pins used in conjunction with 2-1/2 by 2-1/2 in. (63 by 63 mm) square 0.020 in. (0.5 mm) thick, galvanized steel speed clips. Pins spaced 12 in. max transversely and 10-1/2 in. (267 mm) max lengthwise along the ends and bottom of the duct and secured to the duct wrap in accordance with the manufacturers installation instructions.

C. Firestop System – When the ventilation duct passes through a fire separation, the through openings shall be firestopped in accordance with Through-Penetration System No. W-J-7104 (masonry wall), W-L-7180 (gypsum board wall) or F-C-7054 (combustible floor-ceiling). See Through-Penetration Firestop Systems in Vol. 2 of the Fire Resistance Directory.

4. Support Rod – Steel threaded rod, nominal minimum diameter as shown in the table below, mounted to concrete floor by passing through pre-drilled hole and bolting with nut and washer on top of floor, or or with steel drop-in or wedge expansion type concrete anchors sized as follows:

<table>
<thead>
<tr>
<th>Load carried by each rod</th>

5. Cradle – Steel angle, 75 mm by 75 mm by 6.3 mm, used to support wrapped duct at 1500 mm OC maximum. Hung from concrete floor with Support Rods (Item 4).

For ducts not exceeding 1525 mm in width, steel angle 51 mm by 51 mm by 4.8 mm or Unistrut P5500 channel can be used.

Assembly No. V-31
November 14, 2012
Duct A
Fire-resistance rating – 2 hr

1. Wall or Floor Assembly –
   A. **Floor or Wall Assembly** – Min 4-1/2 in. thick reinforced lightweight or normal weight (100-150pcf) concrete floor or wall. Wall may also be constructed of any UL Classified **Concrete Block**.
   See **Concrete Blocks** (CAZT) category in the Fire Resistance Directory for names of manufacturers.
   OR
   B. **Gypsum Board Wall Assembly** – The 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the individual U400 or V400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:
      B1. **Studs** – Wall framing shall consist of steel “C” studs min 3-5/8 in. (92 mm) wide and spaced max 24 in. (610 mm) OC or min. 2 in. by 4 in. wood studs spaced max 16 in. OC. Additional framing members shall be used to completely frame around opening.
      B2. **Gypsum Board** – Thickness, type, number of layers and fasteners shall be as specified in individual Floor-Ceiling Design as specified in the individual U400 or V400 Wall and Partition Design.
   See **Gypsum Board** (CKNX) category in the Fire Resistance Directory for names of manufacturers.
   OR
   C. **Floor-Ceiling Assembly** – The 2 hr fire-rated solid wood joist floor-ceiling assembly shall be constructed of the materials and in the manner described in the individual L500 Series Design in the UL Fire Resistance Directory. The general construction features of the floor-ceiling assembly are summarized below:
      C1. **Flooring System** – Lumber or plywood subfloor with finish floor as specified in the individual Floor-Ceiling Design.
      C2. **Wood Joists** – Nom 2 in. by 10 in. (240 mm) deep (or deeper) wood joists with bridging as required and with ends firestopped. Opening to be framed on all 4 sides with sections of solid wood joist.
      C3. **Gypsum Board** – Thickness, type, number of layers and fasteners shall be as specified in individual Floor-Ceiling Design.

2. **Steel Air Duct** – Min 0.028 in. (22 gauge) thick (or heavier) steel duct having a max perimeter dimension of 218 in. and a max individual dimension of 85 in. When installed is a Combustible Floor-Ceiling Assembly the maximum perimeter dimension shall be 136 in. and a maximum individual dimension of 48 in. Duct sections are intended to be assembled using bolted flanges or SMACNA-approved transverse joint reinforcements. Duct intended to be rigidly supported in accordance with SMACNA requirement and as specified in Item 4. For duct requiring a three-sided wrap, top surface of duct to be located a maximum of 8 in. from the bottom face of floor. Ducts requiring a two-sided wrap shall be installed such that top surface and one side of duct is located maximum 8 in. from bottom surface of floor and adjacent surface of wall assembly.
   For ducts with any dimension greater than 60 in. a 1-1/2 in. by 1-1/2 in. by 1/8 in thick transverse stiffening angle, approximately 2 in. less than the maximum dimension, shall be screw attached 8 in OC to the duct, maximum 4 in. beyond the top surface of floor and both surfaces of wall (at the floor or wall penetration).

3. **Fire-resistive System** – The fire-resistive system shall consist of the following:
**Assembly No. V-31 continued**

A. **Batts and Blankets** – The Duct Insulation fire-resistant system shall consist of Calcium-Magnesium-Silicate (CMS) duct wrap, 1-1/2 in. thick, installed in accordance with the manufacturer’s installation instructions and shall include the following features:

   (a) Copper-coated steel insulation pins (not shown), inductive weld pins or cup-head weld pins, nominal 0.012 in. (3 mm) thick, minimum 1-1/2 in. long, shall be stud-welded to the surfaces of steel duct to be wrapped at 12 in. OC maximum across the width of the duct and 10-1/2 in. mm OC maximum along the length of the duct. Pins are required on the bottom surface of all ducts wider than 12 in.

   (b) Banding, Item 7, may be omitted where pins are used on the side(s) as well as the bottom surface.

   The duct wrap material is installed using either a butt joint and collar method or an overlap method as described below:

A1. **Butt Joint and Collar Method**

A1.1. - One layer of 1-1/2 in. thick duct wrap shall be installed around the duct and cradle support (Items 4 and 5) with perimeter joints tightly butted tightly. The duct wrap is installed on the bottom of the duct and over the cradle supports and around the vertical sides of the duct with an overlap of minimum 3 in. onto the bottom surface of floor slab or to the wall and the floor slab on both sides of the duct to allow for the installation of Clamping Bar (Item 6). All cut edges to be taped with pressure sensitive aluminum foil tape, 3 in. wide.

A1.2. - Collars, minimum 6 in. wide, shall be installed over each of the perimeter joints. Collar shall be installed with an overlap of minimum 3 in. onto the bottom face of the floor slab to allow for the installation of Clamping Bar (Item 6).

A1.3. - The collars and duct wrap shall be secured to the duct using pins (Item 3A.a) located 1-1/2 in. from the edges of each collar (two rows per collar) or banding material (Item 7), 3/16 in. wide and minimum thickness 0.012 in. (0.3 mm) thick, installed with a tensioning tool and located 1-1/2 in. from the edges of each collar (two per collar) and at maximum 10-1/2 in. OC along the length of the duct.

A1.4. - The banding material (where used) is looped and crimped 10-1/2 in. OC maximum over the Clamping Bar (Item 6) which is secured to the floor slab or wall on top of the 3 in. blanket overlap using 1/4 in. diameter by 6 in. long masonry screws.

A2. **Overlap Method**

A2.1. - Duct wrap shall be installed around the duct with the perimeter joints overlapped minimum 3 in. The duct wrap is installed on the bottom of the duct and over the cradle supports and around the vertical side(s) of the duct with an overlap of minimum 3 in. onto the bottom surface of floor slab or to the wall and the floor slab on both sides of the duct to allow for the installation of Clamping Bar (Item 6). All cut edges to be taped with pressure sensitive aluminum foil tape, 3 in. wide.

A2.2. - The layer(s) of blanket are locked into place over the insulation pins with 1 in. by 1 in. galvanized steel speed clips. The duct wrap shall be secured to the duct using pins located 1-1/2 in. from the edges of each collar (two rows per collar) or banding material (Item 7), 3 mm wide and minimum thickness 0.012 in. (0.3 mm) thick, installed with a tensioning tool and spaced at maximum 10-1/2 in. OC along the length of the duct.

A2.3. - The banding material (where used) is looped over the Clamping Bar (Item 6) which is secured to the floor slab or wall on top of the 3 in. blanket overlap using 1/4 in. diameter by 4 in. long masonry screws.

3M COMPANY
3M FIRE PROTECTION PRODUCTS – 3M Fire Barrier Duct Wrap 615 and 3M Fire Barrier Duct Wrap 615+

B. **Firestop System** – When the ventilation duct passes through a fire separation, the through openings shall be firestopped in accordance with Through-Penetration Firestop Systems in Vol. 2 of the Fire Resistance Directory. See Through-Penetration Firestop Systems in Vol. 2 of the Fire Resistance Directory.

4. **Hanger System** – (Not shown) Steel threaded rod, nominal ½ in. minimum diameter, shall be used. For ducts not exceeding a duct perimeter of 146 in., steel threaded rod of nominal 3/8 in. diameter can be used through Cradle (Item 4) and mounted to concrete floor by:

   (a) Passing through pre-drilled hole and bolting with nut and washer on top of floor, or

   (b) Carbon steel or stainless steel masonry anchors, nominal ½ in. or 3/8 in. diameter by 2 in. long, drop-in style anchors embedded a minimum of 2 in. into concrete, or nominal ½ in. or 3/8 in. diameter stud wedge/expansion type anchors embedded a minimum of 2-1/2 in. into concrete.

5. **Cradle** – Steel angle, 2 in. by 2 in. by ½ in. or Unistrut® P5500 channel, used to support wrapped duct at 60 in. OC maximum. Hung from concrete floor with Support Rods (Item 4). For ducts not exceeding a duct perimeter of 146 in., steel angle 1-1/2 in. by 1-1/2 in. by 3/16 in. or Unistrut® P2000 channel can be used.

6. **Clamping Bar** – Minimum 1-1/2 in. by 3/16 in. thick steel flat bar with pre-drilled nominal ¼ in. diameter holes at 8 in. OC used to clamp wrap material against bottom of floor slab and adjacent surface of wall. The Clamping Bar is secured to the floor slab or wall using ¼ in. diameter by 4 in. long masonry screws.

7. **BANDING** – Nominal ½ in. wide, 0.015 in. thick, stainless steel, installed on wrapped duct with tensioning tool.

(Ratings applicable for Ventilation Ducts installed with or without branches)

Maximum Size of Duct - Noncombustible Wall or Floor – 1.32 m² maximum area with no dimension exceeding 2.16 m.
Support Spacing – 1 525 mm maximum.
Duct Use Limitation – Duct is intended for use in pressurization situations or maximum negative pressure 300 Pa within duct.

1(a). Masonry Wall or Floor – Minimum thickness or depth as necessary for the grade of fire separation but not less than 115 mm for floors and 152 mm for walls. Normal-density or low-density concrete. Wall can also be constructed of nominal 190 mm thick concrete block laid up with mortar.

OR

1(b). Gypsum Board Wall Assembly – The fire-rated gypsum wallboard and steel or wood stud assembly shall be constructed of the materials and in the manner described in the individual Wall or Partition design in the ULC Fire Resistance directory.

OR

1(c). Combustible Floor-Ceiling Assembly – Maximum duct size 0.62 m² in area with no dimension exceeding 1.22 m. Constructed using minimum 38 by 240 mm wood joists as described in the individual floor-ceiling design in the ULC Fire Resistance directory.

The Fire Resistance Rating of a wrapped duct penetrating a combustible floor-ceiling assembly is limited to the fire resistance rating of the floor-ceiling assembly.
Design No. FRD-17 continued

2. **Ventilation Air Duct** – Duct to be constructed in accordance with the requirements of the Standard for the Installation of Air Conditioning and Ventilation Systems, NFPA 90A, 1993 Edition. Minimum thickness of steel permitted, 0.70 mm thick galvanized steel; maximum size of duct as noted above.

3. **Duct Insulation** – (HNNZC) – 38 mm thick, Calcium-Magnesium- Silicate (CMS) duct wrap, installed in accordance with the manufacturer’s installation instructions and including the following features:
   (a) Copper-coated steel insulation pins, nominal 3 mm thick - capacitor discharge weld pins minimum 102 mm long or cup-head weld pins, minimum 38 mm long, shall be stud-welded to the bottom surface of steel ducts over 305 mm in width on horizontal runs and on the widest surface on vertical runs of the steel duct at 305 mm OC maximum lateral, and 267 mm OC maximum longitudinal.
   (b) The duct wrap material is installed using one of the options described below:

**Overlap Method**

(i) One layer of duct wrap is installed around duct. All perimeter and longitudinal joints to overlap by a minimum of 75 mm. Cut ends of duct wrap to be sealed with 76 mm wide aluminum tape. Taping of all joint seams is optional. The blanket is locked into place over the insulation pins with 63 mm by 63 mm by 0.5 mm thick galvanized steel speed clips, when weld pins are required. Banding material (Item 6) shall be installed with a tensioning tool and spaced at minimum 267 mm OC and within 38 mm of all perimeter joints.

**Butt Joint and Collar Method**

(ii) One layer of wrap is installed around duct, with perimeter joints tightly butted and all longitudinal joints overlapped 75 mm. Cut ends of duct wrap to be sealed with 76 mm wide aluminum tape. Taping of all joint seams is optional. The blanket is locked into place over the insulation pins with 63 mm by 63 mm by 0.5 mm thick galvanized steel speed clips, when weld pins are required. Collars, minimum 152 mm wide, to be installed and centered over each of the perimeter joints. The collars and duct wrap to be secured to the duct using banding material (Item 6), to be installed with a tensioning tool and located 38 mm from the edges of each collar (two bands per collar) and at maximum 267 mm OC.

**3M COMPANY – 3M FireBarrier Duct Wrap 615**

Note: Steel shafts or threaded rod up to 19 mm in diameter, if required for the operation of mechanical accessories or for duct support, may penetrate the duct and duct wrap through a close-fitting hole at a spacing of 1525 mm or one per duct section, whichever is less.

Application of sealant (Item 7) is not required.

4. **Support Rod** – Steel threaded rod, nominal 13 mm minimum diameter, shall be used. For ducts not exceeding a duct perimeter of 3710 mm, steel threaded rod of nominal 10 mm diameter through Cradle (Item 5) and mounted to concrete floor by:
   (a) Passing through pre-drilled hole and bolting with nut and washer on top of floor, or
   (b) Carbon steel or stainless steel masonry anchors, nominal 13 mm or 10 mm diameter by 50 mm long, drop-in style anchors embedded a minimum of 50 mm into concrete, or nominal 13 mm or 10 mm diameter stud wedge/expansion type anchors embedded a minimum of 60 mm into concrete.

5. **Cradle** – Steel angle, 50 mm by 50 mm by 5 mm or Unistrut® P5500 channel, used to support wrapped duct at 1525 mm OC maximum. Hung from concrete floor with Support Rods (Item 4).

   For ducts not exceeding a duct perimeter of 3710 mm, steel angle 38 mm by 38 mm by 4 mm or Unistrut® P2000 channel can be used.

   As an option, the cradle assembly can be encased within the duct wrap (cocoon wrap) during the installation of duct wrap (Item 3). To encase the cradle support, the duct wrap is slit maximum 152 mm to allow for the threaded rod. A generous application of ULC labelled sealant (Item 11) is applied along the seam. The seam is taped over with minimum 76 mm wide aluminum tape. Additional material is installed such that a crown of sealant minimum 13 mm is formed around the circumference of the threaded rod. The duct wrap adjacent to the threaded rod must be installed with enough overlap to cover the seam.

6. **Steel Band** – (Not shown) Nominal 13 mm wide, 0.4 mm thick, made of carbon or stainless steel for 1 h rating and stainless steel for 2 h rating, installed on wrapped duct with tensioning tool and spaced at minimum 267 mm OC.

**Firestop System Installation**

The duct shall be installed within the opening such that the annular space between the bare or wrapped duct and the edges of the opening is minimum 25 mm, maximum 76 mm. For installations in gypsum wallboard assemblies, the opening to accommodate the duct shall be framed on all sides using lengths of stud installed between vertical studs and secured to the vertical studs.

For installations in combustible floor/ceiling assemblies, only Option D shall be used. The maximum and minimum annular spaces shall be 82 and 22 mm respectively. The opening to accommodate the duct shall be framed on all sides using lengths of minimum 38 mm by 240 mm wood joists.

**Option A**

(Duct Wrap Terminated at Masonry Wall - Maximum Duct Dimension 2.16 m)

- (a). **Firestop Insulation** – Scrap duct wrap or ULC labelled mineral wool insulation with minimum 64 kg/m³ density compressed 50% minimum and installed into the opening to a minimum depth of 100 mm. Material to be recessed 16 mm from both surfaces of wall to allow for the installation of sealant (Item 7b).
- (b). **Firestop System Component** – (XHJZC) – Sealant applied over insulation (Item 7a) to a minimum depth of 16 mm flush with exposed surface of wall.
  
   **3M COMPANY – 3M Fire Barrier Sealsants CP25 WB+, 1000 NS, IC 15WB+ or 3000 WT**

- (c). **Steel Angle** – For ducts with any dimension greater than 1525 mm, stiffening angle 38 mm by 38 mm by 3 mm thick applied around the perimeter of the duct within 100 mm of wall, secured with No. 10 steel screws spaced 200 mm OC.
- (d). **Duct Insulation (Collar)** – (HNNZC) – For ducts with any dimension greater than 1525 mm, duct wrap minimum 610 mm wide, applied over Item 3(b) adjacent to the wall. Collar to be tightly butted to each side of wall, or alternatively, collar may be installed
Design No. FRD-17 continued

continuously through wall provided collar projects a minimum of 610 mm from each side of wall.

3M COMPANY – 3M FireBarrier Duct Wrap 615

Option B
(Duct Wrap Continuous Through Non-Combustible Floor or Combustible or Non-Combustible Wall Opening - Maximum Duct Dimension 2.16 m)

8(a). Firestop Insulation – Scrap duct wrap or ULC labelled mineral wool insulation with minimum 64 kg/m³ density compressed 50% minimum and installed into the opening to a minimum depth of 100 mm. Material to be recessed 6.4 mm from top surface of floor or 16 mm from both surfaces of wall to allow for the installation of sealant (Item 7b).

8(b). Firestop System Component – (XHJZC) – Sealant applied over insulation (Item 7a) to a minimum depth of 6.3 mm flush with top surface of floor or 16 mm flush with both surfaces of wall.

3M COMPANY – 3M Fire Barrier Sealants CP25 WB+, 1003 SL (for floors only), 1000 NS, IC 15WB+ or 3000 WT

8(c). Steel Angle – (Not shown) – For ducts with any dimension greater than 1525 mm, stiffening angles 38 mm by 38 mm by 3 mm thick are applied around the perimeter of the duct within 100 mm of wall, secured with No. 10 steel screws spaced 200 mm OC.

8(d). Duct Insulation (Collar) – (HNZC) – For ducts with any dimension greater than 1525 mm, duct wrap minimum 610 mm wide, applied over Item 3(b) adjacent to the wall. Collar to be tightly butted to each side of wall, or alternatively, collar may be installed continuously through wall provided collar projects a minimum of 610 mm from each side of wall.

3M COMPANY – 3M Fire Barrier Duct Wrap 615

Option C
(Duct Wrap Terminated at Non-Combustible Floor - Maximum Duct Dimension 2.16 m)

9(a). Firestop Insulation – Scrap duct wrap or ULC labelled mineral wool insulation with minimum 64 kg/m³ density compressed 50% minimum and installed into the opening to a minimum depth of 100 mm. Material to be recessed 6.4 mm from top surface of floor to allow for the installation of sealant (Item 7b).

For floor assemblies, the firestop insulation is installed to full depth of floor. The insulation is recessed 6.4 mm from the top surface of floor to allow for the installation of sealant (Item 7b).

9(b). Firestop System Component – (XHJZC) – Sealant applied over insulation (Item 7a) to a minimum depth of 6.4 mm flush with top surface of floor.

3M COMPANY – 3M Fire Barrier Sealants CP25 WB+, 1003 SL (for floors only), 1000 NS, IC 15WB+ or 3000 WT

Option D
(Duct Wrap Continuous Through Combustible Floor-Ceiling Opening - Maximum Duct Dimension 1.22 m)

10(a). Firestop Insulation – Unfaced scrap duct wrap or ULC labelled mineral wool insulation with minimum 64 kg/m³ density compressed 50% minimum and installed into the opening to a minimum depth of 240 mm. Material to be recessed from surface of floor to accommodate required thickness of sealant (Item 7b).

10(b). Firestop System Component – (XHJZC) – Sealant applied over insulation (Item 7a) to a minimum depth of 6.4 mm flush with top surface of floor.

3M COMPANY – 3M Fire Barrier Sealants CP25 WB+, 1003 SL (for floors only), 1000 NS, IC 15WB+ or 3000 WT

3M COMPANY – 3M Fire Barrier Sealants CP25 WB+, 1000 NS, IC 15WB+ or 3000 WT

Reprinted from the ULC Online Directories with permission from Underwriters Laboratories of Canada Inc.

Maximum Size of Duct – 1.32 m² maximum area with no dimension exceeding 2.16 m. For ducts penetrating combustible floor/ceiling assemblies, maximum area 0.62 m² with no dimension exceeding 1.22 m.

Support Spacing – 1525 mm max.

Duct Use Limitation – Duct is intended for use in pressurization situations or maximum negative pressure 300 Pa within duct.

1. Masonry Wall and/or Floor By Which Duct is Supported – Minimum depth or thickness as necessary for the grade of fire separation but not less than 115 mm. Normal-density or low-density concrete. Wall can also be constructed of nominal 190 mm thick concrete block laid up with mortar.

2. Fire Separation Penetrated by Duct –
   (a) Masonry Wall or Floor – Minimum depth or thickness as necessary for the grade of fire separation but not less than 115 mm for floors and 152 mm for walls. Normal-density or low-density concrete. Wall can also be constructed of nominal 190 mm thick concrete block laid up with mortar.

OR
Design No. FRD-23 continued

(b) **Wall Assembly** – The fire-rated gypsum wallboard and steel or wood stud assembly shall be constructed of the materials and in the manner described in the individual Wall or Partition design in the ULC List of Equipment and Materials, Fire Resistance Ratings.

**OR**

(c) **Combustible Floor-Ceiling Assembly** – Maximum duct size 0.62 m² in area with no dimension exceeding 1.22 m. Constructed using minimum 38 by 240 mm wood joists as described in the individual floor-ceiling design in the ULC List of Equipment and Materials, Fire Resistance Ratings.

**Note:** The Stability, Integrity and Insulation Rating of a wrapped duct penetrating a combustible floor-ceiling assembly is limited to the fire resistance rating of the floor-ceiling assembly.

3. **Ventilation Air Duct** – Duct to be constructed in accordance with the requirements of the Standard for the Installation of Air Conditioning and Ventilation Systems, NFPA 90A. Minimum thickness of steel permitted, 0.7 mm thick galvanized steel; maximum size of duct 600 mm by 2160 mm nominal (1.2 m² maximum area with no dimension exceeding 2.16 m).

For duct requiring a two-sided wrap, top surface of duct to be located a maximum of 200 mm from the bottom face of floor. Ducts requiring a two-sided wrap, shall be installed such that top surface and one side of duct is located maximum 200 mm from bottom surface of floor and adjacent surface of wall assembly.

For ducts with any dimension greater than 1525 mm, a 38 mm by 38 mm by 3 mm thick transverse stiffening angle, approximately 50 mm less than the maximum dimension, shall be screw attached 204 mm OC to the duct, 102 mm beyond the top surface of floor and both surfaces of wall (at the floor or wall penetration).

**4. Duct Insulation** – (HNNZC). Calcium-Magnesium-Silicate (CMS) duct wrap, 38 mm thick, installed in accordance with the manufacturer’s installation instructions and shall include the following features:

(a) Copper-coated steel insulation pins (not shown), inductive weld pins or cup-head weld pins, nominal 3 mm thick, minimum 38 mm long, shall be stud-welded to the surfaces of steel duct to be wrapped at 305 mm OC maximum across the width of the duct and 267 mm OC maximum along the length of the duct. Pins are required on the bottom surface of all ducts wider than 305 mm.

(b) Banding, Item 8, may be omitted where pins are used on the side(s) as well as the bottom surface.

The duct wrap material is installed using one of the options described below:

**TWO- AND THREE-SIDED WRAP**

**Butt joint and collar method**

(i) One layer of 38 mm thick duct wrap shall be installed around the duct and cradle support (Items 5 and 6) with perimeter joints tightly butted tightly. The duct wrap is installed on the bottom of the duct and over the cradle supports and around the vertical sides of the duct with an overlap of minimum 76 mm onto the bottom surface of floor slab or to the wall and the floor slab on both sides of the duct to allow for the installation of Clamping Bar (Item 7). All cut edges to be taped with pressure sensitive aluminum foil tape, 76 mm wide.

(ii) Collars, minimum 152 mm wide, shall be installed over each of the perimeter joints. Collar shall be installed with an overlap of minimum 76 mm onto the bottom face of the floor slab to allow for the installation of Clamping Bar (Item 7).

(iii) The collars and duct wrap shall be secured to the duct using pins (Item 4a) located 38 mm from the edges of each collar (two rows per collar) or banding material (Item 8), 13 mm wide and minimum 0.3 mm thick, installed with a tensioning tool and located 38 mm from the edges of each collar (two per collar) and at maximum 267 mm OC along the length of the duct.

(iv) The banding material (where used) is looped and crimped 267 mm OC maximum over the Clamping Bar (Item 7) which is secured to the floor slab or wall on top of the 76 mm blanket overlap using 6 mm diameter by 100 mm long masonry screws.

**Overlap Method**

(v) Duct wrap shall be installed around the duct with the perimeter joints overlapped minimum 76 mm. The duct wrap is installed on the bottom of the duct and over the cradle supports and around the vertical side(s) of the duct with an overlap of minimum 76 mm onto the bottom surface of floor slab or to the wall and the floor slab on both sides of the duct to allow for the installation of Clamping Bar (Item 7). All cut edges to be taped with pressure sensitive aluminum foil tape, 76 mm wide.

(vi) The layer(s) of blanket are locked into place over the insulation pins with 25 mm by 25 mm galvanized steel speed clips. The duct wrap shall be secured to the duct using pins (Item 4a) located 38 mm from the edges of each collar (two rows per collar) or banding material (Item 8), 13 mm wide and minimum 0.3 mm thick, installed with a tensioning tool and spaced at maximum 267 mm OC along the length of the duct.

(vii) The banding material (where used) is looped over the Clamping Bar (Item 7) which is secured to the floor slab or wall on top of the 76 mm blanket overlap using 6 mm diameter by 100 mm long masonry screws.

**3M COMPANY** – Fire Barrier Duct Wrap 615

5. **Support Rod** – Steel threaded rod, nominal 13 mm minimum diameter, shall be used. For ducts not exceeding a duct perimeter of 3710 mm, steel threaded rod of nominal 10 mm diameter can be used through Cradle (Item 5) and mounted to concrete floor by:

(a) Passing through pre-drilled hole and bolting with nut and washer on top of floor, or

(b) Carbon steel or stainless steel masonry anchors, nominal 13 mm or 10 mm diameter by 50 mm long, drop-in style anchors embedded a minimum of 50 mm into concrete, or nominal 13 mm or 10 mm diameter stud wedge/expansion type anchors embedded a minimum of 60 mm into concrete.

6. **Cradle** – Steel angle, 50 mm by 50 mm by 5 mm or Unistrut® P5500 channel, used to support wrapped duct at 1525 mm OC maximum. Hung from concrete floor with Support Rods (Item 5).

For ducts not exceeding a duct perimeter of 3710 mm, steel angle 38 mm by 38 mm by 4 mm or Unistrut® P2000 channel can be used.

7. **Clamping Bar** – Minimum 38 mm by 4 mm thick steel flat bar with pre-drilled nominal 6 mm diameter holes at 204 mm OC used to clamp wrap material against bottom of floor slab and adjacent surface of wall. The Clamping Bar is secured to the floor slab or wall using 6 mm diameter by 100 mm long masonry screws.

8. **Banding** – Nominal 13 mm wide, 0.5 mm thick, stainless steel, installed on wrapped duct with tensioning tool.
Design No. FRD-23 continued

Firestop System Installation

The duct shall be installed within the opening such that the annular space between the wrapped duct (for Firestop Option A), or steel duct (for Firestop Option B), and the edges of the opening is maximum 76 mm. For installations in gypsum wallboard assemblies, the opening to accommodate the duct shall be framed on all sides using lengths of stud installed between vertical studs and secured to the vertical studs.

For installations in combustible floor/ceiling assemblies, only Option C shall be used. The maximum and minimum annular spaces shall be 82 and 22 mm respectively. The opening to accommodate the duct shall be framed on all sides using lengths of nominal 38 mm by minimum 240 mm wood joists.

Option A

(Duct Wrap Continuous Through Non-Combustible Floor or Combustible or Non-combustible Wall Opening)

9(a). Firestop Insulation – (HNNZC). Unfaced scrap duct wrap or ULC labelled mineral wool insulation with minimum 64 kg/m³ density compressed 50% minimum and installed into the opening to a minimum depth of 100 mm. Material to be recessed 6.4 mm from top surface of floor or 16 mm from both surfaces of wall to allow for the installation of sealant (Item 9b).

3M COMPANY – Fire Barrier Duct Wrap 615

▪ 9(b). Firestop System Component – (XHJZC). Sealant applied over insulation (Item 9a) to a minimum depth of 6.3 mm, flush with top surface of floor or to a minimum depth of 16 mm symmetrically to both surfaces of wall.

3M COMPANY – 3M Fire Barrier Sealants CP25 WB+, 1003 SL (for floors only), 1000 NS, IC 15WB+ or 3000 WT

Option B

(Duct Wrap Terminated at Masonry Floor or Wall Opening)

10(a). Firestop Insulation – Unfaced scrap duct wrap or ULC labelled mineral wool insulation with minimum 64 kg/m³ density compressed 50% minimum and installed into the opening to a minimum depth of 100 mm.

For floor assemblies, the insulation is installed to full depth of floor and butted tightly against the duct wrap at the bottom surface of floor. The insulation is recessed 6.4 mm from the top surface of floor to allow for the installation of sealant (Item 10b).

For wall assemblies, the insulation material is recessed 16 mm from both surfaces of wall to allow for the installation of sealant (Item 10b).

▪ 10(b). Firestop System Component – (XHJZC). Sealant applied over insulation (Item 10a) to a minimum depth of 6.3 mm, flush with top surface of floor or symmetrically to both surfaces of wall.

Additional sealant to be installed around the interface of duct wrap to ensure that no gap exists between sealant and duct wrap material.

3M COMPANY – 3M Fire Barrier Sealants CP25 WB+, 1003 SL (for floors only), 1000 NS, IC 15WB+ or 3000 WT

Option C

(Duct Wrap Continuous Through Combustible Floor/Ceiling Opening)

11(a). Firestop Insulation – (HNNZC). Unfaced scrap duct wrap or ULC labelled mineral wool insulation with minimum 64 kg/m³ density compressed 50% minimum and installed into the opening to a minimum depth of 240 mm. Material to be recessed from surface of floor to accommodate required thickness of sealant (Item 11b).

▪ 11(b). Firestop System Component – (XHJZC) – Sealant applied over insulation (Item 11a) to a minimum depth of 6.3 mm, flush with top surface of floor.

3M COMPANY – 3M Fire Barrier Sealants CP25 WB+, 1003 SL (for floors only), 1000 NS, IC 15WB+ or 3000 WT

(Ratings applicable for Ventilation Ducts installed with or without branches)

### Maximum Size of Duct
- 1.32 m² maximum area with no dimension exceeding 2.16 m.

### Support Spacing
- 1525 mm maximum.

### Duct Use Limitation
- Duct is intended for use in pressurization situations or maximum negative pressure 300 Pa within duct.

1(a). **Masonry Wall or Floor**
- Minimum depth or thickness as necessary for the grade of fire separation but not less than 115 mm. Normal-density or low-density concrete. Wall can also be constructed of nominal 190 mm thick concrete block laid up with mortar.

**OR**

1(b). **Wall Assembly**
- The fire-rated gypsum wallboard and steel or wood stud assembly shall be constructed of the materials and in the manner described in the individual Wall or Partition design in the ULC Fire Resistance directory.

**OR**
Design No. FRD-27 continued

1(c). **Combustible Floor-Ceiling Assembly** – Maximum duct size 0.62 m\(^2\) in area with no dimension exceeding 1.22 m. Constructed using minimum 38 by 240 mm wood joists as described in the individual floor-ceiling design in the ULC Fire Resistance directory. The Fire Resistance Rating of a wrapped duct penetrating a combustible floor-ceiling assembly is limited to the fire resistance rating of the floor-ceiling assembly.

2. **Ventilation Air Duct** – Duct to be constructed in accordance with the requirements of the Standard for the Installation of Air Conditioning and Ventilation Systems, NFPA 90A, 1993 Edition. Minimum thickness of steel permitted, 0.70 mm thick galvanized steel; maximum size of duct 600 mm by 2160 mm nominal (1.32 m\(^2\) maximum area with no dimension exceeding 2.16 m).

