Key Test: ISO 5660-1

1045

Client's Identification:

Lot No.: LA-D100-2874-7. Style: DP8610NS. Composition: 2K Acrylic Adhesive. Product End Use: Rail Applications for Structural Adhesive. Adhesive sandwiched between 2 pieces of 1 mm thick Aluminum panels. Adhesive thickness 0.4 mm.

Test Category: Cone Specifier: Eurorail LE: 2015; V 2/19 PC: 48H(ME) /rb

TEST PERFORMED: ISO 5660-1 - Reaction-to-fire tests -- Heat release, smoke production and mass loss rate -- Part 1: Heat release rate (cone calorimeter method) [LE 2015; V 2/19] --

As cited by EN 45545-2 Railway applications - Fire protection on Railway vehicles - Part 2: Requirements for fire behaviour of material and components.

APPROXIMATE THICKNESS DIAMETER OF MATERIAL (as measured by SGS North America): 2.6 mm

Flat Specimen: 4" x 4"; Cylindrical Specimen: 4" lengths vertically grouped to form the 4" x 4" test specimens

HEAT FLUX: 25 kW/m² [CODE 1045]; 50 kW/m² [CODE 1045]

IGNITION MODE: External Spark; Non External

RETAINING WIRE GRID PLACED OVER FACE OF SPECIMEN: Yes; No

BRIEF DESCRIPTION OF TEST: A test specimen measuring 4" x 4" maximum thickness 2" is mounted into the specimen holder. The specimen holder sits on a load cell. The opening of a "cone shaped" radiant heat source faces the test specimen. The heat flux (optionally 25 kW or 50 kW) is radiated onto the surface of the specimen. A spark is introduced to ignite the off-gases. While the test specimen burns and decomposes, measurements are made in the exhaust system of the apparatus. Using the oxygen concentrations present during combustion, pressure flow rates and thermocouple temperatures, the mass of oxygen consumed at any given time can be calculated. Heat release values are then determined using a defined formula based on the release rate of 13.1 MJ per kg oxygen consumed (hence the term oxygen consumption calorimetry). Simultaneously, the optical photometrics, or smoke obscuration measuring system, is gauging smoke release while the weigh cell is tracking specimen mass loss. The data is reported. The smoke value is reported as the specific extinction area [SEA].

Test Report: 3-42295-9

Key Test: ISO 5660-1

1045

SEA = Visible smoke development of material (expressed as the Specific Extinction Area).
N/A = Not applicable.

TEST END CODES:

- 1 = 32 minutes after the time to sustained flaming.
- 2 = 30 minutes have elapsed, and the specimen has not ignited.
- 3 = Oxygen returned to near-pretest values for 10 minutes.
- 4 = The mass of the specimen is less than 0.1 g for 60 s. Minimum test duration shall be 5 minutes.

REMARKS:

None.

Test specimens are thermally thin, containing little mass and fuel. The small amount of fuel results in a very short burning time, e.g. the specimen under test never reaches a steady state burning condition. The small mass results in extremely small mass loss rates nearing the limit of the instrument's capability to measure. This results in high variability in reported results calculated with mass in the denominator, specifically SEA and Effective Heat of Combustion.

Specimen/s _____ exhibited intumescent behavior (swelling as a result of heat exposure) of approximately _____ mm above the top of the specimen holder frame which did not interfere with the burner.

Specimen/s _____ exhibited intumescent behavior (swelling as a result of heat exposure) which interfered with the burner. The distance of the heating surface of the cone heater or the face of the specimen was increased to 60 mm as per the instructions in ISO 5660-1.

Other (described): _____

CLASSIFICATION CRITERIA AND CONCLUSION: The reader is referred to the "Summary of EN 45545-2 Hazard Levels" contained elsewhere in this report to determine the hazard level based on the results contained in this report. To achieve a "Complete Hazard Level Certification", other fire tests are required.

The results contained in this report relate only to the item(s) tested. The test report shall not be reproduced except in full, without written approval from SGS North America.

EXPLANATION: Footnote "a" is taken directly from EN 45545-2.

It is apparently a typographical error as it pertains to ISO 5658-2 rather than ISO 5660-2.

The "-" is also taken directly from EN 45545-2 and is unexplained by EN 45545-2.

Practically, a product that falls within the maximum values for either HL2 or HL3 should automatically qualify for a lower hazard level.

The results contained in this report relate only to the behaviour of the specimens of the product under the particular conditions of test; they are not intended to be the sole criterion for assessing the potential smoke obscuration hazard of the product in use.

The results contained in this report relate only to the item(s) tested. The test report shall not be reproduced except in full, without written approval from SGS North America.
