

WHAT ARE MANGANESE, HEXAVALENT CHROMIUM & BERYLLIUM?

Manganese is a metal that is commonly added to steel to promote hardness and durability. In the workplace, it is commonly found in **welding rods** and **filler metals.**

EXAMPLES:

Steel

Welding rods

Manganese

Filler metals

Chromium is an element naturally found in the earth's crust. Chromium is found in a number of different forms, but it is the hexavalent form that is an emerging health focus. It can be present during operations like **stainless steel welding** as well as found in a **myriad of paints, pigments, dyes, plastics** and **more.**¹

Ceramics

Beryllium

Beryllium is a lightweight but extremely strong metal used in a variety of applications, particularly in welding. Industries where beryllium exposure commonly occurs

include aerospace, aviation, defense, shipbuilding,

Stainless steel

Dyes

Over **550,000** workers a year² from **Manganese and HexChrome**

> Around **62,000** workers could be exposed to **beryllium**

WHY COULD MANGANESE, HEXAVALENT CHROMIUM & BERYLLIUM AFFECT MY TEAM?

According to OSHA, workplace exposures to manganese can result in irritation to the nose, throat and lungs. Exposures

can result in irritation to the nose, throat and lungs. Exposures have also been associated with Manganism, a disease that has been associated with weakness, lethargy, tremors and even paralysis. Manganese is potentially an ototoxic agent, which means that it can be harmful to hearing as well.

A ez

Hexavalent Chromium exposures have been associated with skin irritation, ulcers, allergic reactions and lung cancer.

According to OSHA, workers who have been exposed to beryllium are at an increased risk of developing chronic beryllium disease (CBD), berylliosis and lung cancer.