3. **Duct Insulation** – (HNNZC) – Two layers of 38 mm thick, Calcium-Magnesium-Siclicate (CMS) Duct Wrap installed in accordance with the manufacturer’s installation instructions and shall include the following features:

(a). Copper-coated steel insulation pins, Capacitor discharge weld pins or cup-head duct pins, nominal 3 mm thick, minimum 102 mm long, shall be stud-welded to the bottom surface of duct steel over 305 mm in width on horizontal runs and on the widest surface on vertical runs of the steel duct at 305 mm OC maximum lateral, and 267 mm OC maximum longitudinal.

(b). The duct wrap material is installed using one of the options shown below:

**Butt joint and collar Method**

(i). The first layer of duct wrap to be installed around the duct with the perimeter and longitudinal joints butted tightly together and held in place with tape. A second layer of duct wrap blanket to be installed over the first layer with perimeter and longitudinal joints butted tightly. Minimum 76 mm. Cut ends of duct wrap to be sealed with 76 mm wide aluminum tape. Taping of all joints is optional with pressure sensitive aluminum foil.

(ii). The layers of blanket are locked into place over the insulation pins with 63 mm by 63 mm galvanized steel speed clips when weld pins are required. The duct wrap shall be secured to the duct using banding material (Item 6), 13 mm wide and minimum 0.3 mm thick, installed with a tensioning tool and spaced at maximum 267 mm OC and within 38 mm of all perimeter joints.

**Overlap Method**

(i). The first layer of duct wrap to be installed around the duct with the perimeter and longitudinal joints butted tightly together and held in place with aluminum tape. A second layer of duct wrap to be installed over the first layer with perimeter joints butted tightly. The longitudinal joints are overlapped minimum 76 mm. Cut ends of duct wrap to be sealed with 76 mm wide aluminum tape. Taping of all joints is optional with pressure sensitive aluminum foil.

(ii). The layers of blanket are locked into place over the insulation pins with 63 mm by 63 mm galvanized steel speed clips, when weld pins are required. “3M Fire Barrier Duct Wrap 615” blanket, minimum 150 mm wide, shall be installed as collars and centered over each of the perimeter joints. Collar shall be installed with a longitudinal overlap of minimum 76 mm. The collars and duct wrap shall be secured to the duct using banding material (Item 6), 13 mm wide and minimum 0.3 mm thick, installed with a tensioning tool and located 38 mm from the edges of each collar (two per collar) and at maximum 267 mm OC.

3M COMPANY

3M FIRE PROTECTION PRODUCTS – 3M FireBarrier Duct Wrap 615

Note: Steel shafts or threaded rod up to 19 mm in diameter, if required for the operation of mechanical accessories or for duct support, may penetrate the duct and duct wrap through a close-fitting hole at a spacing of 1525 mm or one per duct section, whichever is less. Application of sealant (Item 7) is not required.

4. **Support Rod** – Steel threaded rod, nominal diameter of 13 mm shall be used. For ducts not exceeding a duct perimeter of 2700 mm, steel threaded rod of nominal 10 mm diameter shall be used through cradle (Item 5) and mounted to concrete by:

(a) Passing through pre-drilled hole and bolting with nut and washer on top of floor, or

(b) Carbon steel or stainless steel masonry anchors, nominal 13 mm or 10 mm diameter by 50 mm long, drop-in style anchors embedded a minimum of 50 mm into concrete, or nominal 13 mm or 10 mm diameter stud wedge/expansion anchors embedded a minimum of 60 mm into concrete

5. **Cradle** – Steel angle, 50 mm by 50 mm by 5 mm or P-5500 channel, used to support wrapped duct at 1525 mm OC maximum. Hung from concrete floor with Support Rods (Item 4).

For ducts not exceeding a duct perimeter of 2700 mm, steel angle 38 mm by 38 mm by 4 mm or Unistrut P2000 channel can be used. As an option, the cradle assembly can be encased within the duct wrap (cocoon wrap) during the installation of duct wrap (Item 3). To encase the cradle support, the duct wrap is slit maximum 152 mm to allow for the threaded rod. A generous application of ULC labelled sealant (Item 11) is applied along the seam. The seam is taped over with minimum 76 mm wide aluminum tape. Additional material is installed such that a crown of minimum 13 mm is formed around the circumference of the threaded rod. The adjacent duct wrap to the threaded rod must be installed with enough overlap to cover the seam.

6. **Steel Band** – Nominal 13 mm wide, 0.4 mm thick, made of made of carbon or stainless steel for 1 h rating and stainless steel for 2 h rating, installed on wrapped duct with tensioning tool and spaced at minimum 267 mm OC.

**Firestop System Installation**

The duct shall be installed within the opening such that the annular space between the bare or wrapped duct and the edges of the opening is maximum 76 mm and a minimum of 25 mm. For installations in gypsum wallboard assemblies, the opening to accommodate the duct shall be framed on all sides using lengths of stud installed between vertical studs and secured to the vertical studs.

For installations in combustible floor/ceiling assemblies, only Option D shall be used. The maximum and minimum annular spaces shall be 82 and 22 mm respectively. The opening to accommodate the duct shall be framed on all sides using lengths of minimum 38 mm by 240 mm wood joists.

Option A

(Duct Wrap Terminated at Non-Combustible Wall - Maximum Duct Dimension 2.16 m)
Design No. FRD-27 continued

7(a). Firestop Insulation – Minimum 64 kg/m³ density scrap duct wrap or ULC labelled mineral wool insulation with minimum 64 kg/m³ density compressed 50% minimum and installed into the opening to a minimum depth of 100 mm. Material to be recessed 16 mm from exposed surface of wall to allow for the installation of sealant (Item 7b).

3M COMPANY
3M FIRE PROTECTION PRODUCTS – 3M FireBarrier Duct Wrap 615

7(b). Firestop System Component – (XHJZC) – Sealant applied over insulation (Item 7a) to a minimum depth of 16 mm flush with exposed surface of wall.

3M COMPANY
3M FIRE PROTECTION PRODUCTS – 3M FireBarrier - Sealants CP-25 WB+, 1000 NS, IC 15WB+ or 3000 WT

7(c). Steel Angle – For ducts with any dimension greater than 1525 mm, stiffening angle 38 mm by 38 mm by 3 mm thick applied around the perimeter of the duct on both sides of wall 100 mm from the wall, secured with No. 10 steel screws spaced 200 mm OC.

Option B

(Duct Wrap Continuous Through Non-Combustible Floor or Combustible or Non-Combustible Wall Opening - Maximum Duct Dimension 2.160 m)

8(a). Firestop Insulation – Unfaced scrap duct wrap or ULC labelled mineral wool insulation with minimum 64 kg/m³ density compressed 50% minimum and installed into the opening to a minimum depth of 100 mm. Material to be recessed 6.4 mm from top surface of floor or 16 mm from both surfaces of wall floor to allow for the installation of sealant (Item 8b).

8(b). Firestop System Component – (XHJZC) – Sealant applied over insulation (Item 8a) to a minimum depth of 6.4 mm flush with top surface of floor or 16 mm flush with both surfaces of wall.

3M COMPANY
3M FIRE PROTECTION PRODUCTS – 3M Fire Barrier Sealants 1003 SL (for floors only), 1000 NS, IC 15 WB+, 3000 WT or CP25 WB+.

8(c). Steel Angle – (Not shown) – For ducts with any dimension greater than 1525 mm, stiffening angles 38 mm by 38 mm by 3 mm thick are applied around the perimeter of the duct within 100 mm of wall, secured with No. 10 steel screws spaced 200 mm OC.

Option C

(Duct Wrap Terminated at Non-Combustible Floor - Maximum Duct Dimension 2.160 m)

9(a). Firestop Insulation – Scrap duct wrap or ULC labelled mineral wool insulation with minimum 64 kg/m³ density compressed 50% minimum and installed into the opening to a minimum depth of 100 mm.

For floor assemblies, the insulation is installed to full depth of floor and butted tightly against the duct at the bottom surface of floor. The insulation is recessed 6.4 mm from the top surface of floor to allow for the installation of sealant (Item 9b).

9(b). Firestop System Component – (XHJZC) – Sealant applied over insulation (Item 9a) to a minimum depth of 6.4 mm flush with top surface of floor.

3M COMPANY
3M FIRE PROTECTION PRODUCTS – 3M Fire Barrier Sealants 1003 SL (for floors only), 1000 NS, IC 15 WB+, 3000 WT or CP-25 WB+.

Option D

(Duct Wrap Continuous Through Combustible Floor-Ceiling Opening - Maximum Duct Dimension 1.22 m)

10(a). Firestop Insulation – Scrap Duct Wrap or ULC labelled mineral wool insulation with minimum 64 kg/m³ density compressed 50% minimum and installed into the opening to a minimum depth of 240 mm. Material to be recessed from surface of floor to accommodate required thickness of sealant (Item 10b).

The Fire Resistance Rating of awrapped duct penetrating a combustible floor-ceiling assembly is limited to the fire resistance rating of the floor-ceiling assembly.

10(b). Firestop System Component – (XHJZC) – Sealant applied over insulation (Item 10a) to a minimum depth of 6.4 mm flush with top surface of floor.

3M COMPANY
3M FIRE PROTECTION PRODUCTS – 3M Fire Barrier Sealants 1003 SL (for floors only), 1000 NS, IC 15WB+, 3000 WT or CP-25 WB+.

11. Firestop System Component – (XHJZC) – (Not shown) Sealant for use in “cocoon wrap” applications if cradle penetrates the wrap.

3M COMPANY
3M FIRE PROTECTION PRODUCTS – 3M Fire Barrier Sealants CP25 WB+, 1000 NS, IC 15WB+ or 3000 WT

CHEMICAL FUME EXHAUST DUCT PROTECTION
3M Company
3M Fire Barrier™ Duct Wrap 15A or 3M Fire Barrier™ Duct Wrap 615+
UL 1978 (June 25, 2002)
Section 12 Temperature Test – Pass
Section 13 Abnormal Temperature Test – Pass
ICC-ES Acceptance Criteria for Grease Duct Enclosure Systems (AC101)
Section 4.5 Fire-Engulfment Test (ASTM E 119 Exposure) – 2 hr

CHEMICAL FUME EXHAUST DUCT: Continuously-welded, liquid-tight L-shaped rectangular duct system with horizontal and vertical shafts constructed of 16 GA sheet steel or 18 GA stainless steel with a maximum 1440 inch² area and a maximum 48 inch dimension. When required, equip the duct with a prefabricated access door (Item 6) or field fabricated access door (Item 7).

A. Construct the duct using sections affixed to each other with welded seams.
B. Reinforce the duct to IMC or NFPA 96 requirements designed to carry the weight of the chemical fume exhaust duct assembly covered with insulation under a fire load equivalent to UL 1978 exposure and the ASTM E 119 time-temperature curve.
C. Rigidly support the duct in accordance with IMC or NFPA 96 requirements or as specified in Item 5.
D. Protect the annular space around the duct passing through a fire-rated wall assembly with an Intertek-certified, compatible, 3M penetration firestop system having the same fire rating as the wall or floor assembly.

2. FASTENERS: Weld minimum 12 GA, 4-1/2-inch-long, copper-coated steel insulation pins or 12 GA insulated cup head pins to the chemical fume exhaust duct (Item 1). Match fastener method with corresponding insulation (Item 4) method.

A. Compression Butt Joint: Locate pins at all blanket overlaps, on all sides of the chemical fume exhaust duct (Item 1), and meet the following requirements.
  I. Space pins maximum 12 inches apart in rows across the width of the chemical fume exhaust duct (Item 1). Locate pins maximum 6-3/4 inches from the edges of the chemical fume exhaust duct (Item 1). Refer to Section view A-A.
II. Space the rows of pins maximum 10 inches apart along the length of the chemical fume exhaust duct (Item 1). Where pieces of insulation (Item 4A) are butted together, space edge pins of the insulation (Item 4A) a maximum 2 inches apart. Refer to Section view B-B.

III. After insulation (Item 4A) is installed, place minimum 2.5-in. x 2.5-inch-square, galvanized steel, self-locking washer clips onto all insulation pins.

IV. After clips are installed, cut off or bend flush with insulation (Item 3) pins that are too long.

B. Butt Joint with Collar: Locate pins at all blanket overlaps, on all sides of the chemical fume exhaust duct (Item 1), and meet the following requirements.

II. Space the rows of pins maximum 10-1/2 inches apart along the length of the chemical fume exhaust duct (Item 1). Where pieces of insulation (Item 4B) are overlapped, space pins a maximum 1-1/2 inches from the edge of the insulation. Refer to Section view B-B.

III. After insulation (Item 4B) is installed, place minimum 2.5-inch x 2.5-inch-square, galvanized steel, self-locking washer clips onto all insulation pins.

IV. After clips are installed, cut off or bend flush with insulation (Item 4B) pins that are too long.

C. Single End Overlap (Telescope): Locate pins at all blanket overlaps, on all sides of the chemical fume exhaust duct (Item 1), and meet the following requirements.

II. Space the rows of pins maximum 10-1/2 inches apart along the length of the chemical fume exhaust duct (Item 1). Where pieces of insulation (Item 4C) are butted together, space pins a maximum 1-1/2 inches from the edge of the insulation. Refer to Section view B-B.

III. After insulation (Item 4C) is installed, place minimum 2.5-inch x 2.5-inch-square, galvanized steel, self-locking washer clips onto all insulation pins.

IV. After clips are installed, cut off or bend flush with insulation (Item 4C) pins that are too long.

D. Dual End Overlap (Checkerboard): Locate pins at all blanket overlaps, on all sides of the chemical fume exhaust duct (Item 1), and meet the following requirements.

II. Space the rows of pins maximum 10-1/2 inches apart along the length of the chemical fume exhaust duct (Item 1). Where pieces of insulation (Item 4D) are butted together, space pins a maximum 1-1/2 inches from the edge of the insulation. Refer to Section view B-B.

III. After insulation (Item 4D) is installed, place minimum 2.5-inch x 2.5-inch-square, galvanized steel, self-locking washer clips onto all insulation pins.

IV. After clips are installed, cut off or bend flush with insulation (Item 4D) pins that are too long.

3. BANDING: Not applicable to Item 2A. Option to fasteners Items 2B, 2C and 2D. After insulation (Item 4) is installed, apply minimum 1/2-inch-wide, 0.015-inch-thick stainless steel bands and secured with minimum 1-inch-long stainless steel crimp clamps. When needed to ease installation, use filament tape as a temporary hold for the insulation (Item 4) prior to banding. Place banding a maximum 1-1/2 inches from all insulation (Item 4) edges and a maximum of 10-1/2 inches on center (O.C.). Tension the banding to hold the insulation (Item 4) in place without cutting or damaging the insulation (Item 4) or chemical fume exhaust duct (Item 1).

4. CERTIFIED COMPANY: 3M Company

CERTIFIED PRODUCT: Duct Insulation

MODEL: 3M Fire Barrier™ Duct Wrap 15A- Nominal 1-1/2-inch thick, 8-pcf blanket, made of mineral fibers and encapsulated with aluminum foil scrim.

Or

CERTIFIED COMPANY: 3M Company

CERTIFIED PRODUCT: Duct Insulation

MODEL: 3M Fire Barrier™ Duct Wrap 615+- Nominal 1-1/2-inch thick, 6-pcf density blanket, made of calcium-, silica-, and magnesium-oxide (CSM) fibers, encapsulated with polypropylene-foil or aluminized polyester scrim.

INSULATION: Apply one layer of duct insulation over the entire surface of the chemical fume exhaust duct (Item 1). Use blanket, available in various widths, that is fully-encapsulated or single-faced scrim. Expose the foil-faced side of insulation to view. Wrap one layer of insulation around the chemical fume exhaust duct (Item 1) circumference so that each terminating end of insulation overlaps onto the starting end of insulation a minimum of 3 inches at all transverse joints. Alternate the transverse overlap location so that no two consecutive adjacent overlaps align. Refer to Section view A-A for transverse overlap section view. Cover all visually exposed ends and edges of insulation with nominal 4-inch-wide pressure-sensitive aluminum foil tape.
DESIGN NO. 3MU/FRD 120-10 continued

B. Butt Joint with Collar: Refer to 4B section view B-B. Wrap the chemical fume exhaust duct (Item 1) with one layer of insulation installed with butt joints at all longitudinal joints. Butt each end of each piece of insulation together with preceding edge of insulation. Each piece of installed insulation width is its nominal width. (Example: each piece of nominal 24-inch-wide insulation when installed is 24 inches wide.) Install insulation with zero clearance at the overlaps, or in the field between overlaps. Place and center 6-inch-wide collar of insulation over the butt joint. Overlap 6-inch-wide collar onto each adjacent insulation 3 inches. Verify all insulation butt joints with collars are a minimum 3 inches in overall thickness.

C. Single End Overlap (Telescope): Refer to 4C section view B-B. Wrap the chemical fume exhaust duct (Item 1) with one layer of insulation installed with 3-inch-minimum overlaps at all longitudinal joints. Overlap each adjacent insulation edge with the edge of the next piece of insulation. Install insulation with zero clearance at the overlaps, or in the field between overlaps. Verify all insulation overlaps are nominally 3 inches in overall thickness.

I. Starting at one end of the chemical fume exhaust duct (Item 1), apply the first piece of insulation around the chemical fume exhaust duct (Item 1) to overlap fasteners (Item 2C). Refer section view A-A.

II. Position and overlap the leading edge of the second piece of insulation nominally 3 inches over the flush edge of the first piece of insulation. Place the opposite edge of the second piece of insulation flush against the surface of the chemical fume exhaust duct (Item 1). An “S-shaped” cross section of the insulation is created. Refer to 4C section view B-B.

III. Apply all additional pieces of insulation as “S-shaped” cross section of the insulation in compliance with Item 4CII.

D. Dual End Overlap (Checkerboard): Refer to 4D section view B-B. Verify all insulation overlaps are a minimum 3 inches in overall thickness. Do not align two consecutive insulation end overlaps. Overlap each full-width insulation edge with the edge of the “gull wing” (\(~\)\)-shaped piece of insulation. Install insulation with zero clearance at the overlaps, or in the field between overlaps. Verify all insulation overlaps are nominally 3 inches in overall thickness.

I. Wrap the first piece of insulation around the chemical fume exhaust duct (Item 1) so that the insulation is flush against the surface of the chemical fume exhaust duct (Item 1). Position the starting end of the insulation to overlap pins (Item 2A) a minimum of 1-1/2 inches while the edges of the insulation overlap the rows of pins (Item 2B) a minimum of 1-1/2 inches.

II. Position the second piece of insulation nominally 18 inches from the edge of the first piece of insulation. Install second piece in the same manner as the first.

III. Cover the chemical fume exhaust duct (Item 1) that is exposed between the edges of the first two pieces of insulation with another piece of insulation. Position the starting end of the insulation to overlap pins (Item 2A) a minimum of 1-1/2 inches while the edges of the insulation overlap the adjacent edges of the two pieces installed insulation a minimum of 1-1/2 inches.

5. SUPPORTS: Support the chemical fume exhaust duct (Item 1) with insulation (Item 4) using a “trapeze” system composed of a minimum 2 x 2 x 1/4-inch steel angle as the trapeze cross-member and minimum 3/8-inch diameter rods. Connect all-thread steel rods (insulation (Item 4) not required) to the trapeze cross-member using nuts and washers. Connect the all-thread steel rods to the bottom of the floor assembly using an attachment method designed to carry the weight of the chemical fume exhaust duct (Item 1) with insulation (Item 4) under a fire load equivalent to ASTM E 119 time-temperature curve. Place one all-thread steel rod 2 inches from each end of trapeze cross-member. Center chemical fume exhaust duct (Item 1) with insulation (Item 4) on trapeze cross-member. Space all-thread steel rods a maximum 6 inches from surface of the insulated chemical fume exhaust duct. Extend trapeze cross-member at least 2 inches past each all-thread steel rod. Space trapeze supports a maximum 60 inches O.C.

6. CERTIFIED MANUFACTURER: 3M Company

CERTIFIED PRODUCT: 3M Fire Barrier™ Grease Duct Access Door

MODELS: 000-51115-16584-9 (20 x 20), 000-51115-16583-2 (12 x 8), and 000-51115-16582-5 (10 x 6)

ACCESS DOOR ASSEMBLY: (Not shown) When required, apply an access door and insulated cover plate as described:

A. OPTIONAL PRE-FABRICATED ACCESS DOOR: Mark a clean-out access opening location on the chemical fume exhaust duct (Item 1) with insulation (Item 4) at its mid-height along the horizontal section. Cut an opening (maximum 22 x 22 inches) in the insulation (Item 4) 2 inches larger than the outside dimension of the pre-fabricated access door (maximum 20 x 20 inches). Remove and discard the cut insulation (Item 4). Cut an opening (maximum 20 x 20 inches) into the side of the chemical fume exhaust duct (Item 1) according to the manufacturer’s instructions for the size of the pre-fabricated access door to be installed. Install and tightly secure the pre-fabricated access door in accordance with the manufacturer’s instructions to the chemical fume exhaust duct (Item 1). Pre-fabricated access door fitted with four 3/8-inch diameter corner thumb bolts through the exterior face.

B. CERTIFIED COMPANY: 3M Company

CERTIFIED PRODUCT: Duct Insulation

MODEL: 3M Fire Barrier™ Duct Wrap 15A

CERTIFIED COMPANY: 3M Company

CERTIFIED PRODUCT: Duct Insulation

MODEL: 3M Fire Barrier™ Duct Wrap 615+

ACCESS INSULATION: (Not Shown) Remove the four corner 3/8-inch diameter thumb bolts and replace them with four 3/8-inch-diameter all-thread steel rods extending from prefabricated access door (Item 6A). Apply 2 layers of access insulation over the pre-fabricated access door (Item 6A) as follows. Cut the first piece of access insulation a minimum 1/4 inch larger than the clean-out access opening. Position, square and impale the first piece of the access insulation over the four 3/8-inch diameter all-thread steel rods extending from pre-fabricated access door (Item 6A). Press the first piece of access insulation flush over the pre-fabricated access door (Item 6A). Compress and abut the cut edges of the first piece of the access insulation against the cut edges of opening in the insulation (Item 4). Cut a second piece of access insulation a minimum of 2 inches larger than first piece of access insulation on all sides. Seal cut edges of the second piece of accessory insulation with nominal 4-inch wide aluminum foil tape. Position, square and impale second piece of the access insulation over the four 3/8-inch-diameter all-thread steel rods extending from pre-fabricated access door (Item 6A). Press the second piece of access insulation flush over first piece of access insulation.
Design No. 3MU/FRD 120-10 continued

C. COVER PLATE: Cut a cover plate to the same dimensions as the second piece of access insulation (Item 6B) using a minimum 16 GA steel sheet. Drill holes in the cover plate that match the location of the four 3/8-inch diameter all-thread steel rods and locate the holes so that the cover plate is square to the second piece of access insulation (Item 6B). After both layers of access insulation (Item 6B) are impaled over the four 3/8-inch diameter all-thread steel rods install the cover plate. Pass the four 3/8-inch diameter all-thread steel rods through the cover plate. Place washers and wing nuts onto each of the four 3/8 inch-diameter all-thread steel rods. Secure the cover plate by tightening wing nuts.

7. OPTIONAL FIELD FABRICATED ACCESS DOORS: (Not shown) Mark a clean-out access opening location on the chemical fume exhaust duct (Item 1) with insulation (Item 4) at its mid-height along the horizontal section. Use either option A or B.

A. (OPTION A) Cut a 13 x 13-inch opening in the insulation (Item 4). Remove and discard the cut insulation (Item 4). Cut a 10 x 10-inch opening into the side of the chemical fume exhaust duct (Item 1) maintaining a 1-inch clearance around the perimeter of the opening and the cut insulation (Item 4). Remove and discard the cut steel. Weld four 4 x 1/4-inch all-thread rods to the chemical fume exhaust duct (Item 1). Locate one at each corner of the chemical fume exhaust duct (Item 1) so that they are 11 inches O.C. and squared within the insulation (Item 4) opening.

I. ACCESS DOOR: Cut a 13 x 13-inch, 16 GA steel plate to be used as an access door. Drill clearance holes in the access door to match the all-thread steel rod pattern. Place the access door over the all-thread steel rods. Seal the opening in the chemical fume exhaust duct (Item 1) by overlapping the access door over the opening in the insulation (Item 4) by 1-1/2-inches on all sides. Weld four 6-1/2-inch-long, 12 GA copper-coated steel insulation pins to the access door corners so that the pins are 9 inches O.C.

II. COVER PLATE: Cut a 20-1/2 x 20-1/2-inch external cover plate out of 16 GA steel and drill clearance holes matching the locations of the all-thread steel rods on the flange. Weld minimum four 12 GA copper-coated steel impaling pins onto the internal surface of the cover plate, spaced minimum 14 inches O.C. Install access insulation (Item 7BIII). Position the cover plate with access insulation over the all-thread steel rods flush to access door. Apply washers and wing nuts over the all-thread steel rods. Secure the access door by tightening the wing nuts.

B. (OPTION B) Cut a maximum 16 x 16-inch opening into the insulation (Item 4) and the chemical fume exhaust duct (Item 1). Remove and discard the cut insulation (Item 4). Cut a 10 x 10-inch opening into the side of the chemical fume exhaust duct (Item 1) maintaining a 1-inch clearance around the perimeter of the opening and the cut insulation (Item 4). Remove and discard the cut steel. Weld four 4 x 1/4-inch all-thread rods to the chemical fume exhaust duct (Item 1). Locate one at each corner of the chemical fume exhaust duct (Item 1) so that they are 11 inches O.C. and squared within the insulation (Item 4) opening.

I. ACCESS DOOR: Cut an 18-1/2 x 18-1/2-inch 16 GA steel plate to be used as an access door. Drill clearance holes in the access door to match the all-thread steel rod pattern on the flange. Place the access door over the all-thread steel rods.

II. COVER PLATE: Cut a 20-1/2 x 20-1/2-inch external cover plate out of 16 GA steel and drill clearance holes matching the locations of the all-thread steel rods on the flange. Weld minimum four 12 GA copper-coated steel impaling pins onto the internal surface of the cover plate, spaced minimum 14 inches O.C. Install access insulation (Item 7BIII). Position the cover plate with access insulation over the all-thread steel rods flush to access door. Apply washers and wing nuts over the all-thread steel rods. Secure the access door by tightening the wing nuts.

This material was extracted and drawn by 3M Fire Protection Products from the 2013 Product Directory, © Intertek
1. CHEMICAL FUME EXHAUST DUCT: Continuously welded, liquid-tight L-shaped round duct system with horizontal and vertical shafts constructed of 16 GA sheet steel or 18 GA stainless steel with a maximum 1320 inch² area and a maximum 41 inch diameter. When required, equip the duct with a prefabricated access door (Item 6) or field fabricated access door (Item 7).
   A. Construct the duct using sections affixed to each other with welded seams.
   B. Reinforce the duct to IMC or NFPA 96 requirements designed to carry the weight of the chemical fume exhaust duct assembly covered with insulation under a fire load equivalent to UL 1978 exposure and the ASTM E 119 time-temperature curve.
   C. Rigidly support the duct in accordance with IMC or NFPA 96 requirements or as specified in Item 5.
   D. Protect the annular space around the duct passing through a fire-rated wall assembly with an Intertek-certified, compatible, 3M penetration firestop system having the same fire rating as the wall or floor assembly.
2. FASTENERS: Weld minimum 12 GA, 4-1/2-inch-long, copper-coated steel insulation pins or 12 GA insulated cup head pins to the chemical fume exhaust duct (Item 1). Match fastener method with corresponding insulation (Item 4) method.
   A. Compression Butt Joint: Locate pins at all blanket overlaps, on all sides of the chemical fume exhaust duct (Item 1), and meet the following requirements.
      I. Space pins maximum 12 inches apart in rows across the width of the chemical fume exhaust duct (Item 1). Locate pins maximum 6-3/4 inches from the edges of the chemical fume exhaust duct (Item 1). Refer to Section view A-A.
Design No. 3MU/FRD 120-11 continued

II. Space the rows of pins maximum 10 inches apart along the length of the chemical fume exhaust duct (Item 1). Where pieces of insulation (Item 4A) are butted together, space edge pins of the insulation (Item 4A) a maximum 2 inches apart. Refer to Section view B-B.

III. After insulation (Item 4A) is installed, place minimum 2.5-inch x 2.5-inch-square, galvanized steel, self-locking washer clips onto all insulation pins.

IV. After clips are installed, cut off or bend flush with insulation (Item 4B) pins that are too long.

B. Butt Joint with Collar: Locate pins at all blanket overlaps, on all sides of the chemical fume exhaust duct (Item 1), and meet the following requirements.

I. Space pins maximum 12 inches apart in rows across the width of the chemical fume exhaust duct (Item 1). Locate pins maximum 6-3/4 inches from the edges of the chemical fume exhaust duct (Item 1). Refer to Section view A-A.

II. Space the rows of pins maximum 10-1/2 inches apart along the length of the chemical fume exhaust duct (Item 1). Where pieces of insulation (Item 4B) are overlapped, space pins a maximum 1-1/2 inches from the edge of the insulation. Refer to Section view B-B.

III. After insulation (Item 4B) is installed, place minimum 2.5-inch x 2.5-inch-square, galvanized steel, self-locking washer clips onto all insulation pins.

IV. After clips are installed, cut off or bend flush with insulation (Item 4B) pins that are too long.

C. Single End Overlap (Telescope): Locate pins at all blanket overlaps, on all sides of the chemical fume exhaust duct (Item 1), and meet the following requirements.

I. Space pins maximum 12 inches apart in rows across the width of the chemical fume exhaust duct (Item 1). Locate pins maximum 6-3/4 inches from the edges of the chemical fume exhaust duct (Item 1). Refer to Section view A-A.

II. Space the rows of pins maximum 10-1/2 inches apart along the length of the chemical fume exhaust duct (Item 1). Where pieces of insulation (Item 4C) are butted together, space pins a maximum 1-1/2 inches from the edge of the insulation. Refer to Section view B-B.

III. After insulation (Item 4C) is installed, place minimum 2.5-inch x 2.5-inch-square, galvanized steel, self-locking washer clips onto all insulation pins.

IV. After clips are installed, cut off or bend flush with insulation (Item 4C) pins that are too long.

D. Dual End Overlap (Checkerboard): Locate pins at all blanket overlaps, on all sides of the chemical fume exhaust duct (Item 1), and meet the following requirements.

I. Space pins maximum 12 inches apart in rows across the width of the chemical fume exhaust duct (Item 1). Locate pins maximum 6-3/4 inches from the edges of the chemical fume exhaust duct (Item 1). Refer to Section view A-A.

II. Space the rows of pins maximum 10-1/2 inches apart along the length of the chemical fume exhaust duct (Item 1). Where pieces of insulation (Item 4D) are butted together, space pins a maximum 1-1/2 inches from the edge of the insulation. Refer to Section view B-B.

III. After insulation (Item 4D) is installed, place minimum 2.5-inch x 2.5-inch-square, galvanized steel, self-locking washer clips onto all insulation pins.

IV. After clips are installed, cut off or bend flush with insulation (Item 4D) pins that are too long.

3. BANDING: (Not Shown) Not applicable to Item 2A. Option to fasteners Items 2B, 2C and 2D. After insulation (Item 4) is installed, apply minimum 1/2-inch-wide, 0.015-inch-thick stainless steel bands and secured with minimum 1-inch-long stainless steel crimp clamps. When needed to ease installation, use filament tape as a temporary hold for the insulation (Item 4) prior to banding. Place banding a maximum 1-1/2 inches from all insulation (Item 4) edges and a maximum of 10-1/2 inches on center (O.C.). Tension the banding to hold the insulation (Item 4) in place without cutting or damaging the insulation (Item 4) or chemical fume exhaust duct (Item 1).

4. CERTIFIED COMPANY: 3M Company
CERTIFIED PRODUCT: Duct Insulation
MODEL: 3M Fire Barrier™ Duct Wrap 15A- Nominal 1-1/2-inch thick, 8-pcf blanket, made of mineral fibers and encapsulated with aluminum foil scrim.

Or
CERTIFIED COMPANY: 3M Company
CERTIFIED PRODUCT: Duct Insulation
MODEL: 3M Fire Barrier™ Duct Wrap 615+- Nominal 1-1/2-inch thick, 6-pcf density blanket, made of calcium-, silica-, and magnesium-oxide (CSM) fibers, encapsulated with polypropylene-foil or aluminumized polyester scrim.

