Step 1: Handling, Collection & Transport of Contaminated Instruments

1. Decontamination Zone
2. Packing Zone
3. Sterile Storage Zone

Step 2: Cleaning & Decontamination Processes

1. Instrumentation is disassembled according to the manufacturer's IFU.
2. Instrumentation is cleaned and disinfected with appropriate manual and mechanical cleaning methods and is visually inspected by users.
3. Instrumentation is packaged in a container with a category 5/PCD and labeled with appropriate verification methods.

Step 3: Instrument Inspection, Preparation & Packaging

1. Cleaning verification methods are used according to the manufacturer's instructions.
2. Cleaning verification methods confirm that the medical device is properly cleaned and are used according to the manufacturer's instructions.
3. Cleaning verification methods are used according to the manufacturer's instructions.

Step 4: Sterilization & Monitoring

1. Sterilized items remain on Sterilizer Cart, do not overload the Sterilizer Cart, and allow space for debris to fall.
2. Cart & allow space for debris to fall.
3. Instruments and Biofilm are removed from the Sterilizer Cart.

Step 5: Sterile Storage & Distribution

1. Sterile supplies are distributed to the point of use.
2. Sterile supplies are distributed to the point of use.
3. Sterile supplies are distributed to the point of use.

General Best Practice

- Cleaning verification methods confirm that the medical device is properly cleaned.
- Cleaning verification methods confirm that the medical device is properly cleaned.
- Cleaning verification methods confirm that the medical device is properly cleaned.

Step-By-Step Guide to Instrument Cleaning, Decontamination, Sterilisation and Storage Process of Medical Instruments

- Cleaning verification methods confirm that the medical device is properly cleaned.
- Cleaning verification methods confirm that the medical device is properly cleaned.
- Cleaning verification methods confirm that the medical device is properly cleaned.
