Clinically-supported skin protection for IV sites.
Catheter-associated skin damage (CASI) is localized skin damage around the vascular access site and encompasses more than medical adhesive-related skin injury (MARS), including factors such as drainage and erythema under a dressing. Preparation of the skin and selection of proper adhesive products are important steps to help minimize the risk of skin damage.

CASI is not a new condition, but it has been added to The Infusion Nurses Society (INS) 2021 Infusion Therapy Standards of Practice to reflect the growing focus on patient-centered infusion care. Among the 2021 standards are guidelines to help protect at-risk skin from irritation and possible injury.

INS recommended steps to help reduce CASI.

**Assess the patient.** *(Std. 55, pg. S168)*
- Check vascular access device (VAD) sites for signs of injury *(Level V)*
- Check color, texture, uniformity of appearance, and integrity of skin
- Identify and promptly avoid suspected irritant/allergens

**Protect the skin.** *(Std. 42, pg. S120 Level II)*
- Use a sterile, alcohol-free skin barrier that is compatible with an antiseptic solution to protect at-risk skin when using an adhesive-based securement method

Catheter-Associated Skin Impairment (CASI) Algorithm

For a detailed and thorough guide on assessing patients for CASI, as well as the steps you can take to protect skin and provide comfort, see the full standards for the Catheter-Associated Skin Impairment (CASI) Algorithm. *(Appendix C, pg. S201)*
First to market. Only one of its kind.

3M™ Cavilon™ No Sting Barrier Film is the original and only terpolymer-based alcohol-free barrier film* that helps prevent skin damage before it occurs.

Unique formulation. Powerful impact.

**Effective**
- Waterproof barrier
- Breathable
- Fast-drying

**Gentle**
- Alcohol-free
- Sting-free

**Standard-compliant**
- Chemically compatible with chlorhexidine-gluconate (CHG)
- Sterile wands and wipes

**Clinically-supported**
- Only barrier film supported by vascular access-specific data
- 80+ pieces of clinical evidence supporting ability to protect skin from adhesives and body fluids

**Unique, peel open packaging**
Available in easy-to-open, peel-down packaging that allows for aseptic delivery.

*Of leading competitors in the market, based on disclosed ingredient information.
How 3M™ Cavilon™ No Sting Barrier Film works.

Cavilon No Sting Barrier Film forms a breathable, transparent, protective coating between the skin and the adhesive of the securement dressing, device or tape. When the adhesive product is changed, Cavilon No Sting Barrier Film is removed instead of skin cell layers. It also protects skin from moisture, friction and shear.

Protection from adhesive products

Protection from moisture, friction and shear

Without 3M™ Cavilon™ No Sting Barrier Film

With 3M™ Cavilon™ No Sting Barrier Film

Applying 3M™ Cavilon™ No Sting Barrier Film.

- Apply antiseptic prep and allow to dry completely
- Insert catheter
- Apply an even coating of Cavilon No Sting Barrier Film to the area that will be covered by the adhesive dressing/device. If using 3M™ Tegaderm™ CHG Chlorhexidine Gluconate I.V. Securement Dressing, do not apply the film to skin where the CHG gel pad is placed
- Allow Cavilon No Sting Barrier Film to dry completely (approximately 30 seconds)
- Apply dressing
The clinical performance of 3M™ Cavilon™ No Sting Barrier Film

Cavilon No Sting Barrier Film is supported by more than 80+ pieces of evidence, including studies focusing on vascular access-specific data.

In a study with patients with Peripherally Inserted Central Catheter (PICC) lines:
- 62% of patients (n=50) experienced skin complications with gauze or tape applied.
- 6% of patients (n=50) experienced skin complications with Cavilon No Sting Barrier applied before gauze and tape protocol.

In a study with critical care patients with Central Venous Access Devices:
- 17 patients (n=30) experienced complete dressing disruptions when using a plain film dressing and no barrier film.
- 2 patients (n=30) experienced complete dressing disruptions when Cavilon No Sting Barrier Film was applied when using CHG dressing.

In a study with critical care patients with Central Venous Catheters (CVC) receiving gauze and tape dressings:
- 47.9% of patients (n=48) in the control group experienced a skin tear.
- 22% of patients (n=50) experienced a skin tear with Cavilon No Sting Barrier Film applied.

**Conclusion**

Skin barriers can help play a role in reducing skin-related complications in patients with long-term PICC lines. 3M™ Cavilon™ No Sting Barrier Film was shown to provide significant skin protection when used prior to gauze and tape protocol.

**Conclusion**

The skin-protective polymer of 3M™ Cavilon™ No Sting Barrier Film was shown to contribute to fewer dressing disruptions and skin integrity issues without impacting the clinical effectiveness of a CHG dressing.

**Conclusion**

A skin barrier can help maintain skin integrity and reduce skin tear incidence. The authors noted the skin protection provided by 3M™ Cavilon™ No Sting Barrier Film could help improve comfort and quality of care for patients with CVCs.