INSULATION: Apply one layer of duct insulation over the entire surface of the chemical fume exhaust duct (Item 1). Use blanket, available in various widths, that is fully-encapsulated or single-faced scrim. Expose the foil-faced side of insulation to view. Wrap one layer of insulation around the chemical fume exhaust duct (Item 1) circumference so that each terminating end of insulation overlaps onto the starting end of insulation a minimum of 3 inches at all transverse joints. Alternate the transverse overlap location so that no two consecutive adjacent overlaps align. Refer to Section view A-A for transverse overlap section view. Cover all visually exposed ends and edges of insulation with nominal 4-inch-wide pressure-sensitive aluminum foil tape.

A. Compression Butt Joint: Refer to 4A section view B-B. Wrap the chemical fume exhaust duct (Item 1) with one layer of insulation installed with compression butt joints at all longitudinal joints. Compress each end of each piece of insulation together and butt to preceding edge of insulation. Each piece of installed insulation width is 2 inches less than insulation nominal width. (Example: each piece of nominal 24-inch-wide insulation when installed is 22 inches wide.) Install insulation with zero clearance at the surface and mating edges, or in the field between overlaps. Verify all insulation butt joints are a minimum 1-1/2 inches in overall thickness at compression butt joints.
B. Butt Joint with Collar: Refer to 4B section view B-B. Wrap the chemical fume exhaust duct (Item 1) with one layer of insulation installed with butt joints at all longitudinal joints. Butt each end of each piece of insulation together with preceding edge of insulation. Each piece of installed insulation width is its nominal width. (Example: each piece of nominal 24 inch-wide insulation when installed is 24 inches wide.) Install insulation with zero clearance at the overlaps, or in the field between overlaps. Place and center 6-inch-wide collar of insulation over the butt joint. Overlap 6-inch-wide collar onto each adjacent insulation 3 inches. Verify all insulation butt joints with collars are a minimum 3 inches in overall thickness.

C. Single End Overlap (Telescope): Refer to 4C section view B-B. Wrap the chemical fume exhaust duct (Item 1) with one layer of insulation installed with 3-inch minimum overlaps at all longitudinal joints. Overlap each adjacent insulation edge with the edge of the next piece of insulation. Install insulation with zero clearance at the overlaps, or in the field between overlaps. Verify all insulation overlaps are nominally 3 inches in overall thickness.
   I. Starting at one end of the chemical fume exhaust duct (Item 1), apply the first piece of insulation around the chemical fume exhaust duct (Item 1) to overlap fasteners (Item 2C). Refer section view A-A.
   II. Position and overlap the leading edge of the second piece of insulation nominally 3 inches over the flush edge of the first piece of insulation. Place the opposite edge of the second piece of insulation flush against the surface of the chemical fume exhaust duct (Item 1). An “S” shaped cross section of the insulation is created. Refer to 4C section view B-B.
   III. Apply all additional pieces of insulation as “S-shaped” cross section of the insulation in compliance with Item 4CII.

D. Dual End Overlap (Checkerboard): Refer to 4D section view B-B. Wrap the chemical fume exhaust duct (Item 1) with one layer of insulation installed with 3-inch minimum overlaps at all longitudinal joints. Overlap each full-width insulation edge with the edge of the “gull wing” (+-) shaped piece of insulation. Install insulation with zero clearance at the overlaps, or in the field between overlaps. Verify all insulation overlaps are a minimum 3 inches in overall thickness. Do not align two consecutive insulation end overlaps.
   I. Wrap the first piece of insulation around the chemical fume exhaust duct (Item 1) so that the insulation is flush against the surface of the chemical fume exhaust duct (Item 1). Position the starting end of the insulation to overlap pins (Item 2A) a minimum of 1-1/2 inches while the edges of the insulation overlap the rows of pins (Item 2B) a minimum of 1-1/2 inches.
   II. Position the second piece of insulation nominally 18 inches from the edge of the first piece of insulation. Install the second piece in the same manner as the first.
   III. Cover the chemical fume exhaust duct (Item 1) that is exposed between the edges of the first two pieces of insulation with another piece of insulation. Position the starting end of the insulation to overlap pins (Item 2A) a minimum of 1-1/2 inches while the edges of the insulation overlap the adjacent edges of the two pieces installed insulation a minimum of 1-1/2 inches.

5. SUPPORTS: Support the chemical fume exhaust duct (Item 1) with insulation (Item 4) using a “trapeze” system composed of a minimum 2 x 2 x 1/4-inch steel angle as the trapeze cross-member and minimum 3/8-inch diameter steel rods. Connect all-thread steel rods (insulation (Item 4) not required) to the trapeze cross-member using nuts and washers. Connect the all-thread steel rods to the bottom of the floor assembly using an attachment method designed to carry the weight of the chemical fume exhaust duct (Item 1) with insulation (Item 4) under a fire load equivalent to ASTM E 119 time-temperature curve. Place one all-thread steel rod 2 inches from each end of trapeze cross-member. Center chemical fume exhaust duct (Item 1) with insulation (Item 4) on trapeze cross-member. Space all-thread steel rods a maximum 6 inches from the surface of the insulated chemical fume exhaust duct. Extend trapeze cross-member at least 2 inches past each all-thread steel rod. Space trapeze supports a maximum 60 inches O.C.

6. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Grease Duct Access Door
   MODELS: 000-51115-16584-9 (20 x 20), 000-51115-16583-2 (12 x 8), and 000-51115-16582-5 (10 x 6)

   ACCESS DOOR ASSEMBLY: (Not shown) When required, apply an access door and insulated cover plate as described:
   A. OPTIONAL PRE-FABRICATED ACCESS DOOR: Mark a clean-out access opening location on the chemical fume exhaust duct (Item 1) with insulation (Item 4) at its mid-height along the horizontal section. Cut an opening (maximum 22 x 22 inches) in the insulation (Item 4) 2 inches larger than the outside dimension of the pre-fabricated access door (maximum 20 x 20 inches). Remove and discard the cut insulation (Item 4). Cut an opening (maximum 20 x 20 inches) into the side of the chemical fume exhaust duct (Item 1) according to the manufacturer’s instructions for the size of the pre-fabricated access door to be installed. Install and tightly secure the pre-fabricated access door in accordance with the manufacturer’s instructions to the chemical fume exhaust duct (Item 1). Pre-fabricated access door fitted with four 3/8-inch diameter corner thumb bolts through the exterior face.

   B. CERTIFIED COMPANY: 3M Company
   CERTIFIED PRODUCT: Duct Insulation
   MODEL: 3M Fire Barrier™ Duct Wrap 15A

   CERTIFIED COMPANY: 3M Company
   CERTIFIED PRODUCT: Duct Insulation
   MODEL: 3M Fire Barrier™ Duct Wrap 615+

   ACCESS INSULATION: (Not Shown) Remove the four corner 3/8-inch diameter thumb bolts and replace them with four 3/8-inch-diameter all-thread steel rods extending from prefabricated access door (Item 6A). Apply 2 layers of access insulation over the pre-fabricated access door (Item 6A) as follows. Cut the first piece of access insulation a minimum 1/4 inch larger than the clean-out access opening. Position, square and impale the first piece of the access insulation over the four 3/8-inch diameter all-thread steel rods extending from pre-fabricated access door (Item 6A). Press the first piece of access insulation flush over the prefabricated access door (Item 6A). Compress and abut the cut edges of the first piece of the access insulation against the cut edges of opening in the insulation (Item 4). Cut a second piece of access insulation a minimum of 2 inches larger than first piece of access insulation on all sides. Seal cut edges of the second piece of access insulation with nominal 4-inch wide aluminum foil tape. Position, square and impale the second piece of the access insulation over the four 3/8-inch-diameter all-thread steel rods extending from pre-fabricated access door (Item 6A). Press the second piece of access insulation flush over first piece of access insulation.
C. COVER PLATE: Cut a cover plate to the same dimensions as the second piece of access insulation (Item 6B) using a minimum 16 GA steel sheet. Drill holes in the cover plate that match the location of the four 3/8-inch diameter all-thread steel rods and locate the holes so that the cover plate is squared to the second piece of access insulation (Item 6B). After both layers of access insulation (Item 6B) are impaled over the four 3/8-inch diameter all-thread steel rods install the cover plate. Pass the four 3/8-inch diameter all-thread steel rods through the cover plate. Place washers and wing nuts onto each of the four 3/8 inch-diameter all-thread steel rods. Secure the cover plate by tightening wing nuts.

7. OPTIONAL FIELD FABRICATED ACCESS DOORS: (Not shown) Mark a clean-out access opening location on the chemical fume exhaust duct (Item 1) with insulation (Item 4) at its mid-height along the horizontal section. Use either option A or B.

A. (OPTION A) Cut a 13 x 13-inch opening in the insulation (Item 4). Remove and discard the cut insulation (Item 4). Cut a 10 x 10-inch opening into the side of the chemical fume exhaust duct (Item 1) maintaining a 1-inch clearance around the perimeter of the opening and the cut insulation (Item 4). Remove and discard the cut steel. Weld four 1/4-inch all-thread rods to the chemical fume exhaust duct (Item 1). Locate one at each corner of the chemical fume exhaust duct (Item 1) so that they are 11 inches O.C. and squared within the insulation (Item 4) opening.

I. ACCESS DOOR: Cut a 13 x 13 inch 16 GA steel plate to be used as an access door. Drill clearance holes in the access door to match the all-thread steel rod pattern. Place the access door over the all-thread steel rods. Seal the opening in the chemical fume exhaust duct (Item 1) by overlapping the access door over the cut in the insulation (Item 4) by 1-1/2-inches on all sides. Weld four 6-1/2-inch-long, 12 GA copper-coated steel insulation pins to the access door corners so that the pins are 9 inches O.C.

II. CERTIFIED COMPANY: 3M Company
CERTIFIED PRODUCT: Duct Insulation
MODEL: 3M Fire Barrier™ Duct Wrap 15A

ACCESS INSULATION: Apply two layers of access insulation over the access door. Cut the first piece of access insulation into a 13 x 13-inch square and install it over the insulation pins and covering the access door (Item 7A1). Cut the second piece of access insulation into a 15 x 15 inch square. Square it to and install it over the insulation pins. Cover the first piece of access insulation so that a 1-inch overlap exists. Secure blanket to pins with 1-1/2-inch square or round, galvanized or stainless steel speed clips. Turn down or cut off insulation pins that extend beyond the second piece of access insulation. Place steel tubing over each all-thread steel rods. Apply washers and wing nuts over the all-thread steel rods. Secure the access door by tightening the wing nuts.

B. (OPTION B) Cut a maximum 16 x 16-inch opening into the insulation (Item 4) and the chemical fume exhaust duct (Item 1). Remove and discard the cut insulation (Item 4) and steel. Weld together 4 pieces of 1-1/2 x 1-1/4 x 1/8 inch steel angle to form a flanged frame. The narrow frame edge is welded to the visual surface of the chemical fume exhaust duct (Item 1) at the perimeter of the opening that positions the 1-1/2-inch flange 1-1/4 inches off the chemical fume exhaust duct (Item 1). The flange extends away from the opening.

Weld four minimum 4-inch-long 1/4-inch-diameter all-thread steel rods to the flange. Locate one each in the center of each corner.

I. ACCESS DOOR: Cut an 18-1/2 x 18-1/2-inch 16 GA steel plate to be used as an access door. Drill clearance holes in the access door to match the all-thread steel rod pattern on the flange. Place the access door over the all-thread steel rods.

II. COVER PLATE: Cut a 20-1/2 x 20-1/2-inch external cover plate out of 16 GA steel and drill clearance holes matching the locations of the all-thread steel rods on the flange. Weld minimum four 12 GA copper-coated steel impaling pins onto the internal surface of the cover plate, spaced minimum 14 inches O.C. Install access insulation (Item 7BIII). Position the cover plate with access insulation over the all-thread steel rods flush to access door. Apply washers and wing nuts over the all-thread steel rods. Secure the access door by tightening the wing nuts.

III. CERTIFIED COMPANY: 3M Company
CERTIFIED PRODUCT: Duct Insulation
MODEL: 3M Fire Barrier™ Duct Wrap 15A

ACCESS INSULATION: Apply two layers of access insulation over the interior of the cover plate. Cut the first piece of access insulation into a 20-1/2 x 20-1/2-inch square and install it over the insulation pins on the internal surface of the cover plate. Cut the second piece of access insulation into a 24 x 24-inch square. Square it to and install it over the insulation pins. Cover the first piece of access insulation so that a 3-1/2-inch overlap exists. Secure blanket to pins with 1-1/2-inch square or round, galvanized or stainless steel speed clips. Turn down or cut off insulation pins that extend beyond the second piece of access insulation.

PENETRATION FIRESTOP THROUGH FLOOR/CEILING ASSEMBLY
3M Company

3M Fire Barrier™ Duct Wrap 15A or 20A
3M Fire Barrier™ Duct Wrap 615
3M Fire Barrier™ 2000+ Silicone Joint Sealant
3M Fire Barrier™ Water Tight 1000-NS Silicone Joint Sealant
3M Fire Barrier™ Water Tight 1003-SL Silicone Joint Sealant

ASTM E 814-06
T Rating – 1 hr
F Rating – 1 hr

1. PENETRATING ITEM: Rectangular or round steel duct constructed of minimum 24 GA sheet steel with maximum 720 inch² area with a maximum 30 inch dimension or 30 inch diameter.

2. CERTIFIED MANUFACTURER: 3M Company
CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
MODEL: 15A, 20A

MODEL: 615: Option for FRD Ventilation Ducts (Old Designation VAD)

INSULATION: Before the packing material (Item 4A) and fill material (Item 4B) of the penetration firestop (Item 4) is installed, protect the penetrating item (Item 1) with at least one layer of minimum 24-inch-wide certified insulation. Minimum 8 pcf density required for grease duct applications. Wrap penetrating item (Item 1) with a one layer of certified insulation, overlap the ends of certified insulation and secure certified insulation to penetrating item (Item 1) in accord with any 1-hour-rated 3M FRD design listing.

3. FLOOR ASSEMBLY – Install penetrating item (Item 1) through a framed hole created in an ASTM E 119 (UL 263 or NFPA 251) one-hour fire-rated floor assembly having the following components as part of its construction:
   A. Joists – Minimum 2 x 10 wood joists spaced a maximum 18-1/2 inches on center (OC).
   B. Flooring – Minimum 3/4-inch-thick plywood attached to the top of wood joists.
   C. Gypsum Board – Minimum one layer of 5/8-inch-thick, Type X, gypsum wallboard attached to the bottom of wood joists.
   D. Reinforcement – When the hole penetrates the joists, additional 2 x 10 wood perimeter framing is required to maintain the floor assembly’s strength at that location.
   E. Opening – Create an opening in the wall assembly having a cross-sectional area of maximum 1083 inch² and a maximum dimension of 35.5 inches. Frame opening with joists (Item 3A) and reinforcement (Item 3D). Position the penetrating item (Item 1) concentrically or eccentrically in the opening so that the annular space ranges from minimum 1 inch to maximum 2-1/2 inches.

4. PENETRATION FIRESTOP: Asymmetrical penetration firestop constructed of the following components:
   A. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
   MODEL: 15A, 20A, 615
   PACKING MATERIAL: Fill the annular space with minimum 4 pcf mineral wool or certified insulation without the encapsulation (foil scrim). Cut the packing material into strips. Compress packing material nominally 25% and insert packing material into the annular space. Fill the entire annular space. Recess the surface of packing material nominally 3/4 inches from both surfaces of the face layers of the gypsum board of the wall assembly (Item 3).

   B. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Joint Sealant
   MODEL: Water Tight 1000-NS Silicone or 2000+ Silicone Joint Sealant or 1003 SL Silicone Joint Sealant
   FILL, VOID OR CAVITY MATERIAL: Install minimum 3/4-inch depth of certified fill material into the recess over the packing material (Item 4A) on top sides of the floor assembly (Item 3). Screed certified fill material flush with the surface of the floor assembly (Item 3).

PENETRATION FIRESTOP THROUGH FLOOR/CEILING ASSEMBLY
3M Company
3M Fire Barrier Duct Wrap
3M Fire Barrier Water Tight 1000-NS Silicone Joint Sealant

ASTM E 814-06
T Rating – 1 hr
F Rating – 1 hr

1. PENETRATING ITEM: Rectangular steel duct constructed of minimum 22 GA sheet steel with maximum 2040 inch² area with a maximum 85 inch dimension.

2. CERTIFIED MANUFACTURER: 3M Company
CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
MODEL: 615
INSULATION: After the packing material (Item 4A) and fill material (Item 4B) of the penetration firestop (Item 4) is installed and the steel angle (Item 4C) attached, protect the penetrating item (Item 1) with at least one layer of minimum 24 inch wide, minimum 6 pcf insulation. Weld mild steel copper plated 12 GA by minimum 7 inch long pins to the bottom of the penetrating item (Item 1) spaced in 12 inch wide rows with pins spaced 10-1/2 inches apart. Wrap penetrating item (Item 1) with a one layer of certified insulation. Overlap the ends of certified insulation a minimum of 3 inches. Place speed clips over the pins to secure certified insulation on bottom. Use nominal 1/2 inch wide, 0.015 inch thick, stainless steel banding and banding clips placed around the circumference of the penetrating item (Item 1) spaced nominally 10-1/2-inches on center to secure certified insulation.

3. FLOOR ASSEMBLY: Install penetrating item (Item 1) through a framed hole created in an ASTM E 119 (UL 263 or NFPA 251) one-hour fire-rated floor assembly having the following components as part of its construction:
   A. Joists – Minimum 2 x 10 wood joists spaced a maximum 18-1/2 inches on center (OC).
   B. Flooring – Minimum 3/4-inch thick plywood attached to the top of wood joists.
   C. Gypsum Board – Minimum one layer of 5/8-inch thick, Type X, gypsum wallboard attached to the bottom of wood joists.
   D. Reinforcement – When the hole penetrates the joists additional 2 x 10 wood perimeter framing is required to maintain the floor assembly’s strength at that location.
   E. Opening – Create an opening through the floor assembly to accommodate the protected penetrating item (Item 1) and the conditions of Item 2e. Position the penetrating item (Item 1) concentrically or eccentrically in the opening so that the annular space ranges from minimum 1 inch to maximum 3 inches.
Design No. 3MU/PV 60-03 continued

4. Penetration Firestop: Symmetrical penetration firestop constructed of the following components:

A. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
   MODEL: 615
   PACKING MATERIAL: Fill the annular space with minimum 6 pcf insulation without the encapsulation (foil scrim). Cut the certified packing material into strips. Layer certified packing material to 50% greater thickness than width of annual space being filled. Compress certified packing material nominally 33%. Insert compressed certified packing material into the annual space. Fill the entire annular space. Recess the surface of certified packing material nominally 5/8 inches from both surfaces of the face layers of the gypsum board of the wall assembly (Item 3).

B. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Joint Sealant
   MODEL: Water Tight 1000-NS Silicone
   FILL, VOID OR CAVITY MATERIAL: Install minimum 5/8-inch depth of fill material into the recess over the packing material (Item 4A) on both sides of the wall assembly (Item 3). Screed certified fill material flush with the surface of the wall assembly (Item 3) on both sides.

C. STEEL ANGLE: Install nominal 16 GA 2 x 1-1/2 inch steel angle around perimeter of penetrating item (Item 1) with notched ends to create a continuous frame. Place vertical 1-1/2 inch leg of angle flush with exposed face of plywood (Item 3B) and exposed face of gypsum board (Item 3C) of floor/ceiling assembly (Item 3). Attach horizontal 2 inch leg of angle to the penetrating item (Item 1) using self drilling screws, 12-24x2 Hex washer Head with #5 Point, spaced a maximum of 6 inches O.C.

D. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
   MODEL: 615
   COLLAR: After the penetrating item (Item 1) is insulated with certified insulation (Item 2), install a layer of minimum 24 inch wide, minimum 6 pcf insulation over the penetrating item (Item 1). Position the certified collar abutting the exposed layers on both sides of the floor/ceiling assembly (Item 3). Overlap the ends of the certified collar a minimum of 3 inches. Certified collar covers the steel angle (Item 4C) of the penetration firestop (Item 4).

3M Fire Barrier™ Water Tight 1003-SL Silicone Joint Sealant
ASTM E 814-06
T Rating – 2 hr
F Rating – 2 hr

1. PENETRATING ITEM: Rectangular or round minimum 24-GA steel duct constructed of sheet steel with a maximum 720 inch² area with a maximum 30 inch dimension or 30 inch diameter.

2. CERTIFIED MANUFACTURER: 3M Company
CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
MODEL: 15A, 20A, 615
INSULATION: Before the packing material (Item 4A) and fill material (Item 4B) of the penetration firestop (Item 4) are installed, wrap the penetrating item (Item 1) with at least one layer of minimum 24-inch wide certified insulation. Minimum 8 pcf density required for grease duct applications. Overlap the ends of certified insulation and secure certified insulation to penetrating item (Item 1) in accord with any 2-hour rated 3M FRD design listing.

3. FLOOR ASSEMBLY: Symmetrical two-hour rated solid concrete floor assembly made from reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Constructed of one of the following:
   A. Solid Concrete – Minimum concrete thickness measured from exposed face to exposed face using one of the following:
      1. lightweight concrete is 3.6 inches;
      2. sand-lightweight concrete is 3.8 inches;
      3. carbonate aggregate concrete is 4.6 inches; and
      4. siliceous aggregate concrete is 5.0 inches.
   B. Opening – Create an opening in the floor assembly. Frame opening with steel studs (Item 3A) and tracks (Item 3B). Position the penetrating item (Item 1) concentrically or eccentrically in the opening so that the annular space ranges from minimum 1-1/4 inch to maximum 2-1/2 inches. The opening shall have a cross-sectional area of maximum 1093 inch² and a maximum dimension of 36.75 inches for penetrating item (Item 1).

4. PENETRATION FIRESTOP: Symmetrical penetration firestop constructed of the following components:
   A. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
   MODEL: 15A, 20A, 615
   PACKING MATERIAL: Fill the annular space with minimum 4-pcf mineral wool or certified insulation without the encapsulation (foil scrim). Cut the packing material into strips. Compress packing material nominally 25% and insert packing material into the annular space. Fill the entire annular space. Recess the surface of packing material nominally 7/16 inches from top surface of the floor assembly (Item 3).
   B. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Joint Sealant
   MODEL: Water Tight 1000-NS Silicone or 2000+ Silicone Joint Sealant or 1003 SL Silicone Joint Sealant
   FILL, VOID OR CAVITY MATERIAL: Install minimum 7/16-inch depth of certified fill material into the recess over the packing material (Item 4A) on top side of the floor assembly

3. WALL ASSEMBLY: Symmetrical one-hour-rated gypsum wall assembly constructed of the following:
   A. Steel Studs – Minimum 25 GA galvanized steel studs measuring 3-5/8 inches wide with 1-1/4-inch legs spaced maximum 24 inches on center (O.C.). Attach studs with minimum #6 x 3/8-inch steel stud framing screws to floor and ceiling tracks.
   B. Tracks – Channel U-shaped floor and ceiling runners measuring 1/2 inch deep by 3-5/8-inches wide, which are secured to floor and ceiling with 1-inch-long fasteners suitable for the mounting to substrate and spaced maximum 18 inches O.C.
   C. Gypsum Board – Cover studs and runners with one layer of 5/8-inch-thick, Type X gypsum board on each face. Fasten gypsum board to steel studs with #6 1-1/8-inch-long bugle head phillips drywall screws spaced maximum 8 inches O.C. Apply vinyl or casein, dry or premixed joint compound to face layers of gypsum board in two coats to all exposed screw heads and gypsum board joints. Embed minimum 2-inch-wide paper, plastic or fiberglass tape in first layer of joint compound over joints in gypsum board. Minimum wall assembly thickness of 4-3/4 inches measured from face layer of gypsum board to opposite face layer of gypsum board.
   D. Opening – Create an opening in the wall assembly having a cross-sectional area of maximum 1118 inch² and a maximum dimension of 35.5 inches. Frame opening with steel studs (Item 3A) and tracks (Item 3B). Position the penetrating item (Item 1) concentrically or eccentrically in the opening so that the annular space ranges from minimum 5/8 inches to maximum 3-1/2 inches.
4. PENETRATION FIRESTOP: Symmetrical penetration firestop constructed of the following components:

   A. CERTIFIED MANUFACTURER: 3M Company  
      CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap

1. PENETRATING ITEM: Rectangular steel duct constructed of minimum 24 GA sheet steel with maximum 2040 inch\(^2\) area with a maximum 85 inch dimension.

2. CERTIFIED MANUFACTURER: 3M Company  
   CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap  
   MODEL: 615  
   INSULATION: After the packing material (Item 4A) and fill material (Item 4B) of the penetration firestop (Item 4) is installed and the steel angle (Item 4C) attached, protect the penetrating item (Item 1) with at least one layer of minimum 24-inch wide, minimum 6 pcf insulation. Weld mild steel copper plated 12 GA by minimum 7 inch long pins to the bottom of the penetrating item (Item 1) spaced in 12 inch wide rows with pins spaced 10-1/2 inches apart. Wrap penetrating item (Item 1) with a one layer of certified insulation. Overlap the ends of certified insulation a minimum of 3 inches. Place speed clips over the pins to secure certified insulation on bottom. Use nominal 1/2 inch wide, 0.015 inch thick, stainless steel banding and banding clips placed around the circumference of the penetrating item (Item 1) spaced nominally 10-1/2-inches on center to secure certified insulation.

3. WALL ASSEMBLY: Symmetrical one-hour rated gypsum wall assembly constructed of the following:  
   A. Steel Studs – Minimum 25 GA galvanized steel studs measuring 3-5/8 inch wide with 1-1/4-inch legs spaced maximum 24 inch on center (O.C.). Attach studs with minimum #6 x 3/8-inch steel stud framing screws to floor and ceiling tracks.  
   B. Tracks – Channel U-shaped floor and ceiling runners measuring 1/2-inch deep by 3-5/8-inch wide, which are secured to floor and ceiling with 1-inch long fasteners, suitable for the mounting to substrate, spaced maximum 18-inch O.C.  
   C. Gypsum Board – Cover studs and runners with one layer of 5/8 inch thick, Type X gypsum board on each face. Fasten gypsum board to steel studs with #6 1-1/8 inch bugle head phillips drywall screws spaced maximum 8 inches O.C. Apply vinyl or casein, dry or premixed joint compound to face layers of gypsum board in two coats to all exposed screw heads and gypsum board joints. Embed minimum 2 inch wide paper, plastic or fiberglass tape in first layer of joint compound over joints in gypsum board. Minimum wall assembly thickness of 4-3/4 inches measured from face layer of gypsum board to opposite face layer of gypsum board.  
   D. Opening – Create an opening in the wall assembly having a cross-sectional area of maximum 2492 inch\(^2\) and a maximum dimension of 89 inches. Position the penetrating item (Item 1) concentrically or eccentrically in the opening so that the annular space ranges from minimum 1 inch to maximum 3 inches.
Design No. 3MU/PH 60-03 continued

4. PENETRATION FIRESTOP: Symmetrical penetration firestop constructed of the following components:
   A. CERTIFIED MANUFACTURER: 3M Company
      CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
      MODEL: 615
      PACKING MATERIAL: Fill the annular space with minimum 6 pcf insulation without the encapsulation (foil scrim). Cut the certified packing material into strips. Layer certified packing material to 50% greater thickness than width of annual space being filled. Compress certified packing material nominally 33%. Insert compressed certified packing material into the annual space. Fill the entire annular space. Recess the surface of certified packing material nominally 5/8 inches from both surfaces of the face layers of the gypsum board of the wall assembly (Item 3).
   B. CERTIFIED MANUFACTURER: 3M Company
      CERTIFIED PRODUCT: 3M Fire Barrier™ Joint Sealant
      MODEL: Water Tight 1000-NS Silicone
      FILL, VOID OR CAVITY MATERIAL: Install minimum 5/8-inch depth of fill material into the recess over the packing material (Item 4A) on both sides of the wall assembly (Item 3). Screed certified fill material flush with the surface of the wall assembly (Item 3) on both sides.
   C. STEEL ANGLE: Install nominal 16 GA 2 x 1-1/2 inch steel angle around perimeter of penetrating item (Item 1) with notched ends to create a continuous frame. Place vertical 1-1/2 inch leg of angle flush with face layers of gypsum board of wall assembly (Item 3). Attach horizontal 2 inch leg of angle to the penetrating item (Item 1) using self drilling screws, 12-24x2 Hex washer Head with #5 Point, spaced a maximum of 6 inches O.C.
   D. CERTIFIED MANUFACTURER: 3M Company
      CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
      MODEL: 615
      COLLAR: After the penetrating item (Item 1) is insulated with certified insulation (Item 2), install a layer of minimum 24 inch wide, minimum 6 pcf insulation over the penetrating item (Item 1). Position the certified collar abutting the face layers of the gypsum board of the wall assembly (Item 2) on both sides of the wall assembly (Item 2). Overlap the ends of the certified collar a minimum of 3 inches. Certified collar covers the steel angle (Item 4C) of the penetration firestop (Item 4)

This material was extracted and drawn by 3M Fire Protection Products from the 2010 Product Directory, © Intertek
1. PENETRATING ITEM: Rectangular steel duct constructed of minimum 24 GA sheet steel with maximum 2040 inch$^2$ area with a maximum 85 inch dimension.

2. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
   MODEL: 615
   INSULATION: After the packing material (Item 4A) and fill material (Item 4B) of the penetration firestop (Item 4) is installed and the steel angle (Item 4C) attached, protect the penetrating item (Item 1) with insulation applied in accordance with an Intertek ISO 6944 3M Design Listing for a Type A Duct using at least one layer of minimum 24-inch wide, minimum 6 pcf insulation.

3. WALL ASSEMBLY: Symmetrical one-hour rated gypsum wall assembly constructed of the following:
   A. Steel Studs – Minimum 25 GA galvanized steel studs measuring 3-5/8 inch wide with 1-1/4-inch legs spaced maximum 24 inch on center (O.C.). Attach studs with minimum #6 x 3/8-inch steel stud framing screws to floor and ceiling tracks.
   B. Tracks – Channel U-shaped floor and ceiling runners measuring 1/2-inch deep by 3-5/8-inch wide, which are secured to floor and ceiling with 1-inch long fasteners, suitable for the mounting to substrate, spaced maximum 18-inch O.C.
   C. Gypsum Board – Cover studs and runners with one layer of 5/8 inch thick, Type X gypsum board on each face. Fasten gypsum board to steel studs with #6 1-1/8 inch bugle head phillips drywall screws spaced maximum 8 inches O.C. Apply vinyl or casein, dry or premixed joint compound to face layers of gypsum board in first layer of joint compound over joints in gypsum board. Minimum wall assembly thickness of 4-3/4 inches measured from face layer of gypsum board to opposite face layer of gypsum board.
   D. Opening – Create an opening in the wall assembly having a cross-sectional area of maximum 2492 inch$^2$ and a maximum dimension of 89 inches. Position the penetrating item (Item 1) concentrically or eccentrically in the opening so that the annular space ranges from minimum 1 inch to maximum 3 inches.

4. PENETRATION FIRESTOP: Symmetrical penetration firestop constructed of the following components:
   A. CERTIFIED MANUFACTURER: 3M Company
      CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
      MODEL: 615
      PACKING MATERIAL: Fill the annular space with minimum 6 pcf insulation without the encapsulation (foil scrim). Cut the certified packing material into strips. Layer certified packing material to 50% greater thickness than width of annular space being filled. Compress certified packing material nominally 33%. Insert compressed certified packing material into the annual space. Fill the entire annular space. Recess the surface of certified packing material nominally 5/8 inches from both surfaces of the face layers of the gypsum board of the wall assembly (Item 3).
Design No. 3MU/PH 60-04 continued

B. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Joint Sealant
   MODEL: Water Tight 1000-NS Silicone
   FILL, VOID OR CAVITY MATERIAL: Install minimum 5/8-inch depth of fill material into the recess over the packing material (Item 4A) on both sides of the wall assembly (Item 3). Screed certified fill material flush with the surface of the wall assembly (Item 3) on both sides.

C. STEEL ANGLE: Install nominal 16 GA 2 x 1-1/2 inch steel angle around perimeter of penetrating item (Item 1) with notched ends to create a continuous frame. Place vertical 1-1/2 inch leg of angle flush with face layers of gypsum board of wall assembly (Item 3). Attach horizontal 2 inch leg of angle to the penetrating item (Item 1) using self drilling screws, 12-24x2 Hex washer Head with #5 Point, spaced a maximum of 6 inches O.C.

D. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
   MODEL: 615
   COLLAR: After the penetrating item (Item 1) is insulated with certified insulation (Item 2), install a layer of minimum 24 inch wide, minimum 6 pcf insulation over the penetrating item (Item 1). Position the certified collar abutting the face layers of the gypsum board of the wall assembly (Item 2) on both sides of the wall assembly (Item 2). Overlap the ends of the certified collar a minimum of 3 inches. Certified collar covers the steel angle (Item 4C) of the penetration firestop (Item 4).

PENETRATION FIRESTOP THROUGH WALL ASSEMBLY
3M Company
3M Fire Barrier™ Duct Wrap 15A or 20A
3M Fire Barrier™ Duct Wrap 615
3M Fire Barrier™ 2000+ Silicone Joint Sealant
3M Fire Barrier™ Water Tight 1000-NS Silicone Joint Sealant
ASTM E 814-06
T Rating – 2 hr
F Rating – 2 hr

1. PENETRATING ITEM: Rectangular or round steel duct constructed of minimum 24 GA sheet steel with maximum 720 inch² area with a maximum 30 inch dimension or 30 inch diameter.

2. CERTIFIED MANUFACTURER: 3M Company
CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
MODEL: 15A, 20A
MODEL: 615: Option for FRD Ventilation Ducts (Old Designation VAD)

INSULATION: Before the packing material (Item 4A) and fill material (Item 4B) of the penetration firestop (Item 4) is installed, protect the penetrating item (Item 1) with at least one layer of minimum 24-inch-wide certified insulation. Minimum 8 pcf density required for grease duct applications. Wrap penetrating item (Item 1) with a one layer of certified insulation, overlap the ends of certified insulation and secure certified insulation to penetrating item (Item 1) in accord with any 2-hour-rated 3M FRD design listing.

3. WALL ASSEMBLY: Symmetrical two-hour-rated gypsum wall assembly constructed of the following:
   A. Steel Studs – Minimum 25 GA galvanized steel studs measuring 3-5/8 inches wide with 1-1/4-inch legs spaced maximum 24 inches on center (O.C.). Attach studs with minimum #6 x 3/8-inch steel stud framing screws to floor and ceiling tracks.
   B. Tracks – Channel U-shaped floor and ceiling runners measuring 1/2 inch deep by 3-5/8-inches wide, which are secured to floor and ceiling with 1-inch-long fasteners suitable for the mounting to substrate and spaced maximum 18 inches O.C.
   C. Gypsum Board – Cover studs and runners with two layers of 5/8-inch-thick, Type X gypsum board on each face. Fasten base layer to gypsum board to steel studs with #6 1-1/8-inch long phillips drywall screws spaced maximum 12 inches O.C. Fasten face layer of gypsum board with #6 1-5/8-inch-long phillips drywall screws spaced maximum 8 inches O.C. Apply vinyl or casein, dry or premixed joint compound to face layers of gypsum board in two coats to all exposed screw heads and gypsum board joints. Embed minimum 2-inch-wide paper, plastic or fiberglass tape in first layer of joint compound over joints in gypsum board. Minimum wall assembly thickness of 6 inches measured from face layer of gypsum board to opposite face layer of gypsum board.
   D. Opening – Create an opening in the wall assembly having a cross-sectional area of maximum 1118 inch² and a maximum dimension of 35.5 inches. Frame opening with steel studs (Item 3A) and tracks (Item 3B). Position the penetrating item (Item 1) concentrically or eccentrically in the opening so that the annular space ranges from minimum 1 inch to maximum 3-1/2 inches.
Design No. 3MU/PH 120-14 continued

4. PENETRATION FIRESTOP: Symmetrical penetration firestop constructed of the following components:

A. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
   MODEL: 15A, 20A, 615
   PACKING MATERIAL: Fill the annular space with minimum 4-pcf mineral wool or certified insulation without the encapsulation (foil scrim). Cut the packing material into strips. Compress packing material nominally 25% and insert packing material into the annular space. Fill the entire annular space. Recess the surface of packing material nominally 5/8 inches from both surfaces of the face layers of the gypsum board of the wall assembly (Item 3).

B. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Joint Sealant
   MODEL: Water Tight 1000-NS Silicone or 2000+ Silicone Joint Sealant
   FILL, VOID OR CAVITY MATERIAL: Install minimum 5/8-inch depth of certified fill material into the recess over the packing material (Item 4A) on both sides of the wall assembly (Item 3). Screed certified fill material flush with the surface of the wall assembly (Item 3) on both sides.

3M Fire Barrier™ Duct Wrap 15A or 20A
3M Fire Barrier™ Duct Wrap 615
3M Fire Barrier™ 2000+ Silicone Joint Sealant
3M Fire Barrier™ Water Tight 1000-NS Silicone Joint Sealant

ASTM E 814-06
T Rating – 2 hr
F Rating – 2 hr

1. PENETRATING ITEM: Rectangular or round steel duct constructed of minimum 24 GA sheet steel with maximum 720 inch² area with a maximum 30 inch dimension or 30 inch diameter.

2. CERTIFIED MANUFACTURER: 3M Company
CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
MODEL: 15A, 20A
MODEL: 615: Option for FRD Ventilation Ducts (Old Designation VAD)

INSULATION: After the packing material (Item 4A) and fill material (Item 4B) of the penetration firestop (Item 4) are installed, wrap the penetrating item (Item 1) with at least one layer of minimum 24-inch-wide certified insulation. Minimum 8 pcf density required for grease duct applications. Overlap the ends of certified insulation and secure certified insulation to penetrating item (Item 1) in accord with any 2-hour-rated 3M FRD design listing. Abut certified insulation to penetration firestop (Item 4) on each side of wall assembly (Item 3).

3. WALL ASSEMBLY: Symmetrical two-hour-rated nominal 8 x 8 x 16 CMU or solid concrete wall assembly made from reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Constructed of one of the following:

A. Solid Concrete – Minimum concrete thickness measured from exposed face to exposed face using one of the following:
   1. lightweight concrete is 3.6 inches;
   2. sand-lightweight concrete is 3.8 inches;
   3. carbonate aggregate concrete is 4.6 inches; and
   4. siliceous aggregate concrete is 5.0 inches.

B. Opening – Create an opening in the wall assembly having a cross-sectional area of maximum 891 inch² and a maximum dimension of 33 inches. Position the penetrating item (Item 1) concentrically or eccentrically in the opening so that the annular space ranges from minimum 1 inch to maximum 2 inches.
Design No. 3MU/PH 120-16 continued

4. PENETRATION FIRESTOP: Symmetrical penetration firestop constructed of the following components:

A. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
   MODEL: 15A, 20A, 615
   PACKING MATERIAL: Fill the annular space with minimum 4 pcf mineral wool or certified insulation without the encapsulation (foil scrim). Cut the packing material into strips. Compress packing material nominally 25% and insert packing material into the annular space. Fill the entire annular space. Recess the surface of packing material nominally 3/8 inches from both surfaces of the face layers of the gypsum board of the wall assembly (Item 3).

B. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Joint Sealant
   MODEL: Water Tight 1000-NS Silicone or 2000+ Silicone Joint Sealant
   FILL, VOID OR CAVITY MATERIAL: Install minimum 3/8-inch depth of certified fill material into the recess over the packing material (Item 4A) on both sides of the wall assembly (Item 3). Screed certified fill material flush with the surface of the wall assembly (Item 3) on both sides. Overlap the fill material onto face of wall assembly (Item 3) a minimum of 1/4 inch.

This material was extracted and drawn by 3M Fire Protection Products from the 2010 Product Directory, © Intertek
1. PENETRATING ITEM: Rectangular steel duct constructed of minimum 24 GA sheet steel with maximum 2040 inch² area with a maximum 85 inch dimension.

2. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
   MODEL: 615
   INSULATION: After the packing material (Item 4A) and fill material (Item 4B) of the penetration firestop (Item 4) is installed and the steel angle (Item 4C) attached, protect the penetrating item (Item 1) with insulation applied in accordance with an Intertek ISO 6944 3M Design Listing for a Type A Duct using at least one layer of minimum 24-inch wide, minimum 6 pcf insulation.

3. WALL ASSEMBLY: Symmetrical two-hour rated solid concrete wall assembly made from reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Constructed of one of the following:
   A. Solid Concrete – Minimum concrete thickness measured from exposed face to exposed face using one of the following:
      1. lightweight concrete is 3.6 inches;
      2. sand-lightweight concrete is 3.8 inches;
      3. carbonate aggregate concrete is 4.6 inches; and
      4. siliceous aggregate concrete is 5.0 inches.
   B. Opening – Create an opening in the wall assembly having a cross-sectional area of maximum 2492 inch² and a maximum dimension of 89 inches. Position the penetrating item (Item 1) concentrically or eccentrically in the opening so that the annular space ranges from minimum 1 inch to maximum 3 inches.

4. PENETRATION FIRESTOP: Symmetrical penetration firestop constructed of the following components:
   A. CERTIFIED MANUFACTURER: 3M Company
      CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
      MODEL: 615
      PACKING MATERIAL: Fill the annular space with minimum 6 pcf insulation without the encapsulation (foil scrim). Cut the certified packing material into strips. Layer certified packing material to 50% greater thickness than width of annular space being filled. Compress certified packing material nominally 33%. Insert compressed certified packing material into the annual space. Fill the entire annular space. Recess the surface of certified packing material nominally 5/8 inches from both surfaces of the face layers of the gypsum board of the wall assembly (Item 3).
B. CERTIFIED MANUFACTURER: 3M Company  
CERTIFIED PRODUCT: 3M Fire Barrier™ Joint Sealant  
MODEL: Water Tight 1000-NS Silicone  
FILL, VOID OR CAVITY MATERIAL: Install minimum 5/8-inch depth of fill material into the recess over the packing material (Item 4A) on both sides of the wall assembly (Item 3). Screed certified fill material flush with the surface of the wall assembly (Item 3) on both sides.

C. STEEL ANGLE: Install nominal 16 GA 2 x 1-1/2 inch steel angle around perimeter of penetrating item (Item 1) with notched ends to create a continuous frame. Place vertical 1-1/2 inch leg of angle flush with exposed faces layers of the concrete wall assembly (Item 3). Attach horizontal 2 inch leg of angle to the penetrating item (Item 1) using self drilling screws, 12-24x2 Hex washer Head with #5 Point, spaced a maximum of 6 inches O.C.

D. CERTIFIED MANUFACTURER: 3M Company  
CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap  
MODEL: 615  
COLLAR: After the penetrating item (Item 1) is insulated with certified insulation (Item 2), install a layer of minimum 24 inch wide, minimum 6 pcf insulation over the penetrating item (Item 1). Position the certified collar abutting the exposed faces on both sides of the concrete wall assembly (Item 3). Overlap the ends of the certified collar a minimum of 3 inches. Certified collar covers the steel angle (Item 4C) of the penetration firestop (Item 4).

This material was extracted and drawn by 3M Fire Protection Products from the 2010 Product Directory, © Intertek
1. PENETRATING ITEM: Rectangular steel duct constructed of minimum 24 GA sheet steel with maximum 2040 inch² area with a maximum 85 inch dimension.

2. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
   MODEL: 615
   INSULATION: After the packing material (Item 4A) and fill material (Item 4B) of the penetration firestop (Item 4) is installed and the steel angle (Item 4C) attached, protect the penetrating item (Item 1) with insulation applied in accordance with an Intertek ISO 6944 3M Design Listing for a Type A Duct using at least one layer of minimum 24-inch wide, minimum 6 pcf insulation.

3. WALL ASSEMBLY: Asymmetrical two-hour rated gypsum shaft wall assembly constructed of the following:
   A. Visual Gypsum Board – Cover studs and runners with two layers of minimum 1/2 inch thick, Type X gypsum board on each face. Fasten base layer of gypsum board to steel studs with #6 1-1/8 inch bugle head phillips drywall screws spaced maximum 12 inch O.C. Fasten face layer of gypsum board with #6 1-5/8 inch long bugle phillips drywall screws spaced maximum 8 inches O.C. Apply vinyl or casein, dry or premixed joint compound to face layers of gypsum board in two coats to all exposed screw heads and gypsum board joints. Embed minimum 2 inch wide paper, plastic or fiberglass tape in first layer of joint compound over joints in gypsum board. Minimum wall assembly thickness of 6 inches measured from face layer of gypsum board to opposite face layer of gypsum board.
   B. Interior Gypsum Board – Cut 1-inch thick Type X gypsum board 1-inch less than floor to ceiling height. Insert the longitudinal edges of the 1-inch thick Type X gypsum board into the C-T or C-H studs. Secure the transverse edge of the 1 inch thick Type X gypsum board to the long leg of J-runner using its tabs or minimum 1-5/8-inch long Type S self-tapping bugle head steel screws spaced maximum 12 inches on center.
   C. Steel Studs – Cut minimum 25 GA galvanized steel C-T or C-H studs measuring minimum 2-1/2 inches wide with minimum 1-1/2-inch flanges 3/4-inches less than floor to ceiling height and spaced maximum 24 inch on center (O.C.) in runners with T or H section abutting long leg of runner.
   D. Runners – Use minimum 2-1/2-inch wide J-runner compatible with studs and having unequal vertical legs: minimum 1-inch short leg and minimum 2-inch long leg. Position J-runners with short leg towards visual face of shaft wall. Attach to floor and ceiling using steel fasteners located a maximum of 2-inches from each end and a maximum of 24 inch O.C.
E. Opening – Create an opening in the shaft wall assembly having a cross-sectional area of maximum 2492 inch² and a maximum dimension of 89 inches. Position the duct assembly eccentrically in the opening so that the annular space ranges from minimum 1 inch on one side to maximum 3 inches on the other.

4. PENETRATION FIRESTOP: Symmetrical penetration firestop constructed of the following components:

A. CERTIFIED MANUFACTURER: 3M Company
CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
MODEL: 615
PACKING MATERIAL: Fill the annular space with minimum 6 pcf insulation without the encapsulation (foil scrim). Cut the certified packing material into strips. Layer certified packing material to 50% greater thickness than width of annular space being filled. Compress certified packing material nominally 33%. Insert compressed certified packing material into the annular space. Fill the entire annular space. Recess the surface of certified packing material nominally 5/8 inches from both surfaces of the face layers of the gypsum board of the wall assembly (Item 3).

B. CERTIFIED MANUFACTURER: 3M Company
CERTIFIED PRODUCT: 3M Fire Barrier™ Joint Sealant
MODEL: Water Tight 1000-NS Silicone
FILL, VOID OR CAVITY MATERIAL: Install minimum 5/8-inch depth of fill material into the recess over the packing material (Item 4A) on both sides of the wall assembly (Item 3). Screed certified fill material flush with the surface of the wall assembly (Item 3) on both sides.

C. STEEL ANGLE: Install nominal 16 GA 2 x 1-1/2 inch steel angle around perimeter of penetrating item (Item 1) with notched ends to create a continuous frame. Place vertical 1-1/2 inch leg of angle flush with face layers of gypsum board of wall assembly (Item 3). Attach horizontal 2 inch leg of angle to the penetrating item (Item 1) using self drilling screws, 12-24x2 Hex washer Head with #5 Point, spaced a maximum of 6 inches O.C.

D. CERTIFIED MANUFACTURER: 3M Company
CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
MODEL: 615
COLLAR: After the penetrating item (Item 1) is insulated with certified insulation (Item 2), install a layer of minimum 24 inch wide, minimum 6 pcf insulation over the penetrating item (Item 1). Position the certified collar abutting the face layers of the gypsum board of the wall assembly (Item 2) on both sides of the wall assembly (Item 2). Overlap the ends of the certified collar a minimum of 3 inches. Certified collar covers the steel angle (Item 4C) of the penetration firestop (Item 4).

This material was extracted and drawn by 3M Fire Protection Products from the 2010 Product Directory, © Intertek
1. PENETRATING ITEM: Rectangular steel duct constructed of minimum 24 GA sheet steel with maximum 2040 inch² area with a maximum 85 inch dimension.

2. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
   MODEL: 615
   INSULATION: After the packing material (Item 4A) and fill material (Item 4B) of the penetration firestop (Item 4) is installed and the steel angle (Item 4C) attached, protect the penetrating item (Item 1) with at least one layer of minimum 24-inch wide, minimum 6 pcf insulation. Weld mild steel copper plated 12 GA by minimum 7 inch long pins to the bottom of the penetrating item (Item 1) spaced in 12 inch wide rows with pins spaced 10-1/2 inches apart. Wrap penetrating item (Item 1) with one layer of certified insulation. Overlap the ends of certified insulation a minimum of 3 inches. Place speed clips over the pins to secure certified insulation on bottom. Use nominal 1/2 inch wide, 0.015 inch thick, stainless steel banding and banding clips placed around the circumference of the penetrating item (Item 1) spaced nominally 10-1/2-inches on center to secure certified insulation.

3. WALL ASSEMBLY: Symmetrical two-hour rated concrete masonry unit (CMU) wall assembly constructed of the following:
   A. Block – Solid, 2 cavity, or 3 cavity, CMU block with minimum dimensions 7-5/8 x 7-5/8 x 15-3/8 inches, which is commonly called standard 8 x 8 x 16 block. Place CMU using standard 3/8-inch joints filled with Type S masonry cement mortar. Use a staggered block pattern where each course (row) laid is offset 50% from the row below. Minimum wall assembly thickness of 7-5/8 inches measured from face to opposite face of CMU.
   B. Opening – Create an opening in the wall assembly having a cross-sectional area of maximum 2492 inch² and a maximum dimension of 89 inches. Position the penetrating item (Item 1) concentrically or eccentrically in the opening so that the annular space ranges from minimum 1 inch to maximum 3 inches.

4. PENETRATION FIRESTOP: Symmetrical penetration firestop constructed of the following components:
   A. CERTIFIED MANUFACTURER: 3M Company
      CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
      MODEL: 615
      PACKING MATERIAL: Fill the annular space with minimum 6 pcf insulation without the encapsulation (foil scrim). Cut the certified packing material into strips. Layer certified packing material to 50% greater thickness than width of annular space being filled. Compress certified packing material nominally 33%. Insert compressed certified packing material into the annular space. Fill the entire annular space. Recess the surface of certified packing material nominally 5/8 inches from both surfaces of the wall assembly (Item 3).
B. CERTIFIED MANUFACTURER: 3M Company
CERTIFIED PRODUCT: 3M Fire Barrier™ Joint Sealant
MODEL: Water Tight 1000-NS Silicone
FILL, VOID OR CAVITY MATERIAL: Install minimum 5/8-inch depth of fill material into the recess over the packing material (Item 4A) on both sides of the wall assembly (Item 3). Screed certified fill material flush with the surface of the wall assembly (Item 3) on both sides.

C. STEEL ANGLE: Install nominal 16 GA 2 x 1-1/2 inch steel angle around perimeter of penetrating item (Item 1) with notched ends to create a continuous frame. Place vertical 1-1/2 inch leg of angle flush with exposed faces of wall assembly (Item 3). Attach horizontal 2 inch leg of angle to the penetrating item (Item 1) using self drilling screws, 12-24x2 Hex washer Head with #5 Point, spaced a maximum of 6 inches O.C.

D. CERTIFIED MANUFACTURER: 3M Company
CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
MODEL: 615
COLLAR: After the penetrating item (Item 1) is insulated with certified insulation (Item 2), install a layer of minimum 24 inch wide, minimum 6 pcf insulation over the penetrating item (Item 1). Position the certified collar abutting the exposed faces both sides of the wall assembly (Item 3). Overlap the ends of the certified collar a minimum of 3 inches. Certified collar covers the steel angle (Item 4C) of the penetration firestop (Item 4).

This material was extracted and drawn by 3M Fire Protection Products from the 2010 Product Directory, © Intertek
1. PENETRATING ITEM: Rectangular steel duct constructed of minimum 24 GA sheet steel with maximum 2040 inch² area with a maximum 85 inch dimension.

2. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
   MODEL: 615
   INSULATION: After the packing material (Item 4A) and fill material (Item 4B) of the penetration firestop (Item 4) is installed and the steel angle (Item 4C) attached, protect the penetrating item (Item 1) with at least one layer of minimum 24-inch wide, minimum 6 pcf insulation. Weld mild steel copper plated 12 GA by minimum 7 inch long pins to the bottom of the penetrating item (Item 1) spaced in 12 inch wide rows with pins spaced 10-1/2 inches apart. Wrap penetrating item (Item 1) with a one layer of certified insulation. Overlap the ends of certified insulation a minimum of 3 inches. Place speed clips over the pins to secure certified insulation on bottom. Use nominal 1/2 inch wide, 0.015 inch thick, stainless steel banding and banding clips placed around the circumference of the penetrating item (Item 1) spaced nominally 10-1/2-inches on center to secure certified insulation.

3. WALL ASSEMBLY: Symmetrical two-hour rated solid concrete wall assembly made from reinforced lightweight or normal weight (100-150 pcf or 1600-2400 kg/m³) concrete. Constructed of one of the following:
   A. Solid Concrete – Minimum concrete thickness measured from exposed face to exposed face using one of the following:
      1. lightweight concrete is 3.6 inches;
      2. sand-lightweight concrete is 3.8 inches;
      3. carbonate aggregate concrete is 4.6 inches; and
   B. siliceous aggregate concrete is 5.0 inches.
   B. Opening – Create an opening in the wall assembly having a cross-sectional area of maximum 2492 inch² and a maximum dimension of 89 inches. Position the penetrating item (Item 1) concentrically or eccentrically in the opening so that the annular space ranges from minimum 1 inch to maximum 3 inches.

4. PENETRATION FIRESTOP: Symmetrical penetration firestop constructed of the following components:
   A. CERTIFIED MANUFACTURER: 3M Company
      CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
      MODEL: 615
      PACKING MATERIAL: Fill the annular space with minimum 6 pcf insulation without the encapsulation (foil scrim). Cut the certified packing material into strips. Layer certified packing material to 50% greater thickness than width of annular space being filled. Compress certified packing material nominally 33%. Insert compressed certified packing material into the annular space. Fill the entire annular space. Recess the surface of certified packing material nominally 5/8 inches from both surfaces of the face layers of the gypsum board of the wall assembly (Item 3)
B. CERTIFIED MANUFACTURER: 3M Company
CERTIFIED PRODUCT: 3M Fire Barrier™ Joint Sealant
MODEL: Water Tight 1000-NS Silicone

FILL, VOID OR CAVITY MATERIAL: Install minimum 5/8-inch depth of fill material into the recess over the packing material (Item 4A) on both sides of the wall assembly (Item 3). Screed certified fill material flush with the surface of the wall assembly (Item 3) on both sides.

C. STEEL ANGLE: Install nominal 16 GA 2 x 1-1/2 inch steel angle around perimeter of penetrating item (Item 1) with notched ends to create a continuous frame. Place vertical 1-1/2 inch leg of angle flush with exposed faces layers of the concrete wall assembly (Item 3). Attach horizontal 2 inch leg of angle to the penetrating item (Item 1) using self drilling screws, 12-24x2 Hex washer Head with #5 Point, spaced a maximum of 6 inches O.C.

D. CERTIFIED MANUFACTURER: 3M Company
CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
MODEL: 615

COLLAR: After the penetrating item (Item 1) is insulated with certified insulation (Item 2), install a layer of minimum 24 inch wide, minimum 6 pcf insulation over the penetrating item (Item 1). Position the certified collar abutting the exposed faces on both sides of the concrete wall assembly (Item 3). Overlap the ends of the certified collar a minimum of 3 inches. Certified collar covers the steel angle (Item 4C) of the penetration firestop (Item 4).

This material was extracted and drawn by 3M Fire Protection Products from the 2010 Product Directory, © Intertek
1. PENETRATING ITEM: Rectangular steel duct constructed of minimum 22 GA sheet steel with maximum 2040 inch² area with a maximum 85 inch dimension.

2. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
   MODEL: 615
   INSULATION: After the packing material (Item 4A) and fill material (Item 4B) of the penetration firestop (Item 4) is installed and the steel angle (Item 4C) attached, protect the penetrating item (Item 1) with at least one layer of minimum 24-inch wide, minimum 6 pcf insulation. Weld mild steel copper plated 12 GA by minimum 7 inch long pins to the bottom of the penetrating item (Item 1) spaced in 12 inch wide rows with pins spaced 10-1/2 inches apart. Wrap penetrating item (Item 1) with a one layer of certified insulation. Overlap the ends of certified insulation a minimum of 3 inches. Place speed clips over the pins to secure certified insulation on bottom. Use nominal 1/2 inch wide, 0.015 inch thick, stainless steel banding and banding clips placed around the circumference of the penetrating item (Item 1) spaced nominally 10-1/2-inches on center to secure certified insulation.

3. WALL ASSEMBLY: Symmetrical two-hour rated gypsum wall assembly constructed of the following:
   A. Steel Studs – Minimum 25 GA galvanized steel studs measuring 3-5/8 inch wide with 1-1/4-inch legs spaced maximum 24 inch on center (O.C.). Attach studs with minimum #6 x 3/8-inch steel stud framing screws to floor and ceiling tracks.
   B. Tracks – Channel U-shaped floor and ceiling runners measuring 1/2-inch deep by 3-5/8-inch wide, which are secured to floor and ceiling with 1-inch long fasteners, suitable for the mounting to substrate, spaced maximum 18-inch O.C.
   C. Gypsum Board – Cover studs and runners with two layers of 5/8 inch thick, Type X gypsum board on each face. Fasten base layer of gypsum board to steel studs with #6 1-5/8 inch long bugle head phillips drywall screws spaced maximum 12 inch O.C. Fasten face layer of gypsum board with #6 1-5/8 inch long bugle phillips drywall screws spaced maximum 8 inches O.C. Apply vinyl or casein, dry or premixed joint compound to face layers of gypsum board in two coats to all exposed screw heads and gypsum board joints. Embed minimum 2 inch wide paper, plastic or fiberglass tape in first layer of joint compound over joints in gypsum board. Minimum wall assembly thickness of 6 inches measured from face layer of gypsum board to opposite face layer of gypsum board.
   D. Opening – Create an opening in the wall assembly having a cross-sectional area of maximum 2492 inch² and a maximum dimension of 89 inches. Position the penetrating item (Item 1) concentrically or eccentrically in the opening so that the annular space ranges from minimum 1 inch to maximum 3 inches.

4. PENETRATION FIRESTOP: Symmetrical penetration firestop constructed of the following components:
   A. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
   MODEL: 615
PACKING MATERIAL: Fill the annular space with minimum 6 pcf insulation without the encapsulation (foil scrim). Cut the certified packing material into strips. Layer certified packing material to 50% greater thickness than width of annular space being filled. Compress certified packing material nominally 33%. Insert compressed certified packing material into the annular space. Fill the entire annular space. Recess the surface of certified packing material nominally 5/8 inches from both surfaces of the face layers of the gypsum board of the wall assembly (Item 3).

B. CERTIFIED MANUFACTURER: 3M Company
CERTIFIED PRODUCT: 3M Fire Barrier™ Joint Sealant
MODEL: Water Tight 1000 NS Silicone

FILL, VOID OR CAVITY MATERIAL: Install minimum 5/8-inch depth of fill material into the recess over the packing material (Item 4A) on both sides of the wall assembly (Item 3). Screed certified fill material flush with the surface of the wall assembly (Item 3) on both sides.

C. STEEL ANGLE: Install nominal 16 GA 2 x 1-1/2 inch steel angle around perimeter of penetrating item (Item 1) with notched ends to create a continuous frame. Place vertical 1-1/2 inch leg of angle flush with face layers of gypsum board of wall assembly (Item 3). Attach horizontal 2 inch leg of angle to the penetrating item (Item 1) using self drilling screws, 12-24x2 Hex washer Head with #5 Point, spaced a maximum of 6 inches O.C.

D. CERTIFIED MANUFACTURER: 3M Company
CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
MODEL: 615

COLLAR: After the penetrating item (Item 1) is insulated with certified insulation (Item 2), install a layer of minimum 24 inch wide, minimum 6 pcf insulation over the penetrating item (Item 1). Position the certified collar abutting the face layers of the gypsum board of the wall assembly (Item 2) on both sides of the wall assembly (Item 2). Overlap the ends of the certified collar a minimum of 3 inches. Certified collar covers the steel angle (Item 4C) of the penetration firestop (Item 4).

This material was extracted and drawn by 3M Fire Protection Products from the 2010 Product Directory, © Intertek
1. PENETRATING ITEM: Rectangular steel duct constructed of minimum 24 GA sheet steel with maximum 2040 inch² area with a maximum 85 inch dimension.

2. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
   MODEL: 615
   INSULATION: After the packing material (Item 4A) and fill material (Item 4B) of the penetration firestop (Item 4) is installed and the steel angle (Item 4C) attached, protect the penetrating item (Item 1) with at least one layer of minimum 24-inch wide, minimum 6 pcf insulation. Weld mild steel copper plated 12 GA by minimum 7 inch long pins to the bottom of the penetrating item (Item 1) spaced in 12 inch wide rows with pins spaced 10-1/2 inches apart. Wrap penetrating item (Item 1) with a one layer of certified insulation. Overlap the ends of certified insulation a minimum of 3 inches. Place speed clips over the pins to secure certified insulation on bottom. Use nominal 1/2 inch wide, 0.015 inch thick, stainless steel banding and banding clips placed around the circumference of the penetrating item (Item 1) spaced nominally 10-1/2-inches on center to secure certified insulation.

3. WALL ASSEMBLY: Asymmetrical two-hour rated gypsum shaft wall assembly constructed of the following:
   A. Visual Gypsum Board – Cover studs and runners with two layers of minimum 1/2 inch thick, Type X gypsum board on each face. Fasten base layer of gypsum board to steel studs with #6 1-1/8 inch bugle head phillips drywall screws spaced maximum 12 inch O.C. Fasten face layer of gypsum board with #6, 1-5/8 inch long bugle phillips drywall screws spaced maximum 8 inches O.C. Apply vinyl or casein, dry or premixed joint compound to face layers of gypsum board in two coats to all exposed screw heads and gypsum board joints. Embed minimum 2 inch wide paper, plastic or fiberglass tape in first layer of joint compound over joints in gypsum board. Minimum wall assembly thickness of 6 inches measured from face layer of gypsum board to opposite face layer of gypsum board.
   B. Interior Gypsum Board – Cut 1-inch thick Type X gypsum board 1-inch less than floor to ceiling height. Insert the longitudinal edges of the 1-inch thick Type X gypsum board into the C-T or C-H studs. Secure the transverse edge of the 1-inch thick Type X gypsum board to the long leg of J-runner using its tabs or minimum 1-5/8-inch long Type S self-tapping bugle head steel screws spaced maximum 12 inches on center.
   C. Steel Studs – Cut minimum 25 GA galvanized steel C-T or C-H studs measuring minimum 2-1/2 inches wide with minimum 1-1/2-inch flanges 3/4-inches less than floor to ceiling height and spaced maximum 24 inch on center (O.C.) in runners with T or H section abutting long leg of runner.
Design No. 3MU/PH 120-26 continued

D. Runners – Use minimum 2-1/2-inch wide J-runner compatible with studs and having unequal vertical legs: minimum 1-inch short leg and minimum 2-inch long leg. Position J-runners with short leg towards visual face of shaft wall. Attach to floor and ceiling using steel fasteners located a maximum of 2-inches from each end and a maximum of 24 inch O.C.

E. Opening – Create an opening in the shaft wall assembly having a cross-sectional area of maximum 2492 inch² and a maximum dimension of 89 inches. Position the duct assembly eccentrically in the opening so that the annular space ranges from minimum 1 inch on one side to maximum 3 inches on the other.

4. PENETRATION FIRESTOP: Symmetrical penetration firestop constructed of the following components:

A. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
   MODEL: 615
   PACKING MATERIAL: Fill the annular space with minimum 6 pcf insulation without the encapsulation (foil scrim). Cut the certified packing material into strips. Layer certified packing material to 50% greater thickness than width of annular space being filled. Compress certified packing material nominally 33%. Insert compressed certified packing material into the annular space. Fill the entire annular space. Recess the surface of certified packing material nominally 5/8 inches from both surfaces of the face layers of the gypsum board of the wall assembly (Item 3).

B. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Joint Sealant
   MODEL: Water Tight 1000-NS Silicone
   FILL, VOID OR CAVITY MATERIAL: Install minimum 5/8-inch depth of fill material into the recess over the packing material (Item 4A) on both sides of the wall assembly (Item 3). Screed certified fill material flush with the surface of the wall assembly (Item 3) on both sides.

C. STEEL ANGLE: Install nominal 16 GA 2 x 1-1/2 inch steel angle around perimeter of penetrating item (Item 1) with notched ends to create a continuous frame. Place vertical 1-1/2 inch leg of angle flush with face layers of gypsum board of wall assembly (Item 3). Attach horizontal 2 inch leg of angle to the penetrating item (Item 1) using self drilling screws, 12-24x2 Hex washer Head with #5 Point, spaced a maximum of 6 inches O.C.

D. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
   MODEL: 615
   COLLAR: After the penetrating item (Item 1) is insulated with certified insulation (Item 2), install a layer of minimum 24 inch wide, minimum 6 pcf insulation over the penetrating item (Item 1). Position the certified collar abutting the face layers of the gypsum board of the wall assembly (Item 2) on both sides of the wall assembly (Item 2). Overlap the ends of the certified collar a minimum of 3 inches. Certified collar covers the steel angle (Item 4C) of the penetration firestop (Item 4).

PENETRATION FIRESTOP THROUGH WALL ASSEMBLY
3M Company
3M Fire Barrier Duct Wrap
3M Fire Barrier Water Tight 1000-NS Silicone Joint Sealant
ISO 6944 (1985)
Stability – 2 hr
Insulation – 2 hr
Integrity – 2 hr

1. PENETRATING ITEM: Rectangular steel duct constructed of minimum 24 GA sheet steel with maximum 2040 inch² area with a maximum 85 inch dimension.

2. CERTIFIED MANUFACTURER: 3M Company
CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
MODEL: 615
INSULATION: After the packing material (Item 4A) and fill material (Item 4B) of the penetration firestop (Item 4) is installed and the steel angle (Item 4C) attached, protect the penetrating item (Item 1) with insulation applied in accordance with an Intertek ISO 6944 3M Design Listing for a Type A Duct using at least one layer of minimum 24-inch wide, minimum 6 pcf insulation.

3. WALL ASSEMBLY: Symmetrical two-hour rated concrete masonry unit (CMU) wall assembly constructed of the following:
   A. Block – Solid, 2 cavity, or 3 cavity, CMU block with minimum dimensions 7-5/8 x 7-5/8 x 15-3/8 inches, which is commonly called standard 8 x 8 x 16 block. Place CMU using standard 3/8-inch joints filled with Type S masonry cement mortar. Use a staggered block pattern where each course (row) laid is offset 50% from the row below. Minimum wall assembly thickness of 7-5/8 inches measured from face to opposite face of CMU.
   B. Opening – Create an opening in the wall assembly having a cross-sectional area of maximum 2492 inch² and a maximum dimension of 89 inches. Position the penetrating item (Item 1) concentrically or eccentrically in the opening so that the annular space ranges from minimum 1 inch to maximum 3 inches.

4. PENETRATION FIRESTOP: Symmetrical penetration firestop constructed of the following components:
   A. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
   MODEL: 615
   PACKING MATERIAL: Fill the annular space with minimum 6 pcf insulation without the encapsulation (foil scrim). Cut the certified packing material into strips. Layer certified packing material to 50% greater thickness than width of annual space being filled. Compress certified packing material nominally 33%. Insert compressed certified packing material into the annular space. Fill the entire annular space. Recess the surface of certified packing material nominally 5/8 inches from both surfaces of the wall assembly (Item 3).
   B. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Joint Sealant
   MODEL: Water Tight 1000-NS Silicone
   FILL, VOID OR CAVITY MATERIAL: Install minimum 5/8-inch depth of fill material into the recess over the packing material (Item 4A) on both sides of the wall assembly (Item 3). Screed certified fill material flush with the surface of the wall assembly (Item 3) on both sides.
C. STEEL ANGLE: Install nominal 16 GA 2 x 1-1/2 inch steel angle around perimeter of penetrating item (Item 1) with notched ends to create a continuous frame. Place vertical 1-1/2 inch leg of angle flush with exposed faces of wall assembly (Item 3). Attach horizontal 2 inch leg of angle to the penetrating item (Item 1) using self drilling screws, 12-24x2 Hex washer Head with #5 Point, spaced a maximum of 6 inches O.C.

D. CERTIFIED MANUFACTURER: 3M Company

CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap

MODEL: 615

COLLAR: After the penetrating item (Item 1) is insulated with certified insulation (Item 2), install a layer of minimum 24 inch wide, minimum 6 pcf insulation over the penetrating item (Item 1). Position the certified collar abutting the exposed faces both sides of the wall assembly (Item 3). Overlap the ends of the certified collar a minimum of 3 inches. Certified collar covers the steel angle (Item 4C) of the penetration firestop (Item 4).

1. PIPE ASSEMBLY: Pipe or conduit with a mass equal to, or less than, of two 4-inch diameter schedule 40 polyethylene pipes. The acceptable pipe materials are one of the following compounds: polyvinyl chloride (PVC), chlorinated polyvinyl chloride (CPVC), polybutylene (PB), polyethylene (PE), polypropylene (PP) or polyvinylidene fluoride (PVDF).

2. FASTENER: Use either wire ties or steel banding to secure each piece of insulation (Item 3) applied around the pipe assembly (Item 1). When banding is selected, use minimum 1/2-inch wide stainless steel bands, which are nominally 0.015-inches thick or 1/2-inch wide carbon steel banding equivalent, which are nominally 0.020-inches thick. When desired, use of filament tape as a temporary hold for the insulation prior to fastening to ease installation is permitted. Place the bands a maximum 1 inch from each blanket edge. Tension the banding material to hold the insulation in place without causing any cutting or damage to the insulation (Item 3). When wire ties are selected, use minimum 24 GA steel wire ties. Place the wire ties a maximum 1 inch from each insulation (Item 3) edge. Tension the wire ties by twisting them together to hold the insulation (Item 3) in place without causing any cutting or damage to the insulation (Item 3).

3. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
   MODEL: 5A+
   INSULATION: Cover the pipe assembly (Item 1) with a single layer of min. 1/2-in. thick by minimum 24-inch wide refractory ceramic fiber blanket or calcium magnesium silicate blanket with a nominal density of 6-pcf. Use insulation fully encapsulated with foil scrim facing. Place one end of the insulation on the pipe assembly (Item 1) and wrap the insulation completely around the pipe assembly (Item 1). Overlap the other end of the insulation a minimum of 1 inch around the perimeter. Overlap the next piece of insulation onto the first piece of insulation a minimum of 1 inch. Overlap adjacent insulation using one of the following methods: (1) telescoping method where each adjacent insulation has one edge exposed and one edge covered by the next piece of insulation, (2) various checkerboard patterns detailed where both edges of each alternating insulation are covered by each adjacent insulation whose edges are exposed, or (3) a butt splice with collar method where the insulation are butted together and a 2-inch wide collar of insulation is centered over the butt splice overlapping each adjacent insulation 1 inch.

4. TAPE: (Not Shown) Apply pressure sensitive tape with aluminum foil facing to all exposed edges of the insulation (Item 3). Overlap tape onto insulation a minimum of 1-inch.

This material was extracted and drawn by 3M Fire Protection Products from the 2013 Product Directory, © Intertek
1. PIPE ASSEMBLY: One or more min. 1-inch diameter pipe or conduits composed of various compositions including polyvinyl chloride (PVC), chlorinated polyvinyl chloride (CPVC), acrylonitrile butadiene styrene (ABS), polybutylene (PB), polyethylene (PE), polypropylene (PP) and polyvinylidene floride (PVDF).

2. FASTENER: Use either wire ties or steel banding to secure each piece of insulation (Item 3) applied around the pipe assembly (Item 1). When banding is selected, use minimum 1/2-inch wide stainless steel bands, which are nominally 0.015-inches thick or 1/2-inch wide carbon steel banding equivalent, which are nominally 0.020-inches thick. When desired, use of filament tape as a temporary hold for the insulation prior to fastening to ease installation is permitted. Place the bands a maximum 1 inch from each blanket edge. Tension the banding material to hold the insulation in place without causing any cutting or damage to the insulation (Item 3). When wire ties are selected, use minimum 24 GA steel wire ties. Place the wire ties a maximum 1 inch from each insulation (Item 3) edge. Tension the wire ties by twisting them together to hold the insulation (Item 3) in place without causing any cutting or damage to the insulation (Item 3).
3. **CERTIFIED MANUFACTURER:** 3M Company  
**CERTIFIED PRODUCT:** 3M Fire Barrier™ Duct Wrap  
**MODEL:** 5A+  

**INSULATION:** Cover the pipe assembly (Item 1) with a single layer of min. 1/2-in. thick by minimum 24-inch wide refractory ceramic fiber blanket or calcium magnesium silicate blanket with a nominal density of 6-pcf. Use insulation fully encapsulated with foil scrim facing. Place one end of the insulation on the pipe assembly (Item 1) and wrap the insulation completely around the pipe assembly (Item 1). Overlap the other end of the insulation a minimum of 1 inch around the perimeter. Overlap the next piece of insulation onto the first piece of insulation a minimum of 1 inch. Overlap adjacent insulation using one of the following methods: (1) telescoping method where each adjacent insulation has one edge exposed and one edge covered by the next piece of insulation, (2) various checkerboard patterns detailed where both edges of each alternating insulation are covered by each adjacent insulation whose edges are exposed, or (3) a butt splice with collar method where the insulation are butted together and a 2-inch wide collar of insulation is centered over the butt splice overlapping each adjacent insulation 1 inch.

4. **TAPE:** (Not Shown) Apply pressure sensitive tape with aluminum foil facing to all exposed edges of the insulation (Item 3). Overlap tape onto insulation a minimum of 1-inch.

CERTIFIED PRODUCT: 3M Fire Barrier™ Duct Wrap
MODEL: 5A+
INSULATION: Cover the cable assembly (Item 1) with a single layer of min. 1/2-in. thick by minimum 24-inch wide refractory ceramic fiber blanket or calcium magnesium silicate blanket with a nominal density of 6-pcf. Use insulation fully encapsulated with foil scrim facing. Place one end of the insulation on the cable assembly (Item 1) and wrap the insulation completely around the cable assembly (Item 1). Overlap the other end of the insulation a minimum of 1 inch around the perimeter. Overlap the next piece of insulation onto the first piece of insulation a minimum of 1 inch. Overlap adjacent insulation using one of the following methods: (1) telescoping method where each adjacent insulation has one edge exposed and one edge covered by the next piece of insulation, (2) various checkerboard patterns detailed where both edges of each alternating insulation are covered by each adjacent insulation whose edges are exposed, or (3) a butt splice with collar method where the insulation are butted together and a 2-inch wide collar of insulation is centered over the butt splice overlapping each adjacent insulation 1 inch.

4. TAPE: (Not Shown) Apply pressure sensitive tape with aluminum foil facing to all exposed edges of the insulation (Item 3). Overlap tape onto insulation a minimum of 1-inch

BXUV - Fire Resistance Ratings - ANSI/UL 263
BXUV7 - Fire Resistance Ratings - CAN/ULC-S101 Certified for Canada
October 24, 2017

Ratings – 1, 2 and 3 Hr.

1. **Steel Column** – Min size of column W10x49, with outside dimensions 10 by 10 in., a flange thickness of 9/16 in., a web thickness of 5/16 in. and a cross-sectional area of 14.4 in. sq ft.

2. **Mat Materials** – The column protection assembly consists of endothermic mat, aluminum foil tape, intumescent jacket. The assembly shall be installed in accordance with detailed installation instructions manual supplied by the manufacturer of the **Mat Materials**. The details of the column assembly are summarized below:

   A. **Mat Materials** – **Endothermic Mat** – Flexible sheet supplied in rolls. Each layer of mat installed by cutting to size and tightly wrapping around the column and itself such that a min 2 in. overlap is present along the vertical seam. With the exception of the final layer of mat, adjacent lengths of mat in each layer to be installed with tightly butted end seams. Successive layers of mat installed in same manner with butted end seams offset a min 2 in. from butted end seams of preceding layer. For final layer of mat, adjacent lengths of mat to overlap the preceding length a min of 2 in. All seams in each layer of mat to be sealed with foil tape (Item 2B). The hourly rating of the column assembly is dependent upon the number of endothermic mat layers as shown in the following table:

   **3M COMPANY** – Type E-5A-3, E-5A-4, E-53A, E-53C, E-54A or E-54C.

   B. **Mat Material** – **Aluminum Foil Tape** – Nom 4 in. wide pressure-sensitive aluminum foil tape supplied in rolls. Used to secure the vertical and circumferential butt joints of the endothermic mat (Item 2A).

   C. **Mat Materials** – **Intumescent Mat** – Flexible sheet material supplied in rolls. After completion of the first layer of endothermic mat (Item 2A) nom 2 in. wide intumescent mat installed by cutting to size and wrapping around the endothermic mat. The intumescent mat spaced 8 in. OC and max 2 in. from and on both sides of the circumferential butt joints with steel banding straps and clips (Item 2D).

   **3M COMPANY** – Type I-10A or M-20A.

   D. **Steel Banding Straps** – Min 5/8 in. wide by 0.020 in. thick stainless steel banding straps used in conjunction with No. 26 gauge galv steel wing-type crimp clips. Steel banding straps spaced 8 in. OC and 2 in. from and on both sides of the circumferential butt joints to secure intumescent mat (Item 2C). Steel banding straps and crimp clips required to be installed over the second layer of endothermic mat (Item 2A) and the third layer of the mat for a 1 h rating and 2 h rating, respectively.
E. **Fill, Void or Cavity Material – Caulk** – (Not Shown) Thick bead of caulk to be applied as a gasket between the endothermic mat (Item 2A) and the floor or ceiling surface. The bead of caulk applied around entire perimeter of endothermic mat at the interface of floor or ceiling surface.

**3M COMPANY** – Type CP.25WB+.

F. **Stainless Steel Jacket** – After completion of the mats and steel banding straps, nominal 36 in. wide by minimum No. 32 gauge (0.012 in.) thick stainless steel jacket wrapped around the outer layer of the mat. Adjacent lengths of steel jacket to overlap the preceding length a minimum of 5 in. All horizontal. Steel jacket secured in place with steel banding straps and clips (Item 2D) spaced maximum 8 in. OC and maximum 1 in. from all horizontal seams.

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

BXUV - Fire Resistance Ratings - ANSI/UL 263
BXUV7 - Fire Resistance Ratings - CAN/ULC-S101 Certified for Canada

October 24, 2017

Rating – 2 and 3 Hr.

1. **Steel Column** – Min size of column W10×49 with outside dimensions of 10 by 10 in., a flange thickness of 9/16 in., a web thickness of 5/16 in. and a cross-sectional area of 14.4 sq in.

2. **Mat Materials** – Flexible endothermic mat supplied in rolls. Starting at the column flange edge at the base of the column, a continuous length of mat is circumferentially wrapped around the column, with the foil side facing outward, to attain the required number of mat layers. For the 2 h fire rating, the mat wrap length shall result in a min two layer cover over three sides of the column and a three layer cover over one flange face. For the 3 h fire rating, the mat wrap length shall result in a min three layer cover over three sides of the column and a four layer cover over one flange face. Butted circumferential joint between adjoining lengths of mat wrap to be sealed with endothermic caulk (Item 3) and covered with aluminum foil tape (Item 4). Vertical seam of adjoining lengths to align with one another and to be sealed with aluminum foil tape.

   **3M COMPANY** – Type E-5A-3, E-5A-4, E-53A, E-53C, E-54A or E-54C.

3. **Endothermic Caulk** – Applied to completely fill butted circumferential joint between adjoining lengths of mat material. Additional endothermic caulk to be applied to butted joints after installation of banding straps, as necessary, to fill all gaps.

   **3M COMPANY** – Type FD-150.

4. **Aluminum Foil Tape** – Nom 4 in. wide min 2 mil thick pressure-sensitive aluminum foil tape supplied in rolls. Used to cover vertical seam of mat wrap and to cover butted circumferential joint between adjoining lengths of mat wrap after installation of the endothermic caulk.

5. **Steel Banding Straps** – Min 1/2 in. wide by 0.020 in. thick stainless steel banding straps used in conjunction with stainless steel crimp clips. Steel banding straps spaced max 12 in. OC and max 2 in. from and on both sides of the butted circumferential joints to secure mat. Additional steel banding straps required to secure stainless steel jacket (Item 7.)

6. **Caulk** – (Not shown) – Thick bead of caulk to be applied around entire perimeter of endothermic mat (Item 2) at its interface with the floor and ceiling surfaces.

   **3M COMPANY** – Type CP 25WB+.

7. **Stainless Steel Jacket** – After completion of the mat wrap installation, nominal 36 in. wide by minimum 0.009 in. thick stainless steel jacket wrapped around the endothermic mat and lapping itself approximately 6 in. Adjoining lengths of stainless steel jacket to overlap a minimum of 4 in. Steel jacket secured in place with stainless steel banding straps (Item 5) spaced maximum 12 in. OC and maximum 1 in. from all seams.

*Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

1. **Steel Column** – Min size of column W10x49.

2. **Mat Materials** – The column protection assembly consists of endothermic mat, aluminum foil tape, and aluminum cladding. The details of the column assembly are summarized below:

   A. **Mat Materials** – Endothermic Mat – Flexible mat supplied in rolls. Each layer of foil-faced mat installed by cutting to size and tightly wrapping around the column and itself such that a min 2 in. overlap is present along the vertical seam. Seams are located on the column flange. Sections are temporarily held in place with several strips of 3M Type 898 filament tape (approx. 24 in. long). Adjacent sections of material on the same layer abut one another forming the circumferential edge seam. Successive layers of mat installed in same manner with butted end seams offset a min 2 in. from butted end seams of preceding layer. For single layer construction only, a 4 in. wide endothermic mat collar is wrapped around each taped circumferential butt joint with a 2 in. overlap on itself. Circumferential edges of collar are sealed with foil tape. Stainless steel bands are applied as described under Item 2C. All seams in each layer of mat to be sealed with foil tape (Item 2B) prior to installation of subsequent layer of mat or collars. The hourly rating of the column assembly is dependent upon the number of endothermic mat layers as shown in the following table:

3M COMPANY
3M FIRE PROTECTION PRODUCTS – Interam™ Types E-54A, E-5A-4 or E-54C.

B. **Aluminum Foil Tape** – (Shown at vertical seam but not shown at butt joints, collars or cladding for clarity) Nom 4 in. wide pressure-sensitive aluminum foil tape supplied in rolls. Used to secure the vertical overlap and circumferential butt joint seams of the endothermic mat (Item 2A).

3M COMPANY
3M FIRE PROTECTION PRODUCTS – Type 425

C. **Steel Banding Straps** – Min 1/2 in. wide by 0.020 in. thick stainless steel banding straps used in conjunction with No. 26 gauge galv steel wing-type crimp clips. Steel banding straps installed at the center and 2 in. from end of mat sections. Steel banding straps applied approx. 1 in. from edges of collars. Steel banding straps installed at the center and 1 in. from top and 1-1/2 in. from bottom of each section.

3M COMPANY
3M FIRE PROTECTION PRODUCTS – Type CP 25WB+ or FB 3000 WT.

D. **Fill, Void or Cavity Material – Caulk** – (Not Shown) Thick bead of caulk to be applied as a gasket between the endothermic mat (Item 2A) and the floor or ceiling surface. The bead of caulk applied around entire perimeter of endothermic mat at interface of floor or ceiling surface prior to and after each layer of mat material and after installation of the cladding.

APPLIED FIREPROOFING
3M Company
3M™ Interam™ E-5, E-54-A and E-54A-4 Series Endothermic Mat
3M™ Fire Barrier CP 25WB+ Caulk
ASTM E 119
Restrained or Unrestrained Beam Rating: 4 Hours

1. **Concrete Floor:** Use normal or lightweight concrete floor with minimum compressive strength of 109 pcf having a minimum depth of 12 in.

2. **Steel Beam:** Use minimum W8x48 W-Shaped steel beam.

3. **Certified Manufacturer:** 3M Company
   **Certified Product:** Applied Fireproofing
   **Model:** 3M™ Interam™ E-5, E-54-A and E-54A-4 Series Endothermic Mat
   **Endothermic Mat:** Install 1 layer of foil faced flexible mat around steel beam (Item 2). Cut length of endothermic mat to ensure minimum 4 in. overlap onto concrete floor (Item 1) adjacent to steel beam (Item 2). Tightly butt joints of endothermic mat and seal joints with foil tape (Item 5).

4. **Certified Manufacturer:** 3M Company
   **Certified Product:** Caulk or Sealant
   **Model:** 3M Fire Barrier CP 25WB+ Caulk
   **Caulk (Not Shown):** Fill any gaps between concrete floor and endothermic mat (Item 3) with caulk.

5. **Tape:** (Not Shown) Apply 4 in. wide pressure sensitive tape with aluminum foil facing to all butt joints of the endothermic mat (Item 3).

6. **Steel Banding:** Install 1/2 in. wide x 0.020 in. thick stainless steel banding around endothermic mat (Item 3) and secure into concrete using fasteners (Item 7). Space banding max. 12 in. oc.

7. **Fastener:** Secure endothermic mat (Item 3) and steel banding (Item 6) to concrete floor (Item 1) using min. 1/4 in. concrete anchors inserted through 1 in. diameter fender washer.

3M COMPANY — Type E-5A-3, E-5A-4, E-53A, E-53C, E-54A or E-54C.

3M COMPANY 3M FIRE PROTECTION PRODUCTS — Interam™ Types E-54A, E-5A-4 or E-54C. Additionally evaluated for acid and solvent spray exposure.

B. **Aluminum Foil Tape** — (Shown at vertical seam but not shown at butt joints, collars or cladding for clarity) Nom 4 in. wide pressure-sensitive aluminum foil tape supplied in rolls. Used to secure the vertical overlap and circumferential butt joint seams of the endothermic mat (Item 2A) and joints in the aluminum cladding (Item 2E).

3M COMPANY 3M FIRE PROTECTION PRODUCTS — Type 425.
C. **Steel Banding Straps** — Min 1/2 in. wide by 0.020 in. thick stainless steel banding straps used in conjunction with No. 26 gauge galv steel wing-type crimp clips. Steel banding straps installed at the center and 2 in. from end of mat sections. Steel banding straps applied approx. 1 in. from edges of collars. Steel banding straps installed at the center and 1 in. from top and 1-1/2 in. from bottom of cladding sections.

D. **Fill, Void or Cavity Material — Caulk*** — (Not Shown) Thick bead of caulk to be applied as a gasket between the endothermic mat (Item 2A) and the floor or ceiling surface. The bead of caulk applied around entire perimeter of endothermic mat at interface of floor or ceiling surface prior to and after each layer of mat material and after installation of the cladding.

3M COMPANY 3M FIRE PROTECTION PRODUCTS — Type CP 25WB+, or FB 3000 WT.

E. **Aluminium Cladding Jacket** — Optional. After installation of the mats, collars, foil tape and steel banding straps, aluminum corner cladding pieces with nominal 12 in. wide legs, 36 in. long and min No. 27 gauge (0.014 in.) thick installed and overlapped on each other to cover column and form outer jacket. Adjacent lengths of cladding to overlap the preceding length a min of 2 in. Cladding jacket secured in place with steel banding straps as noted under Item 2C. All seams of cladding material to be sealed with foil tape after banding has been installed.

F. **Stainless Steel Cladding Jacket** — Optional. (Alternate to Aluminum Cladding Jacket, Item E) - After installation of the mats, nominal 36 in. wide by minimum 0.009 in. thick stainless steel jacket wrapped around endothermic mat and lapping itself approximately 6 in. Adjoining lengths of stainless steel jacket to overlap a minimum of 4 in. Stainless steel jacket secured in place with steel banding straps (item 2C) spaced max. 12 in. OC and max. 1 in. from all seams.

G. **Insulation Jacketing Tape*** — Optional. (Alternate to Aluminum Cladding Jacket, Item E) - After installation of the mats, nominal 23 in. wide by minimum 0.007 in. thick multilayered laminate coated with an aggressive cold weather acrylic pressure sensitive adhesive wrapped around endothermic mat and lapping itself approximately 3 in. Adjoining lengths of insulation jacketing tape to overlap approximately 3 in. Insulation jacketing tape secured in place by self-adhesive bond to the endothermic mat. See Tape, General Use (BVYS).

3M COMPANY 3M FIRE PROTECTION PRODUCTS — VentureClad(R) 1577CW, 1577CW-E, or 1579CW

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

1. **Steel Column** — Min size of column W10x49.

2. **Mat Materials** — The column protection assembly consists of endothermic mat, aluminum foil tape, steel bands, wire ties, and optional metal cladding material. The details of the column assembly are summarized below:

   A. **Mat Materials** — Endothermic Mat — Flexible mat supplied in rolls. Each layer of foil-faced mat installed by cutting to size and tightly wrapping around the column and itself such that a min 2 in. overlap present along the vertical seam. Seams located on the column flange. Sections are temporarily held in place with several strips of 3M Type 898 filament tape (approx. 24 in. long). Adjacent sections of material on the same layer abut one another forming the circumferential butt joint. Successive layers of mat installed in same manner with circumferential butt joints offset a min 2 in. from butted end seams of preceding layer. Circumferential edges of collar are sealed with aluminum foil tape (Item 2B). Stainless steel bands and wire ties are applied as described under Items 2C and 2H, respectively. All seams in each layer of mat to be sealed with aluminum foil tape (Item 2B) prior to installation of subsequent layer of mat or collars. The hourly rating of the column assembly is dependent upon the number of endothermic mat layers as shown in the following table:

<table>

B. **Aluminum Foil Tape** — (Shown at vertical seam but not shown at butt joints, collars or cladding for clarity) Nom 4 in. wide pressure-sensitive aluminum foil tape supplied in rolls. Used to secure the vertical overlap and circumferential butt joint seams of the endothermic mat (Item 2A) and joints in the aluminum cladding (Item 2E).

C. **Steel Banding Straps** — Min 1/2 in. wide by 0.020 in. thick stainless steel banding straps used in conjunction with No. 26 gauge galv steel wing-type crimp clips. Steel banding straps installed at the center and 2 in. from end of mat sections. Steel banding straps applied approx. 1 in. from edges of collars. Steel banding straps installed at the center and 1 in. from top and 1-1/2 in. from bottom of cladding sections.

3M COMPANY 3M FIRE PROTECTION PRODUCTS — Type ES-5A-12. Additionally evaluated for solvent spray exposure.

3M COMPANY 3M FIRE PROTECTION PRODUCTS — Type 425.
D. **Fill, Void or Cavity Material — Caulk** — (Not Shown) Thick bead of caulk to be applied as a gasket between the endothermic mat (Item 2A) and the floor or ceiling surface. The bead of caulk applied around entire perimeter of endothermic mat at interface of floor or ceiling surface prior to and after each layer of mat material and after installation of the cladding.

3M COMPANY 3M FIRE PROTECTION PRODUCTS — Type CP 25WB+, or FB 3000 WT.

E. **Aluminum Cladding Jacket** — Optional. After installation of the mats, collars, foil tape and steel banding straps, aluminum corner cladding pieces with nominal 12 in. wide legs, 36 in. long and min No. 27 gauge (0.014 in.) thick installed and overlapped on each other to cover column and form outer jacket. Adjacent lengths of cladding to overlap the preceding length a min of 2 in. Cladding jacket secured in place with steel banding straps as noted under Item 4. All seams of cladding material to be sealed with foil tape after banding has been installed.

F. **Stainless Steel Cladding Jacket** — Optional. (Alternate to Aluminum Cladding Jacket, Item 2E) - After installation of the mats, nominal 36 in. wide by minimum 0.009 in. thick stainless steel jacket wrapped around endothermic mat and lapping itself approximately 6 in. Adjoining lengths of stainless steel jacket to overlap a minimum of 4 in. Stainless steel jacket secured in place with steel banding straps (item 2C) spaced max. 12 in. OC and max. 1 in. from all seams.

G. **Insulation Jacketing Tape** — Optional. (Alternate to Aluminum Cladding Jacket, Item 2E) - After installation of the mats, nominal 23 in. wide by minimum 0.007 in. thick multilayered laminate coated with an aggressive cold weather acrylic pressure sensitive adhesive wrapped around endothermic mat and lapping itself approximately 3 in. Adjoining lengths of insulation jacketing tape to overlap approximately 3 in. Insulation jacketing tape secured in place by self-adhesive bond to the endothermic mat. See Tape, General Use (BVYS).

3M COMPANY 3M FIRE PROTECTION PRODUCTS — VentureClad(R) 1577CW, 1577CW-E, or 1579CW

H. **Wire Ties** — Steel, No. 18 gauge (0.046 in. thick). Wire ties installed approximately every 12 in. with one tie installed approx. 1 in. away from the circumferential butt joints and one installed approximately mid-height of each section of mat material. All layers except the outermost layer receives wire ties.

* Indicates such products shall bear the UL or cUL Certification Mark for jurisdictions employing the UL or cUL Certification (such as Canada), respectively.

APPLIED FIREPROOFING  
3M Company  
3M™ Interam™ E-5, E-54-A and E-5A-4 Series Endothermic Mat  
3M Fire Barrier CP 25WB+ Caulk  
ASTM E 1529 (Hydrocarbon Exposure)  
ASTM E 119 (2012)  
Restrained or Unrestrained Beam Rating: 4 Hours

1. CONCRETE FLOOR: Use normal or lightweight concrete floor with minimum compressive strength of 109 pcf having a minimum depth of 12 in.
2. STEEL BEAM: Use minimum W8x48 W-Shaped steel beam.
3. CERTIFIED MANUFACTURER: 3M Company  
   CERTIFIED PRODUCT: Applied Fireproofing  
   MODEL: 3M™ Interam™ E-5, E-54-A and E-5A-4 Series Endothermic Mat  
   ENDOTHERMIC MAT: Install 1 layer of foil faced flexible mat around steel beam (Item 2). Cut length of endothermic mat to ensure minimum 4 in. overlap onto concrete floor (Item 1) adjacent to steel beam (Item 2). Tightly butt joints of endothermic mat and seal joints with foil tape (Item 5).
4. CERTIFIED MANUFACTURER: 3M Company  
   CERTIFIED PRODUCT: Caulk or Sealant  
   MODEL: 3M Fire Barrier CP 25WB+ Caulk  
   CAULK (Not shown): Fill any gaps between concrete floor and endothermic mat (Item 3) with caulk.
5. TAPE: (Not Shown) Apply 4 in. wide pressure sensitive tape with aluminum foil facing to all butt joints of the endothermic mat (Item 3).
6. STEEL BANDING: Install 1/2 in. wide x 0.020 in. thick stainless steel banding around endothermic mat (Item 3) and secure into concrete using fasteners (Item 7). Space banding max. 12 in. oc.
7. FASTENER: Secure endothermic mat (Item 3) and steel banding (Item 6) to concrete floor (Item 1) using min. 1/4 in. concrete anchors inserted through 1 in. diameter fender washer.

This material was extracted and drawn by 3M Fire Protection Products from the 2012 Product Directory, © Intertek
1. VESSEL: Use a code approved container for storage of liquid propane gas (LPG).

2. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: Applied Fireproofing
   MODEL: 3M™ Interam™ E-5, E-54-A and E-5A-4 Series Endothermic Mat
   ENDOTHERMIC MAT: Install 2 layers of foil faced flexible mat tightly around the vessel (Item 1). Install first layer with circumferential and longitudinal butt joint fit tightly together. Tape all joints of first layer with Aluminum Tape (Item 3). Install second layer with circumferential and longitudinal butt joint fit tightly together. Install second layer with joints offset minimum 2 in. from joints of first layer. Tape all joints of second layer with Aluminum Tape (Item 3).
   Note: If required filament tape may be used to hold the endothermic mat in place. Filament tape should be spaced minimum 6 in. on center (oc)

3. ALUMINUM TAPE: (Not Shown) Apply 4 in. wide pressure sensitive tape with aluminum foil facing to all joints of the inner and outer layer of the Endothermic Mat (Item 2).

4. STEEL BANDING: Install 1/2 in. wide x 0.020 in. thick stainless steel banding around the outer layer of the endothermic mat (Item 2). Install banding within 1 in. of the edges of each piece of endothermic mat (Item 2) circumferential butt joints and maximum 12 in. oc along the width of the endothermic mat (Item 2) with a minimum of three bands (total) per mat installed.

5. STEEL SHEATHING: Install 1 layer of 0.016 in. thick T-304 stainless steel sheeting over the endothermic mat (Item 2). Install steel sheathing with minimum 2 in. overlap at circumferential joints to create a stepped surface installation. One continuous piece of steel sheathing shall wrap around the container (item 1) and the endothermic mat (Item 2) with a minimum 2 in. overlap at the longitudinal joint.

6. STEEL BANDING: Install 1/2 in. wide x 0.020 in. thick stainless steel banding around the steel sheathing (Item 5). Install banding within centered over the overlap of each joint in the steel sheathing (Item 5) and maximum 12 in. oc along the width of the steel sheathing (Item 2) with a minimum of three bands per sheet installed.

