

Reporting tools for 3MSM CodeRyteSM CodeAssistSM System

Quantitative data to drive change

The ability to manage your business begins with measurement, and reporting is a critical dimension of why organizations rely on **3MSM CodeRyteSM CodeAssistSM System** for determining appropriate utilization, driving change management and generating material benefit. Facilitating change management strategies by using aggregated data can be a primary client benefit of the 3M CodeAssist reports, which are easily accessed through a standard Control Panel.

Designated Control Panel users can review relevant reports for managing their business, leveraging five basic report categories:

- **Operational reports** provide insight into current work in process. These reports monitor note progression, change statistics, measures of confidence and engine agreement. 3M's aggregated Note Audit Trail displays a complete list of events related to each report. The trail Shows all instances where PHI data was accessed and by whom, as required by HIPAA.
- **Performance reports** offer statistical snapshots of coder and physician workload. Coder productivity is monitored for trends through detailed analysis of queues, sites, types of reports, modalities and other breakdowns. Physician monitoring shows insufficient documentation and RVU activity by physician.
- **Quality assurance reports** offer insight into coding operations to fine-tune coding performance and processes. These reports can help drive productivity, compliance and appropriate revenue attainment. 3M's standard solution can provide retrospective audit samples and a detailed analysis of audit outcomes. Concurrent auditing presents real-time, prospective auditing capabilities, which are ideal for new coders or coding in new specialties to build confidence in a coder's skill set.
- **Clinical reports** explore and identify specific areas of clinical concern, including insufficient physician documentation. PQRS monitoring helps managers to understand what percentage of their patients qualify for the measure and how many were reported with PQRS codes and modifiers.
- **Reconciliation reports** offer end-to-end tracking on 100 percent of reported procedures as they move through to billing. Clients use these reports to identify missing documentation and data feed issues. 3M CodeAssist automatically reconciles client manifest files to determine if everything is accounted for and to highlight any missing elements. Automated alerts identify incoming interface data that contain errors, which can help reduce coding delays.
