3M™ Weld-Thru Coating II (PN 05917) uses the power of nature to provide corrosion protection between panels after repairs. The zinc contents of 3M™ Weld-Thru Coating II (PN 05917) corrode in preference to the steel it is in contact with, this process is known as Bi—metallic corrosion is well known and the basis for zinc being the choice of manufacturers worldwide as a preference versus copper coating as a corrosion preventative material over steel.

The chart above displays the electrical activity of metals and known cathodic/anodic reactions resulting in the degradation of steel when in contact with copper, and conversely the degradation of zinc when in contact with steel.

**For best results**

- Apply to the mating flanges of parts immediately after cleaning the weld surfaces of coatings, sealers and other contaminates
- Apply 2 medium coats to ensure coverage and allow to dry
- Fit up panels and clamp in place
- If MIG plug welding: for best results remove the coating from the weld site using an abrasive (such as a 3M™ Bristle Disc)
- Test for proper welder setting on scrap parts prior to actual welding of body parts
- Remove 3M™ Weld-Thru Coating II (PN 05917) overspray from areas outside the weld flange contact surface, 3M™ Weld-Thru Coating II (PN 05917) is not a substitute for paint line primers.
- After welding is complete, apply 3M™ Rust Fighter-I, 18 ounce aerosol, PN 08892 (cavity wax) or 3M™ Undercoating to complete the corrosion protection package and ensure maximum protection.