This material was extracted and drawn by 3M Fire Protection Products from the 2013 Product Directory, © Intertek
1. **STRUCTURAL STEELWORK:** Use structural steel having a min. thickness of 20 mm +/- 0.25 mm (0.79 +/- 0.01 in.).

   **STEEL PANEL:** A steel panel constructed of 10 mm (0.39) thick steel complying with ISO 630:1995, Grade Fe 430 representing steelwork with no corners or edge features.

2. **CERTIFIED MANUFACTURER:** 3M Company

   **CERTIFIED PRODUCT:** Applied Fireproofing

   **MODEL:** 3M™ Interam™ E-5 and E-5A-4 Series Endothermic Mat

   **ENDOTHERMIC MAT:** Install two layers of foil-faced flexible mat tightly over the steel panel (Item 1). Install first layer with continuous vertical sections of Endothermic Mat with vertical joints fit tightly together and foil facing away from the steel panel. Adhere first layer to the steel panel (Item 1) using 3M Hi-Strength 90 Adhesive applied to the steel and the back of the first layer being applied. Use rollers over the entire layer to ensure complete adhesion is achieved. Tape all joints of first layer with Aluminum Tape (Item 6) and use rollers over tape to ensure complete adhesion. Install the additional layer with joints offset min. 51mm (2 in.) from joints of the previous layer. Adhere the additional layer to the previous layer of Endothermic Mat using 3M Hi-Strength 90 Adhesive applied to the face of the previous layer. Use rollers over the entire layer to ensure complete adhesion is achieved. Tape all joints of the additional layer with Aluminum Tape (Item 6).

3. **ALUMINUM TAPE:** Apply 102 mm (4 in.) wide pressure sensitive tape with aluminum foil-facing to all joints of each layer of the Endothermic Mat (Item 2).

4. **STEEL SHEATHING:** Install one layer of 26 A T-304 stainless steel sheathing over the Endothermic Mat (Item 2) in continuous vertical sheets. Install steel sheathing with min. 76 mm (3 in.) overlap at joints to create a stepped surface installation. Adhere each piece of Steel Sheathing to the final layer of Endothermic Mat (Item 2) using 3M Hi-Strength 90 Adhesive applied to the edges of the back of the Steel Sheathing face of the corresponding locations on the final layer of Endothermic Mat (Item 2).

5. **PINS (Not Shown):** Install nominal 35 mm (1-3/8 in.) long, 12 GA (2.7 mm (0.106 in.) thick) stainless steel cup-head pins with a min. 38 mm (1-1/2 in.) washer. Install pins by pre-drilling holes through the Steel Sheathing (Item 4) and the Endothermic Mat (Item 2) with an 11 mm (7/16 in.) drill bit and welding the pins to the Structural Steelwork (Item 1). Pins shall be spaced both vertically and horizontally 305 mm (12 in.) on center and centered over the overlap of each joint in the Steel Sheathing (Item 7).
1. **STRUCTURAL STEELWORK**: Use structural steel having a min. thickness of 20 +/- 0.25mm (0.79 +/- 0.01 in.).

2. **STEEL PANEL**: Use a steel panel constructed of 10mm (0.39 in.) thick steel, complying with ISO 630:1995, Grade Fe 430 representing steelwork with no corners or edge features.

3. **CERTIFIED MANUFACTURER**: 3M Company

   **CERTIFIED PRODUCT**: Applied Fireproofing

   **CERTIFIED MODEL**: 3M™ Interam™ ES-5A-12 Series Endothermic Mat

   **ENDOTHERMIC MAT**: Install two layers of foil-faced flexible Endothermic Mat, tightly over the Structural Steelwork (Item 1) and Steel Plate (Item 2). Each layer shall have one single piece of Endothermic Mat over the Structural Steelwork (Item 1) with the foil facing away from the Structural Steelwork. Install first layer with continuous vertical sections of Endothermic Mat with vertical joints fit tightly together and foil facing away from the steel panel. Adhere the first layer to the steel panel (Item 2) using 3M Hi-Strength 90 Adhesive (not shown) applied to the steel and the back of the first layer being applied. Use rollers over the entire layer to ensure complete adhesion is achieved. Tape all joints of first layer with Aluminum Tape (Item 5) and use rollers over tape to ensure complete adhesion. Install the second layer with joints offset min. 51mm (2 in.) from joints of the previous layer. Adhere the second layer of Endothermic Mat to the first layer of Endothermic Mat using 3M Hi-Strength 90 Adhesive (not shown) applied to the face of the first layer. Use rollers over the entire layer to ensure complete adhesion is achieved. Tape all joints of the second layer with Aluminum Tape (Item 5), with min. 50mm (2 in.) overlap onto itself, with the foil facing away from the cable tray. Temporarily affix sections of Endothermic Mat with filament tape if needed. Install each additional layer in the same manner ensuring the seams between layers are offset a min. of 50mm (2 in.).

4. **CERTIFIED MANUFACTURER**: 3M Company

   **CERTIFIED PRODUCT**: Caulk

   **CERTIFIED MODEL**: 3M™ Fire Barrier CP 25WB+

   **CAULK (Not Shown)**: Install caulk in any joints between Endothermic Mat (Item 3) or between the Endothermic Mat (Item 3) and any steel member (Item 1 and/or 2) that exceed 3mm (1/8 in.).

---

**Figure 1. Structural Steel Work Protection**
5. **ALUMINUM TAPE:** Apply 102mm (4 in.) wide pressure sensitive tape with aluminum foil-facing to all joints of each layer of the Endothermic Mat (Item 3).

6. **STEEL SHEATHING:** Install one layer of min. 0.48mm (26 GA, 0.0156 in.) T-304 stainless steel sheathing over the Endothermic Mat (Item 3) in continuous vertical sheets. Install Steel Sheathing with min. 76mm (3 in.) overlap at joints to create a stepped surface installation. Adhere each piece of Steel Sheathing to the final layer of Endothermic Mat (Item 3) using 3M Hi-Strength 90 Adhesive (not shown) applied to the edges of the back of the Steel Sheathing face of the corresponding locations on the final layer of Endothermic Mat (Item 3).

7. **PINS (Not Shown):** Install nominal 35mm (1 3/8 in.) long, 12 GA (2.70mm (0.106 in.) thick) stainless steel cup-head pins with a min. 38mm (1-1/2 in.) washer. Install pins by pre-drilling holes through the Steel Sheathing (Item 6) and the Endothermic Mat (Item 3) with an 11mm (7/16 in.) drill bit, and welding the pins to the Structural Steelwork (Item 1). Pins shall be spaced both vertically and horizontally 305mm (12 in.) on center and centered over the overlap of each joint in the Steel Sheathing (Item 6).
1. STEEL PANEL: A steel panel constructed of 10 mm (0.39 in.) thick steel complying with ISO 630:1995, Grade Fe 430 representing steelwork with no corners or edge features or cylindrical vessels, pipes and tubular sections of outside diameter greater than 500 mm (19.7 in.).

2. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: Applied Fireproofing
   MODEL: 3M™ Interam™ E-5 and E-5A-4 Series Endothermic Mat
   ENDOTHERMIC MAT: Install two layers of foil-faced flexible mat tightly over the steel panel (Item 1). Install first layer with continuous vertical sections of Endothermic Mat with vertical joints fit tightly together and foil facing away from the steel panel. Adhere first layer to the steel panel (Item 1) using 3M Hi-Strength 90 Adhesive applied to the steel and the back of the first layer being applied. Use rollers over the entire layer to ensure complete adhesion is achieved. Tape all joints of first layer with Aluminum Tape (Item 3) and use rollers over tape to ensure complete adhesion. Install the additional layer with joints offset min. 51 mm (2 in.) from joints of the previous layer. Adhere the additional layer to the previous layer of Endothermic Mat using 3M Hi-Strength 90 Adhesive. Use rollers over the entire layer to ensure complete adhesion is achieved. Tape all joints of each additional layer with Aluminum Tape (Item 3).

3. ALUMINUM TAPE: Apply 102 mm (4 in.) wide pressure sensitive tape with aluminum foil-facing to all joints of each layer of the Endothermic Mat (Item 2).

4. STEEL SHEATHING: Install one layer of 26 GA (0.455 mm (0.0179 in.) thick) T-304 stainless steel sheathing over the Endothermic Mat (Item 2) in continuous vertical sheets. Install steel sheathing with min. 76mm (3 in.) overlap at joints to create a stepped surface installation. Adhere each piece of Steel Sheathing to the final layer of Endothermic Mat (Item 2) using 3M Hi-Strength 90 Adhesive applied to the edges of the back of the Steel Sheathing face of the corresponding locations on the final layer of Endothermic Mat (Item 2).

5. PINS (Not Shown): Install nominal 35 mm (1-3/8 in.) long, 12 GA (2.70 mm (0.106 in.) thick) stainless steel cup-head pins with a min. 38 mm (1-1/2 in.) washer. Install pins by pre-drilling holes through the Steel Sheathing (Item 4) and the Endothermic Mat (Item 2) with an 11 mm (7/16 in.) drill bit and welding the pins to the Steel Panel (Item 1). Pins shall be spaced both vertically and horizontally 305 mm (12 in.) on center.
1. STEEL PANEL: A steel panel constructed of 10mm (0.39 in.) thick steel complying with ISO 630:1995, Grade Fe 430 representing steelwork with no corners or edge features or cylindrical vessels, pipes and tubular sections of outside diameter greater than 500mm (19.7 in.).

2. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: Applied Fireproofing
   MODEL: 3M™ Interam™ E-5 and E-5A-4 Series Endothermic Mat

ENDOTHERMIC MAT: Install 3 layers of foil faced flexible mat tightly over the steel panel (Item 1). Install first layer with continuous vertical sections of Endothermic Mat with vertical joints fit tightly together and foil facing away from the steel panel. Adhere first layer to the steel panel (Item 1) using 3M Hi-Strength 90 Adhesive applied to the steel and the back of the first layer being applied. Use rollers over the entire layer to ensure complete adhesion is achieved. Tape all joints of first layer with Aluminum Tape (Item 3) and use rollers over tape to ensure complete adhesion. Install each additional layer with continuous vertical sections of Endothermic Mat with vertical joints fit tightly together and foil facing away from the previous layer. Install each additional layer with joints offset minimum 51mm (2 in.) from joints of the previous layer. Adhere each additional layer to the previous layer of Endothermic Mat using 3M Hi-Strength 90 Adhesive applied to the face of the previous layer and to the back of the current layer being applied. Use rollers over the entire layer to ensure complete adhesion is achieved. Tape all joints of each additional layer with Aluminum Tape (Item 3).

3. ALUMINUM TAPE: Apply 102mm (4 in.) wide pressure sensitive tape with aluminum foil facing to all joints of each layer of the Endothermic Mat (Item 2).

4. STEEL SHEATHING: Install 1 layer of 26GA (0.455mm (0.0179 in.) thick) T-304 stainless steel sheathing over the Endothermic Mat (Item 2) in continuous vertical sheets. Install steel sheathing with minimum 76mm (3 in.) overlap at joints to create a stepped surface installation. Adhere each piece of Steel Sheathing to the final layer of Endothermic Mat (Item 2) using 3M Hi-Strength 90 Adhesive applied to the edges of the back of the Steel Sheathing face of the corresponding locations on the final layer of Endothermic Mat (Item 2).

5. PINS (Not Shown): Install nominal 35mm (1-3/8 in.) long, 12 GA (2.70mm (0.106 in.) thick) stainless steel cup head pins with a minimum 38mm (1-1/2 in.) washer. Install pins by pre-drilling holes through the Steel Sheathing (Item 4) and the Endothermic Mat (Item 2) with a 11mm (7/16 in.) drill bit and welding the pins to the Steel Panel (Item 1). Pins shall be spaced both vertically and horizontally 305mm (12 in.) on center.

1. **Cable Tray** – Use nominal 24 in. wide x 4 in. deep galvanized steel ladder-back cable tray. Friction fit nominal 13/16 in. wide x 13/32 in. deep, 18 GA galvanized steel struts between side rails spaced 12 in. on center (oc) along the length of the cable tray. Use filament tape for additional support if needed.

2. **Certified Manufacturer:** 3M Company  
**Certified Product:** Fireproofing Applied  
**Model:** 3M™ Interam™ E-5, E-54-A and E-5A-4 Series Endothermic Mat  
**Endothermic Mat:** Install 3 layers of foil faced flexible mat tightly around the cable tray (Item 1). Install each piece of mat with a minimum 2 in. overlap onto itself and temporarily hold in place using filament tape if needed.  
**A. Collar:** Install nominal 4 in. wide strip of endothermic mat (Item 2) around outer layer of the wrapped cable tray (Item 1). Center collar over butt joints over outer layer and secure using steel banding (Item 5).

3. **Certified Manufacturer:** 3M Company  
**Certified Product:** Caulk or Sealant  
**Model:** 3M™ Fire Barrier CP 25WB+ Caulk  
**Caulk:** Install caulk between butt joints of endothermic mat (Item 2) on allayers. Alternative use is to fill gaps and voids along seams greater than 1/8 in. wide.

4. **Tape:** (Not Shown) Apply 4 in. wide pressure sensitive tape with aluminum foil facing to all exposed edges of the collar (Item 2A) as well as the longitudinal (overlap) joints of the endothermic mat (Item 2) on the outer layer.

5. **Steel Banding:** Install 1/2 in. wide x 0.020 in. thick stainless steel banding on the outer layer of the endothermic mat (Item 2). Install banding within 1 in. of the edge of collars (Item 2A) and butt joints and maximum 12 in. oc at all other locations.
1. **Cable Tray** – Use nominal 6 in. wide x 4 in. deep galvanized steel ladder-back cable tray. Friction fit nominal 13/16 in. wide x 13/32 in. deep, 18 GA galvanized steel struts between side rails spaced 12 in. on center (oc) along the length of the cable tray. Use filament tape for additional support if needed.

2. **Certified Manufacturer:** 3M Company  
   **Certified Product:** Applied Fireproofing  
   **Model:** 3M™ Interam™ E-5, E-54-A and E-5A-4 Series Endothermic Mat  
   **Endothermic Mat:** Install 3 layers of foil faced flexible mat tightly around the cable tray (Item 1). Install each piece of mat with a minimum 2 in. overlap onto itself and temporarily hold in place using filament tape if needed.  
   **A. Collar:** Install nominal 4 in. wide strip of endothermic mat (Item 2) around outer layer of the wrapped cable tray (Item 1). Center collar over butt joints over outer layer and secure using steel banding (Item 5).

3. **Certified Manufacturer:** 3M Company  
   **Certified Product:** Caulk or Sealant  
   **Model:** 3M™ Fire Barrier CP 25WB+ Caulk  
   **Caulk:** Install caulk between butt joints of endothermic mat (Item 2) on all layers. Alternative use is to fill gaps and voids along seams greater than 1/8 in. wide.

4. **Tape:** (Not Shown) Apply 4 in. wide pressure sensitive tape with aluminum foil facing to all exposed edges of the collar (Item 2A) as well as the longitudinal (overlap) joints of the endothermic mat (Item 2) on the outer layer.

5. **Steel Banding:** Install 1/2 in. wide x 0.020 in. thick stainless steel banding on the outer layer of the endothermic mat (Item 2). Install banding within 1 in. of the edge of collars (Item 2A) and butt joints and maximum 12 in. oc at all other locations.

1. **Junction Box:** Use nominal 12 in. wide x 12 in. high x min. 8 in. deep, 16 GA galvanized steel junction box.

2. **Certified Manufacturer:** 3M Company  
   **Certified Product:** Applied Fireproofing  
   **Model:** 3M™ Interam™ E-5, E-54-A and E-5A-4 Series Endothermic Mat  
   **Endothermic Mat:** Install 3 layers of foil faced flexible mat tightly around the junction box (Item 1). Install the first two innermost layers to form an overlapped, square edge joint. Install the outermost layer creating a 2 in. min. overlap is created on the resulting seam and a 3 in. overlap is created on all four adjacent junction box faces. Temporarily hold in place using filament tape if needed.

3. **Certified Manufacturer:** 3M Company  
   **Certified Product:** Caulk or Sealant  
   **Model:** 3M™ Fire Barrier CP 25WB+ Caulk  
   **Caulk (Not Shown):** Install caulk between butt joints of endothermic mat (Item 2) on all layers. Alternative use is to fill gaps and voids along seams greater than 1/8 in. wide.

4. **Tape:** (Not Shown) Apply 4 in. wide pressure sensitive tape with aluminum foil facing to all exposed edges of the collar (Item 2A) as well as the longitudinal (overlap) joints of the endothermic mat (Item 2) on the outer layer.

5. **Steel Banding:** Install 1/2 in. wide x 0.020 in. thick stainless steel banding on the outer layer of the endothermic mat (Item 2). Install banding within 1 in. of the edge of the 3 in. overlap edges of the endothermic mat (Item 2) and butt joints and maximum 4 in. oc at all other locations.
1. **CONDUIT**: Use 1 in. diameter (or larger) electrical metal tubing conduit (EMT), intermediate metal conduit (IMC) or rigid metal conduit (RMC)

2. **CERTIFIED MANUFACTURER**: 3M Company  
   **CERTIFIED PRODUCT**: Applied Fireproofing  
   **CERTIFIED MODEL**: 3M™ Interam™ E-5, E-54-A and E-5A-4 Series Endothermic Mat  
   **ENDOTHERMIC MAT**: Install 5 layers of foil faced flexible mat tightly around the conduit (Item 1). Install each piece of mat with a min 2 in. overlap onto itself and temporarily hold in place using filament tape if needed. The seaming arrangement of adjacent pieces on the same layer is butted joints with a max 3/8 in. gap. From one layer to the next, the butted seams are staggered a min of 2 in. away from the seam in the previous layer.  
   
   A. **COLLAR (Optional)**: As an alternate to staggering the butted seams, and if there is a through-seam through all the layers, install nominal 4 in. wide strip of endothermic mat (Item 2) around outer layer of the wrapped EMT conduit (Item 1). Center collar over butt joints over the outer layer and secure using steel banding (Item 5).

3. **CERTIFIED MANUFACTURER**: 3M Company  
   **CERTIFIED PRODUCT**: Caulk or Sealant  
   **CERTIFIED MODEL**: 3M™ Fire Barrier CP 25WB+  
   **CAULK**: When the butt joint between adjacent pieces on the same layer exceeds 1/8 in., install caulk between butt joints of endothermic mat (Item 2) to the same depth of the mat.

4. **TAPE (Not Shown)**: Apply 4 in. wide pressure sensitive tape with aluminum foil facing to longitudinal (overlap) joints and lateral (butted) joints of the endothermic mat (Item 2) on all layers. If applicable, also apply tape to exposed edges of the collar (Item 2A).

5. **STEEL BANDING**: Install 1/2 in. wide by 0.020 in. thick stainless steel banding on the outer layer of the endothermic mat (Item 2). Install banding within 1 in. of the edge of collars (Item 2A) and butt joints and max 12 in. oc at all other locations.

This material was extracted and drawn by 3M Fire Protection Products from the 2016 Product Directory, © Intertek
1. **Conduit:** Use 1 in. diameter (or larger) rigid steel conduit.

2. **Certified Manufacturer:** 3M Company
   **Certified Product:** Applied Fireproofing
   **Model:** 3M™ Interam™ E-5, E-54-A and E-5A-4 Series Endothermic Mat
   **Endothermic Mat:** Install 5 layers of foil faced flexible mat tightly around the conduit (Item 1). Prior to installing innermost layer, cut 1-1/2 in. wide strips of endothermic mat and wrap around conduit (Item 1) spaced 15 in. on center (oc) and hold in place with filament tape. This is done in order to create an air gap between the conduit (Item 1) and the first (innermost) layer of the endothermic mat. After this is done, install the first two innermost layers creating a min. 4 in. overlap onto itself. Temporarily hold in place using filament tape if needed. After this is done, install a second set of 1-1/2 in. wide strips of endothermic mat in the same manner as previously done. Then, install the remaining three layers of endothermic mat in the same manner as the first two.

   **A. Collar:** Install nominal 4 in. wide strip of endothermic mat (Item 2) around outermost layer of the wrapped conduit (Item 1). Center collar over butt joints over outer layer and secure using steel banding (Item 5).

3. **Certified Manufacturer:** 3M Company
   **Certified Product:** Caulk or Sealant
   **Model:** 3M™ Fire Barrier CP 25WB+ Caulk
   **Caulk (Not Shown):** Install caulk between butt joints of endothermic mat (Item 2) on all layers. Alternative use is to fill gaps and voids along seams greater than 1/8 in. wide.

4. **Tape:** (Not Shown) Apply 4 in. wide pressure sensitive tape with aluminum foil facing to all exposed edges of the collar (Item 2A) as well as the longitudinal (overlap) joints of the endothermic mat (Item 2) on the outer layer.

5. **Steel Banding:** Install 1/2 in. wide x 0.020 in. thick stainless steel banding on the outermost layer of the endothermic mat (Item 2). Install banding within 1 in. of the edge of collars (Item 2A) and butt joints and maximum 12 in. oc at all other locations.

Cable Bundle
3M™ Interam™ E-5, E-54-A, and E-5A-4 Series Endothermic Mat
Rating: 3 Hour
(Approved for any cable fill)

1. **CABLE BUNDLE:** Use any number or type of cables.

2. **CERTIFIED MANUFACTURER:** 3M Company
   **CERTIFIED PRODUCT:** Applied Fireproofing
   **CERTIFIED MODEL:** 3M™ Interam™ E-5, E-54-A, and E-5A-4 Series Endothermic Mat
   **ENDOTHERMIC MAT:** Install five layers of foil-faced flexible mat tightly around the cable bundle (Item 1). Install each piece of mat with a min. 2 in. overlap at the seam with the internal diameter of the air drop being min. 2 in. The endothermic mat is to continue past the innermost layer of protection of the adjacent cable tray (not shown).
   
   **A. COLLAR** - Install min. 4 in. wide strips of endothermic mat (Item 2) around outermost layer at the base of the air drop at the cable entry point. The collar serves as support for the adjacent cable tray protection.

3. **CERTIFIED MANUFACTURER:** 3M Company
   **CERTIFIED PRODUCT:** Caulk or Sealant
   **CERTIFIED MODEL:** 3M™ Fire Barrier CP 25WB+ Caulk
   **CAULK:** Install caulk between butt joints of endothermic mat (Item 2) on all layers. Alternative use is to fill gaps and voids along seams greater than 1/8 in. wide.

4. **ALUMINUM TAPE (Not Shown):** Apply 4 in. wide pressure-sensitive tape with aluminum foil-facing to all exposed edges of the collar (Item 2A) as well as the longitudinal (overlap) joints of the endothermic mat (Item 2) on the outer layer.

5. **STEEL BANDING:** Install 1/2 in. wide x 0.020 in. thick stainless steel banding on the outer layer of the endothermic mat (Item 2). Install banding within 1 in. of the edge of collars (Item 2A) and butt joints and max. 12 in. on center (oc) at all other locations.

1. **Junction Box:** Use nominal 12 in. wide x 12 in. high x min. 8 in. deep, 16 GA galvanized steel junction box.

2. **Certified Manufacturer:** 3M Company
   **Certified Product:** Applied Fireproofing
   **Model:** 3M™ Interam™ E-5, E-54-A and E-5A-4 Series Endothermic Mat
   **Endothermic Mat:** Install 6 layers of foil faced flexible mat tightly around the junction box (Item 1). Prior to installing innermost layer, cut 1-1/2 in. wide strips of endothermic mat and wrap around conduit (Item 1) spaced 15 in. on center (oc) and hold in place with filament tape. This is done in order to create an air gap between the junction box (Item 1) and the first (innermost) layer of the endothermic mat. After this is done, install the first two innermost layers to form an overlapped, square edge joint. After this is done, install a second set of 1-1/2 in. wide strips of endothermic mat in the same manner as previously done. Install the following three layers in the same manner as the first two. Install the outermost layer creating a 4 in. min. overlap is created on the resulting seam and a 4 in. overlap is created on all four adjacent junction box faces. Temporarily hold in place using filament tape if needed.

3. **Certified Manufacturer:** 3M Company
   **Certified Product:** Caulk or Sealant
   **Model:** 3M™ Fire Barrier CP 25WB+ Caulk
   **Caulk (Not Shown):** Install caulk between butt joints of endothermic mat (Item 2) on all layers. Alternative use is to fill gaps and voids along seam greater than 1/8 in. wide.

4. **Tape:** (Not Shown) Apply 4 in. wide pressure sensitive tape with aluminum foil facing to all exposed edges of the collar (Item 2A) as well as the longitudinal (overlap) joints of the endothermic mat (Item 2) on the outer layer.

5. **Steel Banding:** Install 1/2 in. wide x 0.020 in. thick stainless steel banding on the outer layer of the endothermic mat (Item 2). Install banding within 1 in. of the edge of the 3 in. overlap edges of the endothermic mat (Item 2) and butt joints and maximum 4 in. oc at all other locations.
1. **Wall or Floor Assembly** — (Not shown) — Min 1 hr fire rated concrete or masonry wall or concrete floor. Opening in wall or floor through which cable tray passes is to be sized to closely follow the contour of the cable tray. Through opening in wall or floor to be firestopped prior to installation of the electrical circuit protective system using a compatible firestop system. The perimeter of the firestopped through opening shall be within the outer bounds of the electrical circuit protective system. See Through Penetration Firestop Systems (Guide XHEZ) for presently Classified firestop systems.

2. **Cable Tray** — 24 in. wide, min 4 in. deep, solid bottom or open ladder cable trays. Solid bottom cable trays to be formed of minimum 0.056 in. (16 gauge) galvanized steel. Open ladder cable trays to consist of channel-shaped side-rails formed of minimum 0.056 in. (16 gauge) galvanized steel with nominal 3/4 in. wide by 1 in. deep boxed channel rungs formed of minimum 0.029 in. (22 gauge) galvanized steel and spaced 6 in. O.C. Cable trays shall be installed as a complete system in accordance with all provisions of the current National Electrical Code.

3. **Cable Tray Supports** — The cable trays shall be supported by U-shaped welded hangers formed of minimum 0.093 in. thick (12 gauge) painted or galvanized steel channels, 1-5/8 in. wide by min 1-5/8 in. deep with the flange edges hemmed for stiffness.
4. **Cables** — Min No. 16 AWG jacketed multi-conductor cables and/or min 250 MCM jacketed copper single-conductor power cables. Cable insulation to be cross-linked polyethylene. Cable jacket to be polyvinyl chloride or cross-linked polyethylene. When fillers are used in the cable construction, fillers to be hemp, polyvinyl chloride or cross-linked polyethylene. Cables to be installed in cable trays in accordance with all provisions of the current National Electrical Code.

5. **Electrical Circuit Protective System** — The electrical circuit protective system may consist of either a multilayer mat wrap system or a composite system consisting of a mat wrap within an intumescent sheet enclosure on steel framing. The multilayer mat wrap system consists of a mat wrap, aluminum foil tape, stainless steel wire, intumescent sheet, steel hardware cloth, steel banding straps and caulk. The composite system consists of the same component materials plus steel framing members. The systems shall be installed in accordance with the detailed installation instruction manual supplied by the manufacturer of the Electrical Circuit Protective Materials*. The details of the two electrical circuit protective system types are summarized below:

   A. **Electrical Circuit Protective Materials** — *Intumescent Mat* — Flexible sheet material. Installed by cutting to size and wrapping around the cable tray system with each circumferential wrap lapping itself over the top of the cable tray. For the multilayer mat wrap system, overlap of each circumferential wrap to be min 2 in. For the composite system, overlap of the single circumferential lap to be min 6 in. Adjacent sheets of mat in each layer must overlap the preceding sheet 2 to 6 in. For the multilayer mat wrap system, successive layers of mat wrap installed with seams offset min 4 in. from seams of preceding layer. All seams in each layer of mat wrap to be sealed with aluminum foil tape (Item 5B). For the multilayer mat wrap system, a min of four layers of mat are required. For the composite system, only one layer of mat is required.

   3M COMPANY — Types M-20A, I-10A.

   B. **Aluminum Foil Tape** — Nom 4 in. wide min 3 mil thick pressure-sensitive aluminum foil tape supplied in rolls. Used to secure seams of mat wrap (Item 5A).

   C. **Steel Framing** — (Composite System Only) — Steel channels with nominal 1-1/4 in. wide web with either 1-1/4 in. or 3/4 in. high flanges with the flange edges hemmed for stiffness and to accommodate special mechanical fasteners. The channels shall be formed of minimum 0.067 in. thick (14 gauge) painted or galvanized steel. Steel channels assembled to form a four sided framework around the cable tray along the entire cable tray system. The longitudinal members along the four corners of the cable tray framing and the transverse members spanning across the top and bottom of the cable tray to be nominal 1-1/4 in. wide by 3/4 in. high channels. The framing members spanning between the longitudinal members along the cable tray side-rails to be nominal 1-1/4 in. wide by 1-1/4 in. high channels. The transverse members around the four sides of the cable tray shall be spaced not more than 36 in. O.C. along the entire cable tray system to occur at each butted end joint of the intumescent sheets (Item 5D). The steel framing members shall be assembled by welding or through the use of special fittings in conjunction with 3/8 in. diameter steel bolts with nuts. The steel framing must be installed such that the minimum clearance between the intumescent sheets (Item 5D) and the cable tray system is 2-1/4 in. When cable air drops (Item 6) are present, additional steel framing members shall be installed to provide screw-attachment means for the intumescent sheets (Item 5D) around the perimeter of the cable air drop opening. The steel framing is to be secured to the steel cable tray supports (Item 3) and to the floor or wall and is to be installed without direct contact with the cable tray system.

   D. **Electrical Circuit Protective Material** — *Intumescent Sheet* — Rigid aluminum foil-faced sheets with galvanized steel sheet backer. Installed on steel framing of composite system, with aluminum foil facing on exterior, to completely enclose cable tray system. Sheets installed with tightly butted joints at corners of steel framing and with adjacent sheets tightly butted with joints centered over transverse framing members. Each sheet to be affixed to steel framing at corners with No. 10-16 by 3/4 in. long self-drilling, self-tapping hex-washer head steel screws.

   For the multilayer mat wrap system, a nom 4 in. wide piece of intumescent sheet to be formed into collar around mat wrapped cable tray with seam butted and with steel backer exposed (foil facing against mat wrap). Collar butted against wall or floor surface and secured to mat wrapped cable tray with stainless steel banding strap (Item 5H). A two-piece plate cut from intumescent sheet to be installed on wall or floor surface around intumescent sheet collar. Plate pieces cut to tightly-follow the contours of the intumescent sheet collar with seams between pieces tightly butted. Plate to lap min 2 in. on the wall or floor surface with the steel backer exposed (foil face against wall or floor surface). Plate secured to wall or floor surface with steel anchor bolts, or equivalent, in conjunction with min 1-1/4 in. diameter steel fender washers. Anchor bolts located max 2 in. from both sides of butted seams and max 4 in. O.C. around perimeter of plate, 1 in. in from plate edges. When butted seams of two-piece plate are not completely backed by concrete, seams to be covered with min 2 in. wide strips of min 0.016 in. thick galv steel secured with steel screws or rivets spaced max 2 in. O.C. on both sides of seam.

   3M COMPANY — Type CS-195.

   E. **Electrical Circuit Protective Material** — *Caulk* — Thick bead of caulk to be applied along the edges of the intumescent mat (Item 5A) at its interface with the cable tray supports (Item 3), over butted joints of intumescent sheet (Item 5D) and around perimeter of cable tray support (Item 3) and cable air drop protective system (Item 6) at their egress from the membranes of the composite protective system. For multilayer mat wrap system, thick bead of caulk to be applied around the base of the intumescent sheet collar (Item 5D) at its interface with the intumescent sheet plate. Thick bead of caulk applied around perimeter of mat wrap at interface with intumescent sheet collar.

   3M COMPANY — CP 25WB+

   F. **Electrical Circuit Protective Material** — *Intumescent Mat* — Flexible sheet material. Installed in conjunction with steel hardware cloth (Item 5G) to cover all seams in intumescent sheet enclosure of composite system. Mat strips cut to length to completely cover each butted seam, centered over seam and temporarily held in position with aluminum foil tape (Item 5B).

   3M COMPANY — Types I-10A, M-20A.
System No. 2 (cont.)

G. Steel Hardware Cloth — Max 1/2 by 1/2 in. welded mesh of min 0.041 in. diameter (19 SWG) galvanized steel wire. Nominal 4 in. wide strips of hardware cloth cut to length and installed over each intumescent mat seam cover (Item 5F). Hardware cloth secured to intumescent sheet (Item 5D), through intumescent mat (Item 5F), with No. 10-16 by 3/4 in. long self-drilling, self-tapping, hex-washer head steel screws in conjunction with 5/8 in. diameter steel washers.

