Tegaderm™ High Performance Foam Adhesive Dressing

Delivers more.

- Highest fluid-handling capacity
- Reduced risk of maceration
- Greater cost savings
High performance through innovative features and construction

Soft, absorbent foam layer
- Absorbs and rapidly wicks excess moisture away from the wound and periwound skin
  - Protects wound
  - Conformable and non-adherent
  - Comfortable

Moisture-control layer
- Enables rapid evaporation of excess moisture out of the dressing, extending wear times
  - Distributes moisture
  - Facilitates evaporation
  - Maintains moisture balance

High-capacity absorbent layer
- Absorbs and retains moisture away from wound, reducing the risk of maceration
  - Increases absorbency by 100%
  - Minimises backward moisture migration

Highly conformable adhesive-film backing
- Assures that the dressing remains securely and comfortably in place
  - Highly breathable when needed
  - Minimises edge lift and fluid leakage
  - Waterproof barrier protects against contamination and outside moisture

Patented, award-winning spoke delivery system
- Allows for easy, one-handed application

Indications:
- Pressure ulcers
- Skin tears
- Skin graft donor sites
- Venous leg ulcers
- Neuropathic ulcers
- Arterial ulcers
- Abrasions
Providing superior fluid handling

In clinical and laboratory tests, Tegaderm™ High Performance Foam Adhesive Dressing outperforms other leading brands in managing low- to high-exudate levels.

**Chart 1:**

The highest fluid-handling capacity among industry leading brands

Under simulated moderate- to high-exudate conditions, 3M™ Tegaderm™ High Performance Foam Adhesive Dressing managed significantly more fluid than other leading brands. The median amount of fluid Tegaderm™ High Performance Foam Adhesive Dressing can handle is based on the average amount of fluid managed by the dressing before failing. This is an underestimate as <50 percent of dressings failed when the maximum volume (87 ml) was delivered and the study ended.

**Chart 2:**

Providing moisture balance

In bench tests, 3M™ Tegaderm™ High Performance Foam Adhesive Dressing demonstrated a broad range of evaporative capacity. It is significantly less evaporative under low moisture conditions, which helps prevent wounds from drying out. Yet it has extremely high evaporation when there is excess moisture, helping to prevent maceration.
Long-wearing comfort and convenience

Tegaderm™ High Performance Foam Adhesive Dressing provides up to seven-day wear times. Plus, because the adhesive-film backing is thin, the dressing’s profile is low. Fitting comfortably under clothes, the dressing moves with patients and is less likely to catch on material — including bedding. The dressing is also waterproof, so patients can shower.

Chart 3: Longer wear times
Under simulated moderate- to high-exudate conditions, 3M™ Tegaderm™ High Performance Foam Adhesive Dressing provided significantly longer wear times than other leading brands.

Protecting for up to seven days — and then removing gently

Tegaderm™ High Performance Foam Adhesive Dressing features a highly conformable adhesive-film backing and superior fluid-handling capabilities, features that help deliver longer wear times. At the same time, it provides similar levels of comfort and gentle removal as other leading brands.

Median number of days dressing can be worn before failure

Chart 4: Effective adhesion to skin
3M™ Tegaderm™ High Performance Foam Adhesive Dressing effectively adheres to skin over a seven-day period. The adhesive improves over the first few days and then slowly releases, providing exceptional protection during wear — yet the dressing consistently removes gently for patient comfort.

Meeting the needs of patients and clinicians
Creating the optimal wound-healing environment

3M™ Tegaderm™ High Performance Foam Adhesive Dressing is scientifically formulated to adapt to changing wound environments, facilitating the body’s dynamic wound-healing process. It combines four unique layers to deliver exceptional fluid handling, which helps create the optimal moist healing environment for low- to high-exudating wounds.

At the same time, the dressing incorporates the patented spoke design to deliver easy, one-handed application.

Adapting to different moisture levels

HIGH EXUDATE: Reducing the risk of maceration
When excess moisture pools in or around a wound, exposing periwound skin to exudate, it can cause maceration, which may delay wound healing and cause patient discomfort. Each layer of the dressing plays a critical role in reducing the potential for maceration.

How it works
• Rapid vertical wicking of wound exudate into the soft, absorbent foam layer
• Retention of wound exudate off the wound and periwound skin in the high-capacity absorbent layer
• Distribution of exudate across the moisture-control layer, which facilitates evaporation
• High evaporation of the exudate through the breathable adhesive film layer

LOW EXUDATE: Reducing the risk of desiccation and adherence
Low-exudate conditions can cause wound bed desiccation or dressing adherence, both of which can lead to patient discomfort. Further, a dry environment may reduce the rate of re-epithelialisation and slow the healing process. In a low-exudating wound, the dressing’s moisture-control layer and adhesive film backing moderate evaporation, discouraging rapid evaporation and allowing the dressing to maintain a moist wound-healing environment.