For multilayer mat wrap system, nominal 8 in. wide strip of hardware cloth formed to contour of cable tray wrap beneath cable tray support and secured with steel banding straps (Item 5H) on each side of cable tray support member.

H. Steel Banding Strap — Nominal 5/8 in. wide by 0.020 in. thick steel straps used in conjunction with nominal 1 in. long channel-shaped crimp clips formed of 0.021 in. thick electrogalvanized or painted steel. In composite system, steel banding straps spaced max 12 in. O.C. to secure the joint covers and intumescent sheets in position.

In multilayer mat wrap protective system, steel banding straps spaced max 8 in. OC and at each overlapping end seam to secure mat wrap layers in position. Banding straps also used to secure intumescent sheet collar on mat wrapped cable tray at interface with wall or floor.

I. Electrical Circuit Protective Materials* — Intumescent Mat — Flexible sheet material. Min of two layers wrapped around steel cable tray supports (Item 3) outside of intumescent sheet enclosure. Mat secured in place using aluminum foil tape (Item 5B) at all joints. Mat additionally secured with stainless steel wire (Item 5J) and/or steel hardware cloth (Item 5K).

3M COMPANY — Types I-10A, M-20A.

J. Stainless Steel Wire — Min 0.046 in. diameter (18 ga) stainless steel wire supplied in spools. Where accessible around entire circumference of cable tray support wrap, wire is tied-off at base of wrap at interface with intumescent sheet enclosure, spiraled upward at a spacing not to exceed 2 in. O.C., and tied-off at interface with wall or floor. Wire tie-off at top and base of cable tray support wrap covered with aluminum foil tape (Item 5B).

K. Steel Hardware Cloth — Max 1/2 by 1/2 in. welded mesh of min 0.041 in. diameter (19 SWG) galvanized steel wire. Strips of hardware cloth cut to size to cover intumescent mat wrap (Item 5I) on cable tray supports (Item 3) where 360 degrees access to the wrap is not present. Hardware cloth secured to intumescent sheet enclosure with No. 10-16 by 3/4 in. long self-drilling, self-tapping, hex-washer head steel screws in conjunction with 5/8 in. diameter steel washers.

L. Cable Air Drop — Cables passing from one cable tray protective system to another cable tray protective system, through the air, to be protected with an electrical circuit protective system consisting of intumescent mat, aluminum foil tape, stainless steel wire, caulk and steel hardware cloth. Minimum aggregate area of cables in air drop (cross-sectional area of cables including cable insulation and jacket materials) is 1.88 sq in. The system shall be installed in accordance with the manufacturer’s detailed instructions accompanying the Electrical Circuit Protective Materials*. The details of the cable air drop protective system are summarized below:

A. Electrical Circuit Protective Material* — Intumescent Mat — Flexible sheet material. Installed by cutting to size and folding around tightly-bundled cables of cable air drop with the edges of the mat sheet secured together with steel staples and aluminum foil tape (Item 6B) along the longitudinal standing seam. Adjacent sheets of material must overlap the preceding sheet 3 to 6 in. Successive layers of intumescent mat installed in the same manner with the stapled and taped longitudinal seam of each layer diametrically opposed from that of the preceding layer and with overlap locations for each layer offset a minimum of 6 in. from the overlap of the preceding layer. A total of five layers of intumescent mat are required. Intumescent mat wrap on cable air drop to extend a minimum of 9 in. into intumescent mat wrap (Item 5A) of cable tray protective system at each end. Opening in cable tray protective systems to accommodate cable air drop shall conform to contours of mat wrapped cable air drop.

3M COMPANY — Type M20A.

B. Aluminum Foil Tape — Nom 4 in. wide min 3 mil thick pressure-sensitive aluminum foil tape supplied in rolls. Used to secure intumescent mat wrap (Item 6A).

C. Stainless Steel Wire — Min 0.046 in. diam (18 ga) stainless steel wire supplied in spools used for final securement of outer layer of intumescent mat wrap after aluminum foil tape application. Wire is tied-off at base of wrap at interfaces with cable tray protective systems, spiraled around intumescent mat wrap in both directions in a criss cross pattern and spaced 2 in. O.C.

D. Electrical Circuit Protective Materials* — Caulk — Thick bead of caulk to be applied around the perimeter of the intumescent mat wrap on the cable air drop at each interface with the cable tray protective system.

3M COMPANY — CP 25WB+

*Bearing the UL Classification Mark
1. **Wall or Floor Assembly** — Min 1 hr fire rated concrete or masonry wall or concrete floor. Opening in wall or floor through which conduit passes is to be sized to closely follow the contour of the conduit. Through opening in wall or floor to be firestopped prior to installation of the electrical circuit protective system using a compatible firestop system. The perimeter of the firestopped opening shall be within the outer bounds of the electrical circuit protective system. See Through Penetration Firestop Systems (Guide XHEZ) for presently Classified firestop systems.

2. **Steel Conduit** — Nominal 2 in. diameter (or larger) Trade Size rigid steel conduit. Conduits shall be installed as a complete system in accordance with all provisions of the current National Electrical Code.

3. **Conduit Support** — (Not Shown) — The conduits shall be supported by U-shaped welded hangers formed of minimum 0.093 in. thick (12 gauge) painted steel or minimum 0.097 in. thick (12 gauge) galvanized steel channels, 1-5/8 in. wide web with 1-5/8 in. high flanges with the flange edges hemmed for stiffness.

4. **Cables** — Minimum No. 16 AWG jacketed multi-conductor cable and/or minimum 250 MCM jacketed copper single-conductor power cables. Cable insulation to be cross-linked polyethylene. Cable jacket to be polyvinyl chloride. When fillers are used in the cable construction, fillers to be hemp, polyvinyl chloride or cross-linked polyethylene. Cables to be installed in conduits in accordance with all provisions of the current National Electrical Code.

5. **Electrical Circuit Protective System** — The electrical circuit protective system consists of intumescent mat, aluminum or stainless steel foil tape, stainless steel wire, intumescent sheet, caulk and steel hardware cloth. The system must be installed in accordance with the manufacturer’s detailed instructions accompanying the Electrical Circuit Protective Materials*. The details of the electrical circuit protective system are summarized below:

*For electrical circuit protective systems,*

**Endothermic Mat**

**Flexible Wraps**
System No. 3 (cont.)

A. **Electrical Circuit Protective Material* — Intumescent Mat** — Flexible sheet material. Installed by cutting to size and folding around conduit with the edges of the mat sheet secured together with foil tape (Item 5B) along the longitudinal standing seam. Adjacent sheets of material must overlap the preceding sheet 3 to 6 in. Successive layers of intumescent mat installed in the same manner with the taped longitudinal seam of each layer diametrically opposed from that of the preceding layer and with the overlap locations for each layer offset a minimum of 6 in. from the overlap of the preceding layer. A minimum of five layers of intumescent mat are required on nominal 2 in. to nominal 4-1/2 in. diameter Trade Size rigid steel conduit. A minimum of two layers of intumescent mat are required on nominal 5 and 6 in. diameter Trade Size rigid steel conduit. Minimum of two layers of intumescent mat wrapped around steel conduit supports (Item 3). Mat secured in place using aluminum foil tape (Item 5B) at all joints.

**3M COMPANY** — Types I-10A, -10C, M-20A, -20C.

B. **Foil Tape** — Nom 4 in. wide pressure-sensitive foil tape supplied in rolls. When Type I-10A or M-20A intumescent mat is used, min 3 mil thick foil tape shall be used to secure intumescent mat wrap. When Type I-10C or M-20C intumescent mat is used, min 3 mil thick stainless steel foil tape shall be used to secure intumescent mat wrap.

C. **Stainless Steel Wire** — Min. 0.046 in. diam (18 ga) stainless steel wire supplied on spools. Wire is tied-off at base of wrap at interface with wall and/or floor, spiraled around outer layer of mat at a spacing not to exceed 2 in. O.C. Wire tie-off at interface with wall and/or floor covered with foil tape (Item 5B).

D. **Electrical Circuit Protective Material* — Intumescent Sheet** — Rigid foil-faced sheets with galvanized steel sheet backer. Installed around intumescent mat wrapped conduit and conduit supports at the interface with the wall and/or floor. Secured to wall and/or floor with steel anchors.

**3M COMPANY** — Type CS-195.

E. **Electrical Circuit Protective Material* — Caulk** — Supplied in cartridges. Thick bead of caulk to be applied as a gasket between intumescent sheet (Item 5D) and the wall and/or floor.

**3M COMPANY** — CP 25WB+

*Bearing the UL Classification Mark*
1. **Wall or Floor Assembly** — Min 1 hr fire rated concrete or masonry wall or concrete floor. Opening in wall or floor through which conduit passes is to be sized to closely follow the contour of the conduit. Through opening in wall or floor to be firestopped prior to installation of the electrical circuit protective system using a compatible firestop system. The perimeter of the firestopped through opening shall be within the outer bounds of the electrical circuit protective system. See Through Penetration Firestop Systems (Guide XHEZ) for presently Classified firestop systems.

2. **Steel Conduit** — Nominal 2 in. diameter (or larger) Trade Size rigid steel conduit. Conduits installed parallel with and maximum 2 in. from wall or floor. Conduits shall be installed as a complete system in accordance with all provisions of the current National Electrical Code.

3. **Conduit Supports** — (Not Shown) — Conduits shall be supported in accordance with all provisions of the current National Electrical Code. The supports used shall be completely within the three-sided intumescent sheet enclosure (Item 5D).

4. **Cables** — Minimum No. 16 AWG jacketed multi-conductor cables and/or minimum 250 MCM jacketed copper single-conductor power cables. Cable insulation to be cross-linked polyethylene. Cable jacket to be polyvinyl chloride. When fillers are used in the cable construction, fillers to be hemp, polyvinyl chloride or cross-linked polyethylene. Cables to be installed in conduit in accordance with all provisions of the current National Electrical Code.

5. **Electrical Circuit Protective System** — The electrical circuit protective system consists of intumescent mat, aluminum foil tape, steel framing, intumescent sheet, caulk and steel hardware cloth. The system must be installed in accordance with the manufacturer’s detailed instructions accompanying the Electrical Circuit Protective Materials*. The details of the electrical circuit protective system are summarized below:

   A. **Electrical Circuit Protective Material** — Intumescent Mat — Flexible sheet material. Installed by cutting to size and folding around steel conduit with the edges of the mat sheet secured together with steel staples and aluminum foil tape (Item 5B) along the longitudinal standing seam. Adjacent sheets of material must overlap the preceding sheet 3 to 6 in.

   B. **Aluminum Foil Tape** — Nominal 4 in. wide minimum 3 mil thick pressure-sensitive aluminum foil tape supplied in rolls. Used to secure intumescent mat wrap (Item 5A).

   C. **Steel Framing** — Steel channels with nominal 1-1/4 in. wide web with 3/4 in. high flanges with the flange edges hemmed for stiffness and to accommodate special mechanical fasteners. The channels shall be formed of minimum 0.067 in. thick (14 gauge) painted steel or minimum 0.070 in. thick (14 gauge) galvanized steel. Steel channels assembled to form a U-shaped bracket around three sides of the conduit and secured to the wall or floor with steel anchors. The U-shaped brackets must be formed such that the minimum clearance between the intumescent sheets (Item 5D) and the conduit is 2 in. The U-shaped brackets shall be assembled by welding or through the use of special fittings in conjunction with 3/8 in. diameter steel bolts with nuts. Brackets installed at the interface with the wall or floor at each end of the conduit system and along the entire length of the conduit system with maximum spacing of 36 in. O. C. (bracket required at each butted joint of the intumescent sheet enclosure).
D. **Electrical Circuit Protective Material* — Intumescent Sheet** — Rigid aluminum foil-faced sheets with galvanized steel sheet backer. Intumescent sheet formed around U-shaped brackets with nominal 2 in. wide flanges along both side edges against wall or floor. Adjacent lengths of formed intumescent sheets to be tightly butted and to be centered over U-shaped brackets. Intumescent sheet secured to wall or floor with steel anchors spaced maximum 12 in. O. C. Sheets secured to U-shaped brackets with No. 10-16 by 3/4 in. long self-drilling, self-tapping hex-washer head steel screws.

3M COMPANY — Type CS-195.

E. **Electrical Circuit Protective Material* — Intumescent Mat** — Flexible sheet material. Installed in conjunction with steel hardware cloth (Item 5F) to cover all joints in intumescent sheet enclosure. Mat strips cut to length to completely cover each butted joint, centered over joint and temporarily held in position with aluminum foil tape (Item 5B).

3M COMPANY — Types I-10A, M-20A.

F. **Steel Hardware Cloth** — Maximum 1/2 by 1/2 in. welded mesh of minimum 0.041 in. diameter (19 SWG) galvanized steel wire. Nominal 4 in. wide strips of hardware cloth cut to length and installed over each intumescent mat joint cover (Item 5E). Hardware cloth secured to intumescent sheet (Item 5D), through intumescent mat (Item 5E), with No. 10-16 by 3/4 in. long self-drilling, self-tapping hex-washer head steel screws in conjunction with 5/8 in. diameter steel washers.

G. **Electrical Circuit Protective Material* — Caulk** — (Not shown) — Thick bead of caulk to be applied along the edges of the intumescent mat (Item 5A) at its interface with the conduit supports (Item 3), over butted joints of intumescent sheets (Item 5D) and around the perimeter of the intumescent mat (Item 5A) and intumescent sheet (Item 5D) at their interfaces with the floor or wall. Thick bead of caulk also to be applied as a gasket between the flanges of the intumescent sheet enclosure and the floor or wall surface.

3M COMPANY — CP 25WB+

*Bearing the UL Classification Mark
1. Wall or Floor Assembly — Min 1 hr fire rated concrete or masonry wall or concrete floor. Opening in wall or floor through which conduit passes is to be sized to closely follow the contour of the conduit. Through opening in wall or floor to be firestopped prior to installation of the electrical circuit protective system using a compatible firestop system. The perimeter of the firestopped through opening shall be within the outer bounds of the electrical circuit protective system. See Through Penetration Firestop Systems (Guide XHEZ) for presently Classified firestop systems.

2. Steel Junction Box — Min 12 in. by 12 in. by 6 in. deep surface-mounted junction box formed of min 0.052 in. thick (16 gauge) steel. Steel junction box to be installed in accordance with all provisions of the current National Electrical Code.

3. Steel Conduit — Optional — Nominal 2 in. diam (or larger) Trade Size rigid steel conduit. Conduits to be installed as a complete system in accordance with all provisions of the current National Electrical Code. Conduit to be provided with a min 1 hr fire rated electrical circuit protective system which is compatible with the electrical circuit protective system (Item 5) installed on the steel junction box. Details of electrical circuit protective system at conduit/junction box interface to be in accordance with the detailed installation instruction manual supplied by the manufacturer of the Electrical Circuit Protective Materials*.

4. Cables — Min No. 16 AWG jacketed multi-conductor cables and/or min 250 MCM jacketed single-conductor copper power cables. Cable insulation to be cross-linked polyethylene. Cable jacket to be cross-linked polyethylene or polyvinyl chloride. Cables to be installed in accordance with all provisions of the current National Electrical Code.

5. Electrical Circuit Protective System — The electrical circuit protective system consists of an intumescent mat wrap, aluminum foil tape, steel banding straps, caulk, steel framing, intumescent sheet and steel hardware cloth. The system shall be installed in accordance with the detailed installation instruction manual supplied by the manufacturer of the Electrical Circuit Protective Materials*. The details of the electrical circuit protective system are summarized below:

   A. Electrical Circuit Protective Materials* — Mat Wrap — Flexible sheet material. Installed by cutting to size and wrapping around four sides of junction box with a min 2 in. overlap at the seam and with the seam sealed with aluminum foil tape layers of mat wrap required on sides of junction box with seams of two layers offset. Cover of junction box covered with min of two layers of mat wrap with each layer lapping min 2 in. on sides of junction box and secured with aluminum foil tape. After installation of all mat layers, mat layers secured with steel banding straps (Item 5C).

      3M COMPANY — Types I-10A, M-20A.

   B. Aluminum Foil Tape — (Not Shown) — 4 in. wide, min 3 mil thick pressure-sensitive aluminum foil tape, supplied in rolls. Used to secure seams of mat wrap (Item 5A).

   C. Steel Banding Straps — Min 5/8 in. wide by 0.020 in. thick stainless or carbon steel straps used in conjunction with steel crimp clips. Banding straps used to secure mat wrap layers (Item 5A).

   D. Electrical Circuit Protective Materials* — Caulk — Thick bead of caulk to be applied to perimeter of mat wrap layers at interface with wall or floor. Thick bead of caulk also used to cover seams of intumescent sheets (Item 5F).

      3M COMPANY — CP 25WB+
E. **Steel Framing** — (Not Shown) — Steel channels with nominal 1-1/4 in. wide web with 3/4 in. high flanges with the flange edges hemmed for stiffness and to accommodate special mechanical fasteners. The channels shall be formed of min 0.067 in. thick (14 ga) painted or galvanized steel. Steel channels assembled to form a five sided enclosure around the junction box. The steel framing shall be installed such that the minimum clearance between the intumescent sheets (Item 5F) and the junction box is 2 in. The steel framing members shall be assembled by welding or through the use of special fittings in conjunction with 3/8 in. diameter steel bolts with nuts.

**3M COMPANY** — Type CS-195.

G. **Electrical Circuit Protective Material** — **Intumescent Mat** — Flexible sheet material. Installed in conjunction with steel hardware cloth (Item 5H) to cover all joints at corners of intumescent sheet enclosure. Mat strips cut to length to completely cover each butted joint, centered over joint and temporarily held in position with aluminum foil tape (Item 5B).

**3M COMPANY** — Types I-10A, M-20A.

H. **Steel Hardware Cloth** — Maximum 1/2 in. by 1/2 in. welded mesh of min 0.041 in. diameter (19 SWG) galvanized steel wire. Nom 4 in. wide strip of steel hardware cloth cut to length and installed over each intumescent sheet joint cover (Item 5G). Hardware cloth secured to intumescent sheet (Item 5F), through intumescent mat (Item 5G), with No. 10-16 by 3/4 in. long self-drilling, self-tapping, hex-washer head steel screws in conjunction with min 5/8 in. diam steel washers.

*Bearing the UL Classification Mark*
Fire Ratings — 1 and 3 Hr (See Item 5)

1. **Wall or Floor Assembly** — Concrete or masonry wall or concrete floor having a fire rating equal to or greater than the fire rating of the electrical circuit protective system. Opening in wall or floor through which conduit passes is to be sized to closely follow the contour of the conduit. Through opening in wall or floor to be firestopped prior to installation of the electrical circuit protective system using a compatible firestop system. The perimeter of the firestopped through opening shall be within the outer bounds of the electrical circuit protective system. See Through Penetration Firestop Systems (Guide XHEZ) for presently Classified firestop systems.

2. **Steel Conduit** — Nominal 2 in. (51 mm) diameter (or larger) Trade Size rigid steel conduit. Conduit shall be installed as a complete system in accordance with all provisions of the current National Electrical Code.

3. **Conduit Supports** — Conduit system shall be supported by welded hangers formed of min 0.093 in. (2.4 mm) thick (12 ga) painted or galvanized steel channels, 1-5/8 in. (41 mm) wide by min 1-5/8 in. (41 mm) deep with the flange edges hemmed for stiffness. As an alternate, conduits may be supported by steel pipe hangers in conjunction with min 3/8 in. (10 mm) diameter threaded steel rod.

4. **Cables** — Min No. 16 AWG jacketed multi-conductor cables and/or min 250 kcmil jacketed single-conductor copper power cables. Cable insulation to be cross-linked polyethylene. Cable jacket to be cross-linked polyethylene or polyvinyl chloride. When fillers are used in cable construction, fillers to be hemp, polyvinyl chloride or cross-linked polyethylene. Cables to be installed in accordance with all provisions of the current National Electrical Code.
5. **Electrical Circuit Protective System** — The electrical circuit protective system consists of a mat wrap, foil tape, stainless steel banding straps, intumescent sheet and caulk. The system shall be installed in accordance with the detailed installation instruction manual supplied by the manufacturer of the Electrical Circuit Protective Materials*. The details of the electrical circuit protective system are summarized below:

A. **Electrical Circuit Protective Materials* — Mat Wrap** — Nominal 0.4 in. (10 mm) thick flexible sheet material supplied in 24 in. (610 mm) wide rolls. Each layer of mat wrap installed by cutting to size and wrapping around the conduit and itself such that a minimum 2 in. (51 mm) overlap is present along the longitudinal seam. With the exception of the final layer of mat wrap, adjacent lengths of mat wrap in each layer to be installed with tightly-butted end seams. Successive layers of mat wrap installed in same manner with butted end seams offset minimum 2 in. (51 mm) from butted end seams of preceding layer. For final layer of mat wrap, adjacent lengths of mat wrap to overlap the preceding length a minimum of 2 in. (51 mm). All seams in each layer of mat wrap to be sealed with foil tape (Item 5B). Mat wrap layers secured in place with stainless steel banding straps (Item 5D). The hourly fire rating of the electrical circuit protective system is dependent upon the nom diameter of the conduit system and the number of mat wrap layers installed, as shown in the following table:

3M COMPANY — Types E-5A-4, E-54A, E-54C

B. **Foil Tape** — (Not Shown) — 4 in. (102 mm) wide min 3 mil (0.08 mm) thick pressure-sensitive aluminum foil tape or min 3 mil (0.08 mm) thick stainless steel foil tape, supplied in rolls. Used to secure seams of mat wrap (Item 5A).

C. **Stainless Steel Mesh** — (Not Shown) — Woven stainless steel wire mesh, supplied in 42 in. (1.1 m) wide rolls. Stainless steel mesh tightly wrapped around outermost layer of mat wrap and secured in place with steel banding straps (Item 5D) spaced maximum 8 in. (203 mm) O.C. Stainless steel mesh not required for 3 Hr rated system.

D. **Steel Banding Straps** — Min 5/8 in. (16 mm) wide by 0.020 in. (0.51 mm) thick stainless steel straps used in conjunction with stainless steel crimp clips. Banding straps spaced max 8 in. (203 mm) O.C. to secure stainless steel mesh and final mat wrap layers. For 3 Hr rated system, steel banding straps required to be installed after second mat wrap layer in addition to steel banding straps securing fifth mat wrap layer. Steel banding straps to be installed 1 in. (25 mm) from each side of final layer mat seams.

E. **Electrical Circuit Protective Materials* — Intumescent Sheet** — Rigid aluminum foil faced sheets with galvanized sheet steel backer. Nom 4 in. (102 mm) wide piece of sheet formed into collar around mat wrapped conduit with seam butted and with steel backer exposed (foil facing against mat wrap). Collar butted against wall or floor surface and secured to mat wrapped conduit with stainless steel banding strap (Item 5D). A two-piece plate cut from intumescent sheet to be installed on wall or floor surface around intumescent sheet collar. Plate pieces cut to tightly follow the contours of the intumescent sheet collar with seams between pieces tightly butted. Plate to lap min 2 in. (51 mm) on the wall or floor surface with the steel backer exposed (foil face against wall or floor surface). Plate secured to wall or floor surface with steel anchor bolts, or equivalent, in conjunction with min 1-1/4 in. (32 mm) diameter steel fender washers. Anchor bolts located max 2 in. (51 mm) from both sides of butted seams and spaced max 4 in. (102 mm) O.C. around perimeter of plate, 1 in. (25 mm) in from plate edges. When butted seams of two-piece plate are not completely backed by concrete, seams to be covered with minimum 2 in. (51 mm) wide strips of minimum 0.016 in. (0.41 mm) thick steel secured with steel screws or rivets spaced maximum 2 in. (51 mm) O.C. on both sides of seam.

3M COMPANY — Type CS-195+

F. **Electrical Circuit Protective Materials* — Caulk** — Thick bead of caulk to be applied around the base of the intumescent sheet collar (Item 5E) at its interface with the intumescent sheet plate. Thick bead of caulk applied around entire perimeter of mat wrap at interface with intumescent sheet collar. Top edges of mat wrap layers on conduit support covered with minimum 1/8 in. (3.2 mm) thickness of caulk.

3M COMPANY — CP 25WB+

*Bearing the UL Classification Mark
1. **Wall or Floor Assembly** — Concrete or masonry wall or concrete floor having a fire rating equal to or greater than the fire rating of the electrical circuit protective system. Opening in wall or floor through which cable tray passes is to be sized to closely follow the contour of the cable tray. Through opening in wall or floor to be firestopped prior to installation of the electrical circuit protective system using a compatible firestop system. The perimeter of the firestopped through opening shall be within the outer bounds of the electrical circuit protective system. See *Through Penetration Firestop Systems* (Guide XHEZ) for presently Classified firestop systems.

2. **Cable Tray** — 24 in. (610 mm) wide, min 4 in. (102 mm) deep, solid bottom or open ladder cable trays. Solid bottom cable trays to be formed of min 0.056 in. (1.4 mm) thick galvanized steel. Open ladder cable trays to consist of channel-shaped side-rails formed of min 0.056 in. (1.4 mm) thick galvanized steel with nom 3/4 in. (19 mm) wide by 1 in. (25 mm) deep boxed channel rungs formed of min 0.029 in. (0.74 mm) thick galvanized steel and spaced 6 in. (152 mm) OC. Cable trays shall be installed as a complete system in accordance with all provisions of the current National Electrical Code.
3. **Cable Tray Supports** — The cable trays shall be supported by U-shaped welded hangers formed of min 0.093 in. (2.4 mm) thick painted or galvanized steel channels, 1-5/8 in. (41 mm) wide by min 1-5/8 in. (41 mm) deep with the flange edges hemmed for stiffness.

4. **Cables** — Min No. 16 AWG jacketed multi-conductor cables and/or min 250 kcmil jacketed single-conductor copper power cables. Cable insulation to be cross-linked polyethylene. Cable jacket to be cross-linked polyethylene or polyvinyl chloride. When fillers are used in the cable construction, fillers to be hemp, polyvinyl chloride or cross-linked polyethylene. Cables to be installed in cable trays in accordance with all provisions of the current National Electric Code.

5. **Strapping** — (Not Shown) — Nom 1/2 to 1 in. (13 to 25 mm) wide plastic strapping or filament strapping tape. Strapping applied around circumference of cable tray on maximum 12 in. (305 mm) centers to prevent sag of mat wrap layers (Item 6A) into trough of cable tray.

6. **Electrical Circuit Protective System** — The electrical circuit protective system consists of a mat wrap, foil tape, woven stainless steel wire mesh, stainless steel banding straps, intumescent sheet and caulk. The system shall be installed in accordance with the detailed installation instruction manual supplied by the manufacturer of the Electrical Circuit Protective Materials*. The details of the electrical circuit protective system are summarized below:

A. **Electrical Circuit Protective Material** — **Mat Wrap** — Nom 0.4 in. (10 mm) flexible sheet material supplied in 24 in. (610 mm) wide rolls. Installed by cutting to size and wrapping around the cable tray system with each circumferential wrap lapping itself 2 to 4 in. (51 to 102 mm) over the top of the cable tray. With the exception of the final layer of mat wrap, adjacent lengths of mat wrap in each layer to be installed with tightly-butted end seams. Successive layers of mat wrap installed in same manner with butted end seams offset min 2 in. (51 mm) from butted end seams of preceding layer. For final layer of mat wrap, adjacent lengths of mat wrap to overlap the preceding length a min of 2 in. (51 mm). All seams in each layer of mat wrap to be sealed with aluminum foil tape (Item 6B). Mat wrap layers secured in place with steel banding straps (Item 6D). A min of three layers of mat wrap are required for the 1 hr fire rating. A min of five layers of mat wrap are required for the 3 hr fire rating.

3M COMPANY — Types E-5A-4, E-5A4, E-5A4C.

B. **Foil Tape** — Nom 4 in. (102 mm) wide min 3 mil (0.08 mm) thick pressure-sensitive aluminum foil tape or nom 4 in. (102 mm) wide min 3 mil (0.08 mm) thick pressure-sensitive stainless steel foil tape, supplied in rolls. Used to secure seams of mat wrap (Item 6A).

C. **Stainless Steel Mesh** — (Optional, Not Shown) — Woven stainless steel wire mesh, supplied in 42 in. (1.1 m) wide rolls. Stainless steel mesh tightly wrapped around outermost layer of mat material and secured in place with stainless steel banding straps (Item 6D) spaced maximum 8 in. (203 mm) O.C.

D. **Steel Banding Strap** — Min 5/8 in. (16 mm) wide by 0.020 in. (0.51 mm) thick stainless steel straps used in conjunction with stainless steel crimp clips. Banding straps spaced max 8 in. (203 mm) O.C. to secure stainless steel mesh and mat wrap layers. For 3 hr rated system, steel banding straps required to be installed after second mat wrap layer in addition to steel banding straps securing stainless steel mesh. Steel banding straps to be installed 1 in. (25 mm) from each side of final layer mat seams.

E. **Electrical Circuit Protective Materials** — **Intumescent Sheet** — Rigid aluminum foil-faced sheets with galvanized sheet steel backer. Nom 4 in. (102 mm) wide piece of sheet formed into collar around mat wrapped cable tray and mat wrapped cable air drop (Item 7) with seam butted and with steel backer exposed (foil facing against mat wrap). Collar butted against wall or floor surface and secured to mat wrapped cable tray or cable air drop with stainless steel banding strap (Item 6D). A two-piece plate cut from intumescent sheet to be installed on wall or floor surface around intumescent sheet collar. Plate pieces cut to tightly follow the contours of the intumescent sheet collar with seams between pieces tightly butted. Plate to lap min 2 in. (51 mm) on the wall or floor surface with the steel backer exposed (foil face against wall or floor surface). Plate secured to wall or floor surface with steel anchor bolts, or equivalent, in conjunction with min 1-1/4 in. (32 mm) diameter steel fender washers. Anchor bolts located max 2 in. (51 mm) from both sides of butted seams and max 4 in. (102 mm) O.C. around perimeter of plate, 1 in. (25 mm) in from plate edges. When butted seams of two-piece plate are not completely backed by concrete, seams to be covered with min 2 in. (51 mm) wide strips of min 0.016 in. (0.41 mm) thick galvanized steel secured with steel screws or rivets spaced max 2 in. (51 mm) O.C. on both sides of seam.

3M COMPANY — Type CS-195+

F. **Electrical Circuit Protective Materials** — **Caulk** — Thick bead of caulk to be applied around the base of the intumescent sheet collar (Item 6E) at its interface with the intumescent sheet plate. Thick bead of caulk applied around perimeter of mat wrap at interface with intumescent sheet collar. Top edges of mat wrap layers on cable tray supports covered with min 1/8 in. (3.2 mm) thickness of caulk.

3M COMPANY — CP 25WB+

7. **Cable Air Drop** — (Not Shown) — Cable passing from one fire rated cable tray protective system to another fire rated cable tray protective system, through the air, to be protected with a fire rated electrical circuit protective system consisting of a mat wrap, foil tape, stainless steel banding straps or ceramic cord and caulk or putty. The system shall be installed in accordance with the detailed installation instruction manual supplied by the manufacturer of the Electrical Circuit Protective Materials*. The details of the electrical circuit protective system are summarized below:

A. **Electrical Circuit Protective Materials** — **Mat Wrap** — Nom 0.4 in. (10 mm) flexible sheet material supplied in 24 in. (610 mm) wide rolls. Mat wrap installed by cutting to size and wrapping around cable bundle with each circumferential wrap lapping itself min 2 in. (51 mm). With the exception of the final layer of mat wrap, adjacent lengths of mat wrap in each layer to be installed with tightly-butted end seams. Successive layers of mat wrap installed in same manner with butted end seams offset min 2 in. (51 mm) from butted end seams of preceding layer. For final layer of mat wrap, adjacent lengths of mat wrap to overlap the preceding length a min of 2 in. (51 mm). All seams in each layer of mat wrap to be sealed with foil tape (Item 7B). Mat wrap layers secured in place with stainless steel banding straps (Item 7C). A min of three layers of mat material is required for a 1 hr fire rating. A min of five layers of mat material is required for a 3 hr fire rating.

3M COMPANY — Types E-5A-4, E-5A4, E-5A4C.
System No. 8 (cont.)

B. **Foil Tape** — Nom 4 in. (102 mm) wide min 3 mil (0.08 mm) thick pressure-sensitive aluminum foil tape or min 3 mil (0.08 mm) thick stainless steel foil tape, supplied in rolls. Used to secure seams of mat wrap (Item 7A).

C. **Steel Banding Straps** — Min 5/8 in. (16 mm) wide by 0.020 in. (0.51 mm) thick stainless steel straps used in conjunction with stainless steel crimp clips. Banding straps spaced max 8 in. (203 mm) OC to secure mat wrap layers. For 1 hr fire rated system, steel banding straps required to be installed on outermost mat wrap layer. For 3 hr fire rated system, steel banding straps required to be installed after second mat wrap layer in addition to steel banding straps securing outermost mat wrap layer.

D. **Stainless Steel Wire** — As an alternate to the steel banding straps (Item 7C) for the 1 hr fire rated system only, min 0.046 in. (1.12 mm) diam (18 ga) stainless steel wire spiral-wrapped around outermost layer of mat wrap at a maximum spacing of 2 in. (51 mm) OC. Wire covered with aluminum foil tape (Item 7B).

E. **Electrical Circuit Protective Materials* — Caulk** — Thick bead of caulk to be applied around the perimeter of the mat wrap on the cable air drop at each interface with the cable tray protective system.

3M COMPANY — CP 25WB+

*Bearing the UL Classification Mark*
1. **Wall or Floor Assembly** — Concrete or masonry wall or concrete floor having a fire rating equal to or greater than the fire rating of the electrical circuit protective system. Opening in wall or floor through which conduit passes is to be sized to closely follow the contour of the conduit feeding into the steel junction box. Through opening in wall or floor to be firestopped prior to installation of the electrical circuit protective system using a compatible firestop system. The perimeter of the firestopped through opening shall be within the outer bounds of the electrical circuit protective system. See Through Penetration Firestop Systems (Guide XHEZ) for presently Classified firestop systems.

2. **Steel Junction Box** — Min 12 by 12 by 6 in. (305 by 305 by 152 mm) deep surface-mounted junction box formed of min 0.052 in. (1.3 mm) thick steel. Steel junction box to be installed in accordance with all provisions of the current National Electrical Code.

3. **Steel Conduit** — (Optional) — Nom 2 in. (51 mm) diameter (or larger) Trade Size rigid steel conduit. Conduits to be installed as a complete system in accordance with all provisions of the current National Electrical Code. Conduit to be provided with a fire rated electrical circuit protective system which is compatible with the electrical circuit protective system (Item 5) installed on the steel junction box. Details of electrical circuit protective system at conduit/junction box interface to be in accordance with the detailed installation instruction manual supplied by the manufacturer of the Electrical Circuit Protective Materials*.

4. **Cables** — Min No. 16 AWG jacketed multi-conductor cables and/or min 250 kcmil jacketed single-conductor copper power cables. Cable insulation to be cross-linked polyethylene. Cable jacket to be cross-linked polyethylene or polyvinyl chloride. Cables to be installed in accordance with all provisions of the current National Electrical Code.

5. **Electrical Circuit Protective System** — The electrical circuit protective system consists of an endothermic mat wrap, foil tape, intumescent sheet, stainless steel banding straps and caulk. The system shall be installed in accordance with the detailed installation instruction manual supplied by the manufacturer of the Electrical Circuit Protective Materials*. The details of the electrical circuit protective system are summarized below:

   A. **Electrical Circuit Protective Materials** — **Mat Wrap** — Nom 0.4 in. (10 mm) flexible sheet material supplied in 24 in. (610 mm) wide rolls. Pieces of mat cut to size to cover all exposed surfaces of junction box with min 2 in. (51 mm) overlap at all seams. As an alternate for the 3 hr fire rated system, the inner mat layers may be installed in a boxed manner such that the overlap at each seam is equal to the thickness of the mat. The final layer of mat must be installed with a min 2 in. (51 mm) overlap at all seams. Successive layers of mat installed in same manner with overlapping seams offset from preceding layer. Seams of each layer sealed with foil tape (Item 5B). Mat wrap layers secured in place with stainless steel banding straps (Item 5D). A min of three layers of mat is required for 1 hr rating. A min of five layers of mat is required for 3 hr rating.

   3M COMPANY — Types E-5A-4, E-54A, E-54C.
B. **Foil Tape** — (Not Shown) — Nom 4 in. (102 mm) wide min 3 mil (0.08 mm) thick pressure sensitive aluminum foil tape or min 3 mil (0.08 mm) thick stainless steel foil tape, supplied in rolls. Used to secure seams of mat wrap (Item 5A).

C. **Electrical Circuit Protective Materials** — Intumescent Sheet — Rigid aluminum foil faced sheets with galvanized steel sheet backer. Nom 4 in. (102 mm) wide piece of sheet formed into collar around mat wrapped junction box with seam butted and with steel backer exposed (foil facing against mat wrap). Collar butted against wall or floor surface and secured to mat wrapped junction box with steel banding strap (Item 5D). A two-piece plate cut from intumescent sheet to be installed on wall or floor surface around intumescent sheet collar. Plate pieces cut to tightly follow the contours of the intumescent sheet collar with seams between pieces tightly butted. Plate to lap min 2 in. (51 mm) on the wall or floor surface with the steel backer exposed (foil face against wall or floor surface). Plate secured to wall or floor surface with steel anchor bolts, or equivalent, in conjunction with min 1-1/4 in. (32 mm) diameter steel fender washers. Anchor bolts located max 2 in. (51 mm) from both sides of butted seams and max 4 in. (102 mm) O.C. around perimeter of plate, 1 in. (25 mm) in from plate edges. When butted seams of two-piece plate are not completely backed by concrete, seams to be covered with min 2 in. (51 mm) wide strips of min 0.016 in. (0.41 mm) thick galvanized steel secured with steel screws or rivets spaced max 2 in. (51 mm) O.C. on both sides of seam.

**3M COMPANY** — Type CS-195+

D. **Steel Banding Strap** — Min 5/8 in. (16 mm) wide by 0.020 in. (0.51 mm) thick stainless steel banding straps used in conjunction with stainless steel crimp clips. Banding straps used to secure intumescent sheet collar (Item 5C) and mat wrap (Item 5A) layers in position. For the 1 hr rated system, steel banding straps required to be installed on outermost mat wrap layer. For 3 hr rated system, steel banding straps required to be installed after second mat wrap layer in addition to steel banding straps securing outermost mat wrap layer.

E. **Electrical Circuit Protective Materials** — Caulk — Thick bead of caulk to be applied as a gasket between the intumescent sheet plate (Item 5C) and the wall or floor surface. Thick bead of caulk to be applied around the base of the intumescent sheet collar (Item 5C) at its interface with the intumescent sheet plate.

**3M COMPANY** — Type CP.25WB+

*Bearing the UL Classification Mark*
1. **Wall or Floor Assembly** — (Not Shown) - Concrete or masonry wall or concrete floor having a fire rating equal to or greater than the fire rating of the electrical circuit protective system. Diam of opening in wall or floor through which conduit passes is to be max 1-1/2 in. (38 mm) larger than the outside diam of the conduit. Conduit installed eccentrically or concentrically in the opening with a min 0 in. (point contact) to max 3/4 in. (19 mm) annular space. Through opening in wall or floor to be firestopped prior to installation of the electrical circuit protective system using min 4 pcf (64 kg/m³) mineral wool batt packing material throughout the thickness of the floor or wall except for a recess at each surface to accommodate the caulk fill material (Item 5D). A min 1/2 in. (13 mm) depth of caulk fill material (Item 5D) is required to be installed in the annular space flush with each surface of the floor or wall assembly. The perimeter of the firestopped through opening shall be within the outer bounds of the electrical circuit protective system.

2. **Steel Conduit** — Nominal 4 in. (102 mm) to 6 in. (152 mm) Trade Size rigid steel conduit. Conduit shall be installed as a complete system in accordance with all provisions of the current National Electrical Code.

3. **Conduit Supports** — (Not Shown) - Conduit system shall be supported by steel pipe hangers in conjunction with min 3/8 in. (10 mm) diameter threaded steel rod.

4. **Cables** — Min No. 16 AWG jacketed multi-conductor cables and/or min No. 12 AWG single-conductor copper power cables. Cables to be installed in conduit in accordance with all provisions of the current National Electrical Code.

5. **Electrical Circuit Protective System** — The electrical circuit protective system consists of a mat wrap, foil tape, stainless steel banding straps and caulk. The system shall be installed in accordance with the detailed installation instruction manual supplied by the manufacturer of the Electrical Circuit Protective Materials*. The details of the electrical circuit protective system are summarized below:

   A. **Electrical Circuit Protective Materials** — Mat Wrap — Nom 0.4 in. (10 mm) flexible sheet material supplied in 24 in. (610 mm) wide rolls. A min of four layers of mat wrap are required. Each layer of mat wrap installed by cutting to size and wrapping around the conduit and itself such that a min 2 in. (51 mm) overlap is present along the longitudinal seam. With the exception of the final layer of mat wrap, adjacent lengths of mat wrap in each layer to be installed with tightly-butted end seams. Successive layers of mat wrap installed in same manner with butted end seams offset min 2 in. (51 mm) from butted end seams of preceding layer. For final layer of mat wrap, adjacent lengths of mat wrap to overlap the preceding length by a min of 2 in. (51 mm). All seams in each layer of mat wrap to be sealed with foil tape (Item 5B). Mat wrap layers secured in place with stainless steel banding straps (Item 5C) on outermost layer.

   B. **Foil Tape** — (Not Shown) — 4 in. (102 mm) wide min 3 mil (0.08 mm) thick pressure-sensitive aluminum foil or stainless steel foil tape, supplied in rolls. Used to secure seams of mat wrap (Item 5A).

   C. **Steel Banding Straps** — Min 1/2 in. (13 mm) wide by 0.020 in. (0.5 mm) thick stainless steel straps used in conjunction with stainless steel crimp clips. Banding straps spaced max 8 in. (203 mm) OC to secure mat wrap layers.

   D. **Electrical Circuit Protective Materials** — Caulk — (Not Shown) - Thick bead of caulk applied around entire perimeter of each layer of mat wrap at its interface with the firestop system and the floor or wall surface. Any joint between the adjacent layers of mat wrap that exceed 1/16 in. (1.6 mm) in width shall be filled with caulk. Each layer of E-Mat on the conduit supports abutting the mat wrap on the conduit shall also be sealed with caulk.

APPLIED FIREPROOFING
3M Company
3M™ Interam™ E-5, E-54-A and E-5A-4 Series Endothermic Mat
3M Fire Barrier CP 25WB+ Caulk
IEEE 848
Rating: Ampacity Derating – 49.9%
Reference Intertek Design Listing 3MU/AF 60-01 for Fire Resistance Ratings

1. Cable Tray: Use nominal 24 in. wide x 4 in. deep galvanized steel ladderback cable tray. Friction fit nominal 13/16 in. wide x 13/32 in. deep, 18 GA galvanized steel struts between side rails spaced 12 in. on center (oc) along the length of the cable tray. Use filament tape for additional support if needed.

2. Certified Manufacturer: 3M Company
   Certified Product: Applied Fireproofing
   Model: 3M™ Interam™ E-5, E-54-A and E-5A-4 Series Endothermic Mat
   Endothermic Mat: Install 3 layers of foil faced flexible mat tightly around the cable tray (Item 1). Install each piece of mat with a minimum 2 in. overlap onto itself and temporarily hold in place using filament tape if needed.
   A. Collar: Install nominal 4 in. wide strip of endothermic mat (Item 2) around outer layer of the wrapped cable tray (Item 1). Center collar over butt joints over outer layer and secure using steel banding (Item 5).

3. Certified Manufacturer: 3M Company
   Certified Product: Caulk or Sealant
   Model: 3M™ Fire Barrier CP 25WB+ Caulk
   Caulk: Install caulk between butt joints of endothermic mat (Item 2) on all layers. Alternative use is to fill gaps and voids along seams greater than 1/8 in. wide.

4. Tape: (Not Shown) Apply 4 in. wide pressure sensitive tape with aluminum foil facing to all exposed edges of the collar (Item 2A) as well as the longitudinal (overlap) joints of the endothermic mat (Item 2) on the outer layer.

5. Steel Banding: Install 1/2 in. wide x 0.020 in. thick stainless steel banding on the outer layer of the endothermic mat Item 2). Install banding within 1 in. of the edge of collars (Item 2A) and butt joints and maximum 12 in. oc at all other locations.

1. **Conduit:** Use minimum 1 in. (or larger) rigid galvanized steel conduit.

2. **Certified Manufacturer:** 3M Company  
   **Certified Product:** Applied Fireproofing  
   **Model:** 3M™ Interam™ E-5, E-54-A and E-5A-4 Series Endothermic Mat  
   **Endothermic Mat:** Install 4 layers of foil faced flexible mat tightly around the conduit (Item 1). Install each piece of mat with a minimum 2 in. overlap onto itself and temporarily hold in place using filament tape if needed.  
   A. **Collar:** Install nominal 4 in. wide strip of endothermic mat (Item 2) around outer layer of the wrapped conduit (Item 1). Center collar over butt joints over outer layer and secure using steel banding (Item 5).

3. **Certified Manufacturer:** 3M Company  
   **Certified Product:** Caulk or Sealant  
   **Model:** 3M™ Fire Barrier CP 25WB+ Caulk  
   **Caulk:** Install caulk between butt joints of endothermic mat (Item 2) on all layers. Alternative use is to fill gaps and voids along seams greater than 1/8 in. wide.

4. **Tape:** (Not Shown) Apply 4 in. wide pressure sensitive tape with aluminum foil facing to all exposed edges of the collar (Item 2A) as well as the longitudinal (overlap) joints of the endothermic mat (Item 2) on the outer layer.

5. **Steel Banding:** Install 1/2 in. wide x 0.020 in. thick stainless steel banding on the outer layer of the endothermic mat (Item 2). Install banding within 1 in. of the edge of collars (Item 2A) and butt joints and maximum 12 in. oc at all other locations.
System No. TB-7  
January 15, 2014  
Rating – 1/4 Hr., 1/2 Hr., 1 Hr. (See Item 5A)

1. **Wall or Floor Assembly** – (Not shown)– Concrete or masonry wall or floor. Through opening in wall or floor to be firestopped using a Classified firestop system. See Through-Penetration Firestop Systems (XHEZ) in Volume 2 of the Fire Resistance Directory for Classified firestop systems.

2. **Cable Tray** – Nom 12 in. (305 mm) wide by min 4 in. (102 mm) deep open-ladder galv steel cable tray with channel-shaped side rails flanged inward or outward and with nom 1 in. (25 mm) high boxed-channel rungs spaced max 9 in. (229 mm) OC. Cable trays shall be installed as a complete system in accordance with all provisions in the National Electrical Code (NFPA 70).

3. **Cable Tray Supports** – (Not Shown) – The cable trays shall be supported by U-shaped welded hangers formed of min 0.093 in. (2.4 mm) thick painted or galvanized steel channels, 1-5/8 in. (41 mm) wide by min 1-5/8 in. (41 mm) deep with the flange edges hemmed for stiffness.

4. **Cables** – Cables to be installed in accordance with all provisions in the National Electrical Code (NFPA 70).

5. **Thermal Barrier System** – The thermal barrier system consists of an aluminum faced blanket, caulk, filament tape, aluminum foil tape and stainless steel banding straps with wing clips. The thermal barrier system shall be installed on the cable tray and supports in accordance with the manufacturer’s detailed instructions accompanying the **Batts and Blankets** and as summarized below:

   A. **Batts and Blankets** – Nom 0.4 in. (10 mm) thick endothermic blanket supplied in nom 24-1/2 in. (622 mm) wide rolls. Blanket installed by cutting-to-length and tightly wrapping around the cable tray with a min 2 in. (50 mm) circumferential overlap and butt perimeter seams. Subsequent layers are to be offset min 2 in. (51 mm). A min of two, three or four layers is required for 1/4, 1/2 and 1 Hr. systems, respectively. Blanket installed on cable tray supports by cutting-to-length and tightly wrapping around each support member with a min 2 in. (51 mm) circumferential overlap. The blanket should extend past the end of the cable tray support and be capped with a piece of blanket cut-to-size. Subsequent layers are to be offset min 2 in. (51 mm).

   B. **Fill, Void or Cavity Materials** – (Not Shown) – Caulk used to seal any joint or seam gap greater than 1/4 in. (6 mm) on the outer blanket layer. Additionally used over the blanket caps wrapped around the cable tray supports.

   C. **Filament Tape** – (Not Shown) – Nom 3/4 in. (19 mm) wide pressure-sensitive tape supplied in rolls. Used during installation to temporarily secure the blankets in place before final compression and permanent attachment with banding (Item 5E). Minimally to be wrapped around the entire circumference of each installed blanket within 2 in. (51 mm) of each joint edge.

   D. **Aluminum Foil Tape** – (Not Shown) – Nom 4 in. (102 mm) wide pressure-sensitive aluminum foil tape supplied in rolls. Used over all joints, seams and any location filled with caulk or sealant (Item 5B).

   E. **Banding** – Min 0.020 in. (0.5 mm) thick by 1/2 in. (13 mm) wide Type 304 stainless steel banding installed over the outer layer of blanket material and cable tray supports. The bands are to be minimally placed 1-2 in. (25-50 mm) above and below each joint and at the midpoint of any blanket with a length greater than 12 in. (305 mm). Banding to be ratchet-tightened and secured with stainless steel wing clips.

System tested using rapid-temperature-rise test methods in ASTM E1529 (2010) and/or UL 1709 (2007).

1. **Wall or Floor Assembly** — (Not shown) — Concrete or masonry wall or floor. Through opening in wall or floor to be firestopped using a Classified firestop system. See Through-Penetration Firestop Systems (XHEZ) in Volume 2 of the Fire Resistance Directory for Classified firestop systems.

2. **Cable Tray** — Nom 12 in. (305 mm) wide by min 4 in. (102 mm) deep open-ladder galv steel cable tray with channel-shaped side rails flanged inward or outward and with nom 1 in. (25 mm) high boxed-channel rungs spaced max 9 in. (229 mm) OC. Cable trays shall be installed as a complete system in accordance with all provisions in the National Electrical Code (NFPA 70).

3. **Cable Tray Supports** — (Not Shown) — The cable trays shall be supported by U-shaped welded hangers formed of min 0.093 in. (2.4 mm) thick painted or galvanized steel channels, 1-5/8 in. (41 mm) wide by min 1-5/8 in. (41 mm) deep with the flange edges hemmed for stiffness.

4. **Cables** — Cables to be installed in accordance with all provisions in the National Electrical Code (NFPA 70).

5. **Thermal Barrier System** — The thermal barrier system consists of an aluminum faced blanket, caulking, filament tape, aluminum foil tape and stainless steel banding straps with wing clips. The thermal barrier system shall be installed on the cable tray and supports in accordance with the manufacturer’s detailed instructions accompanying the Batts and Blankets* and as summarized below:
   
   A. **Batts and Blankets** — Nom 0.4 in. (10 mm) thick endothermic blanket supplied in nom 24-1/2 in. (622 mm) wide rolls. Blanket installed by cutting-to-length and tightly wrapping around the cable tray with a min 2 in. (50 mm) circumferential overlap and butt perimeter seams. Subsequent layers are to be offset min 2 in. (51 mm). A min of two, three or four layers is required for 1/4, 1/2 and 1 Hr. systems, respectively. Blanket installed on cable tray supports by cutting-to-length and tightly wrapping around each support member with a min 2 in. (51 mm) circumferential overlap. The blanket should extend past the end of the cable tray support and be capped with a piece of blanket cut-to-size. Subsequent layers are to be offset min 2 in. (51 mm).

   B. **Fill, Void or Cavity Materials** — (Not Shown) — Caulk used to seal any joint or seam gap greater than 1/4 in. (6 mm) on the outer blanket layer. Additionally used over the blanket caps wrapped around the cable tray supports.

   C. **Filament Tape** — (Not Shown) — Nom 3/4 in. (19 mm) wide pressure-sensitive tape supplied in rolls. Used during installation to temporarily secure the blankets in place before final compression and permanent attachment with banding (Item 5E). Minimally to be wrapped around the entire circumference of each installed blanket within 2 in. (51 mm) of each joint edge.

   D. **Aluminum Foil Tape** — (Not Shown) — Nom 4 in. (102 mm) wide pressure-sensitive aluminum foil tape supplied in rolls. Used over all joints, seams and any location filled with caulking or sealant (Item 5B).

   E. **Banding** — Min 0.020 in. (0.5 mm) thick by 1/2 in. (13 mm) wide Type 304 stainless steel banding installed over the outer layer of blanket material and cable tray supports. The bands are to be minimally placed 1-2 in. (25-50 mm) above and below each joint and at the midpoint of any blanket with a length greater than 12 in. (305 mm). Banding to be ratchet-tightened and secured with stainless steel wing clips.

1. CABLE TRAY: Use galvanized steel ladder-back cable tray with min. dimensions of 102mm (4 in.) high × 305mm wide (12 in.).

2. CERTIFIED MANUFACTURER: 3M Company
   CERTIFIED PRODUCT: Applied Fireproofing
   CERTIFIED MODEL: 3M™ Interam™ ES-5A-12 Series Endothermic Mat

   ENDOTHERMIC MAT: Install three layers of foil-faced flexible Endothermic Mat, wrapped tightly around the cable tray (Item 1) with the foil facing away from the cable tray. Ensure a min. 50mm (2 in.) overlap onto itself at end of wrap. Temporarily affix sections of Endothermic Mat with filament tape if needed. Install each additional layer in the same manner, ensuring the seams between layers are offset a min. of 50mm (2 in.).

3. ALUMINUM TAPE (Not Shown): Apply 102mm (4 in.) wide pressure sensitive tape with aluminum foil-facing to all joints of each layer of the Endothermic Mat (Item 2).

4. STEEL SHEATHING: Install a one layer of min. 0.48mm (26 GA, 0.0156 in.) T-304 stainless steel sheathing over the Endothermic Mat (Item 2) with min. 76mm (3 in.) overlap at joints to create a stepped surface installation.

5. STEEL BANDING (Not Shown): Apply 13mm (1/2 in.) wide by 0.5mm (0.02 in.) thick stainless steel banding as follows:
   A. (Not Shown) Following the installation of the outer layer of the Endothermic Mat (item 2), install bands a max. of 400mm (16 in.), on center (oc) and 40mm (1-1/2 in.) from the ends of the Endothermic Mat.
   B. Following the installation of the stainless steel sheathing (Item 4), install bands a max. of 400mm (16 in.) oc and 40mm (1-1/2 in.) from the ends of the sheathing.

Figure 1. Cable Tray Protection

This material was extracted and drawn by 3M Fire Protection Products from the 2018 Product Directory, © Intertek
CABLE TRAY: Use aluminum or other metallic cable tray with min. nominal dimensions of 44.5mm (1-3/4 in.) high × 152mm wide (6 in.), with ventilated or solid bottom.

CERTIFIED MANUFACTURER: 3M Company

CERTIFIED PRODUCT: Applied Fireproofing

CERTIFIED MODEL: 3M™ Interam™ E-5A-4 Series Endothermic Mat

ENDOTHERMIC MAT: Refer to Table 1. Install the prescribed number of layers of foil-faced flexible Endothermic Mat for the desired rating period.

Each layer of Endothermic Mat is wrapped tightly around the cable tray (Item 1) with the foil facing away from the cable tray. Ensure a min. 50mm (2 in.) overlap onto itself at end of wrap. Each section of Endothermic Mat is to be tightly butted to the adjacent section. Temporarily affix sections of Endothermic Mat with 3M™ Scotch 898 Filament Tape (1/2 in. wide), spaced nominally 3 in. on center (oc). Any gaps larger than 3mm (1/8 in.) in width between adjacent Endothermic Mat wraps are to be filled with 3M™ Fire Barrier Sealant CP25+ WB (not shown).

Install each additional layer in the same manner, ensuring the seams between layers are offset a min. of 50mm (2 in.).
3. ALUMINUM TAPE (Not Shown): Apply 102mm (4 in.) wide pressure sensitive tape with aluminum foil-facing to all joints of each layer of the Endothermic Mat (Item 2).

4. STEEL SHEATHING: Install a one layer of min. 0.48mm (26 GA, 0.0156 in.) S-304 stainless steel sheathing over the Endothermic Mat (Item 2) with min. 76mm (3 in.) overlap at joints to create a stepped surface installation. Circumferential wraps will be overlapped by a min. of 3 in. at the end of the wrap.

5. STEEL BANDING: Apply 13mm (1/2 in.) wide × 0.5mm (0.02 in.) thick stainless steel banding as follows:
   A. (Not Shown) Following the installation of the outer layer of the Endothermic Mat (Item 2), install bands a max. of 305mm (12 in.) oc and 0mm (1-1/2 in.) from the ends of the Endothermic Mat (Item 2). Bands shall be tightened such that they compress, but do not cut, into the foil-facing of the Endothermic Mat (Item 2).
   B. Following the installation of the stainless steel sheathing (Item 4), install bands a max. of 400mm (16 in.) oc and 40mm (1-1/2 in.) from the ends of the sheathing.

UL System No. FP-1
HNKJ - Fire-resistant Pipe-protection Systems

January 19, 2017

Fire-resistance Rating – 2 H

1. **Fuel Pipe Assembly** – Nom 1 in. (25 mm) to nom 4 in. (102 mm) diam Schedule 40 (or heavier) steel pipe with threaded or welded fittings. For all pipes greater than 1 in. (25 mm) diam, all fittings shall be welded.

2. **Pipe Supports** – (Not Shown) – Pipe shall be supported by steel pipe hangers in conjunction with min 3/8 in. (10 mm) diameter threaded steel rod. Refer to the manufacturer’s installation instructions for additional details.

3. **Fire-resistant Pipe-protection System** – The fire-resistant pipe-protection system consists of a mat wrap, foil tape, stainless steel banding straps and caulk. The system shall be installed in accordance with the detailed installation instruction manual supplied by the manufacturer of the Fire-resistant Pipe-protection Materials. The details of the fire-resistant pipe-protection system are summarized below:
   
   **A. Fire-resistant Pipe-protection Materials** – Mat – Nom 0.4 in. (10 mm) flexible sheet material. A min of five layers of mat wrap are required. Each layer of mat wrap installed by cutting to size and wrapping around the fuel pipe and itself such that a min 2 in. (51 mm) overlap is present along the longitudinal seam. Adjacent lengths of mat wrap in each layer to be installed with tightly butted end seams. Successive layers of mat wrap installed in same manner with butted end seams offset min 2 in. (51 mm) from butted end seams of preceding layer. All seams in each layer of mat wrap to be sealed with foil tape (Item 3B). Mat wrap layers secured in place with stainless steel banding straps (Item 3C) on outermost layer.

   **3M COMPANY 3M FIRE PROTECTION PRODUCTS** – Type E-5A-4

   **B. Foil Tape** – (Not Shown) – Nom 4 in. (102 mm) wide min 3 mil (0.08 mm) thick pressure-sensitive aluminum foil or stainless steel foil tape, supplied in rolls. Used to secure seams of mat wrap (Item 3A).

   **C. Steel Banding Straps** – Min 1/2 in. (13 mm) wide by min 0.019 in. (0.5 mm) thick stainless steel straps used in conjunction with stainless steel crimp clips. Banding straps spaced max 8 in. (203 mm) OC to secure mat wrap layers.

   **D. Fill, Void or Cavity Materials** – Caulk – (Not Shown) – Any joint between the adjacent layers of mat wrap that exceed 1/8 in. (3.2 mm) in width shall be filled with caulk to the full depth of the joint. Each layer of E-Mat (Item 3A) on the pipe supports abutting the mat wrap on the pipe shall also be sealed with caulk.

   **3M COMPANY 3M FIRE PROTECTION PRODUCTS** – CP 25WB+, FB-3000 WT

*Indicates such products shall bear the UL Certification Mark for jurisdictions employing the UL Certification.

1. Fuel Pipe Assembly – One or more nominal 1 in. (25 mm) to nominal 4 in. (102 mm) diameter Schedule 40 (or heavier) steel pipe with threaded or welded fittings for nominal 1 in. (25 mm) diameter or smaller pipes installed symmetrically within the outer containment pipe (Item 2) utilizing steel pipe spacers. For all pipes greater than 1 in. (25 mm) diameter, all fittings shall be welded.

2. Outer Containment Pipe – Nominal 4 in. (102 mm) to nominal 12 in. (305 mm) diameter Schedule 10 (or heavier) steel pipe with threaded or welded fittings. When outer containment pipe is greater than nominal 4 in. (102 mm) diameter, the fire resistance rating is 2 hr.

2A. Outer Containment Pipe – As an alternate to the Schedule 10 pipe, the outer containment pipe may be fabricated from 10 gauge (nominal 0.134 in. or 3.5 mm) steel for nominal 4 in. (102 mm) and 6 in. (152 mm) pipes only.

3. Pipe Supports – (Not Shown) – Outer containment pipe shall be supported by steel pipe hangers in conjunction with minimum 3/8 in. (10 mm) diameter threaded steel rod. Refer to the manufacturer’s installation instructions for additional details.

4. Fire-resistant Pipe-protection System* – The fire-resistant pipe-protection system consists of a mat wrap, foil tape, stainless steel banding straps and caulk. The system shall be installed in accordance with the detailed installation instruction manual supplied by the manufacturer of the Fire-resistant Pipe-protection Materials*. The details of the fire-resistant pipe-protection system are summarized below:

A. Fire-resistant Pipe-protection Materials* – Mat – Nominal 0.4 in. (10 mm) flexible sheet material. A minimum of four layers of mat wrap are required. Each layer of mat wrap installed by cutting to size and wrapping around the outer containment pipe and itself such that a minimum 2 in. (51 mm) overlap is present along the longitudinal seam. Adjacent lengths of mat wrap in each layer to be installed with tightly butted end seams. Successive layers of mat wrap installed in the same manner with butted end seams offset minimum 2 in. (51 mm) from butted end seams of preceding layer. All seams in each layer of mat wrap to be sealed with foil tape (Item 4B). Mat wrap layers secured in place with stainless steel banding straps (Item 4C) on outermost layer.

B. Foil Tape – (Not Shown) – Nominal 4 in. (102 mm) wide minimum 3 mil (0.08 mm) thick pressure-sensitive aluminum foil or stainless steel foil tape, supplied in rolls. Used to secure seams of mat wrap (Item 4A).

C. Steel Banding Straps – Minimum 1/2 in. (13 mm) wide by minimum 0.019 in. (0.5 mm) thick stainless steel straps used in conjunction with stainless steel crimp clips. Banding straps spaced maximum 8 in. (203 mm) OC to secure mat wrap layers.

D. Fill, Void or Cavity Materials* – Caulk – (Not Shown) – Any joint between the adjacent layers of mat wrap that exceed 1/8 in. (3.2 mm) in width shall be filled with caulking to the full depth of the joint. Each layer of E-Mat (Item 4A) on the pipe supports abutting the mat wrap on the pipe shall also be sealed with caulking.

*Indicates such products shall bear the UL Certification Mark for jurisdictions employing the UL Certification.

Important Notice to Purchaser

Technical Information: The technical information, guidance, and other statements contained in this document or otherwise provided by 3M are based upon records, tests, or experience that 3M believes to be reliable, but the accuracy, completeness, and representative nature of such information is not guaranteed. Such information is intended for people with knowledge and technical skills sufficient to assess and apply their own informed judgment to the information. No license under any 3M or third party intellectual property rights is granted or implied with this information.

Product Selection and Use: Many factors beyond 3M's control and uniquely within user's knowledge and control can affect the use and performance of a 3M product in a particular application. As a result, customer is solely responsible for evaluating the product and determining whether it is appropriate and suitable for customer's application, including conducting a workplace hazard assessment and reviewing all applicable regulations and standards (e.g., OSHA, ANSI, etc.). Failure to properly evaluate, select, and use a 3M product and appropriate safety products, or to meet all applicable safety regulations, may result in injury, sickness, death, and/or harm to property.

Warranty, Limited Remedy, and Disclaimer: Unless a different warranty is specifically stated on the applicable 3M product packaging or product literature (in which case such warranty governs), 3M warrants that each 3M product meets the applicable 3M product specification at the time 3M ships the product. 3M MAKES NO OTHER WARRANTIES OR CONDITIONS, EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, ANY IMPLIED WARRANTY OR CONDITION OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR ARISING OUT OF A COURSE OF DEALING, CUSTOM, OR USAGE OF TRADE. If a 3M product does not conform to this warranty, then the sole and exclusive remedy is, at 3M's option, replacement of the 3M product or refund of the purchase price.

Limitation of Liability: Except for the limited remedy stated above, and except to the extent prohibited by law, 3M will not be liable for any loss or damage arising from or related to the 3M product, whether direct, indirect, special, incidental, or consequential (including, but not limited to, lost profits or business opportunity), regardless of the legal or equitable theory asserted, including, but not limited to, warranty, contract, negligence, or strict liability.
